HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use ALLEGRA safely and effectively. See full prescribing information for ALLEGRA.

ALLEGRA® (fexofenadine hydrochloride) oral suspension, for oral use
Initial U.S. Approval: 1996

----------INDICATIONS AND USAGE----------
ALLEGRA is an H_1-receptor antagonist indicated for:

- Treatment of uncomplicated skin manifestations of chronic idiopathic urticaria in children between 6 months and 6 years of age. (1.1)

----------DOSAGE AND ADMINISTRATION----------

Patient Population	ALLEGRA oral suspension (2.1)
Children 2 to 6 years	30 mg twice daily[1]
Children 6 months to less than 2 years	15 mg twice daily[1]

[1] starting dose in patients with decreased renal function should be the recommended dose indicated above but administered once daily

----------DOSAGE FORMS AND STRENGTHS----------

- ALLEGRA oral suspension: 30 mg/5 mL (6 mg/mL) (3)

----------CONTRAINDICATIONS----------
Patients with known hypersensitivity to fexofenadine and any of the ingredients of ALLEGRA. (4)

----------ADVERSE REACTIONS----------
The most common adverse reactions (≥2%) in subjects age 12 years and older were headache, back pain, dizziness, stomach discomfort, and pain in extremity. In subjects aged 6 to 11 years, cough, upper respiratory tract infection, pyrexia, and otitis media were more frequently reported. In subjects aged 6 months to 5 years, vomiting, diarrhea, somnolence/fatigue, and rhinorrhea were more frequently reported. (6.1)

Other adverse reactions have been reported. (6)

To report SUSPECTED ADVERSE REACTIONS, contact sanofi-aventis at 1-800-633-1610 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

----------DRUG INTERACTIONS----------

- Antacids: Do not take at the same time as aluminum and magnesium containing antacids. (7.1)
- Fruit juice: Take with water; not fruit juice.

----------USE IN SPECIFIC POPULATIONS----------

See 17 for PATIENT COUNSELING INFORMATION

Revised: 5/2019

FULL PRESCRIBING INFORMATION: CONTENTS*

*Sections or subsections omitted from the full prescribing information are not listed.

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

1.1 Chronic Idiopathic Urticaria

ALLEGRA is indicated for treatment of uncomplicated skin manifestations of chronic idiopathic urticaria in children between 6 months and 6 years of age.

2 DOSAGE AND ADMINISTRATION

2.1 ALLEGRA Oral Suspension

Chronic Idiopathic Urticaria

Children 6 months to 6 years

The recommended dose of ALLEGRA oral suspension is 30 mg (5 mL) twice daily for patients 2 to 6 years of age and 15 mg (2.5 mL) twice daily for patients 6 months to less than 2 years of age. For pediatric patients with decreased renal function, the recommended starting doses of ALLEGRA oral suspension are 30 mg (5 mL) once daily for patients 2 to 6 years of age and 15 mg (2.5 mL) once daily for patients 6 months to less than 2 years of age *[see Clinical Pharmacology (12.3)]*.

Shake bottle well, before each use.

3 DOSAGE FORMS AND STRENGTHS

ALLEGRA oral suspension is available as 30 mg/5 mL (6 mg/mL).

4 CONTRAINDICATIONS

ALLEGRA oral suspension is contraindicated in patients with known hypersensitivity to fexofenadine and any of the ingredients of ALLEGRA. Rare cases of hypersensitivity reactions with manifestations such as angioedema, chest tightness, dyspnea, flushing and systemic anaphylaxis have been reported.

6 ADVERSE REACTIONS

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety data described below reflect exposure to fexofenadine hydrochloride in 5083 patients in trials for allergic rhinitis and chronic idiopathic urticaria. In these trials, 3010 patients 12 years of age and older with seasonal allergic rhinitis were exposed to fexofenadine hydrochloride at doses of 20 to 240 mg twice daily or 120 to 180 mg once daily. A total of 646 patients 6 to 11 years of age with seasonal allergic rhinitis were exposed to fexofenadine hydrochloride at doses of 15 to 60 mg twice daily. The duration of treatment in these trials was 2 weeks. A total of 534 patients 6 months to 5 years of age with allergic rhinitis were exposed to fexofenadine hydrochloride at doses of 15 to 30 mg twice daily. The duration of treatment in these trials ranged from 1 day to 2 weeks. There were 893 patients 12 years of age and older with chronic

idiopathic urticaria exposed to fexofenadine hydrochloride at doses of 20 to 240 mg twice daily or 180 mg once daily. The duration of treatment in these trials was 4 weeks.

