Access the BNF your way

The *British National Formulary* (BNF) and *BNF for Children* are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

You can be alerted to all the latest updates by signing up to the BNF eNewsletter at www.bnf.org/newsletter.

**ONLINE**

- **BNF on MedicinesComplete**
  Access BNF and *BNF for Children* on MedicinesComplete and receive the very latest drug information through monthly online updates.

- **BNF on FormularyComplete**
  Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and *BNF for Children*.

**MOBILE**

- **BNF app** – Stay up to date anywhere with the BNF app available for iOS, Android and Blackberry.
- **BNF eBook** – Available as an ePDF via a range of suppliers. See www.pharmpress.com/bnf.
- **BNF on MedicinesComplete** – Now mobile responsive.

**PRINT**

- **BNF subscription** – if you prefer to access BNF in print, take advantage of our subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNFC) are available. Discounted pricing is also available on bulk sales.

**BNF on Evidence Search**
Search the BNF and *BNF for Children* alongside other authoritative clinical and non-clinical evidence and best practice at http://evidence.nhs.uk from NICE.
How to purchase

Purchase direct from Pharmaceutical Press by visiting
www.pharmpress.com/bnf

For enquiries about the BNF or BNFC in print, contact
direct@macmillan.co.uk
Tel: +44 (0) 1256 302 699

For enquiries concerning MedicinesComplete, BNF on FormularyComplete, or bulk orders of the print edition, contact
pharmpress@rpharms.com
Tel: +44 (0) 20 7572 2266

Download mobile apps by visiting your appropriate app store. Available for iOS, Android and Blackberry

For pricing information please visit the website at
www.pharmpress.com/bnf

For international sales contact your local sales agent. Contact details at www.pharmpress.com/agents

Stay up to date – sign up to the BNF eNewsletter at
www.bnf.org/newsletter

NICE have altered their distribution arrangement for England, and eligible health professionals will now receive one free print copy of BNF a year - the September issue - to supplement online access. To buy your copy/ies of the March BNF direct, go to www.pharmpress.com/bnf.

ROYAL PHARMACEUTICAL SOCIETY

BMA
Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group overseas the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers’ Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers’ product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF’s recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services.

It is important to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this update were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska.

S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists’ Therapy & Guidelines Subcommittee, D.A. Buckley, M. Cork, E. Duarte Williams, M. Griffiths, T. Leslie, E. Mallon, P. McHenry, P. Hunasehally, I. Nasr, C. Saunders, V. Swale, S. Ungureanu, S. Wakelin, A. Brain (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.I. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Laloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNF interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNF has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

J. Macdonald and staff provided valuable technical assistance.

K.K. Cheema, M.E. Elnaeem, H.G. Hesketh, M. Khalid, and E. Laughton provided considerable assistance during the production of this update of the BNF.

How BNF publications are constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts.

Hundreds of changes are made between print editions, and are published monthly in some digital formats. The most clinically significant updates are listed under Changes p. xv.

Joint Formulary Committee
The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Group, pharmacists appointed by the Royal Pharmaceutical Society, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group
The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers’ Advisory Group
The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers’ Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Editorial Team
BNF clinical writers have all worked as pharmacists and have a sound understanding of how drugs are used in clinical practice. Each clinical writer is responsible for editing, maintaining, and updating BNF content. During the publication cycle the clinical writers review information in the BNF against a variety of sources.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Joint Formulary Committee for consideration. Additionally, sections are regularly chosen for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Clinical writers prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers
The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:
- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information
The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics
The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:
- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature
Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

Systematic reviews
The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-
based resources). These are used for answering specific queries, for reviewing existing text, and for constructing new text. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNF advice.

**Consensus guidelines**

The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

**Reference sources**

Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. The BNF has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

**Statutory information**

The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

**Medicines and devices**

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

**Comments from readers**

Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

**Comments from industry**

Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF’s presentation of the role of various drugs; this is yet another check on the balance of BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

**Market research**

Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

**Overview**

The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.
How to use the BNF

This edition of the BNF marks a fundamental change to the structure of the content. The changes have been made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For this print edition, the most notable changes include:
— Drug monographs – where possible, all information that relates to a single drug is now contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
— Drug-class monographs – where substantial amounts of information is common to all drugs within a drug class (e.g. macrolides, p. 469), a drug-class monograph has been created to contain the common information.
— Medicines – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
— Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.
— Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions, p. 14.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This How to Use the BNF is key in introducing the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF

This new BNF broadly follows the high-level structure of previous editions:
Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations);
Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.
Within each chapter, content is organised alphabetically by therapeutic use (e.g. Respiratory disease, obstructive), with the treatment summaries first (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta,-agonist bronchodilators) and then alphabetically within each classification (e.g. Acetylcholine, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.
Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturer’s contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the thumbnail), alongside the chapter title. The top of the page includes the therapeutic use (the running head) alongside the page number.

On one page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, class monographs, and drug monographs.
Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries; as well as the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types
Treatment summaries

Treatment summaries are of three main types;
— an overview of delivering a drug to a particular body system (e.g. Skin conditions, management, p. 998),
— a comparison between a group or groups of drugs (e.g. Beta-adrenoceptor blocking drugs, p. 139),
— an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension, p. 121, or Malaria, prophylaxis, p. 528).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient’s medical and drug history.

Monographs

Overview

In previous editions, a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems body systems. So, for example, codeine phosphate was found in chapter 1, for its antiemetic effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

In this new BNF all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate is now included in chapter 4. This
carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with previous editions, into the relevant chapters.

This means that the majority of drugs will still be placed in the same chapters and sections as previous editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

**Nomenclature**

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title, and in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. Ispaghula husk with senna, p. 54) or for drugs that are related to a class monograph (see Class monographs, below).

**Indication and dose**

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore in this edition, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in previous editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In previous editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible the age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight range of 35 to 59kg is applicable to a patient as soon as they tip the scales at 35kg right up until, but not including, the point that the scales tip to 60kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

**Other information relevant to indication and dose**

The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

**Minimising harm and drug safety**

The drug chosen to treat a particular condition should minimise the patient’s susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

Clinically relevant Side-effects for drugs are included in the monographs or class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions, when the information is included under Allergy and cross sensitivity.

The Important safety advice section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and
Healthcare products Regulatory Agency (MHRA) are found here. Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1 p. 1137, followed by details of drug interactions.

**Use of drugs in specific patient populations**

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in Hepatic Impairment p. 17, and Prescribing in Renal Impairment p. 17. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic impairment and Renal impairment (e.g. fluconazole p. 518).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in Pregnancy p. 19 and Prescribing in Breast-feeding p. 19. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. asthma p. 210).

Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. fluconazole p. 518).

In this edition a new section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1045) has been included.

**Administration and monitoring**

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir, p. 561). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A new Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl, p. 362).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline, p. 238). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin, p. 837), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine, p. 137): these are covered under Treatment cessation.

**Choice and supply**

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see Taking Medicines to Best Effect, p. 1). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline, p. 496); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeable e.g. Dilatazem, p. 149), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil, p. 656, or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride, p. 56).

**Medicinal forms**

In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient. In previous editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations record. This information has now been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil), p. 40.

In the new BNF, the medicinal forms (formerly preparations) record provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement at the top of the monograph that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Previously the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all the changes in the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms (formerly Preparations) record. Details of these labels can be found in Appendix 3, p. 1291. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.
In the case of compound preparations, the prescribing information for all constituents should be taken into account.

**Prices in the BNF**

Basic NHS net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (www.ppa.org.uk/systems/pccdbrowserv2.3new/browser.jsp). Prices have been calculated from the net cost used in pricing NHS prescriptions in June 2015 and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers.

In Appendix 5 prices stated are per dressing or bandage. BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.isdsclot.org/HealthTopics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.dhsspsni.gov.uk/pas-tariff); prices in the different tariffs may vary.

**Drug-class monographs**

In previous editions of the BNF, information relating to a class of drug sharing the same properties (e.g. tetracyclines, p. 496), was contained within the prescribing notes. In this new edition, drug-class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. Beta blockers, systemic, p. 140). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag (e.g. metoprolol, p. 144). Where the drug monographs run on from a class monograph no further cross referencing is given. However, occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the class monograph. In this situation the need to consider a class monograph is still indicated by a flag, but a cross reference is also provided to help navigate the user to the class monograph (e.g. sotalol, p. 93).

**Other content**

**Nutrition**

Appendix 2, p. 1260 includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

**Wound dressings**

A table on wound dressings in Appendix 4 (previously Appendix 5), p. 1294 allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

Advanced wound contact dressings have been classified in order of increasing absorbency.

**Other useful information**

**Finding significant changes in the BNF**

— **Changes**, p. xv, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently.

— **Changes to the Dental Practitioners’ Formulary**, p. 27, are located at the end of the Dental List.

— **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.

— An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

**Using other sources for medicines information**

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. **BNF for Children** should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.
Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

**Significant changes**

Significant changes made since release of data for the print edition of BNF 69 (March–September 2015):

- Accelexfenac p. 916: updated cardiovascular advice—new contra-indications in certain established cardiovascular diseases [MHRA advice].
- Apixaban p. 108 for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism [NICE guidance].
- Axitinib p. 802 for treating advanced renal cell carcinoma after failure of prior systemic treatment [NICE guidance].
- Codeine phosphate p. 360 for cough and cold: restricted use in children [MHRA advice].
- Dabigatran etexilate p. 117 for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism [NICE guidance].
- Diclofenac potassium p. 920, 12.5 mg tablets no longer available over the counter [MHRA advice].
- Dimethyl fumarate p. 727: risk of lymphopenia and potential risk of progressive multifocal leukoencephalopathy [MHRA advice].
- Empagliflozin p. 610 in combination therapy for treating type 2 diabetes [NICE guidance].
- Hydroxyzine hydrochloride p. 248: risk of QT interval prolongation and Torsade de Pointes [MHRA advice].
- Indinavir p. 906, adalimumab p. 901 and golimumab p. 904 for treating moderately to severely active ulcerative colitis after the failure of conventional therapy [NICE guidance].
- Obinutuzumab p. 739 in combination with chlorambucil for untreated chronic lymphocytic leukaemia [NICE guidance].
- Ofatumumab p. 740 in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia [NICE guidance].
- Omalizumab p. 235 for previously treated chronic spontaneous urticaria [NICE guidance].
- Pomalidomide p. 797 for relapsed and refractory multiple myeloma previously treated with lenalidomide p. 796 and bortezomib p. 801 [NICE guidance].
- Rivaroxaban p. 109 for preventing adverse outcomes after acute management of acute coronary syndrome [NICE guidance].
- Rifaximin p. 495 for preventing episodes of overt hepatic encephalopathy [NICE guidance].
- Simeprevir p. 548 in combination with peginterferon alfa p. 542 and ribavirin p. 545 for treating genotypes 1 and 4 chronic hepatitis C [NICE guidance].
- Sofosbuvir p. 546 for treating chronic hepatitis C [NICE guidance].
- Ustekinumab p. 899 for treating active psoriatic arthritis [NICE guidance].

**Dose changes**

Changes in dose statements made since release of data for the print edition of BNF 69 (March–September 2015):

- Eprosartan p. 133
- Lisdxemafetamine mesilate p. 271 [dose in renal impairment]
- Tetrastarch p. 854 [Volulyte®]
- Tetrastarch p. 854 [Volufen®]
- Tramadol hydrochloride p. 373 [oral dose for acute and chronic pain]

**Classification changes**

Classification changes made since release of data for the print edition of BNF 69 (March–September 2015):

**New names**

Name changes introduced since release of data for the print edition of BNF 69 (March–September 2015):

**Deleted preparations**

Preparations discontinued since release of data for the print edition of BNF 69 (March–September 2015):

**New preparations**

New preparations included since release of data for the print edition of BNF 69 (March–September 2015):

- Anafranil SR®
- BindRen®
- Brexidol®
- Calcium-Sandoz®
- Calmurl HC®
- Didronel®
- Eporatio®
- Fluarix®
- Froben®
- Ortho-Gynelet®
- Penbritin® syup
- Pneumovax® II
- Rienso®
- Rupafin®
- Vantas®
- Vistabel®
- Jaydess® [levonorgestrel p. 692]
- Ketoconazole HRA® [ketocanazole p. 587]
- Lonquex® [lipefilgrastim p. 842]
- Salofalk® 1 g suppositories [mesalazine p. 34]
Guidance on prescribing

General guidance
Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Taking medicines to best effect
Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient’s acceptance of medicines. Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for abandonment of unacceptable treatment.

Biosimilar medicines
A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme. For biosimilar medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

Complementary and alternative medicine
An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles
In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles
Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

Proprietary titles
Names followed by the symbol ® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice
In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF
Guidance on prescribing

2 Guidance on prescribing

s suggests a use (or route) that is outside the licensed indication of a product (‘off-label’ use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Prescribing unlicensed medicines

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient’s carer that the prescribed medicine is unlicensed.

Oral syringes

An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5–5 mL spoon is used for doses of 5 mL (or multiples thereof).

Important To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled 'Oral' or 'Enteral' in a large font size; it is the healthcare practitioner’s responsibility to label the syringe with this information if the manufacturer has not done so.

Excipients

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on selected preservatives and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 428 and metronidazole p. 475. The lactose content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Proprietary Manufacturers) if it is essential to check details.

Extemporaneous preparation

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

Drugs and driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including cannabis, cocaine, and ketamine p. 1110, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Amphetamines are also expected to be added to the legislation later in 2015. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 332) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 340. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Patents

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters
Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

**Health and safety**
When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

**Safety in the home**
Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:
- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.

**Labelling of prescribed medicines**
There is a legal requirement for the following to appear on the label of any prescribed medicine:
- name of the patient;
- name and address of the person dispensing the medicine;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:
- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

**Non-proprietary names of compound preparations**
Non-proprietary names of compound preparations which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co’ should be retained.

Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

**EEA and Swiss prescriptions**
Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

**Security and validity of prescriptions**
The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:
- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

**Patient group direction (PGD)**
In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

**NICE and Scottish Medicines Consortium**
Advice issued by the National Institute for Health and Care Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.uk.
Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (S1) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg /m² where this would reduce error.

The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc.
- Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- Micrograms and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.
- The term ‘millilitre’ (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital ‘L’ in mL is a printing convention throughout the BNF; both ‘ml’ and ‘mL’ are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. ‘125 mg 3 times daily’); terms such as ‘5 mL’ or ‘1 tablet’ should be avoided except for compound preparations.

When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities:

- Elixir, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
- Adult Mixtures (10 mL dose), 200 or 300 mL

Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)

- Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations.
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used, for details, see Inside Back Cover.

Sample prescription

Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)

Eye Lotions, Gargles, and Mouthwashes, 200 mL

Prescribing by dentists

Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical
situation. There is no statutory requirement for the dentist to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s surname, one forename, other initials, and address, and may also print out the patient’s title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT, Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.

3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.

7. The BNF recommendations should be followed as listed above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item.

Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ′♀′, (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).

15. The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confidential’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.
Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   iii) as to the dose that it would be appropriate for the person to take;

b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 409, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
   i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   ii) an oral contraceptive when a full cycle may be supplied;
   iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

c) that an entry shall be made by the pharmacist in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the patient;
   iv) the nature of the emergency;

d) that the container or package must be labelled to show:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name of the patient;
   iv) the name and address of the pharmacy;
   v) the words 'Emergency supply';
   vi) the words 'Keep out of the reach of children' (or similar warning);

e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 409 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

f) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;

b) that the prescriber has undertaken to furnish a prescription within 72 hours;

c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;

d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 409 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

e) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.