Seasonal Allergic Rhinitis

Adults and adolescents

In placebo-controlled seasonal allergic rhinitis clinical trials in subjects 12 years of age and older, 2439 subjects received fexofenadine hydrochloride capsules at doses of 20 mg to 240 mg twice daily. All adverse reactions that were reported by greater than 1% of subjects who received the recommended daily dose of fexofenadine hydrochloride (60 mg capsules twice daily) are listed in Table 1.

In another placebo-controlled clinical study in the United States, 571 subjects aged 12 years and older received fexofenadine hydrochloride tablets at doses of 120 or 180 mg once daily. Table 1 also lists adverse reactions that were reported by greater than 2% of subjects treated with fexofenadine hydrochloride tablets at doses of 180 mg once daily.

The incidence of adverse reactions, including somnolence/fatigue, was not dose related and was similar across subgroups defined by age, gender, and race.

Table 1: Adverse Reactions in Subjects Aged 12 Years and Older Reported in Placebo-Controlled Seasonal Allergic Rhinitis Clinical Trials in the United States

Twice-daily dosing with fexofenadine hydrochloride capsules at rates of greater than 1%		
Adverse reaction	**Fexofenadine hydrochloride 60 mg Twice Daily (n=680) Frequency**	**Placebo Twice Daily (n=674) Frequency**
Dysmenorrhea	1.5%	0.3%
Once-daily dosing with fexofenadine hydrochloride tablets at rates of greater than 2%		
Adverse reaction	**Fexofenadine hydrochloride 180 mg Once Daily**	**Placebo**
	(n=283)	**(n=293)**
	Frequency	**Frequency**
Headache	10.3%	7.2%
Back Pain	2.5%	1.4%

The frequency and magnitude of laboratory abnormalities were similar in fexofenadine hydrochloride-treated and placebo-treated subjects.

Pediatrics

Table 2 lists adverse reactions in subjects aged 6 years to 11 years of age which were reported by greater than 2% of subjects treated with fexofenadine hydrochloride tablets at a dose of 30 mg twice daily in placebo-controlled seasonal allergic rhinitis studies in the United States and Canada.

Table 2: Adverse Reactions Reported in Placebo-Controlled Seasonal Allergic Rhinitis Studies in Pediatric Subjects Aged 6 Years to 11 Years in the United States and Canada at Rates of Greater than 2%

Adverse reaction	Fexofenadine hydrochloride 30 mg Twice Daily (n=209) Frequency	Placebo (n=229) Frequency
Cough	3.8%	1.3%
Upper Respiratory Tract Infection	2.9%	0.9%
Pyrexia	2.4%	0.9%
Otitis Media	2.4%	0.0%

Table 3 lists adverse reactions in subjects 6 months to 5 years of age which were reported by greater than 2% of subjects treated with fexofenadine hydrochloride in 3 open single-dose and multiple-dose pharmacokinetic studies and 3 placebo-controlled safety studies with fexofenadine hydrochloride capsule content (484 subjects) and suspension (50 subjects) at doses of 15 mg (108 subjects) and 30 mg (426 subjects) given twice a day.

Table 3: Adverse Reactions Reported in Placebo-Controlled Studies in Pediatric Subjects with Allergic Rhinitis Aged 6 Months to 5 Years of Age at Rates Greater than 2%

Adverse reaction	Fexofenadine hydrochloride 15 mg Twice Daily (n=108) Frequency	Fexofenadine hydrochloride 30 mg Twice Daily (n=426) Frequency	Fexofenadine hydrochloride Total Twice Daily (n=534) Frequency	Placebo (n=430) Frequency
Vomiting	12.0%	4.2%	5.8%	8.6%
Diarrhea	3.7%	2.8%	3.0%	2.6%
Somnolence/Fatigue	2.8%	0.9%	1.3%	0.2%
Rhinorrhea	0.9%	2.1%	1.9%	0.9%

Chronic Idiopathic Urticaria

Adverse reactions reported by subjects 12 years of age and older in placebo-controlled chronic idiopathic urticaria studies were similar to those reported in placebo-controlled seasonal allergic rhinitis studies.

In placebo-controlled chronic idiopathic urticaria clinical trials, 726 subjects 12 years of age and older received fexofenadine hydrochloride tablets at doses of 20 to 240 mg twice daily. Table 4 lists adverse reactions in subjects aged 12 years and older which were reported by greater than 2% of subjects treated with fexofenadine hydrochloride 60 mg tablets twice daily in controlled clinical studies in the United States and Canada.

In a placebo-controlled clinical study in the United States, 167 subjects aged 12 years and older received fexofenadine hydrochloride 180 mg tablets. Table 4 also lists adverse reactions that were reported by greater than 2% of subjects treated with fexofenadine hydrochloride tablets at doses of 180 mg once daily.

Table 4: Adverse Reactions Reported in Subjects 12 Years of Age and Older in Placebo-Controlled Chronic Idiopathic Urticaria Studies

Twice-daily dosing with fexofenadine hydrochloride in studies in the United States and Canada at rates of greater than 2%		
Adverse reaction	**Fexofenadine hydrochloride 60 mg Twice Daily (n=191) Frequency**	**Placebo (n=183) Frequency**
Dizziness	2.1%	1.1%
Back Pain	2.1%	1.1%
Stomach discomfort	2.1%	0.6%
Pain in extremity	2.1%	0.0%
Once-daily dosing with fexofenadine hydrochloride in a study in the United States at rates of greater than 2%		
Adverse reaction	**Fexofenadine hydrochloride 180 mg Once Daily (n=167) Frequency**	**Placebo (n=92) Frequency**
Headache	4.8%	3.3%

The safety of fexofenadine hydrochloride in the treatment of chronic idiopathic urticaria in pediatric patients 6 months to 11 years of age is based on the safety profile of fexofenadine hydrochloride in adults and pediatric patients at doses equal to or higher than the recommended dose *[see Use in Specific Populations (8.4)]*.

6.2 Postmarketing Experience

In addition to the adverse reactions reported during clinical studies and listed above, the following adverse events have been identified during postapproval use of ALLEGRA. Because these events are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. Events that have been reported rarely during postmarketing experience include: insomnia, nervousness, sleep disorders or paroniria, and hypersensitivity reactions (including anaphylaxis, urticaria, angioedema, chest tightness, dyspnea, flushing, pruritus, and rash).

7 DRUG INTERACTIONS

7.1 Antacids

Fexofenadine hydrochloride should not be taken closely in time with aluminum and magnesium containing antacids. In healthy adult subjects, administration of 120 mg of fexofenadine hydrochloride (2 × 60 mg capsule) within 15 minutes of an aluminum and magnesium containing antacid (Maalox®) decreased fexofenadine AUC by 41% and C_{max} by 43%.

7.2 Erythromycin and Ketoconazole

Fexofenadine has been shown to exhibit minimal (ca. 5%) metabolism. However, coadministration of fexofenadine hydrochloride with either ketoconazole or erythromycin led to increased plasma concentrations of fexofenadine in healthy adult subjects. Fexofenadine had no effect on the pharmacokinetics of either erythromycin or ketoconazole. In 2 separate studies in healthy adult subjects, fexofenadine hydrochloride 120 mg twice daily (240 mg total daily dose) was coadministered with either erythromycin 500 mg every 8 hours or ketoconazole 400 mg

once daily under steady-state conditions to healthy adult subjects (n=24, each study). No differences in adverse events or QT_c interval were observed when subjects were administered fexofenadine hydrochloride alone or in combination with either erythromycin or ketoconazole. The findings of these studies are summarized in the following table:

Table 5: Effects on Steady-State Fexofenadine Pharmacokinetics after 7 Days of Coadministration with Fexofenadine Hydrochloride 120 mg Every 12 Hours in Healthy Adult Subjects (n=24)

Concomitant Drug	C_{maxSS} (Peak plasma concentration)	$AUC_{ss(0-12h)}$ (Extent of systemic exposure)
Erythromycin (500 mg every 8 hrs)	+82%	+109%
Ketoconazole (400 mg once daily)	+135%	+164%

The changes in plasma levels were within the range of plasma levels achieved in adequate and well-controlled clinical trials.

The mechanism of these interactions has been evaluated in *in vitro, in situ*, and *in vivo* animal models. These studies indicate that ketoconazole or erythromycin coadministration enhances fexofenadine gastrointestinal absorption. This observed increase in the bioavailability of fexofenadine may be due to transport-related effects, such as p-glycoprotein. *In vivo* animal studies also suggest that in addition to enhancing absorption, ketoconazole decreases fexofenadine gastrointestinal secretion, while erythromycin may also decrease biliary excretion.