2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London Pharmaceutical Press, (always consult latest edition).
The Misuse of Drugs Act, 1971 prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

**Class C** includes: certain drugs related to the amphetamines such as benzphetamine and chlorphentermine, butenafine p. 434, diethylpropion, mazindol, meoraphosphate p. 265 pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 373, zaleplon p. 422, zolpidem tarrate p. 423, zopiclone p. 423, and non-human chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin p. 642.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

**Schedule 1** includes drugs such as lysergide which is not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

**Schedule 2** includes drugs such as diamorphine hydrochloride p. 361 (heroin), morphine p. 367, nabilone p. 346, remifentanil p. 1108, pethidine hydrochloride p. 372, secobarbital, glutethimide, the amphetamines, sodium oxybate and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

**Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), butenafine p. 434, diethylpropion, mazindol, meoraphosphate p. 265, midazolam p. 414, pentazocine p. 371, phenmetrazine, temazepam p. 420, and tramadol hydrochloride p. 373. They are subject to the special prescription requirements (except for temazepam p. 420) and to the safe custody requirements (except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meoraphosphate p. 265, midazolam p. 414, pentazocine p. 371, phenmetrazine, tramadol hydrochloride p. 373, or any stereoisomeric form or salts of the above). Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

**Schedule 4** includes in Part 1 benzodiazepines (except temazepam p. 420 and midazolam p. 414, which are in Schedule 3), zaleplon p. 422, zolpidem tarrate p. 423, and zopiclone p. 423 which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chonic gonadotrophin (HCG), non-human chonic gonadotrophin, somatotropin, somatrem, and somatropin p. 642. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

**Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

### Prescriptions

Preparations in Schedules 1, 2, 3, and 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Schedule</th>
</tr>
</thead>
<tbody>
<tr>
<td>CD1</td>
<td>for preparations in Schedule 1</td>
</tr>
<tr>
<td>CD2</td>
<td>for preparations in Schedule 2</td>
</tr>
<tr>
<td>CD3</td>
<td>for preparations in Schedule 3</td>
</tr>
<tr>
<td>CD4-1</td>
<td>for preparations in Schedule 4 (Part I)</td>
</tr>
<tr>
<td>CD4-2</td>
<td>for preparations in Schedule 4 (Part II)</td>
</tr>
</tbody>
</table>

The principal legal requirements relating to medical prescriptions are listed below.

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements, (all preparations in Schedules 2 and 3, except temazepam p. 420), must be indelible, (a machine-written prescription is acceptable; the prescriber’s signature must be handwritten), and must be signed by the prescriber, be dated, and specify the prescriber’s address. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form, (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus or whether only one form is available), and where appropriate the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose (the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not);
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or
in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (implementation date for N. Ireland not confirmed). Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and carers and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription).

Instalments and ‘repeats’
A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified. A total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 434, and diazepam p. 267 may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H(MDA) (blue) should be used. In Scotland, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days’ treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used. Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Drug Misuse and Dependence: UK Guidelines on Clinical Management (2007), available at www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf.

Private prescriptions
Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber’s identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Department of Health guidance
Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:
• In general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days’ treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;
• the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3. Further information is available at www.gov.uk/dh.

See sample prescription:

Dependence and misuse
The most serious drugs of addiction are cocaine, diamorphine hydrochloride p. 361 (heroin), morphine p. 367, and the synthetic opioids. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts. Despite marked reduction in the prescribing of amphetamines, there is concern that abuse of illicit amphetamine and related compounds is widespread. Benzodiazepines are commonly misused. However, the misuse of barbiturates is now uncommon, in line with declining medicinal use and consequent availability. Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product. Lysergide (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening. There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 1110 and gamma-hydroxybutyrate (sodium oxybate, GHB).

Supervised consumption
Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of
instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.

**Prescribing drugs likely to cause dependence or misuse**

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy, and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.gov.uk/controlled-drugs-licences-fees-andreturns or from the Home Office by contacting licensing_enquiry.aadu@homeoffice.gsi.gov.uk

In cases of emergency, telephone (020) 7035 6330

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient’s name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;

- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, SW1P 4DF. Alternatively, completed application forms can be emailed to dlcucommsofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulat in the UK.

**Notification of patients receiving structured drug treatment for substance dependence**

In England, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx.

Enquiries about NDTMS, and how to submit data, should initially be directed to:

Malcolm Roxburgh, NTA Information Manager
Tel: (020) 7972 1964
malcolm.roxburgh@nta-nhs.org.uk

In Scotland, doctors should report cases to the Substance Misuse Programme (SMP).
Tel: (0131) 275 6348

In Northern Ireland, the Misuse of Drugs (Notification of Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:
Dr Ian McMaster,
C3 Castle Buildings
Belfast BT4 3FQ
Tel: (028) 9052 2421
Fax: (028) 9052 0718
ian.mcmaster@dhsspsni.gov.uk

Administrative contact:
Public Health Information & Research Branch
Annex 2
Castle Building
Belfast, BT4 3SQ
Tel: (028) 9052 2520

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In Wales, doctors should report cases where they are providing structured drug treatment for substance...
dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substance.misuse-queries@wales.nhs.uk.

**Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts**

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine hydrochloride p. 361, dipipanone (Diconal®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine hydrochloride p. 361, dipipanone, and cocaine for patients (including addicts) for relieving pain from organic disease or injury.
Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the BNF.

Send Yellow Cards to:
FREEPOST YELLOW CARD
(No other address details required).
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages. The following Yellow Card Centres can be contacted for further information:

Yellow Card Centre West Midlands
City Hospital
Dudley Road
Birmingham B18 7QH
Tel: (0121) 507 5672

Yellow Card Centre Scotland
CARDS, Royal Infirmary of Edinburgh
51 Little France Crescent
Old Dalkeith Road
Edinburgh EH16 4SA
Tel: (0131) 242 2919
YCCScotland@luht.scot.nhs.uk

The MHRA’s database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update

Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.mhra.gov.uk/drugsafetyupdate.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring

In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well...
Adverse reactions to drugs

Established drugs and vaccines
Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are serious, medically significant, or result in harm. Serious reactions include those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Medication errors
Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices
Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF
The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness.

In the product literature the frequency of side-effects is generally described as follows:

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very common</td>
<td>greater than 1 in 10</td>
</tr>
<tr>
<td>Common</td>
<td>1 in 100 to 1 in 10</td>
</tr>
<tr>
<td>Uncommon</td>
<td>1 in 1000 to 1 in 100</td>
</tr>
<tr>
<td>Rare</td>
<td>less than 1 in 10 000</td>
</tr>
</tbody>
</table>

Special problems

Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

Prevention of adverse reactions
Adverse reactions may be prevented as follows:
- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 506 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.

Oral side-effects of drugs
Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.
Oral mucosa Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind. Aspirin p. 104 tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent. The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 762. Other drugs capable of causing oral ulceration include ACE inhibitors, gold, nicoardil p. 185, NSAIDs, pancreatin p. 81, penicillamine p. 896, proguanil hydrochloride p. 539, and protease inhibitors. Erythema multiforme or Stevens-Johnson syndrome may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulphonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs. Lichenoid eruptions are associated with ACE inhibitors, NSAIDs methylprednisoil p. 138, chloroquine p. 536, oral antidiabetics, thiazide diuretics, and gold. Candidiasis can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers.

Teeth and jaw Brown staining of the teeth frequently follows the use of chlorhexidine p. 989 mouthwash, spray or gel, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav p. 484 suspension. Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey. Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child’s age (taking into account the fluoride content of the local drinking water and of toothpaste). The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Fagate’s disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving bevacizumab p. 736 or sunitinib p. 817 may also be at risk of osteonecrosis of the jaw. Periodontium Gingival overgrowth (gingival hyperplasia) is a side-effect of phenytoin p. 398 and sometimes of ciclosporin p. 717 or of nifedipine p. 154 (and some other calcium-channel blockers). Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands The most common effect that drugs have on the salivary glands is to reduce flow (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly antimuscarinics (anticholinergic), antidepressants (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), alpha-blockers, antihistamines, antipsychotics, baclofen p. 914, bupropion hydrochloride p. 433, clonidine hydrochloride p. 137, 5HT; agonists, opioids, and tizanidine p. 913. Excessive use of diuretics can also result in xerostomia. Some drugs (e.g. clozapine p. 313, neostigmine p. 912) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some antihypertensives (e.g. clonidine hydrochloride p. 137, methylprednisoil p. 138) and with vinca alkaloids. Swelling of the salivary glands can occur with iodides, antithyroid drugs, phenothiazines, and sulphonamides.

Taste There may be decreased taste acuity or alteration in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 88, calcitonin, ACE inhibitors, carbimazole p. 664, clarithromycin p. 470, gold, griseofulvin p. 1012, lithium salts, metformin hydrochloride p. 594, metronidazole p. 475, penicillamine p. 896, phenindione p. 129, propafenone hydrochloride p. 92, protease inhibitors, terbinafine p. 514, and zopiclone p. 423.

Defective medicines During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification. The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

Guidance on intravenous infusions

Intravenous additives policies
A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines
- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate.
- Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems
Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘sinking-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextran (formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (interaction with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextran (formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (interaction with blood). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 ml.

Method
Ready-prepared infusions should be used whenever available. Potassium chloride is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. Lidocaine hydrochloride is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5). When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing
is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. Potassium chloride is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

Information provided in the BNF

The BNF gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for continuous infusion must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by intermittent infusion in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin. An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the ‘piggy-back’ technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition via the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

Drugs given by intravenous infusion

The BNF includes information on addition of drugs to Glucose intravenous infusion 5 and 10%, and Sodium chloride intravenous infusion 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.
Prescribing for children

For detailed advice on medicines used for children, consult BNF for Children.

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity. Whenever possible, intramuscular injections should be avoided in children because they are painful. Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use. Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications (‘off-label’ use) is often necessary in paediatric practice.

Adverse drug reactions in children

Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:

- serious, medically significant or result in harm.
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card. The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- many drugs are not specifically licensed for use in children and are used either ‘off-label’ or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children. It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful. When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an oral syringe will be supplied. Parents should be advised not to add any medicines to the infant’s feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents. Parents must be warned to keep all medicines out of reach of children.

Rare paediatric conditions

Information on substances such as biotin and sodium benzoate used in rare metabolic conditions is included in BNF for Children; further information can be obtained from:

Alder Hey Children’s Hospital
Drug Information Centre

Tel: (0151) 252 5381

Great Ormond Street Hospital for Children
Pharmacy
Great Ormond St
London WC1N 3JH
Tel: (020) 7405 9200

Dosage in children

Children’s doses in the BNF are stated in the individual drug entries or a cross-reference is provided to BNF for Children. Doses are generally based on body-weight (in kilograms) or specific age ranges, e.g. first month (neonate), 1–5 years, 6–11 years, 12–17 years.

Dose calculation

Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body surface area (in m²). These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from an ideal weight, related to height and age.

Body surface area (BSA) estimates are sometimes preferable to body-weight for calculation of paediatric doses.
since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to BNF for Children. Where the dose for children is not stated, prescribers should consult BNF for Children or seek advice from a medicines information centre.

**Dose frequency**
Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime. Where new or potentially toxic drugs are used, the manufacturers’ recommended doses should be carefully followed.

**Prescribing in hepatic impairment**
Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

**Impaired drug metabolism**
Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.
A few drugs, e.g. rifampicin p. 508 and fusidic acid p. 463, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

**Hypoproteinaemia**
The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 398 and prednisolone p. 585.

**Reduced clotting**
Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin sodium p. 121 and phenindione p. 120.

**Hepatic encephalopathy**
In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

**Fluid overload**
Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

**Hepatotoxic drugs**
Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.
Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

---

**Prescribing in renal impairment**
The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

**Principles of dose adjustment in renal impairment**
The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity. For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient. For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted.
Prescribing in renal impairment

according to clinical response and plasma-drug concentration. Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly. The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function. Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced. Dose recommendations are based on the severity of renal impairment. Renal function is measured either in terms of estimated glomerular filtration rate (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study (‘MDRD formula’ that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as creatinine clearance (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG)).

Cockcroft and Gault Formula

\[
\text{Estimated Creatinine Clearance} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}} \quad \text{in mL/minute}
\]

Age in years
Weight in kilograms; use ideal body-weight
Serum creatinine in micromol/litre
Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a rough guide to drug dosing.

Important Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m² and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR). The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (exceptions include toxic drugs and patients at extremes of weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD ‘formula’) can be used to determine dosage adjustments in place of creatinine clearance. An individual’s absolute glomerular filtration rate can be calculated from the eGFR as follows:

\[
\text{GFR Absolute} = \text{eGFR} \times (\text{individual’s body surface area}/1.73)
\]

Toxic drugs For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

Patients at extremes of weight In patients at both extremes of weight (BMI of less than 18.5 kg/m² or greater than 30 kg/m²) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages.

In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

### Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal - Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild - Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate - Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe - Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure - Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

1. NICE clinical guideline 73 (September 2008) — Chronic kidney disease: Stage 3a eGFR 45–59, Stage 3b eGFR 30–44

Dialysis

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

Drug prescribing should be kept to the minimum in all patients with severe renal disease. If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.
Prescribing in pregnancy

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The BNF and BNF for Children identifies drugs which:
- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and BNF for Children.

Important Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy.

Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. Tel: 0844 892 0909 (09:00–17:00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:
- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction. A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 180), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity. Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 409) while others can affect lactation (e.g. bromocriptine p. 333).
Prescribing in palliative care

Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team. Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams. Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish. Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment

The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 354, NSAID), opioid (e.g. codeine phosphate p. 360 ‘weak’, morphine p. 367 ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate or tramadol hydrochloride p. 373 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 434, transdermal fentanyl p. 362, hydromorphone hydrochloride p. 366, methadone hydrochloride p. 436, or oxycodone hydrochloride p. 369, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases

In addition to the above approach, radiotherapy, bisphosphonates, and radioactive isotopes of strontium ranelate p. 626 (Metastron® available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain

Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 392 and pregabalin p. 400 are licensed for neuropathic pain. Ketamine p. 1110 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 947, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route

Treatment with morphine p. 367 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 362 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures. Morphine immediate-release 30mg 4-hourly (or modified-release 100mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600mg 12-hourly), occasionally more is needed.

Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 367. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.
Oxycodone hydrochloride p. 369 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

**Equivalent doses of opioid analgesics**

This table is only an approximate guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required.

<table>

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

**Parenteral route** The equivalent parenteral dose of morphine p. 367 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 361 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride, see table above of approximate equivalent doses of morphine and diamorphine hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

**Rectal route** Morphine p. 367 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 369 can be obtained on special order.

**Transdermal route** Transdermal preparations of fentanyl p. 362 and buprenorphine p. 434 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 434 and fentanyl p. 362 (inappropriate use has caused fatalities). Immediate-release morphine can be given for breakthrough pain.

The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

**Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine**

Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

**Symptom control**

Several recommendations in this section involve unlicensed indications or routes.

**Anorexia** Anorexia may be helped by prednisolone p. 979 or dexamethasone p. 947.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 344, hyoscine butylbromide p. 73, or glycopyrronium bromide p. 1100. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

**Capillary bleeding** Capillary bleeding can be treated with tranexamic acid p. 95 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 95 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 196 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver.
disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 889) should be considered.

**Constipation** Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 52) or lactulose p. 47 solution with a seppa p. 53 preparation should be used. Methylalazine bromide p. 47 is licensed for the treatment of opioid-induced constipation.

**Convulsions** Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 398 or carbamazepine p. 387 should be considered. When oral medication is no longer possible, diazepam p. 267 given rectally, or phenobarbital p. 409 by injection is continued as prophylaxis. For the use of midazolam p. 414 by subcutaneous infusion using a continuous infusion device see below.

**Dry mouth** Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry and measures such as chewing sugar-free gum, sucking ice butylbromide p. 73 may also be helpful if there is bronchospasm or partial obstruction.

**Dry mouth** Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry and measures such as chewing sugar-free gum, sucking ice butylbromide p. 73 may also be helpful if there is bronchospasm or partial obstruction.

**Dysphagia** A corticosteroid such as dexamethasone p. 947 may help, temporarily, if there is an obstruction due to tumour. See also ‘Dry mouth’, above.

**Dyspnoea** Breathlessness at rest may be relieved by regular oral morphine p. 367 in carefully titrated doses. Diazepam p. 267 may be helpful for dryness or association with anxiety. A corticosteroid, such as dexamethasone p. 947, may also be helpful if there is bronchospasm or partial obstruction.

**Fungating tumours** Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 475 is often required to reduce malodour but topical metronidazole is also used.

**Gastro-intestinal pain** The pain of bowel colic may be reduced by loperamide hydrochloride p. 56. Hyoscine butylbromide may also be helpful, given sublingually as 5wells® tablets. Subcutaneous injections of hyoscine butylbromide p. 73, hyoscine hydrobromide p. 344, and glycopyrrocol bromide p. 1100 can also be used to treat bowel colic.

**Hiccups** Hiccups may be due to gastric distension and may be treated by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone p. 346 before meals.

**Insomnia** Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 420, may be useful.

**Intractable cough** Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 367. Methadone hydrochloride p. 436 linctus should be avoided because it has a long duration of action and tends to accumulate.

**Muscle spasm** The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 267 or baclofen p. 914.

**Nausea and vomiting** Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A prokinetic antiemetic may be a preferred choice for first-line therapy.