7.3 Fruit Juices

Fruit juices such as grapefruit, orange and apple may reduce the bioavailability and exposure of fexofenadine. This is based on the results from 3 clinical studies using histamine induced skin wheals and flares coupled with population pharmacokinetic analysis. The size of wheal and flare were significantly larger when fexofenadine hydrochloride was administered with either grapefruit or orange juices compared to water. Based on the literature reports, the same effects may be extrapolated to other fruit juices such as apple juice. The clinical significance of these observations is unknown. In addition, based on the population pharmacokinetics analysis of the combined data from grapefruit and orange juices studies with the data from a bioequivalence study, the bioavailability of fexofenadine was reduced by 36%. Therefore, to maximize the effects of fexofenadine, it is recommended that ALLEGRA tablets should be taken with water *[see Clinical Pharmacology (12.3) and Dosage and Administration (2.1)]*.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

ALLEGRA oral suspension is not intended for use in females of reproductive potential *[see Indications and Usage (1)];* however, other formulations have been approved for use in adults. The available data from published literature and pharmacovigilance cases with fexofenadine hydrochloride use during pregnancy have not identified a drug-associated risk for major birth defects, miscarriage, or adverse maternal or fetal outcomes.

Animal reproduction studies were conducted in rats and rabbits with terfenadine, which is rapidly converted in vivo to fexofenadine. Estimated fexofenadine exposures were calculated and expressed relative to the maximum recommended human dose (MRHD) of fexofenadine hydrochloride. No adverse developmental effects were observed with oral administration of terfenadine to pregnant rats and rabbits during organogenesis at dose exposures up to 4 and 30 times, respectively, the human exposure at the MRHD of fexofenadine hydrochloride. Administration of terfenadine to rats 2 weeks prior to mating through weaning resulted in post-implantation loss and decreased postnatal growth and survival at maternal dose exposures greater than or equal to 3 times the human exposure at the MRHD of fexofenadine hydrochloride. Administration of fexofenadine hydrochloride to mice 2 weeks prior to mating through weaning resulted in no adverse developmental effects at exposures up to 15 times the human exposure at the MRHD.

Data

Animal Data

In an embryo-fetal development study, pregnant rats were treated with terfenadine using oral doses of 30, 100, and 300 mg/kg/day during the period of organogenesis. No adverse embryo-fetal effects were observed in rats at any dose, corresponding to fexofenadine exposures (AUC) of up to 4 times the exposure at the MRHD of fexofenadine hydrochloride. In a fertility, pre-, and postnatal development study, female rats were treated with terfenadine using oral doses of 50, 150, and 300 mg/kg/day for two weeks prior to mating until pup weaning. No adverse embryo-fetal effects were observed at 50 mg/kg/day (between 0.5 to 1 time the exposure at the MRHD). At ≥150 mg/kg/day (equivalent to ≥3 times the exposure at the MRHD), adverse findings were noted including post-implantation loss, reduced litter sizes, and decreased postnatal growth and survival.

Pregnant rabbits were treated with terfenadine using oral doses of 30, 100, and 300 mg/kg/day (up to 30 times the exposure at the MRHD on an AUC basis for fexofenadine hydrochloride) during the period of organogenesis. No adverse embryo-fetal effects were observed. The high dose produced maternal toxicity resulting in decreased food consumption, decreased maternal body weight, and maternal death at exposures equivalent to 30 times that at the MRHD.

In a fertility, pre- and postnatal development study, female mice were treated with fexofenadine hydrochloride in a dietary food study with doses equivalent to 925, 1,889, and 3730 mg/kg/day (up to 15 times the exposure at the MRHD) beginning prior to mating through weaning. No adverse embryo-fetal effects were observed.

8.2 Lactation

Risk Summary

ALLEGRA oral suspension is not intended for use in females of reproductive potential *[see Indications and Usage (1)];* however, other formulations have been approved for use in adults. Fexofenadine is present in human milk. There is no information available on the effects of the drug on the breastfed infant or on milk production.

8.4 Pediatric Use

The recommended doses of fexofenadine hydrochloride in pediatric patients 6 months to 11 years of age are based on cross-study comparison of the pharmacokinetics of fexofenadine in adults and pediatric subjects, and on the safety profile of fexofenadine hydrochloride in both adult and pediatric subjects at doses equal to or higher than the recommended doses. The safety and effectiveness of fexofenadine hydrochloride in pediatric patients younger than 6 months of age have not been established.

The safety of fexofenadine hydrochloride is based on the administration of ALLEGRA tablets at a dose of 30 mg twice daily demonstrated in 438 pediatric subjects 6 years to 11 years of age in 2 placebo-controlled, 2-week, seasonal allergic rhinitis trials. The safety of fexofenadine hydrochloride at doses of 15 mg and 30 mg given once and twice a day has been demonstrated in 969 pediatric subjects (6 months to 5 years of age) with allergic rhinitis in 3 pharmacokinetic studies and 3 safety studies. The safety of fexofenadine hydrochloride for the treatment of chronic idiopathic urticaria in subjects 6 months to 11 years of age is based on cross-study comparison of the pharmacokinetics of ALLEGRA in adult and pediatric subjects and on the safety profile of fexofenadine hydrochloride in both adult and pediatric subjects at doses equal to or higher than the recommended dose.

The effectiveness of fexofenadine hydrochloride for the treatment of seasonal allergic rhinitis in subjects 6 to 11 years of age was demonstrated in 1 trial (n=411) in which ALLEGRA tablets 30 mg twice daily significantly reduced total symptom scores compared to placebo, along with extrapolation of demonstrated efficacy in subjects aged 12 years and above, and the pharmacokinetic comparisons in adults and children. The effectiveness of fexofenadine hydrochloride 30 mg twice daily for the treatment of seasonal allergic rhinitis in patients 2 to 5 years of age is based on the pharmacokinetic comparisons in adult and pediatric subjects and an extrapolation of the demonstrated efficacy of fexofenadine hydrochloride in adult subjects with this condition and the likelihood that the disease course, pathophysiology, and the drug's effect are substantially similar in pediatric patients to those in adult patients. The effectiveness of fexofenadine hydrochloride for the treatment of chronic idiopathic urticaria in patients 6 months to 11 years of age is based on the pharmacokinetic comparisons in adults and children and an extrapolation of the demonstrated efficacy of ALLEGRA in adults with this condition and the likelihood that the disease course, pathophysiology and the drug's effect are substantially similar in children to that of adult patients. Administration of a 15 mg dose of fexofenadine hydrochloride to pediatric subjects 6 months to less than 2 years of age and a 30 mg dose to pediatric subjects 2 to 11 years of age produced exposures comparable to those seen with a dose of 60 mg administered to adults.

8.6 Renal Impairment

Based on increases in bioavailability and half-life, a dose of 60 mg once daily is recommended as the starting dose in adult patients with decreased renal function (mild, moderate or severe renal impairment). For pediatric patients with decreased renal function (mild, moderate or severe renal impairment), the recommended starting dose of fexofenadine hydrochloride is 30 mg once daily for patients 2 to 11 years of age and 15 mg once daily for patients 6 months to less than 2 years of age. *[See Dosage and Administration (2.1) and Clinical Pharmacology (12.3).]*

8.7 Hepatic Impairment

The pharmacokinetics of fexofenadine in subjects with hepatic impairment did not differ substantially from that observed in healthy subjects.

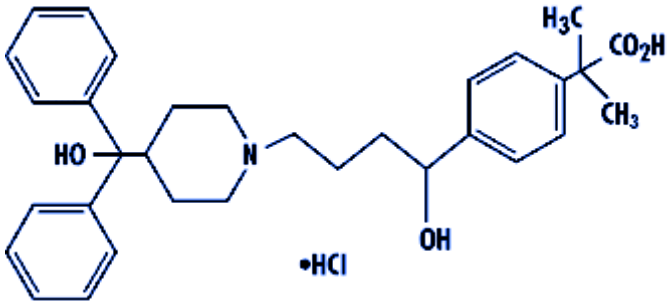
10 OVERDOSAGE

Dizziness, drowsiness, and dry mouth have been reported with fexofenadine hydrochloride overdose. Single doses of fexofenadine hydrochloride up to 800 mg (6 healthy subjects at this dose level), and doses up to 690 mg twice daily for 1 month (3 healthy subjects at this dose level) or 240 mg once daily for 1 year (234 healthy subjects at this dose level) were administered without the development of clinically significant adverse events as compared to placebo.