**Nausea and vomiting** Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 306 or metoclopramide hydrochloride p. 347. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term). Metoclopramide hydrochloride has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently. Haloperidol is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 343 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness. Levomepromazine p. 345 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 947 by mouth can be used as an adjunct. Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

**Pruritus** Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 173).

**Raised intracranial pressure** Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 947 and should be given before 6 p.m. to reduce the risk of insomnia.

**Restlessness and confusion** Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 306 or levomepromazine p. 345, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device. Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).
Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma
- there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube)
- occasionally when the patient does not wish to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine butylbromide p. 344 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation). Hyoscine butylbromide p. 72 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide.

Glycopyrronium bromide p. 1100 may also be used to treat bowel colic or excessive respiratory secretions.

Confusion and restlessness Haloperidol p. 306 has little sedative effect.

Levomepromazine p. 345 has a sedative effect. Levomepromazine p. 414 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

Convulsions If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion.

Nausea and vomiting Haloperidol p. 306 and levomepromazine p. 345 can both be given as a subcutaneous infusion but sedation can limit the dose of levomepromazine.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below).

Metoclopramide hydrochloride p. 304, prochlorperazine p. 309, and diazepam p. 267 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 343 and levomepromazine p. 345 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 953) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous injection rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation). The following can be mixed with diamorphine:

- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.
- Haloperidol, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoulouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 304, prochlorperazine p. 309, and diazepam p. 267 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 343 and levomepromazine p. 345 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 953) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous injection rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation). The following can be mixed with diamorphine:

- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.
- Haloperidol, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoulouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. Medicines for Older People, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing
Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal.

In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine
Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing
In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity
The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and anti-parkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics
Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients. The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 94) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions
Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension and falls (with diuretics and many psychotropics).

Hypnotics
Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics
Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs
Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:

- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol p. 354 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 927 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol p. 354;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary see, NSAID-associated ulcers under Peptic ulceration p. 61.

Other drugs
Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin p. 94. The usual maintenance dose of digoxin p. 94 in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily.

Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 461, mianserin
hydrochloride p. 290) should be avoided unless there is no acceptable alternative. The elderly generally require a lower maintenance dose of warfarin sodium p. 121 than younger adults; once again, the outcome of bleeding tends to be more serious.

**Guidelines**

Always consider whether a drug is indicated at all.

**Limit range** It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

**Reduce dose** Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 611) should be avoided altogether.

**Review regularly** Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

**Simplify regimens** Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

**Explain clearly** Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like ‘as directed’. Child-resistant containers may be unsuitable.

**Repeats and disposal** Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

**Drugs and sport**

UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. An advice card listing examples of permitted and prohibited substances is available from:

UK Anti-doping
Oceanic House
1a Cockspur Street
London SW1Y 5BG
Tel: (020) 7766 7350
information@ukad.org.uk
www.ukad.org.uk

**General Medical Council’s advice** Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Prescribing in dental practice

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF. The following is a list of topics of particular relevance to dentists.

**General guidance**
- Prescribing by dentists, see Prescription writing p. 4
- Oral side-effects of drugs, see Adverse reactions to drugs p. 11
- Medical emergencies in dental practice (below)
- Medical problems in dental practice p. 30

**Drug management of dental and oral conditions**

**Dental and orofacial pain, see Analgesics p. 352**
- Neuropathic pain p. 382
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 352
- Opioid analgesics, see Analgesics p. 352
- Non-steroidal anti-inflammatory drugs p. 915

**Oral infections**
- Bacterial infections, see Antibacterials, principles of therapy p. 438
- Phenoxymethylpenicillin p. 481
- Broad-spectrum penicillins (amoxicillin p. 482 and ampicillin p. 483)
- Cephalosporins (cefalexin p. 456 and cefradine p. 458)
- Tetracyclines p. 496
- Macrolides (clarithromycin p. 470, erythromycin p. 471 and azithromycin p. 955)
- Clindamycin p. 467
- Metronidazole p. 475
- Fusidic acid p. 956

**Fungal infections**
- Local treatment, Oropharynx infections, fungal p. 996
- Systemic treatment, Antifungals, systemic use p. 512
- Viral infections
- Herpetic gingivostomatitis, local treatment, see Oropharynx infections, viral p. 997
- Herpetic gingivostomatitis, systemic treatment, see Oropharynx infections, viral p. 997
- Herpes labialis

**Anaesthetics, anxiolytics and hypnotics**
- Anaesthesia, sedation, and resuscitation in dental practice p. 1094
- Hypnotics, see Hypnotics and anxiolytics p. 416
- Sedation for dental procedures, see Hypnotics and anxiolytics p. 416
- Local anaesthesia p. 1111
- Oral ulceration and inflammation p. 992
- Mouthwashes, gargles and dentifrices, see Mouthwashes and other preparations for oropharyngeal use p. 989
- Dry mouth, see Treatment of dry mouth p. 987
- Aromatic inhalations, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258
- Nasal decongestants, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258

**Dental Practitioners’ Formulary p. 1520**

**Changes to Dental Practitioners’ Formulary, see Dental Practitioners’ Formulary p. 1520**

**Medical emergencies in dental practice**

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 195.

**The drugs referred to in this section include:**
- Adrenaline/epinephrine Injection, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amp p. 196
- Aspirin Dispersible Tablets 300 mg p. 104
- Glucagon Injection, glucagon (as hydrochloride), 1-unit vial (with solvent) p. 618
- Glucose (for administration by mouth) p. 852
- Glyceryl trinitrate Spray p. 190
- Midazolam Oromucosal Solution, midazolam 5 mg/mL p. 414
- Oxygen
- Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation p. 222

**Adrenal insufficiency**

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see also Adrenal suppression for details of corticosteroids (systemic) p. 579 cover before dental surgical procedures under general anaesthesia).

**Management**
- **Lay the patient flat**
- **Give oxygen**
- Transfer patient urgently to hospital

**Anaphylaxis**

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

**Symptoms and signs**
- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

**Management**

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 196. This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if
Prescribing in dental practice

necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Oxygen administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

**Asthma**

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient’s short-acting beta, agonist inhaler such as salbutamol 100 micrograms/puff p. 222; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen should be given with salbutamol 5 mg or terbutaline sulfate 10 mg p. 225 by nebuliser; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 196 (as detailed under Anaphylaxis) should be given.

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient’s medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

**Cardiac emergencies**

If there is a history of angina the patient will probably carry isosorbide dinitrate spray or tablets p. 190 (or isosorbide dinitrate tablets p. 191) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease p. 29.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers p. 30.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged.

**Symptoms and signs of myocardial infarction**

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

**Initial management of myocardial infarction**

Call immediately for medical assistance and an ambulance, as appropriate. Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered.

Sublingual glyceryl trinitrate p. 190 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 104 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction p. 186.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 195.

**Epileptic seizures**

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

**Symptoms and signs**

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

**Management**

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give oxygen to support respiration if necessary. Do not attempt to restrain convulsive movements. After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused (postictal confusion) and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred. Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

**Midazolam** oromucosal solution p. 414 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see Drugs used in status epilepticus (Epilepsy p. 383).

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

**Hypoglycaemia**

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

**Symptoms and signs**

- Shaking and trembling
- Sweating
Unconsciousness

Convulsions

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition.

If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

Allergy

Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis p. 242.

Arrhythmias

Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient’s medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 420) may be useful in some instances for very anxious patients.

See also Cardiac emergencies and Dental Anaesthesia (Local anaesthesia p. 1111).

Cardiac prostheses

For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis p. 29. For advice on patients receiving anticoagulants, see Thromboembolic disease p. 30.

Coronary artery disease

Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient’s medical practitioner before commencing treatment. See also Cardiac Emergencies p. 28.

Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 106, or dipyrindamole p. 107 should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease

Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension

Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Local anaesthesia p. 1111).

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

Prescribing in dental practice
Prescribing in dental practice

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Infecive endocarditis**

While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine p. 989 mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

**Reduction of oral bacteraemia**

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteraemia.

**Postoperative care**

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

**Patients on anticoagulant therapy**

For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease (below).

**Joint prostheses**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Pacemakers**

Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

**Thromboembolic disease**

Patients receiving a heparin or an oral anticoagulant such as warfarin sodium p. 121, acenocoumarol p. 120 (nicoumalone), phenindione p. 120, apixaban p. 108, dabigatran etexilate p. 117 or rivaroxaban p. 109 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin sodium, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra-indicated in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.
Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 387, imidazole and triazole antifungals (including miconazole p. 1011), erythromycin p. 471, clarithromycin p. 470, and metronidazole p. 475; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 483 or amoxicillin p. 482. Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.

Liver disease
Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy. For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 17. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment
The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists. For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 17. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy
Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 19. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding
Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 19. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.
1 Chronic bowel disorders

Chronic bowel disorders

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Clostridium difficile infection

Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin, amoxicillin, co-amoxiclav, second- and third-generation cephalosporins, clindamycin, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 475, vancomycin p. 465, and fidaxomicin p. 468.

Diverticular disease

Diverticular disease is treated with a high-fibre diet, bran supplements, and bulk-forming drugs. Antispasmodics may provide symptomatic relief when colic is a problem. Antibacterials are used only when the diverticula in the intestinal wall become infected. Antimotility drugs which slow intestinal motility, e.g. codeine phosphate p. 360, diphenoxylate, and loperamide hydrochloride p. 56 could possibly exacerbate the symptoms of diverticular disease and are contra-indicated.

Irritable bowel syndrome

Irritable bowel syndrome can present with pain, constipation, or diarrhea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The fibre intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk p. 45, sterculia p. 46, or oats) is recommended; insoluble fibre (e.g. bran) may exacerbate symptoms and its use should be discouraged. A laxative can be used to treat constipation. An osmotic laxative, such as a macrogl, is preferred; lactulose p. 47 may cause bloating. Linaclotide p. 40 is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. Stimulant laxatives should be avoided or used only occasionally. Loperamide hydrochloride p. 56 may relieve diarrhoea and antispasmodic drugs may relieve pain. Opioids with a central action, such as codeine phosphate p. 360, are better avoided because of the risk of dependence.

A tricyclic antidepressant can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide hydrochloride p. 56, or antispasmodics. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Malabsorption syndromes

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatin supplements.

See further information on foods for special diets (ACBS), see Borderline substances p. 1260.

1.1 Inflammatory bowel disease

Inflammatory bowel disease

Chronic inflammatory bowel diseases include ulcerative colitis and Crohn’s disease. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide sodium p. 34, mesalazine p. 34, olsalazine sodium p. 37, and sulfasalazine p. 37), corticosteroids (hydrocortisone p. 583, beclometasone dipropionate p. 38, budesonide p. 38, and prednisolone p. 585), and drugs that affect the immune response are used in the treatment of inflammatory bowel disease.

Treatment of acute ulcerative colitis and Crohn’s disease

Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid is treated initially with local application of an aminosalicylate; alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local
corticosteroid can be used for proctitis that does not respond to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone for 4–8 weeks. Modified-release budesonide is licensed for Crohn’s disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone p. 583 or methylprednisolone p. 584); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin p. 717 [unlicensed indication]. Patients with unresponsive or chronically active Crohn’s disease may benefit from azathioprine p. 716, mercaptopurine p. 762 [unlicensed indication], or once-weekly methotrexate p. 762 [unlicensed indication]; these drugs have a slower onset of action.

Infliximab p. 906 is licensed for the management of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them.

Adalimumab p. 901 is licensed for the treatment of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. For inducing remission, adalimumab can be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated. Adalimumab may also be used for Crohn’s disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

Golimumab p. 904 is licensed for the treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it.

Vedolizumab p. 39 is licensed for the treatment of moderate to severe active Crohn’s disease and ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor.

Maintenance of remission of acute ulcerative colitis and Crohn’s disease

Smoking cessation reduces the risk of relapse in Crohn’s disease and should be encouraged. Aminosalicylates are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn’s disease. Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine p. 716 or mercaptopurine p. 762 [unlicensed indication], given under close supervision may be helpful. Methotrexate p. 762 is tried in Crohn’s disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab p. 906 should be considered for patients with Crohn’s disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. Adalimumab p. 901 is licensed for maintenance therapy in Crohn’s disease and ulcerative colitis. Golimumab p. 904 is licensed for maintenance therapy in ulcerative colitis.

Fistulating Crohn’s disease

Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole p. 475 or ciprofloxacin p. 450 can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely [unlicensed indication]. Metronidazole is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine p. 716 or mercaptopurine p. 762 is used as a second-line treatment for fistulating Crohn’s disease and continued for maintenance [unlicensed indication]. Infliximab p. 906 is used for fistulating Crohn’s disease refractory to conventional treatments; fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. Adalimumab p. 901 can be used if there is intolerance to infliximab p. 906 [unlicensed indication].

Adjuvantive treatment of inflammatory bowel disease

Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate. Antimotility drugs such as codeine phosphate p. 360 and loperamide hydrochloride p. 56, and antisipasmic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. An osmotic laxative, such as a macrogol, may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine p. 173, which binds bile salts.

Drugs used in chronic bowel disorders

Aminosalicylates

Sulfasalazine p. 37 is a combination of 5-aminosalicylic acid (‘5-ASA’) and sulapyridine; sulapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine p. 34 (5-aminosalicylic acid), balsalazide sodium p. 34 (a prodrug of 5-aminosalicylic acid) and olsalazine sodium p. 37 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

Drugs affecting the immune response

Azathioprine p. 716, ciclosporin p. 717, mercaptopurine p. 762, and methotrexate p. 762 have a role in the treatment of inflammatory bowel disease. Folic acid p. 836 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.
Cytokine modulators
Infliximab p. 906, adalimumab p. 901, and golimumab p. 904 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

AMINOSALICYLATES

Aminosalicylates

- **SIDE-EFFECTS**
  - Rare Acute pancreatitis · agranulocytosis · alopecia · aplastic anaemia · arthralgia · blood disorders · eosinophilia · fibrosing alveolitis · hepatitis · interstitial nephritis · leukopenia · lung disorders · lupus erythematosus-like syndrome · methaemoglobinemia · myalgia · myocarditis · nephrotic syndrome · neutropenia · pericarditis · peripheral neuropathy · renal dysfunction · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
  - Frequency not known Abdominal pain · diarrhoea · exacerbation of symptoms of colitis · headache · hypersensitivity reactions · nausea · rash · urticaria · vomiting

-BLOOD DISORDERS A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in salicylate hypersensitivity.

- **RENAI IMPAIRMENT** Renal function should be monitored more frequently in renal impairment.

- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.