In the event of overdose, consider standard measures to remove any unabsorbed drug. Symptomatic and supportive treatment is recommended. Following administration of terfenadine, hemodialysis did not effectively remove fexofenadine, the major active metabolite of terfenadine, from blood (up to 1.7% removed).

11 DESCRIPTION

Fexofenadine hydrochloride, the active ingredient of ALLEGRA tablets, ALLEGRA ODT and ALLEGRA oral suspension, is a histamine H_1-receptor antagonist with the chemical name (±)-4-[1 hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-butyl]-α, α-dimethyl benzeneacetic acid hydrochloride. It has the following chemical structure



The molecular weight is 538.13 and the empirical formula is $C_{32}H_{39}NO_4$•HCl.

Fexofenadine hydrochloride is a white to off-white crystalline powder. It is freely soluble in methanol and ethanol, slightly soluble in chloroform and water, and insoluble in hexane. Fexofenadine hydrochloride is a racemate and exists as a zwitterion in aqueous media at physiological pH.

ALLEGRA is formulated as a tablet for oral administration. Each tablet contains 30, 60, or 180 mg fexofenadine hydrochloride (depending on the dosage strength) and the following excipients: croscarmellose sodium, magnesium stearate, microcrystalline cellulose, and pregelatinized starch. The aqueous tablet film coating is made from hypromellose, iron oxide blends, polyethylene glycol, povidone, silicone dioxide, and titanium dioxide.

ALLEGRA ODT is formulated for disintegration in the mouth immediately following administration. Each orally disintegrating tablet contains 30 mg fexofenadine hydrochloride and the following excipients: citric acid anhydrous, crospovidone, magnesium stearate, mannitol, methacrylate copolymer, microcrystalline cellulose, povidone K-30, sodium bicarbonate, sodium starch glycolate, aspartame, natural and artificial orange flavor, artificial cream flavor, and alcohol anhydrous; the alcohol is predominantly removed during the manufacturing process.

ALLEGRA oral suspension, a white uniform suspension, contains 6 mg fexofenadine hydrochloride per mL and the following excipients: propylene glycol, edetate disodium,

propylparaben, butylparaben, xanthan gum, poloxamer 407, titanium dioxide, sodium phosphate monobasic monohydrate, sodium phosphate dibasic heptahydrate, artificial raspberry cream flavor, sucrose, xylitol and purified water.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Fexofenadine, the major active metabolite of terfenadine, is an antihistamine with selective H_1-receptor antagonist activity. Both enantiomers of fexofenadine hydrochloride displayed approximately equipotent antihistaminic effects. Fexofenadine hydrochloride inhibited antigen-induced bronchospasm in sensitized guinea pigs and histamine release from peritoneal mast cells in rats. The clinical significance of these findings is unknown. In laboratory animals, no anticholinergic or alpha$_1$-adrenergic blocking effects were observed. Moreover, no sedative or other central nervous system effects were observed. Radiolabeled tissue distribution studies in rats indicated that fexofenadine does not cross the blood-brain barrier.

12.2 Pharmacodynamics

Wheal and Flare: Human histamine skin wheal and flare studies in adults following single and twice daily doses of 20 and 40 mg fexofenadine hydrochloride demonstrated that the drug exhibits an antihistamine effect by 1 hour, achieves maximum effect at 2 to 3 hours, and an effect is still seen at 12 hours. There was no evidence of tolerance to these effects after 28 days of dosing. The clinical significance of these observations is unknown.

Histamine skin wheal and flare studies in 7 to 12 year old subjects showed that following a single dose of 30 or 60 mg, antihistamine effect was observed at 1 hour and reached a maximum by 3 hours. Greater than 49% inhibition of wheal area and 74% inhibition of flare area were maintained for 8 hours following the 30 and 60 mg dose.

No statistically significant increase in mean QT_c interval compared to placebo was observed in 714 adult subjects with seasonal allergic rhinitis given fexofenadine hydrochloride capsules in doses of 60 to 240 mg twice daily for 2 weeks. Pediatric subjects from 2 placebo-controlled trials (n=855) treated with up to 60 mg fexofenadine hydrochloride twice daily demonstrated no significant treatment-related or dose-related increases in QT_c. In addition, no statistically significant increase in mean QT_c interval compared to placebo was observed in 40 healthy adult subjects given fexofenadine hydrochloride as an oral solution at doses up to 400 mg twice daily for 6 days, or in 230 healthy adult subjects given fexofenadine hydrochloride 240 mg once daily for 1 year. In subjects with chronic idiopathic urticaria, there were no clinically relevant differences for any ECG intervals, including QT_c, between those treated with fexofenadine hydrochloride 180 mg once daily (n=163) and those treated with placebo (n=91) for 4 weeks.

12.3 Pharmacokinetics

The pharmacokinetics of fexofenadine in subjects with chronic urticaria were similar to those in healthy subjects.

Absorption

A dose of 5 mL of ALLEGRA oral suspension containing 30 mg of fexofenadine hydrochloride is bioequivalent to a 30 mg dose of ALLEGRA tablets. Following oral administration of a 30 mg dose of ALLEGRA oral suspension to healthy adult subjects, the mean C_{max} was 118 ng/mL and

occurred at approximately 1 hour. The administration of 30 mg ALLEGRA oral suspension with a high fat meal decreased the AUC and the mean C_{max} by approximately 30 and 47%, respectively in healthy adult subjects.

Distribution

Fexofenadine is 60% to 70% bound to plasma proteins, primarily albumin and α_1-acid glycoprotein.

Metabolism

Approximately 5% of the total dose of fexofenadine hydrochloride was eliminated by hepatic metabolism.

Elimination

The mean elimination half-life of fexofenadine was 14.4 hours following administration of 60 mg twice daily in healthy adult subjects.

Human mass balance studies documented a recovery of approximately 80% and 11% of the [^{14}C]-fexofenadine hydrochloride dose in the feces and urine, respectively. Because the absolute bioavailability of fexofenadine hydrochloride has not been established, it is unknown if the fecal component represents primarily unabsorbed drug or is the result of biliary excretion.

Special Populations

Pharmacokinetics in renally and hepatically impaired subjects and geriatric subjects, obtained after a single dose of 80 mg fexofenadine hydrochloride, were compared to those from healthy subjects in a separate study of similar design.

Renally impaired

In subjects with mild to moderate (creatinine clearance 41-80 mL/min) and severe (creatinine clearance 11-40 mL/min) renal impairment, peak plasma concentrations of fexofenadine were 87% and 111% greater, respectively, and mean elimination half-lives were 59% and 72% longer, respectively, than observed in healthy subjects. Peak plasma concentrations in subjects on dialysis (creatinine clearance ≤10 mL/min) were 82% greater and half-life was 31% longer than observed in healthy subjects. Based on increases in bioavailability and half-life, a dose of 60 mg once daily is recommended as the starting dose in adult patients with decreased renal function. For pediatric patients with decreased renal function, the recommended starting dose of fexofenadine hydrochloride is 30 mg once daily for patients 2 to 11 years of age and 15 mg once daily for patients 6 months to less than 2 years of age *[see Dosage and Administration (2.1)]*.

Hepatically impaired

The pharmacokinetics of fexofenadine hydrochloride in subjects with hepatic impairment did not differ substantially from that observed in healthy subjects.

Pediatric subjects

A population pharmacokinetic analysis was performed with data from 77 pediatric subjects (6 months to 12 years of age) with allergic rhinitis and 136 adult subjects. The individual apparent oral clearance estimates of fexofenadine were on average 44% and 36% lower in pediatric subjects 6 to 12 years (n=14) and 2 to 5 years of age (n=21), respectively, compared to adult subjects.

Administration of a 15 mg dose of fexofenadine hydrochloride to pediatric subjects 6 months to less than 2 years of age and a 30 mg dose to pediatric subjects 2 to 11 years of age produced exposures comparable to those seen with a dose of 60 mg administered to adults.

Effect of gender

Across several trials, no clinically significant gender-related differences were observed in the pharmacokinetics of fexofenadine.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

The carcinogenic potential of fexofenadine was assessed using terfenadine studies with adequate fexofenadine exposure (based on plasma area-under-the-concentration vs. time [AUC] values). No evidence of carcinogenicity was observed in an 18-month study in mice and in a 24-month study in rats at oral doses up to 150 mg/kg of terfenadine (which led to fexofenadine exposures that were approximately 3 and 5 times the exposure at the MRHD of fexofenadine hydrochloride in adults [180 mg] and children [60 mg] respectively).

In in vitro (Bacterial Reverse Mutation, CHO/HGPRT Forward Mutation, and Rat Lymphocyte Chromosomal Aberration assays) and in vivo (Mouse Bone Marrow Micronucleus assay) tests, fexofenadine hydrochloride revealed no evidence of mutagenicity.