-PATIENT AND CARER ADVICE Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

Balsalazide sodium

- **INDICATIONS AND DOSE**
  - **PENTASA® TABLETS**
    - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
      - Adult: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks
    - **Maintenance of remission of ulcerative colitis**
      - By mouth
        - Adult: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day
  - **ASACOL® MR 800MG TABLETS**
    - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
      - Adult: 2.4–4.8 g daily in divided doses
    - **Maintenance of remission of ulcerative colitis**
      - By mouth
        - Adult: Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses
      - **Maintenance of remission of Crohn’s ileo-colitis**
        - By mouth
          - Adult: Up to 2.4 g daily in divided doses
    - **ASACOL® MR 400MG TABLETS**
      - Treatment of mild to moderate ulcerative colitis, acute attack
      - BY MOUTH
        - Child 12-17 years: 800 mg 3 times a day
        - Adult: 2.4 g daily in divided doses
    - **OCTASA®**
      - Treatment of mild to moderate ulcerative colitis, acute attack
      - BY MOUTH
        - Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only
      - **Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis**
        - By mouth
          - Adult: 1.2–2.4 g daily in divided doses
  
- **CAUTIONS** History of asthma
  - **SIDE-EFFECTS** Cholelithiasis
  - **PREGNANCY** Manufacturer advises avoid.
  - **BREAST FEEDING** Diarrhoea may develop in the infant. Monitor breast-fed infants for diarrhoea.
  - **HEPATIC IMPAIRMENT** Avoid in severe impairment.
  - **RENAI IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

Mesalazine

- **INDICATIONS AND DOSE**
  - **PENTASA® TABLETS**
    - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
      - Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–3 divided doses
      - **Maintenance of remission of ulcerative colitis**
        - By mouth
          - Adult: 2.4 g once daily
      - **MEZAVANT® XL**
        - Treatment of mild to moderate ulcerative colitis, acute attack
        - BY MOUTH
          - Adult: 2.4 g once daily
      - **ASACOL® MR 400MG TABLETS**
        - Treatment of mild to moderate ulcerative colitis, acute attack
        - BY MOUTH
          - Adult: 2.4–4.8 g daily in divided doses

**SALOFALK® TABLETS**

Treatment of mild to moderate ulcerative colitis, acute attack

**BY MOUTH**

- Child 5–17 years (body-weight up to 39 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
- Adult: 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**

**BY MOUTH**

- Child 5–17 years (body-weight up to 39 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day
- Adult: 500 mg 3 times a day

**IPOCOL®**

Treatment of mild to moderate ulcerative colitis, acute attack

**BY MOUTH**

- Adult: 2.4 g daily in divided doses

**PENTASA® GRANULES**

Treatment of mild to moderate ulcerative colitis, acute attack

**BY MOUTH**

- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 41 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
- Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

**Maintenance of remission of ulcerative colitis**

**BY MOUTH**

- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 41 kg and above): 2 g once daily
- Adult: 2 g once daily

**SALOFALK® GRANULES**

Treatment of mild to moderate ulcerative colitis, acute attack

**BY MOUTH**

- Child 5–17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 41 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
- Adult: 1.5–3 g once daily, dose preferably taken in the morning, alternatively 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**

**BY MOUTH**

- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 41 kg and above): 500 mg 3 times a day
- Adult: 500 mg 3 times a day

**SALOFALK® RECTAL FOAM**

Treatment of mild ulcerative colitis affecting sigmoid colon and rectum

**BY RECTUM**

- Child 12–17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
- Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

**ASACOL® FOAM ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the rectosigmoid region

**BY RECTUM**

- Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

**SALOFALK® SUPPOSITORIES**

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon

**BY RECTUM**

- Adult: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

**Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum**

**BY RECTUM**

- Adult: 1 g daily, preferably at bedtime, dose to be given using 1 g suppositories

**ASACOL® SUPPOSITORIES**

Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission

**BY RECTUM**

- Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

**PENTASA® SUPPOSITORIES**

Treatment of acute attack, ulcerative proctitis

**BY RECTUM**

- Child 15–17 years: 1 g daily for 2–4 weeks
- Adult: 1 g daily for 2–4 weeks

**Maintenance, ulcerative proctitis**

**BY RECTUM**

- Child 15–17 years: 1 g daily
- Adult: 1 g daily

**PENTASA® RETENTION ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

**BY RECTUM**

- Adult: 1 g once daily, dose to be administered at bedtime

**Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region**

**BY RECTUM**

- Child 12–17 years: 1 g once daily, dose to be administered at bedtime

**SALOFALK® ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

**BY RECTUM**

- Adult: 2 g once daily, dose to be administered at bedtime

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 21, 25

> Mezavant XL (Shire Pharmaceuticals Ltd)
Mesalazine 1.2 gram Mezavant XL 1200mg tablets | 60 tablet (£62.44 DT price = £62.44
> Pentasa (Ferring Pharmaceuticals Ltd)
Mesalazine 500 mg Pentasa 500mg modified-release tablets | 60 tablet (£36.89 DT price = £36.89

**INTERACTIONS**

The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol® MR tablets, Ipoloc®, Salofalk® granules) suggest that preparations that lower stool pH (e.g. lactulose) may prevent the release of mesalazine.

**SIDE-EFFECTS**

Rare Dizziness
Very rare Oligospermia (reversible)

**PREGNANCY**

Negligible quantities cross placenta.

**BREAST FEEDING**

Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk. Monitor breast-fed infant for diarrhoea.

**HEPATIC IMPAIRMENT**

Avoid in severe impairment.

**RENAL IMPAIRMENT**

Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

**PENTASA® TABLETS**

Tablets may be halved, quartered, or dispersed in water, but should not be chewed.

**PENTASA® GRANULES**

Granules should be placed on tongue and washed down with water or orange juice without chewing.

In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

**SALOFALK® GRANULES**

Granules should be placed on tongue and washed down with water without chewing.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of granule formulations of Salofalk® may include vanilla. There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

**PATIENT AND CARER ADVICE**

If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.
Olsalazine sodium

**INDICATIONS AND DOSE**

Treatment of acute attack of mild ulcerative colitis

**BY MOUTH**

- Adult: 1 g daily in divided doses, doses to be taken after meals, then increased if necessary up to 3 g daily in divided doses (max. per dose 1 g), dose to be increased over 1 week.

**Maintenance of remission of mild ulcerative colitis**

**BY MOUTH**

- Adult: Maintenance 500 mg twice daily, dose to be taken after food.

**SIDE-EFFECTS**

- **Common or very common** Watery diarrhoea
- **Frequency not known** Blurred vision • palpitation • photosensitivity • pyrexia • tachycardia
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Monitor breast-fed infants for diarrhoea.
- **RENAI IMPAIRMENT** Use with caution; manufacturer advises avoid in significant impairment.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and contents sprinkled on food.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

- **Tablet**

Sulfasalazine (Sulphasalazine)

**INDICATIONS AND DOSE**

Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn’s disease

**BY MOUTH**

- Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary
- Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Maintenance of remission of mild to moderate and severe ulcerative colitis**

**BY MOUTH**

- Adult: 500 mg 4 times a day

**BY RECTUM**

- Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Active rheumatoid arthritis (administered on expert advice)**

**BY MOUTH**

- Adult: Initially 500 mg daily, increased in steps of 500 mg every 1 week, increased to 2–3 g daily in divided doses, enteric coated tablets to be administered

**CONTRA-INDICATIONS** Child under 2 years of age

**CAUTIONS** Acute porphyrias p. 864, G6PD deficiency • history of allergy • history of asthma • maintain adequate fluid intake • risk of haematological toxicity • risk of hepatic toxicity • slow acetylator status

**INTERACTIONS** → Appendix 1 (aminosalicylates).

**SIDE-EFFECTS**

- **Common or very common** Blood disorders • cough • dizziness • fever • Heinz body anaemia • insomnia • megaloblastic anaemia • proteinuria • pruritus • stomatitis • taste disturbances • tinnitus
- **Uncommon** Alopecia • convulsions • depression • dyspnoea • vasculitis
- **Frequency not known** Anaphylaxis • aseptic meningitis • ataxia • crystalluria • disturbances of smell • epidermal necrolysis • exfoliative dermatitis • gastro-intestinal intolerance • hallucinations • hypersensitivity reactions • leucopenia (especially in patients with rheumatoid arthritis) • loss of appetite • neutropenia (especially in patients with rheumatoid arthritis) • oligospermia • parotitis • photosensitivity • rashes • serum sickness • some soft contact lenses may be stained • thrombocytopenia (especially in patients with rheumatoid arthritis) • yellow-orange discoloration of other body fluids • yellow-orange discoloration of skin • yellow-orange discoloration of urine

**SID-EFFECTS, FURTHER INFORMATION**

**Gastro-intestinal side effects** Upper gastro-intestinal side-effects common over 4 g daily.

**Blood disorders** Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

**PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.

**BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAI IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
- Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
- Liver function Liver function tests should be performed at monthly intervals for first 3 months.

**PATIENT AND CARER ADVICE**

Contact lenses Some soft contact lenses may be stained.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**

  - **Salmazosprin (Pfizer Ltd)**
    - Sulfasalazine 500 mg Salazosprin 500mg tablets | 112 tablet [PD] £16.97 DT price = £15.38
Budesonide
The properties listed below are those particular to the drug only. For properties common to the class, see corticosteroids (systemic), p. 579.

INDICATIONS AND DOSE
ENTOCORT® CAPSULES
Mild to moderate Crohn’s disease affecting the ileum or ascending colon | Chronic diarrhoea due to collagenous colitis
BY MOUTH
▶ Adult: 3 mg 3 times a day for up to 8 weeks, reduce dose for the last 2 weeks of treatment
Autoimmune hepatitis, induction of remission
BY MOUTH
▶ Adult: 3 mg 3 times a day
Autoimmune hepatitis, maintenance
BY MOUTH
▶ Adult: 3 mg twice daily

BUDENOFALK® GRANULES
Mild to moderate Crohn’s disease affecting the ileum or ascending colon | Collagenous colitis
BY MOUTH
▶ Adult: 9 mg daily for up to 8 weeks, to be taken in the morning, dose to be reduced for the last 2 weeks of treatment

BUDENOFALK® RECTAL FOAM
Ulcerative colitis affecting sigmoid colon and rectum
BY RECTUM
▶ Adult: 1 metered application once daily for up to 8 weeks
Dose equivalence and conversion
1 metered application is equivalent to budesonide 2 mg.

ENTOCORT® ENEMA
Ulcerative colitis involving rectal and recto-sigmoid disease
BY RECTUM
▶ Adult: 1 enema daily for 4 weeks, to be administered at bedtime

● CAUTIONS
▶ With systemic use | Autoimmune hepatitis
▶ HEPATIC IMPAIRMENT
▶ With systemic use | When used in autoimmune hepatitis liver function tests should be monitored every 2 weeks for 1 month, then at least every 3 months.

DIRECTIONS FOR ADMINISTRATION
▶ With oral use | Granules should be placed on tongue and washed down with water without chewing.

BUDENOFALK® GRANULES
Granules should be placed on tongue and washed down with water without chewing.

● PRESCRIBING AND DISPENSING INFORMATION
Flavours of granule formulations may include lemon.

ENTOCORT® CAPSULES
Dispense in original container (contains dessicant).

PATIENT AND CARER ADVICE
▶ With oral use | Patients or carers should be given advice on how to administer budesonide granules.

NATIONAL FUNDING/ACCESS DECISIONS
BUDENOFALK® CAPSULES
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (April 2015) that Budenofalk® gastro-resistant capsules are accepted for restricted use within NHS Scotland for the treatment of autoimmune hepatitis in non-cirrhotic patients who are intolerant of conventional oral corticosteroids (prednisolone) with severe corticosteroid-related side effects (actual or anticipated) such as psychosis, poorly controlled diabetes or osteoporosis.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Modified-release tablet
▶ Cortisporin (Ferring Pharmaceuticals Ltd)
Budesonide 9 mg Cortisporin 9mg modified-release tablets | 30 tablet | £5.00

Foam
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, propylene glycol, sorbic acid
Budesonide 2 mg per 1 actuation Budenofalk 2mg foam entema | 14 dose | £57.11

Enema
▶ Entocort (AstraZeneca UK Ltd)
Budesonide 20 microgram per 1 ml Entocort 2mg/100ml enema | 7 enema | £39.60

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)
Vedolizumab

▶ DRUG ACTION Vedolizumab is a monoclonal antibody that binds specifically to the α4β7 integrin, which is preferentially expressed on gut homing T helper lymphocytes.

INDICATIONS AND DOSE
Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

BY INTRAVENOUS INFUSION
▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn’s disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

BY INTRAVENOUS INFUSION
▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

CONTRA-INDICATIONS Severe active infection

CAUTIONS Controlled chronic severe infection; history of recurring severe infection; previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk) • previous treatment with rituximab

CAUTIONS, FURTHER INFORMATION
Risk of infection Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

INTERACTIONS ▶ Appendix 1 (vedolizumab).

SIDE-EFFECTS
▶ Common or very common Acne • arthralgia • back pain • constipation • cough • dyspepsia • eczema • erythema • flatulence • gastroenteritis • headache • hypertension • infections • malaise • muscle spasms • muscular weakness • nasal congestion • nausea • night sweats • oropharyngeal pain • paraesthesia • pharyngitis • pruritus • pyrexia • rash • upper respiratory tract infection

▶ Uncommon Folliculitis • oral candidiasis • vulvovaginal candidiasis

SIDE-EFFECTS, FURTHER INFORMATION
Infusion-related reactions Infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each infusion for signs and symptoms of acute hypersensitivity reactions; they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.

CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 18 weeks after treatment.

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

MONITORING REQUIREMENTS
Monitor closely for infection before, during and after treatment—potential increased risk of opportunistic infection.

Monitor for new onset or worsening neurological signs and symptoms (withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Entyvio®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21–25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21–25 gauge needle), and add to 250 mL of infusion fluid; gently mix and give over 30 minutes.

PATIENT AND CARER ADVICE Patients should be provided with a patient alert card.
1.2 Irritable bowel syndrome

Drugs used for irritable bowel syndrome not listed below;
Alverine citrate, p. 74 • Mebeverine hydrochloride, p. 75

ANTISPASMODICS

Peppermint oil

INDICATIONS AND DOSE

COLPERMIN®
Relief of abdominal colic and distension, particularly in irritable bowel syndrome
BY MOUTH
- Child 15-17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water
- Adult: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

MINTEC®
Relief of abdominal colic and distension, particularly in irritable bowel syndrome
BY MOUTH
- Adult: 1–2 capsules 3 times a day for up to 2–3 months if necessary, dose to be taken before meals, swallowed whole with water

CAUTIONS
- Sensitivity to menthol

SIDE-EFFECTS
- Rare Allergic reactions • ataxia • bradycardia • headache • muscle tremor • rash
- Frequency not known Heartburn • perianal irritation
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Significant levels of menthol in breast milk unlikely.
- DIRECTIONS FOR ADMINISTRATION Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Modified-release capsule
CAUTIONARY AND ADVISORY LABELS 5, 22, 25
EXCIPIENTS: May contain Arachis (peanut) oil

LIQUID

- PEPPERMINT OIL (Non-proprietary)
  Ethanol 90% 15 ml per 1 litre, Peppermint oil 0.5 ml per 1 litre, Purified water 9.5 ml per 1 litre Peppermint oil BP 1973 | 100 ml [SSL] £5.95 | 100 ml £19.50

GUANYLATE CYCLASE-C RECEPTOR AGONISTS

Linaclotide

INDICATIONS AND DOSE
Moderate to severe irritable bowel syndrome with constipation
BY MOUTH
- Adult: 290 micrograms once daily, review treatment if no response after 4 weeks

CONTRA-INDICATIONS
- Gastro-intestinal obstruction • inflammatory bowel disease

CAUTIONS
- Predisposition to fluid and electrolyte disturbances

SIDE-EFFECTS
- Common or very common Abdominal distension • abdominal pain • diarrhoea (if severe or prolonged, consider suspending treatment) • dizziness • flatulence
- Uncommon Decreased appetite • dehydration • hypokalaemia • orthostatic hypotension
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

PRESCRIBING AND DISPENSING INFORMATION
Dispense capsules in original container (contains desiccant); discard any capsules remaining 18 weeks after opening.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (May 2013) that linaclotide (Constella®) is accepted for restricted use within NHS Scotland for moderate to severe irritable bowel syndrome in patients whose condition has not responded adequately to all other treatments, or who are intolerant of them.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

  Linaclotide 290 microgram capsules | 28 capsule [POTS] £37.56

2 Constipation and bowel cleansing

2.1 Bowel cleansing

Drugs used for Bowel cleansing not listed below;
Bisacodyl, p. 52 • Docusate sodium, p. 52 • Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride, p. 48 • Magnesium sulfate, p. 858 • Phosphate, p. 861 • Sodium picosulfate, p. 54
MAGNESIUM-CONTAINING DRUGS

**Citric acid with magnesium carbonate**
(Formulated as a bowel cleansing preparation)

**INDICATIONS AND DOSE**
Bowel evacuation for surgery, colonoscopy or radiological examination

**BY MOUTH**
- Child 5-9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
- Child 10-17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure
- Adult: 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients

**CONTRA-INDICATIONS**
Acute severe colitis • gastric retention • gastro-intestinal obstruction • gastro-intestinal perforation • toxic megacolon

**CAUTIONS**
Children • colitis (avoid if acute severe colitis) • debilitated • elderly • hypovolaemia (should be corrected before administration of bowel cleansing preparations) • impaired gag reflex or possibility of regurgitation or aspiration • patients with fluid and electrolyte disturbances

**CAUTIONS, FURTHER INFORMATION**
Adequate hydration should be maintained during treatment.

**INTERACTIONS**
Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

**SIDE-EFFECTS**
- Common or very common Abdominal distention • abdominal pain • nausea • vomiting
- Uncommon Dehydration • dizziness • electrolyte disturbances • headache

**SIDE-EFFECTS, FURTHER INFORMATION**
Abdominal pain Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

**PREGNANCY**
Use with caution.

**BREAST FEEDING**
Use with caution.

**HEPATIC IMPAIRMENT**
Avoid in hepatic coma if risk of renal failure.

**RENAL IMPAIRMENT**
- In adults Avoid if eGFR less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.
- In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.

**MONITORING REQUIREMENTS**
Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION**
One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

**PRESCRIBING AND DISPENSING INFORMATION**
Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg²⁺. Flavours of oral powders may include lemon and lime.

**PATIENT AND CARER ADVICE**
Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber’s advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Effervescent powder**

**ELECTROLYTES: Magnesium**
- Citramag (Sanochemia Diagnostics UK Ltd)
  Citric acid anhydrous 17.79 gram, Magnesium carbonate heavy 11.57 gram

**OSMOTIC LAXATIVES**

**Macrogol 3350 with anhydrous sodium sulfate, ascorbic acid, potassium chloride, sodium ascorbate and sodium chloride**
(Polyethylene glycols)

**INDICATIONS AND DOSE**
MOVIPREP®
Bowel evacuation for surgery, colonoscopy or radiological examination

**BY MOUTH**
- Adult: 1 litre daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 2 litres daily for 1 dose; reconstituted solution to be taken on the evening before the procedure, treatment should be completed at least 1 hour before colonoscopy

**CONTRA-INDICATIONS**
Acute severe colitis • G6PD deficiency • gastric retention • gastro-intestinal obstruction • gastro-intestinal perforation • toxic megacolon

**CAUTIONS**
Colitis (avoid if acute severe colitis) • debilitated patients • elderly • fluid and electrolyte disturbances • heart failure • hypovolaemia (should be corrected before administration of bowel cleansing preparations) • impaired gag reflex or possibility of regurgitation or aspiration

**INTERACTIONS**
Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given.

**SIDE-EFFECTS**
- Common or very common Abdominal distention • abdominal pain • nausea • vomiting
- Uncommon Dehydration • dizziness • electrolyte disturbances • headache
- Frequency not known Anal discomfort • fatigue • sleep disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**
Abdominal pain Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride (Formulated as a bowel cleansing preparation)

**INDICATIONS AND DOSE**
Bowel cleansing before radiological examination, colonoscopy, or surgery

**INITIALLY BY MOUTH**
- Adult: Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed

**CONTRA-INDICATIONS** Acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon

**CAUTIONS** Colitis (avoid if acute severe colitis) · debilitated patients · elderly · fluid and electrolyte disturbances · heart failure · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration

**INTERACTIONS** Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

**SIDE-EFFECTS**
- Common or very common Abdominal distension · abdominal pain · nausea · vomiting
- Uncommon Anal discomfort · dehydration · dizziness · electrolyte disturbances · fatigue · headache · sleep disturbances

**STIMULANT LAXATIVES**
Magnesium citrate with sodium picosulfate (Formulated as a bowel cleansing preparation)

**INDICATIONS AND DOSE**
Citraflex® SACHETS
Bowel evacuation on day before radiological examination, endoscopy, or surgery

**BY MOUTH**
- Adult: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours

**PHARMACOKINETICS**
Acts within 3 hours of first dose.

**PICOLAX® SACHETS**
Bowel evacuation on day before radiological procedure, endoscopy, or surgery

**BY MOUTH**
- Child 1 year: 0.25 sachet taken before 8 a.m., then 0.25 sachet after 6–8 hours
- Child 2–3 years: 0.5 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
- Child 4–8 years: 1 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
- Child 9–17 years: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours
- Adult: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours
**PATIENT AND CARER ADVICE**

- **SIDE-EFFECTS**
  - Common or very common: Abdominal distention, abdominal pain (usually transient—reduced by taking more slowly), nausea, vomiting
  - Uncommon: Dehydration, dizziness, electrolyte disturbances, headache
  - Frequency not known: Anal discomfort, fatigue, rash, sleep disturbances

**CAUTIONS**

- **GENERAL CAUTIONS:**
  - Cardiac disease (avoid in congestive cardiac failure), children, colitis (avoid if acute severe colitis), debilitated patients, elderly, fluid and electrolyte disturbances, hypovolaemia (should be corrected before administration), impaired gag reflex or possibility of regurgitation or aspiration, recent gastro-intestinal surgery

- **CONTRA-INDICATIONS**
  - Acute severe colitis, ascites, congestive cardiac failure, gastric retention, gastro-intestinal obstruction, gastro-intestinal perforation, gastro-intestinal ulceration, toxic megacolon

- **BREAST FEEDING**

- **PREGNANCY**

- **HEPATIC IMPAIRMENT**

- **RENOV IMPAIRMENT**

**ELECTROLYTES:** May contain Magnesium, potassium

- **PATIENT AND CARER ADVICE**

**2.2 Constipation**

**Constipation**

Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint. It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement every day. A useful definition of constipation is the passage of hard stools less frequently than the patient’s own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia.

Thus, laxatives should generally be avoided except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in drug-induced constipation, for the expulsion of parasites after anthelmintic treatment, and to clear the alimentary tract before surgery and radiological procedures. Prolonged treatment of constipation is sometimes necessary. Also see the prevention of opioid-induced constipation in palliative care.

The laxatives that follow have been divided into 5 main groups. This simple classification disguises the fact that some laxatives have a complex action.

**Bulk-forming laxatives**

Bulk-forming laxatives are of value if the diet is deficient in fibre. Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives can be used in the management of patients with colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome, and as adjuncts in ulcerative colitis. Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose p. 45, ispaghula husk p. 45, and sterculia p. 46 are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

**Stimulant laxatives**

Stimulant laxatives include bisacodyl p. 52, sodium picosulfate p. 54, and members of the anthraquinone group, senna p. 53, co-danthramer p. 52 and co-danthrusate p. 51. The indications for co-danthramer and
co-danthrusate are limited by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as cascara (an anthraquinone) and castor oil are obsolete. Docusate sodium p. 52 probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances.

Glycerol p. 53 suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Unstandardised preparations of cascara, fragula, rhubarb, and senna should be avoided as their laxative action is unpredictable. Aloes, colocynthis, and jalap should be avoided as they have a drastic purgative action.

The parasympathomimetics betanechol chloride p. 676, neostigmine p. 912, and pyridostigmine bromide p. 912 enhance parasympathetic activity in the gut and increase intestinal motility. They are rarely used for their gastro-intestinal effects. Organic obstruction of the gut must first be excluded and they should not be used shortly after bowel anastomosis.

Other stimulant laxatives
Unstandardised preparations of cascara, fragula, rhubarb, and senna should be avoided as their laxative action is unpredictable. Aloes, colocynthis, and jalap should be avoided as they have a drastic purgative action.

Faecal softeners
Liquid paraffin p. 49, the traditional lubricant, has disadvantages. Bulk laxatives and non-ionic surfactant ‘wetting’ agents e.g. docusate sodium p. 52 also have softening properties. Such drugs are useful for oral administration in the management of haemorrhoids and anal fissure; glycerol p. 53 is useful for rectal use.

Enemas containing arachis oil p. 51 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.

Osmotic laxatives
Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 47 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy.

Macrogols are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydration effect sometimes seen with osmotic laxatives.

Saline purgatives such as magnesium hydroxide p. 46 are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. Magnesium salts, such as magnesium sulfate are useful where rapid bowel evacuation is required. Sodium salts should be avoided as they may give rise to sodium and water retention in susceptible individuals. Phosphate enemas are useful in bowel clearance before radiology, endoscopy, and surgery.

Other drugs used in constipation
Linaclotide p. 40 is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain. It is metabolised within the gastro-intestinal tract and is virtually undetectable in the plasma after therapeutic doses.

Lubiprostone p. 46 is a chloride-channel activator that is licensed for the treatment of chronic idiopathic constipation in adults whose condition has not responded adequately to lifestyle changes (including dietary changes).

Prucacloride p. 50 is a selective serotonin 5HT4 receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in women, when other laxatives have failed to provide an adequate response.

Bowel cleansing preparations
Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

Pregnancy
If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose p. 47, can also be used. Bisacodyl p. 52 or senna p. 53 may be suitable, if a stimulant effect is necessary.

Constipation in children
Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In infants, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose p. 47 can be used to soften the stool; either an oral preparation containing macrogols or, rarely, glycerol p. 53 suppositories can be used to clear faecal impaction. The infant should be referred to a hospital paediatrician if these measures fail.

The diet of children over 1 year of age should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols can also be used, particularly in children with chronic constipation; lactulose p. 47 is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a stimulant laxative can be added.

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogols is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate p. 677 enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of
months, according to response. Some children may require laxative therapy for several years.

**Chronic constipation**
For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

**Bulk-forming laxatives**

**Indications and dose**

**ISPAGEL® ORANGE**

**Constitution**

**By mouth**

- Child 6-11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals
- Child 12-17 years: 1 sachet 1–3 times a day, dose to be given in water preferably after meals, alternatively 10 mL 1–3 times a day, dose to be given as level spoonfuls in water, preferably after meals
- Adult: 1 sachet 1–3 times a day, dose to be made up in water, preferably taken after food

**Dose equivalence and conversion**

1 sachet equivalent to 2 level 5 mL spoonfuls.

**Fybogel®**

**Constitution**

**By mouth**

- Child 6-11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonfuls in water, preferably after meals
- Child 12-17 years: 1 sachet twice daily, dose to be made up in water, preferably taken after food, alternatively 10 mL twice daily, dose to be made up in water, preferably taken after food
- Adult: 1 sachet twice daily, dose to be made up in water, preferably taken after food, alternatively 10 mL twice daily, dose to be made up in water, preferably taken after food

**Dose equivalence and conversion**

1 sachet equivalent to 2 level 5 mL spoonfuls.

**Contra-indications**

Colonic atony · difficulty in swallowing · faecal impaction · infective bowel disease · intestinal obstruction

**Caution**

Adequate fluid intake should be maintained to avoid intestinal obstruction

**Further information**

It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.

**Side-effects**

Abdominal distension (especially during the first few days of treatment) · flatulence (especially during the first few days of treatment) · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity

**Prescribing and dispensing information**

Ispagel® Orange and Fybogel® effervescent granules are available as GSL medicines. Flavours of soluble granules formulations may include plain, lemon, or orange.

**Patient and carer advice**

Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

**Methylcellulose**

**Drug action**

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

**Indications and dose**

**Constitution**

**Diarrhoea**

**By mouth using tablets**

- Adult: 3–6 tablets twice daily

**Contra-indications**

Colonic atony · difficulty in swallowing · faecal impaction · infective bowel disease · intestinal obstruction

**Caution**

Adequate fluid intake should be maintained to avoid intestinal obstruction

**Further information**

It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.

**Side-effects**

Abdominal distension (especially during the first few days of treatment) · flatulence (especially during the first few days of treatment) · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity

**Directions for administration**

In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

**Patient and carer advice**

Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Granules**

**Cautionary and advisory labels**

13 EXCIPMENTS: May contain Aspartame

- ISPAGHULA HUSK (Non-proprietary)
- Ispaghula husk 3.5 g granules sachets gluten free | 30 sachets GSL £2.29

**Effervescent granules**

**Cautionary and advisory labels**

13 EXCIPMENTS: May contain Aspartame

- ISPAGHULA HUSK (Non-proprietary)
- Ispaghula husk 3.5 g effervescent granules sachets gluten free sugar free (sugar-free) | 30 sachets no price available DT price = £2.29

**Powder**

**Cautionary and advisory labels**

13 EXCIPMENTS: May contain Aspartame

- ISPAGHULA HUSK (Non-proprietary)
- Ispaghula husk 1 mg per 1 mg Husk oral powder (sugar-free) | 200 gram GSL £1.24

Also available in combination with senna, p. 53
**Sterculia**

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

### INDICATIONS AND DOSE

**Constipation**

**BY MOUTH**

- Child 6–11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5–mL spoonful once or twice a day; washed down without chewing with plenty of liquid after meals.
- Child 12–17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5–mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals.
- Adult: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5–mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals.

### CONTRA-INDICATIONS

Colonic atony - difficulty in swallowing - faecal impaction - intestinal obstruction.

### CAUTIONS

Adequate fluid intake should be maintained to avoid intestinal obstruction.

### SIDE-EFFECTS

- Abdominal distension (especially during the first few days of treatment).
- Flatulence (especially during the first few days of treatment).
- Gastro-intestinal obstruction.

### PREGNANCY

Manufacturer of Normacol Plus® advises avoid.

### BREAST FEEDING

Manufacturer of Normacol Plus® advises avoid.

### PATIENT AND CARER ADVICE

Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Granules

**CAUTIONARY AND ADVISORY LABELS** 25, 27

- **Normacol** (Norgine Pharmaceuticals Ltd)
- **Sterculia** 620 mg per 1 gram (Normacol granules 7g sachets) [60 sachet | £5.77 DT price = £5.77]
- **Normacol granules** | 500 gram [53] | £6.85 DT price = £6.85

### CHLORIDE-CHANNEL ACTIVATORS

**Lubiprostone**

- **DRUG ACTION** A chloride-channel activator that acts in the gut to increase intestinal fluid secretion, which increases motility.

### INDICATIONS AND DOSE

**Chronic idiopathic constipation when response to lifestyle changes (including diet) inadequate**

**BY MOUTH**

- Adult: 24 micrograms twice daily for 2 weeks.

### CONTRA-INDICATIONS

Gastro-intestinal obstruction.

### SIDE-EFFECTS

- **Common or very common** Abdominal pain - diarrhoea - dizziness - dyspepsia - dysphoria - flatulence - headache - hot flush - hyperhidrosis - nausea - oedema - palpitation
- **Uncommon** Chest pain - muscle spasm - syncope - vomiting
- **Frequency not known** Influenza-like symptoms - rash - tachycardia

### PREGNANCY

Manufacturer advises avoid — toxicity in animal studies.

### BREAST FEEDING

Manufacturer advises avoid.

### HEPATIC IMPAIRMENT

In moderate to severe impairment initially 24 micrograms once daily; if tolerated, and if necessary, increased to 24 micrograms twice daily.

### PRESCRIBING AND DISPENSING INFORMATION

Dispense capsules in original container; discard any capsules remaining 4 weeks after opening.

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- Lubiprostone for treating chronic idiopathic constipation (July 2014) NICE TA318

Lubiprostone is recommended as an option for treating chronic idiopathic constipation for adults in whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and for whom invasive treatment for constipation is being considered. If treatment with lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered. Lubiprostone should only be prescribed by a clinician with experience of treating chronic idiopathic constipation, after careful review of the patient’s previous courses of laxative treatments. [www.nice.org.uk/TA318](www.nice.org.uk/TA318)

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** has advised (July 2014) that lubiprostone (Amitiza®) is **not** recommended for use within NHS Scotland.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

**CAUTIONARY AND ADVISORY LABELS** 21

- **Amitiza** (Sucampo Pharma Europe Ltd)

Lubiprostone 24 microgram | Amitiza 24microgram capsules | 28 capsule | £29.68 | 56 capsule | £53.48

### MAGNESIUM-CONTAINING DRUGS

**Magnesium hydroxide**

### INDICATIONS AND DOSE

**Constipation**

**BY MOUTH**

- Adult: 30–45 mL as required, dose to be given mixed with water at bedtime.

### CONTRA-INDICATIONS

Acute gastro-intestinal conditions.

### CAUTIONS

Debilitated patients - elderly.

### INTERACTIONS

Appendix 1 (antacids).

### SIDE-EFFECTS

Colic.

### HEPATIC IMPAIRMENT

Avoid in hepatic coma if risk of renal failure.

### RENAL IMPAIRMENT

Avoid or reduce dose. Increased risk of toxicity in renal impairment.

### PRESCRIBING AND DISPENSING INFORMATION

When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
Methylnaltrexone bromide

**DRUG ACTION** Peripherally acting opioid-receptor antagonist which does not alter the central analgesic effect of opioids.

**INDICATIONS AND DOSE**

Adjunct to other laxatives in opioid-induced constipation in terminally ill patients, when response to other laxatives is inadequate

**BY SUBCUTANEOUS INJECTION**

- Adult (body-weight up to 38 kg): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 38-62 kg): 8 mg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 62-114 kg): 12 mg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
- Adult (body-weight 115 kg and above): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day

**PHARMACOKINETICS**

May act with 30–60 minutes.

- **CONTRA-INDICATIONS** Acute surgical abdominal conditions - gastro-intestinal obstruction
- **CAUTIONS** Diverticular disease - faecal impaction - patients with colostomy - patients with perineal catheter
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - diarrhoea - dizziness - flatulence - hyperhidrosis - injection site reactions - nausea
  - **Frequency not known** Gastro-intestinal perforation
- **PREGNANCY** Toxicity at high doses in *animal* studies - manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk - present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe hepatic impairment - no information available.
- **RENAL IMPAIRMENT** If eGFR less than 30 ml/minute/1.73 m², reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site.