In a male fertility study, rats were treated beginning 63 days prior to mating with terfenadine at doses of 50, 150, and 300 mg/kg/day (up to 4 times the exposure at the MRHD of fexofenadine hydrochloride). No adverse effects on male fertility were observed. In a fertility, pre- and postnatal development study, male and female rats were administered terfenadine at oral doses of 50, 150, and 300 mg/kg/day . Males were dosed 81 days prior to and through mating and females were dosed from 14 days prior to mating through weaning. Dose-related reductions in implants and increases in postimplantation losses were observed at oral doses of ≥150 mg/kg/day of terfenadine (≥3 times the exposure at the MRHD of fexofenadine hydrochloride). These adverse effects were associated with maternal toxicity with findings of decreased body weight gain and decreased food consumption. In a mouse dietary fertility study, male mice received fexofenadine hydrochloride 28 days prior to and throughout mating and female mice received fexofenadine hydrochloride 14 days prior to and throughout mating, gestation, and weaning. There was no effect on male or female fertility at average oral doses up to 4438 mg/kg/day (up to 13 times the exposure at the MRHD).

14 CLINICAL STUDIES

14.1 Chronic Idiopathic Urticaria

Two 4-week, multicenter, randomized, double-blind, placebo-controlled clinical trials compared four different doses of fexofenadine hydrochloride tablet (20, 60, 120, and 240 mg twice daily) to placebo in subjects aged 12 to 70 years with chronic idiopathic urticaria (n=726). Efficacy was demonstrated by a significant reduction in mean pruritus scores (MPS), mean number of wheals (MNW), and mean total symptom scores (MTSS, the sum of the MPS and MNW score). Although all 4 doses were significantly superior to placebo, symptom reduction was greater and efficacy was maintained over the entire 4-week treatment period with fexofenadine

hydrochloride doses of ≥60 mg twice daily. However, no additional benefit of the 120 or 240 mg fexofenadine hydrochloride twice daily dose was seen over the 60 mg twice daily dose in reducing symptom scores. There were no significant differences in the effect of fexofenadine hydrochloride across subgroups of subjects defined by gender, age, weight, and race.

In one 4-week, multicenter, randomized, double-blind, placebo-controlled clinical trial in subjects 12 years of age and older with chronic idiopathic urticaria (n=259), fexofenadine hydrochloride 180 mg once daily significantly reduced the mean number of wheals (MNW), the mean pruritus score (MPS), and the mean total symptom score (MTSS, the sum of the MPS and MNW scores). Similar reductions were observed for mean number of wheals and mean pruritus score at the end of the 24-hour dosing interval. Symptom reduction was greater with fexofenadine hydrochloride 180 mg than with placebo. Improvement was demonstrated within 1 day of treatment with fexofenadine hydrochloride 180 mg and was maintained over the entire 4-week treatment period. There were no significant differences in the effect of fexofenadine hydrochloride across subgroups of subjects defined by gender, age, and race.

16 HOW SUPPLIED/ STORAGE AND HANDLING

16.1 ALLEGRA Oral Suspension

ALLEGRA oral suspension (fexofenadine hydrochloride, 30 mg/5 mL (6 mg/mL)) is available in an amber PET bottle containing 300 mL (NDC 0088-1097-20) of suspension.

Store ALLEGRA oral suspension at controlled room temperature 20°C-25°C (68°F-77°F). (See USP Controlled Room Temperature).

Shake bottle well, before each use.

17 PATIENT COUNSELING INFORMATION

Provide the following information to patients and parents/caregivers of pediatric patients taking ALLEGRA oral suspension:

- ALLEGRA oral suspension is prescribed for the relief of symptoms of chronic idiopathic urticaria (hives). Instruct patients to take ALLEGRA only as prescribed. **Do not exceed the recommended dose**. If any untoward effects occur while taking ALLEGRA, discontinue use and consult a doctor.
- Patients who are hypersensitive to any of the ingredients should not use these products.
- Patients who are pregnant or nursing should use these products only if the potential benefit justifies the potential risk to the fetus or nursing infant.
- Advise patients and parents/caregivers of pediatric patients to store the medication in a tightly closed container in a cool, dry place, away from small children.
- Advise patients and parents/caregivers not to take ALLEGRA with fruit juices.
- Advise patients and parents/caregivers of pediatric patients to shake the ALLEGRA oral suspension bottle well, before each use.