**OSMOTIC LAXATIVES**

**Lactulose**

**INDICATIONS AND DOSE**

- **Constipation**
  - **BY MOUTH**
    - Child 1–11 months: 2.5 mL twice daily, adjusted according to response
    - Child 1-4 years: 2.5–10 mL twice daily, adjusted according to response
    - Child 5–17 years: 5–20 mL twice daily, adjusted according to response
    - Adult: Initially 15 mL twice daily, adjusted according to response

- **Hepatic encephalopathy (portal systemic encephalopathy)**
  - **BY MOUTH**
    - Adult: Adjusted according to response to 30–50 mL 3 times a day, subsequently adjusted to produce 2–3 soft stools per day

**PHARMACOKINETICS**

Lactulose may take up to 48 hours to act.

- **UNLICENSED USE**
  - In children Not licensed for use in children for hepatic encephalopathy.
  - In adults Lactulose doses in the BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Galactosaemia - intestinal obstruction
- **CAUTIONS** Lactose intolerance
- **INTERACTIONS** [Appendix 1 (lactulose).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort - cramps - flatulence - nausea - vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Nausea Nausea can be reduced by administration with water, fruit juice or meals.
- **PREGNANCY** Not known to be harmful.
- **PATIENT AND CARER ADVICE**

  - **Oral solution**
    - **LACTULOSE (Non-proprietary)**
      - Lactulose 666.667 mg per 1 mL Lactulose 10g/15ml oral solution
      - 15ml sachets sugar free (sugar-free) | 10 sachet £2.50 DT price = £2.50
      - Lactulose 680 mg per 1 ml Lactulose 3.1-3.7g/5ml oral solution
      - 300 ml £6.85 | 500 ml £14.50 DT price = £3.22
    - **Brands may include Duphalac oral solution; Lactugal oral solution**
Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride

**INDICATIONS AND DOSE**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily
- Adult: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction**

**BY MOUTH**
- Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**MOVICOL® LIQUID**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 25 mL 1–3 times a day usually for up to 2 weeks; maintenance 25 mL 1–2 times a day
- Adult: 25 mL 1–3 times a day usually for up to 2 weeks; maintenance 25 mL 1–2 times a day

**MOVICOL-PAEDIATRIC®**

**Chronic constipation | Prevention of faecal impaction**

**BY MOUTH**
- Child 2-5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 6-11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

**Faecal impaction**

**BY MOUTH**
- Child 5-11 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

**MOVICOL® ORAL POWDER**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily
- Adult: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction**

**BY MOUTH**
- Child 12-17 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- Adult: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**MOVICOL-HALF®**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily
- Adult: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

**Faecal impaction**

**BY MOUTH**
- Child 12-17 years: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day
- Adult: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day

**UNLICENSED USE**

**MOVICOL-PAEDIATRIC®**

Movicol® Paediatric not licensed for use in faecal impaction in children under 5 years, or for chronic constipation in children under 2 years.

**CONTRA-INDICATIONS**
- Crohn’s disease · intestinal obstruction · intestinal perforation · paralytic ileus · severe inflammatory conditions of the intestinal tract · toxic megacolon · ulcerative colitis

**MOVICOL-PAEDIATRIC®**

Cardiovascular impairment · renal impairment.

**CAUTIONS**

Cardiovascular impairment (should not take more than 2 ‘full-strength’ sachets or 4 ‘half-strength’ sachets in any one hour) · discontinue if symptoms of fluid and electrolyte disturbance

**MOVICOL-PAEDIATRIC®**

Impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)

**INTERACTIONS** → Appendix 1 (macrogols).

**SIDE-EFFECTS**
- Abdominal distention · flatulence · nausea

**PREGNANCY**
- Limited data, but manufacturer advises that it can be used.

**BREAST FEEDING**
- Manufacturer advises that it can be used.

**DIRECTIONS FOR ADMINISTRATION**

Contents of each ‘full strength’ sachet of oral powder to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL® LIQUID**

25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL) of water. After dilution the solution should be discarded if unused after 24 hours.

**MOVICOL-PAEDIATRIC®**

Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

**MOVICOL® ORAL POWDER**

Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL-HALF®**

Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution
the solution should be kept in a refrigerator and discarded if unused after 6 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid paraffin formulations may include orange. Flavours of oral powder formulations may include chocolate, lime and lemon, or plain.

  - Movicol

- **MACROGL 3350 WITH POTASSIUM CHLORIDE, SODIUM BICARBONATE AND SODIUM CHLORIDE (Non-proprietary)**
  - Liquid paraffin with magnesium hydroxide
  - The properties listed below are those particular to the combination only. For the properties of the components please consider, liquid paraffin above, magnesium hydroxide p. 46.

- **INDICATIONS AND DOSE**
  - **Constipation**
    - **By Mouth**
      - Adult: 5–20 mL as required

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Liquid paraffin and magnesium hydroxide preparations are on sale to the public. When prepared extemporaneously, the BP states Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP consists of 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide.

- **LESS SUITABLE FOR PRESCRIBING**
  - Liquid Paraffin Oral Emulsion BP is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

- **Liquid paraffin with magnesium hydroxide**

- **PHOSPHATE-CONTAINING DRUGS**
  - Sodium acid phosphate with sodium phosphate

- **INDICATIONS AND DOSE**
  - **Constipation**
    - (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)
    - **By Rectum**
      - Child 3–6 years: 45–65 mL once daily
      - Child 7–11 years: 65–100 mL once daily
      - Child 12–17 years: 100–128 mL once daily
      - Adult: 128 mL daily
**FLEET® PHOSPHO-SODA**

**Bowel evacuation before colonic surgery** | **Bowel evacuation before colonoscopy** | **Bowel evacuation before radiological examination**
---|---|---
**BY MOUTH**
- Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water; timing of doses is dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

**PHARMACOKINETICS**

Onset of action is within half to 6 hours of first dose.

**FLEET® READY-TO-USE ENEMA**

**Constipation** | **Bowel evacuation before abdominal radiological procedures** | **Bowel evacuation before endoscopy** | **Bowel evacuation before surgery**
---|---|---|---
**BY RECTUM**
- Adult: 118 mL

**CONTRA-INDICATIONS**

- With oral use Acute severe colitis, ascites, congestive cardiac failure, gastric retention, gastro-intestinal obstruction, gastro-intestinal perforation, toxic megacolon
- With rectal use Conditions associated with increased colonic absorption, gastro-intestinal obstruction, inflammatory bowel disease

**CAUTIONS**

- With oral use Cardiac disease (avoid in congestive cardiac failure), colitis (avoid if acute severe colitis), elderly and debilitated patients, fluid and electrolyte disturbances, hypovolaemia (should be corrected before administration), impaired gap reflex or possibility of regurgitation or aspiration
- With rectal use Ascites, congestive heart failure, elderly and debilitated patients, electrolyte disturbances, uncontrolled hypertension

**INTERACTIONS**

- With oral use Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

**SIDE-EFFECTS**

- Common or very common
  - With oral use Abdominal distension, abdominal pain (usually transient—reduced by taking more slowly), nausea, vomiting
  - Uncommon
  - With oral use Dehydration, dizziness, headache
  - Frequency not known
  - With oral use Arrhythmias, asthenia, chest pain, electrolyte disturbances, renal failure
  - With rectal use Electrolyte disturbances, local irritation

**PREGNANCY**

- With oral use Caution.
- With rectal use Caution.

**HEPATIC IMPAIRMENT**

Use with caution in cirrhosis.

**RENAL IMPAIRMENT**

- With oral use Avoid if eGFR less than 60 mL/minute/1.73 m²
- With rectal use Use with caution.

**MONITORING REQUIREMENTS**

- With oral use Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION**

**FLEET® PHOSPHO-SODA**

Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. after afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.

**PRESCRIBING AND DISPENSING INFORMATION**

- When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dodecahydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

**PATIENT AND CARER ADVICE**

**FLEET® PHOSPHO-SODA**

Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed. Patients or carers should be advised that adequate hydration should be maintained during treatment. Patients or carers should be given advice on administration of Fleet Phospho-soda® oral solution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 10**

**ELECTROLYTES:** May contain Phosphate, sodium

- **Fleet Phospho-soda** (Laboratorios Casen-Fleet S.L.U)
  - Disodium hydrogen phosphate dodecahydrate 240 mg per 1 ml
  - Sodium dihydrogen phosphate dihydrate 542 mg per 1 ml

**Enema**

- **SODIUM ACID PHOSPHATE WITH SODIUM PHOSPHATE (Non proprietary)**
  - Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml
  - Sodium dihydrogen phosphate dihydrate 100 mg per 1 ml

- **Fleet Ready-to-use** (Laboratorios Casen-Fleet S.L.U)
  - Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml
  - Sodium dihydrogen phosphate dihydrate 181 mg per 1 ml

**SELECTIVE 5-HT4 RECEPTOR AGONISTS**

**Prucalopride**

**DRUG ACTION**

A selective serotonin 5-HT4-receptor agonist with prokinetic properties.

**INDICATIONS AND DOSE**

Chronic constipation in women when other laxatives fail to provide an adequate response

**BY MOUTH**

- Adult: 2 mg once daily, review treatment if no response after 4 weeks
- Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

**CONTRA-INDICATIONS**

Crohn’s disease, intestinal obstruction, intestinal perforation, severe inflammatory conditions of the intestinal tract, toxic megacolon, ulcerative colitis

**CAUTIONS**

- History of arrhythmias.
- History of ischaemic heart disease, severe, unstable chronic illness
INTERACTIONS Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS
- Common or very common Abdominal pain - diarrhoea - dizziness - dyspepsia - fatigue - flatulence - gastrointestinal symptoms - headache - nausea - polyuria - rectal bleeding - vomiting
- Uncommon Anorexia - fever - palpitation - tremor

SID-EFFECTS, FURTHER INFORMATION Side-effects generally occur at the start of treatment and are usually transient.

CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during treatment.

PREGNANCY

BREAST FEEDING Manufacturer advises avoid.

HEPATIC IMPAIRMENT In severe impairment, initially 1 mg once daily, increased if necessary to 2 mg once daily.

RENAL IMPAIRMENT Max. 1 mg daily if eGFR less than 30 ml/minute/1.73 m².

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211
  Prucalopride is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.
  Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient’s previous courses of laxative treatments.

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium (SMC) has advised (November 2010) that prucalopride (Resolor®) is not recommended for use within NHS Scotland because weaknesses in the clinical data prevent assessment of its efficacy in the target population.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Resolor (Shire Pharmaceuticals Ltd)
  Prucalopride (as Prucalopride succinate) 1 mg Resolor 1mg tablets 28 tablet (P) £38.69 DT price = £38.69
  Prucalopride (as Prucalopride succinate) 2 mg Resolor 2mg tablets 28 tablet (P) £59.52 DT price = £59.52

Milk.

NATIONAL FUNDING/ACCESS DECISIONS

HEPATIC IMPAIRMENT
- In severe impairment, initially 1 mg once daily, increased if necessary to 2 mg once daily.
- Max. 1 mg daily if eGFR less than 30 ml/minute/1.73 m².

NATIONAL FUNDING/ACCESS DECISIONS

Co-danthrusate

INDICATIONS AND DOSE
Constipation in terminally ill patients

BY MOUTH USING CAPSULES
- Child 6–11 years: 1 capsule once daily, to be taken at night
- Child 12–17 years: 1–3 capsules once daily, to be taken at night
- Adult: 1–3 capsules once daily, to be taken at night

BY MOUTH USING ORAL SUSPENSION
- Child 6–11 years: 5 mL once daily, to be taken at night
- Child 12–17 years: 5–15 mL once daily, to be taken at night
- Adult: 5–15 mL once daily, to be taken at night

Dose equivalence and conversion
Co-danthrusate suspension contains dantron 50 mg and docusate 60 mg per 5 mL.
Co-danthrusate capsules contain dantron 50 mg and docusate 60 mg per capsule.

CONTRA-INDICATIONS
Acute abdominal conditions (in children) - acute inflammatory bowel disease - acute surgical abdominal conditions (in adults) - intestinal obstruction - severe dehydration

CAUTIONS
- Rodent studies indicate potential carcinogenic risk - excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - may cause local irritation

CAUTIONS, FURTHER INFORMATION
Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).

SIDE-EFFECTS
Abdominal cramp - urine may be coloured red

PREGNANCY
- Manufacturers advise avoid—limited information available.

BREAST FEEDING
- Manufacturer’s advise avoid—no information available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
- CAUTIONARY AND ADVISORY LABELS 14
  - CO-DANTHRUSATE (Non-proprietary)
    - Dantron 50 mg, Docusate sodium 60 mg - Co-danthrusate 50mg/60mg capsules 63 capsule (P) £42.50 DT price = £42.50
    - Normax (Galen Ltd)
      - Dantron 50 mg, Docusate sodium 60 mg - Normax capsules 63 capsule (P) £42.50 DT price = £42.50
  - Oral suspension
    - CAUTIONARY AND ADVISORY LABELS 14
      - Normax (Focus Pharmaceuticals Ltd)
        - Dantron 10 mg per 1 mL, Docusate sodium 12 mg per 1 mL Normax oral suspension (sugar-free) 200 mL (P) £89.92 DT price = £89.92

Arachis oil

INDICATIONS AND DOSE
To soften impacted faeces

BY RECTUM
- Adult: 130 mL as required

CAUTIONS
- Hypersensitivity to soya - intestinal obstruction

ALLERGY AND CROSS-SENSITIVITY
- Contraindicated if history of hypersensitivity to arachis oil or peanuts.

DIRECTIONS FOR ADMINISTRATION
- Warm enema in warm water before use.
**52 Constipation and bowel cleansing**

**Gastro-intestinal system**

**INDICATIONS AND DOSE**

**Docusate sodium**

*(Dioctyl sodium sulphosuccinate)*

**Chronic constipation**

**BY MOUTH**

- Child 6 months–1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
- Child 2–11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
- Child 12–17 years: Up to 500 mg daily in divided doses, adjusted according to response
- Adult: Up to 500 mg daily in divided doses, adjusted according to response

**WITH RECTUM**

- Adult: 120 mg for 1 dose

**Adjunct in abdominal radiological procedures**

**BY MOUTH**

- Adult: 400 mg, to be administered with barium meal

**BY RECTUM**

- Adult: 120 mg for 1 dose

**PHARMACOKINETICS**

Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

**SIDE-EFFECTS**

- Abdominal cramp
- Diarrhoea (excessive use) - hypokalaemia - rash
- **PREGNANCY** Not known to be harmful — manufacturer advises caution.

**CAUTIONS**

- Do not give with liquid paraffin
- Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - rectal preparations not indicated if haemorrhoids or anal fissure

**CONTRA-INDICATIONS**

- Acute abdominal conditions (in children)
- Acute inflammatory bowel disease
- Acute surgical abdominal conditions (in adults)
- Intestinal obstruction
- Severe dehydration

**GENERAL SIDE-EFFECTS**

- Abdominal cramp - colitis - nausea - vomiting

**SPECIFIC SIDE-EFFECTS**

- Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - risk of electrolyte imbalance with prolonged use (in children)

**MEDI-CAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Dicoaryl (UCB Pharma Ltd)
  - Docusate sodium 100 mg: Dicoaryl 100 mg capsules | 30 capsule | £2.09 DT price = £2.09 | 100 capsule | £6.98

**Oral solution**

- Docusol (Tyzharm Ltd)
  - Docusate sodium 2.5 mg per 1 ml: Docusol Paediatric 12.5 mg/5 ml oral solution (sugar-free) | 30 ml | £5.29 DT price = £5.29

**Enema**

- Norgalax (Norgine Pharmaceuticals Ltd)
  - Docusate sodium 12 mg per 1 gram: Norgalax 120 mg/10 g enema | 6 enema | £3.97

**STIMULANT LAXATIVES**

**Bisacodyl**

**INDICATIONS AND DOSE**

**Constipation**

**BY MOUTH**

- Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
- Adult: 5–10 mg once daily; increased if necessary up to 20 mg once daily, dose to be taken at night

**BY RECTUM**

- Adult: 10 mg once daily, dose to be taken in the morning

**Bowel clearance before radiological procedures and surgery**

**INITIALLY BY MOUTH**

- Adult: 10 mg twice daily, dose to be taken in the morning and evening on the day before procedure and (by rectum) 10 mg to be administered 1–2 hours before procedure the following day

**PHARMACOKINETICS**

Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

**CONTRA-INDICATIONS**

- Acute abdominal conditions (in children)
- Acute inflammatory bowel disease
- Acute surgical abdominal conditions (in adults)
- Intestinal obstruction
- Severe dehydration

**CAUTIONS**

- Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia
- Risk of electrolyte imbalance with prolonged use (in children)

**MEDI-CAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, enema, suppository

**Gastro-resistant tablet**

### Senna

### INDICATIONS AND DOSE

#### Constipation

- **By mouth using tablets:**
  - Child 6-17 years: 1–4 tablets once daily, adjusted according to response
  - Adult: 2–4 tablets daily, dose usually taken at night; initial dose should be low then gradually increased

- **By mouth using syrup:**
  - Child 1 month–3 years: 2.5–10 mL once daily, adjusted according to response
  - Child 4-17 years: 2.5–20 mL once daily, adjusted according to response
  - Adult: 10–20 mL once daily, dose usually taken at bedtime

#### Pharmacokinetics

- Onset of action 8–12 hours.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- **CO-DANTHRAMER (Non-proprietary)**
  - Dantron 25 mg, Poloxamer 188 200 mg
  - 25mg/200mg capsules | 60 capsules (BDP) | £12.86 DT price = £12.86
  - Dantron 37.5 mg, Poloxamer 188 500 mg
  - 37.5mg/500mg capsules | 60 capsules (BDP) | £15.55 DT price = £15.55

#### Oral suspension

- **CO-DANTHRAMER (Non-proprietary)**
  - Dantron 5 mg per 1 mL, Poloxamer 188 40 mg per 1 mL
  - 25mg/200mg/5ml oral suspension sugar free (sugar-free) | 300 mL (BDP) | £134.99
  - Dantron 15 mg per 1 mL, Poloxamer 188 200 mg per 1 mL
  - 75mg/1000mg/5ml oral suspension sugar free (sugar-free) | 300 mL (BDP) | £274.73

### Precautions

- **Contra-indications**
  - Acute abdominal conditions (in children) - acute inflammatory bowel disease - acute surgical abdominal conditions (in adults) - intestinal obstruction - severe dehydration

- **Caution**
  - Rodent studies indicate potential carcinogenic risk - excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - may cause local irritation

- **CAUTIONS**
  - Local irritation
    - Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies — risk of irritation and excoriation).

- **Side-effects**
  - Abdominal cramp - urine may be coloured red

- **Pregnancy**
  - Manufacturers advise avoid — limited information available.

- **Breastfeeding**
  - Manufacturer’s advise avoid — no information available.

### Unlicensed Use

- Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.

- **Contra-indications**
  - Intestinal obstruction

- **Caution**
  - Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia

- **Side-effects**
  - Abdominal cramp

- **Pregnancy**
  - May be suitable for constipation in pregnancy if a stimulant effect is necessary.

- **Breastfeeding**
  - Not known to be harmful.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Senokot® brand.

EXCIPIENTS: May contain Sucrose

25

Granules

Contains 0.5 mg of Loperamide hydrochloride

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Sucrose

25

Ispaghula husk with senna

The properties listed below are those particular to the combination only. For the properties of the components please consider, ispaghula husk p. 45, senna p. 53.

INDICATIONS AND DOSE

Constipation

BY MOUTH

Child 12–17 years: 5–10 mL once daily, to be taken at night, 5 mL equivalent to one level teaspoonful of granules

Adult: 5–10 mL once daily, to be taken at night, 5 mL equivalent to one level teaspoonful of granules

DIRECTIONS FOR ADMINISTRATION

Take at night with at least 150 mL water, fruit juice, milk or warm drink.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer ispaghula with senna granules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Sucrose

25

Ispaghula 542 mg per 1 gram, Senna fruit 124 mg per 1 gram

Medicines for Children leaflet: Sodium picosulfate for constipation www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation

Sodium picosulfate

(Sodium picosulphate)

INDICATIONS AND DOSE

Constipation

BY MOUTH

Child 1 month–3 years: 2.5–10 mg once daily, adjusted according to response

Child 4–17 years: 2.5–20 mg once daily, adjusted according to response

Adult: 5–10 mg once daily, dose to be taken at night

PHARMACOKINETICS

Onset of action 6–12 hours.

UNLICENSED USE

▶ In children Sodium picosulfate elixir, licensed for use in children (age range not specified by manufacturer).

▶ In adults Sodium picosulfate doses in BNF may differ from those in product literature.

CONTRA-INDICATIONS

Avoid in intestinal obstruction – severe dehydration

CAUTIONS

Active inflammatory bowel disease (avoid if fulminant) – excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia

SIDE-EFFECTS

Abdominal cramp – nausea – vomiting

Medicines for Children leaflet: Sodium picosulfate for constipation www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

▶ SODIUM PICOSULFATE (Non-proprietary)

Sodium picosulfate 1 mg per 1 ml

Oral solution sugar free (sugar-free) | 500 mL [P] £2.99 DT price = £2.99

Dulco-Lax (sodium picosulfate) (Boehringer Ingelheim Self-Medication Division)

Sodium picosulfate 1 mg per 1 ml

Dulcolax Pico 5mg/5ml liquid (sugar-free) | 30 ml [G] £1.72 (sugar-free) | 100 ml [P] £1.85 (sugar-free) | 300 ml [P] £4.40 DT price = £6.75

3 Diarrhoea

Acute diarrhoea

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. Oral rehydration preparations are used in the prevention or reversal of fluid and electrolyte depletion. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

Antimotility drugs

Antimotility drugs relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are not recommended for acute diarrhoea in young children.

Antimotility drugs prolong the duration of intestinal transit by binding to opioid receptors in the gastrointestinal tract. Loperamide hydrochloride p. 56 does not cross the blood-brain barrier readily. Antimotility drugs have a role in the management of uncomplicated acute diarrhoea in adults but not in young children. However, in severe cases, fluid and electrolyte replacement are of primary importance.

Antimotility drugs have a role in Inflammatory bowel disease p. 32 and in Stoma care p. 83.

Loperamide hydrochloride p. 56 can be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

Antispasmodics

Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

Antibacterial drugs

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment.
Ciprofloxacin p. 490 is occasionally used for prophylaxis against travellers’ diarrhoea, but routine use is not recommended. Lactobacillus preparations have not been shown to be effective.

**Adsorbsents and bulk-forming drugs**

Adsorbsents such as kaolin p. 57 are not recommended for acute diarrhoeas. Bulk-forming drugs, such as ispaghula husk p. 45, methylcellulose p. 45, and sterculia p. 46 are useful in controlling diarrhoea associated with diverticular disease.

Colestyramine p. 173 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

**Enkephalinase inhibitors**

Racemadotril p. 57 is a pro-drug of thiorphan. Thiorphan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racemadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racemadotril does not affect the duration of intestinal transit.

### Drugs used for Diarrhoea not listed below; Codeine phosphate, p. 360 - Co-phenotrope, p. 173 - Morphine, p. 367

#### Antimotility Drugs

**Co-phenotrope**

**INDICATIONS AND DOSE**

**Adjunct to rehydration in acute diarrhoea**

**BYPYOUTH**

- Adult: 10 mL every 6 hours, dose to be given in water

**CONTRA-INDICATIONS**

Acute abdomen - delayed gastric emptying - heart failure secondary to chronic lung disease - phaeochromocytoma

**CAUTIONS**

Cardiac arrhythmias - pancreatitis - severe cor pulmonale

**SIDE-EFFECTS**

**REFERENCES**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Kaolin and Morphine Mixture, BP consists of light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.

**LESS SUITABLE FOR PRESCRIBING**

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension) is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Loperamide hydrochloride

**INDICATIONS AND DOSE**

**Symptomatic treatment of acute diarrhoea**

**BY MOUTH**

- **Child 4–7 years**: 1 mg 3–4 times a day for up to 3 days only
- **Child 8–11 years**: 2 mg 4 times a day for up to 5 days
- **Child 12–17 years**: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day
- **Adult**: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

**Chronic diarrhoea**

**BY MOUTH**

- **Adult**: Initially 4–8 mg daily in divided doses, adjusted according to response; maintenance up to 16 mg daily in 2 divided doses

**Faecal incontinence**

**BY MOUTH**

- **Adult**: Initially 500 micrograms daily, adjusted according to response, maximum daily dose to be given in divided doses; maximum 16 mg per day

**Pain of bowel colic in palliative care**

**BY MOUTH**

- **Adult**: 2–4 mg 4 times a day

**UNLICENSED USE** Capsules not licensed for use in children under 8 years. Syrup not licensed for use in children under 4 years.

**CONTRA-INDICATIONS** Active ulcerative colitis - antibiotic-associated colitis - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided

**CAUTIONS** Not recommended for children under 12 years

**INTERACTIONS** → Appendix 1 (loperamide).

**SIDE-EFFECTS**

- **Common or very common** Dizziness - flatulence - headache - nausea
- **Uncommon** Abdominal pain - drowsiness - dry mouth - dyspepsia - rash - vomiting
- **Rare** Fatigue - hypotension - paralytic ileus - Stevens-Johnson syndrome - toxic epidermal necrolysis - urinary retention

**PREGNANCY** Manufacturers advise avoid—no information available.

**BREAST FEEDING** Amount probably too small to be harmful.

**HEPATIC IMPAIRMENT** Risk of accumulation—manufacturer advises caution.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Loperamide for diarrhoea [www.medicinesforchildren.org.uk/loperamide-for-diarrhoea](http://www.medicinesforchildren.org.uk/loperamide-for-diarrhoea)

**EXCEPTIONS TO LEGAL CATEGORY** Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults over 18 years of age.

Loperamide hydrochloride can be sold to the public, for use in adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **LOPERAMIDE HYDROCHLORIDE (Non-proprietary)**
  - Loperamide hydrochloride 2 mg Loperamide 2mg tablets | 30 tablet £1.15 DT price + £2.15

**Orodispersible tablet**

- **Imodium (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg Imodium Instant Melts 2mg orodispersible tablets (sugar-free) | 12 tablet £3.75 (sugar-free) | 18 tablet £5.02

**Capsule**

- **LOPERAMIDE HYDROCHLORIDE (Non-proprietary)**
  - Loperamide hydrochloride 2 mg Loperamide 2mg capsules | 6 capsule £3.15 | 10 capsule £4.76 | 12 capsule £1.94 | 30 capsule £3.19 DT price + £3.19
  - **Imodium (McNeil Products Ltd)**
    - Loperamide hydrochloride 2 mg Imodium IBS Relief 2mg capsules | 6 capsule £2.23 | 12 capsule £3.79
    - Imodium 2mg Soft capsules | 12 capsule £3.79
    - Imodium Classic 2mg capsules | 12 capsule £3.31 | 18 capsule £4.13

**Oral solution**

- **Imodium (Janssen-Cilag Ltd)**
  - Loperamide hydrochloride 200 microgram per 1 ml Imodium 1mg/5ml oral solution (sugar-free) | 100 ml DT price + £1.17

**Oral lyophilisate**

- **Imodium (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg Imodium Instants 2mg oral lyophilisates (sugar-free) | 6 tablet £2.45 (sugar-free) | 12 tablet £3.76

Loperamide with simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, loperamide hydrochloride above, simeticone p. 60.

**INDICATIONS AND DOSE**

**Acute diarrhoea with abdominal colic**

**INITIALLY BY MOUTH**

- **Child 12–17 years**: Initially 1 tablet, then (by mouth) 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day
- **Adult**: Initially 2 tablets, then (by mouth) 1 tablet, after each loose stool, (by mouth) for up to 2 days; maximum 4 tablets per day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Imodium Plus (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg, Dimeticone (as Simeticone) 125 mg Imodium Plus caplets | 12 tablet £3.66
ENKEPHALINASE INHIBITORS

Raconovidril

INDICATIONS AND DOSE
Adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea

BY MOUTH
- Child 3 months–7 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–7 years (body-weight 9–13 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–7 years (body-weight 13–27 kg): 30 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–7 years (body-weight 28 kg and above): 60 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Adult: Initially 100 mg, then 100 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days, dose to be taken preferably before food

SIDE-EFFECTS
- Common or very common Headache
- Common Rash
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT
  - In adults Manufacturer advises caution.
  - In children Manufacturer advises avoid.
- RENAL IMPAIRMENT
  - In adults Manufacturer advises caution.
  - In children Manufacturer advises avoid.
- DIRECTIONS FOR ADMINISTRATION Granules may be added to food or mixed with water or bottle feeds and then taken immediately.

PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer racecadotril granules.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
- *Hidrasec* (Lincoln Medical Ltd)
  - Racecadotril 100 mg Hidrasec 100mg capsules | 20 capsule (£4.82

Granules EXCIPIENTS: May contain Sucrose
- *Hidrasec* (Lincoln Medical Ltd)
  - Racecadotril 10 mg Hidrasec Infants 10mg granules sachets | 20 sachet (£4.82
  - Racecadotril 30 mg Hidrasec Children 30mg granules sachets | 20 sachet (£4.82

INTESTINAL ADSORBENTS

Kaolin

INDICATIONS AND DOSE
Diarrhoea (not recommended for acute diarrhoea)

BY MOUTH
- Adult: 10–20 mL every 4 hours

INTERACTIONS → Appendix 1 (kaolin).

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include peppermint. When prepared extemporaneously, the BP states Kaolin Mixture, BP consists of light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.

LESS SUITABLE FOR PRESCRIBING Kaolin Mixture BP is less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
- **KAOLIN (Non-proprietary)**
  - Kaolin light 200 mg per 1 ml, Magnesium carbonate light 50 mg per 1 ml, Sodium bicarbonate 50 mg per 1 ml Kaolin mixture | 200 ml (£0.86 DT price = £0.86
  - Kaolin light 200 mg per 1 gram Kaolin mixture paediatric BP 1980 | 100 ml (£0.78 DT price = £0.78

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

Dyspepsia

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for *Helicobacter pylori* and given eradication therapy if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the ‘test and treat’ strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.

If *H. pylori* is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. If symptoms persist, treatment with
either a proton pump inhibitor or a histamine H$_2$-receptor antagonist can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from H. pylori eradication therapy or antisecretory drugs.

### Alginate

#### INDICATIONS AND DOSE

**GAVISCON INFANT® POWDER SACHETS**

Management of gastro-oesophageal reflux disease

**BY MOUTH**
- Child 1 month–2 years (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day
- Child 1 month–2 years (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day

#### PRESCRIBING AND DISPENSING INFORMATION

Each half of a dual-sachet is identified as ‘one dose’. To avoid errors prescribe with directions in terms of ‘dose’.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Powder**
- Gaviscon Infant (Forum Health Products Ltd)
  - Magnesium alginate 87.5 mg, Sodium alginate 225 mg Gaviscon Infant oral powder sachets (sugar-free) | 15 dual dose sachet £3.99

### Calcium carbonate with sodium alginate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginate acid above.

#### INDICATIONS AND DOSE

**Mild symptoms of gastro-oesophageal reflux disease**

**BY MOUTH**
- Child 6–11 years: 5–10 mL, to be taken after meals and at bedtime
- Child 12–17 years: 10–20 mL, to be taken after meals and at bedtime
- Adult: 10–20 mL, to be taken after meals and at bedtime

#### PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include aniseed or peppermint.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- **ELECTROLYTES:** May contain Sodium
  - Calcium carbonate 16 mg per 1 mL, Sodium alginate 50 mg per 1 mL
  - Sodium bicarbonate 26.7 mg per 1 mL
- **Flavours of**
  - Alginic acid
  - Potassium bicarbonate
  - Sodium alginate

#### POTASSIUM BICARBONATE WITH SODIUM ALGINATE (Non-proprietary)

- Calcium carbonate 16 mg per 1 mL, Sodium alginate 50 mg per 1 mL
- Alginic acid above.

#### PRESCRIBING AND DISPENSING INFORMATION

- Flavours of oral liquid formulations may include aniseed or peppermint.

### Potassium bicarbonate with sodium alginate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginate acid above.

#### INDICATIONS AND DOSE

Management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease

**BY MOUTH USING CHEWABLE TABLETS**
- **Child 6–11 years (under medical advice only):** 1 tablet, to be chewed after meals and at bedtime
- **Child 12–17 years: 1–2 tablets, to be chewed after meals and at bedtime**
- **Adult:** 1–2 tablets, to be chewed after meals and at bedtime

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Chewable tablet**
- **EXCIPIENTS:** May contain Aspartame
- **ELECTROLYTES:** May contain Potassium, sodium
  - **POTASSIUM BICARBONATE WITH SODIUM ALGINATE (Non-proprietary)**
    - Potassium bicarbonate 100 mg, Sodium alginate 500 mg / Potassium bicarbonate 100 mg chewable tablets sugar free (sugar-free) | 60 tablet | no price available
    - Brands may include Gaviscon Advance

#### Oral suspension

**ELECTROLYTES:** May contain Potassium, sodium
- **GAVISCON ADVANCE (Reckitt Benckiser Healthcare (UK) Ltd)**
  - Potassium bicarbonate 20 mg per 1 mL, Sodium alginate 100 mg per 1 mL
  - Gaviscon Advance oral suspension aniseed (sugar-free) | 30 mL [£5.82 (sugar-free)]
  - Gaviscon Advance oral suspension peppermint (sugar-free) | 30 mL [£5.82 (sugar-free)]
Calcium-containing antacids can induce rebound acid syndrome. The evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium– aluminium antacids promote ulcer healing, but less well than secretory drugs; proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and magnesium-containing antacids (e.g. aluminium hydroxide p. 859, and magnesium carbonate p. 60, hydroxide and magnesium trisilicate p. 61), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal. Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage. Sodium bicarbonate p. 848 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating. Calcium-containing antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

Simeticone Simeticone p. 60 (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

Alginates Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux. The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, magnesium hydroxide p. 46.
Magnesium carbonate

**INDICATIONS AND DOSE**

**Dyspepsia**
- **BY MOUTH USING ORAL SUSPENSION**
  - Adult: 10 mL 3 times a day, to be taken in water

**CONTRA-INDICATIONS**
- Hypophosphataemia

**INTERACTIONS**
- Avoid with antacids, as other drugs since they may impair absorption.
Antacids should preferably not be taken at the same time as aluminium-containing antacids should not be taken with children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**SIDE-EFFECTS**
- Belching due to liberated carbon dioxide
- Diarrhoea

**HEPATIC IMPAIRMENT**
- In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

**RENAL IMPAIRMENT**
- Avoid or use at a reduced dose; increased risk of toxicity. Magnesium carbonate mixture has a high sodium content; avoid in patients with fluid retention.

**PRESCRIBING AND DISPENSING INFORMATION**
- **Altacite Plus®** is low in Na⁺.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Oral suspension**
  - Altacite Plus (Peckforton Pharmaceuticals Ltd)
    - Hydrolatec 100 mg per 1 mL, Simeticone 25 mg per 1 mL Altacite Plus oral suspension (sugar-free) | 100 mL (£1.42) (sugar-free) | 500 mL (£3.20)
  - Infacol® oral suspension (sugar-free) (Sanofi) 40 mg per 1 mL oral suspension
  - Dentinox Infant colic drops (Dendron Ltd) 8.4 mg per 1 mL

---

**DEFOAMING DRUGS**

**Simeticone (Activated dimeticone)**
- **DRUG ACTION**
  - Simeticone (activated dimeticone) is an antifoaming agent.

**INDICATIONS AND DOSE**

**INFACOL®**
- Colic | Wind pains
- **BY MOUTH**
  - Child 1 month-1 year: 0.5–1 mL, to be taken before feeds
  - DENTINOX®
  - Colic | Wind pains
  - **BY MOUTH**
  - Child 1 month-1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day

**PATIENT AND CARER ADVICE**
- Infacol®
  - Patients or carers should be given advice on use of the Infacol® dropper.

**LESS SUITABLE FOR PRESCRIBING**
- Infacol®
  - Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).
  - DENTINOX®
  - Dentinox® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

**Aluminium hydroxide with magnesium hydroxide and simeticone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, simeticone above.

**INDICATIONS AND DOSE**

**Dyspepsia**
- **BY MOUTH**
  - Child 12-17 years: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required
  - Adult: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

**PRESCRIBING AND DISPENSING INFORMATION**
- **Maalox®** is low Na⁺.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Maalox Plus® (Sanofi)
      - Aluminium hydroxide gel dried 44 mg per 1 mL, Magnesium hydroxide 39 mg per 1 mL, Simeticone 5 mg per 1 mL Maalox Plus oral suspension (sugar-free) | 500 mL (£3.90)

---

**Magnesium Carbonate Mixture, BP**
- Magnesium carbonate, calcium carbonate, sodium bicarbonate, simeticone, hydroxide and simeticone.
- **HEPATIC IMPAIRMENT**
  - Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT**
- Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
  - In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
  - In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**PRESCRIBING AND DISPENSING INFORMATION**
- Altacite Plus®
- Altacite
  - Magnesium Carbonate Mixture, BP consists of light Magnesium carbonate heavy (Ennogen Healthcare Ltd) 500 mg
  - Magnesite (Ennogen Healthcare Ltd)
    - Magnesium carbonate heavy 500 mg
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
    - **Capsule**
      - Magnesite
      - Magnesium carbonate heavy 500 mg
      - Magnesite 500 mg capsules | 30 capsule £92.20
  - Also available in combination with calcium acetate, p. 61.
  - magnesium trisilicate and sodium bicarbonate, p. 61

---
Magnesium trisilicate

**INDICATIONS AND DOSE**

**Dyspepsia**

- **BY MOUTH USING CHEWABLE TABLETS**
  - Adult: 1–2 tablets as required

- **CONTRA-INDICATIONS**
  - Hypophosphataemia

- **INTERACTIONS**
  - Appendix 1 (antacids).
  - Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

- **SIDE-EFFECTS**
  - Belching due to liberated carbon dioxide - diarrhoea - silica-based renal stones (with long-term treatment)

- **HEPATIC IMPAIRMENT**
  - Avoid in hepatic coma; risk of renal failure.

- **RENAL IMPAIRMENT**
  - Avoid or used at a reduced dose (increased risk of toxicity).

- **MEDICINAL FORMS**
  - Medicines not identified.

Magnesium carbonate with magnesium trisilicate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, magnesium carbonate p. 60, magnesium trisilicate above, sodium bicarbonate p. 848.

**INDICATIONS AND DOSE**

**Dyspepsia**

- **Child 5-11 years**: 5–10 mL 3 times a day or as required, dose to be made up with water
- **Child 12-17 years**: 10–20 mL 3 times a day or as required, dose to be made up with water
- **Adult**: 10–20 mL 3 times a day or as required, dose to be made up with water

- **HEPATIC IMPAIRMENT**
  - In patients with fluid retention avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

- **RENAL IMPAIRMENT**
  - Magnesium trisilicate mixture has a high sodium content; avoid in patients with fluid retention.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Oral suspension**
    - **MAGNESIUM CARBONATE WITH MAGNESIUM TRISILICATE AND SODIUM BICARBONATE (Non-proprietary)**
      - Magnesium carbonate light 50 mg per 1 mL, Magnesium trisilicate 50 mg per 1 mL, Sodium bicarbonate 50 mg per 1 mL
      - Magnesium trisilicate oral suspension | 200 mL £1.28 DT price = £2.28

4.2 **Gastric and duodenal ulceration**

**Pepitic ulceration**

Pepitic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

**Helicobacter pylori infection**

Eradication of Helicobacter pylori reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The presence of H. pylori should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 470, and either amoxicillin p. 482 or metronidazole p. 475 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin and metronidazole is preferred for initial therapy. These regimens eradicate H. pylori in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are more common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of H. pylori eradication and are not recommended.

Tinidazole p. 476 is also used occasionally for H. pylori eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated H. pylori associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate p. 63, plus tetracycline p. 498, plus metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under NSAID-associated ulcers for the role of H. pylori eradication therapy in patients starting or taking a NSAID. Also see Dyspepsia p. 57 for H. pylori eradication in patients with dyspepsia.
Recommended regimens for *Helicobacter pylori* eradication

**Test for *Helicobacter pylori***

¹³C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹⁴Curea breath test kit for children is available (*Helicobacter Test INFAI for children of the age 3–11*). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

**NSAID-associated ulcers**

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastrointestinal side-effects, or those with serious co-morbidity (e.g. cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H₂-receptor antagonist such as ranitidine p. 65 given at twice the usual dose or misoprostol p. 710 are alternatives. Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H₂-receptor antagonist or misoprostol p. 710. On healing, patients should be tested for *H. pylori* and given eradication therapy if *H. pylori* is present (see also Test for *Helicobacter pylori*).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

**GASTROPROTECTIVE COMPLEXES AND CHELATORS**

**Chelates and complexes**

Tripotassium dicitratobismuthate p. 63 is a bismuth chelate effective in healing gastric and duodenal ulcers. See under Peptic ulceration p. 61 for the role of tripotassium dicitratobismuthate p. 63 in a *Helicobacter pylori* eradication regimen for those who have not responded to first-line regimens.

The bismuth content of tripotassium dicitratobismuthate p. 63 is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate p. 63 may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.
Sucralfate

**INDICATIONS AND DOSE**

**Benign gastric ulceration | Benign duodenal ulceration**

**BY MOUTH**

- Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Chronic gastritis**

**BY MOUTH**

- Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Prophylaxis of stress ulceration in child under intensive care**

**BY MOUTH**

- Child 15-17 years: 1 g 6 times a day; maximum 8 g per day

**Prophylaxis of stress ulceration**

**BY MOUTH**

- Adult: 1 g 6 times a day; maximum 8 g per day

**UNLICENSED USE**

**CAUTIONS**

Patients under intensive care (Important: reports of bezoar formation)

**CAUTIONS, FURTHER INFORMATION**

**Bezoar formation** Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.

**INTERACTIONS** → Appendix 1 (sucralfate).

**SIDE-EFFECTS**

- Common or very common Constipation
- Uncommon Back pain, bezoar formation, diarrhoea, dizziness, dry mouth, earache, flatulence, gastric discomfort, indigestion, nausea, rash
- Pregnancy No evidence of harm; absorption from gastro-intestinal tract negligible.

**BREAST FEEDING** Amount probably too small to be harmful.

**RENAL IMPAIRMENT** Use with caution; aluminium is absorbed and may accumulate.

**DIRECTIONS FOR ADMINISTRATION** Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by mouth, sucralfate should be given 1 hour before meals. Oral suspension blocks fine-bore feeding tubes. Crushed tablets may be dispersed in water.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed and caramel.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, cream, powder, enema

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Antepsin** (Chugai Pharma UK Ltd)
  - Sucralfate 1 gram Antepsin 1g tablets | 50 tablet [PO] £6.36 DT price = £6.36
  - Sucralfate 200 mg per 1 ml Antepsin 1g/5ml oral suspension (sugar-free) | 250 ml [PO] £6.36 DT price = £6.36

**Tripotassium dicitratobismuthate**

**INDICATIONS AND DOSE**

**Eradication failure of Helicobacter pylori infection (in combination with omeprazole, tetracycline and metronidazole)**

**BY MOUTH**

- Adult: 120 mg 4 times a day for 2 weeks

**Benign gastric and duodenal ulceration**

**BY MOUTH**

- Adult: 240 mg twice daily, alternatively 120 mg 4 times a day both dosage regimens taken for 28 days followed by a further 28 days if necessary, maintenance dose not indicated but course may be repeated after interval of 1 month

**INTERACTIONS** → Appendix 1 (tripotassium dicitratobismuthate).

**SIDE-EFFECTS**

- Common or very common May blacken faeces—may darken tongue
- Uncommon Constipation, diarrhoea, nausea, pruritus, rash, vomiting

**PREGNANCY** Manufacturer advises avoid on theoretical grounds.

**BREAST FEEDING** No information available.

**RENAL IMPAIRMENT** Avoid in severe impairment.

**DIRECTIONS FOR ADMINISTRATION** To be swallowed with half a glass of water. Twice-daily dosage to be taken 30 minutes before breakfast and main evening meal. Four-times-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal.

**PATIENT AND CARER ADVICE** Milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal. Antacids, fruit, or fruit juice should not be taken half an hour before or after a dose. Patients and carers should be aware that the patient may develop darkened tongue and blackened faeces.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**ELECTROLYTES:** May contain Potassium

- **De-Noltab** (Astellas Pharma Ltd)
  - Tripotassium dicitratobismuthate 120 mg De-Noltab 120mg tablets | 112 tablet [P] £5.09
### H₂-RECEPTOR ANTAGONISTS

**H₂-receptor antagonists**

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease. H₂-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens. In adults, H₂-receptor antagonists are used for the treatment of *functional dyspepsia* and may be used for the treatment of *uninvestigated dyspepsia* without alarm features.

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from *gastroduodenal erosions in hepatic coma*, and possibly in other conditions requiring intensive care. H₂-receptor antagonists also reduce the risk of *acid aspiration* in obstetric patients at delivery (Mendelson’s syndrome).

#### CAUTIONS

**Side-effects, further information**

- **Signs and symptoms of gastric cancer**
- **Caution:** Signs and symptoms of gastric cancer

- **Common or very common** Diarrhoea · dizziness · headache
- **Uncommon** Erythema multiforme · rash · toxic epidermal necrolysis
- **Rare** Arthralgia · blood disorders · bradycardia · cholestatic jaundice · confusion · depression · hallucinations · hepatitis · leucopenia · myalgia · pancytopenia · psychiatric reactions · thrombocytopenia
- **Frequency not known** Gynaecomastia · impotence

#### Side-effects, further information

- **Psychiatric reactions** Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the elderly or the very ill.

---

### Cimetidine

**Indications and dose**

- **Benign duodenal ulceration**
  - Adult: 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg twice daily, to be taken in the morning and at night

- **Benign gastric ulceration**
  - Adult: 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning at and night

- **NSAID-associated ulceration**
  - Adult: 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

- **Reflex oesophagitis**
  - Adult: 400 mg 4 times a day for 4–8 weeks

- **Prophylaxis of stress ulceration**
  - Adult: 200–400 mg every 4–6 hours

- **Gastric acid reduction in obstetrics**
  - Adult: Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

- **Gastric acid reduction during surgical procedures**
  - Adult: 400 mg, to be given 90–120 minutes before induction of general anaesthesia

- **Short-bowel syndrome**
  - Adult: 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

- **To reduce degradation of pancreatic enzyme supplements**
  - Adult: 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1½ hours before meals

#### Interactions

- **Appendix 1 (histamine H₂-antagonists).**

#### Side-effects

- **Common or very common** Malaise
- **Uncommon** Tachycardia
- **Rare** Interstitial nephritis
- **Very rare** alopecia · galactorrhoea · pancreatitis · vasculitis
- **Pregnancy** Manufacturer advises avoid unless essential.
- **Breastfeeding** Significant amount present in milk—not known to be harmful but manufacturer advises avoid.
- **Hepatic Impairment** Reduce dose. Increased risk of confusion.
- **Renal Impairment** Occasional risk of confusion. Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m²

#### Exceptions to legal category

Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

#### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Famotidine

**INDICATIONS AND DOSE**
Treatment of benign gastric and duodenal ulceration

**BY MOUTH**
- Adult: 40 mg once daily for 4–8 weeks, dose to be taken at night

**Maintenance treatment of duodenal ulceration**

**BY MOUTH**
- Adult: 20 mg once daily, dose to be taken at night

**Reflux oesophagitis**

**BY MOUTH**
- Adult: 20–40 mg twice daily for 6–12 weeks; maintenance 20 mg twice daily

**INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).

**SIDE-EFFECTS**
- Common or very common Constipation
- Uncommon Fatigue, vomiting, anorexia, dry mouth, flatulence, nausea, taste disorders
- Very rare Chest tightness, interstitial pneumonia, paraesthesia, seizures

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Present in milk—not known to be harmful but manufacturer advises avoid.

**RENAL IMPAIRMENT** Use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 ml/minute/1.73 m². Seizures reported very rarely.

**EXCEPTIONS TO LEGAL CATEGORY** Famotidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**
- **NIZATIDINE (Non-proprietary)**
  - Nizatidine 150 mg Nizatidine 150 mg capsules | 30 capsule £12.20 DT price = £5.40
  - Nizatidine 300 mg Nizatidine 300 mg capsules | 30 capsule £17.40 DT price = £5.43

Ranitidine

**INDICATIONS AND DOSE**
Benign gastric ulceration | Duodenal ulceration

**BY MOUTH**
- Child 1-5 years: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months-2 years: 2–4 mg/kg twice daily
- Child 3-11 years: 2–4 mg/kg twice daily (max. per dose 150 mg) for 4–8 weeks
- Child 12-17 years: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night
- Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

**Chronic episodic dyspepsia**

**BY MOUTH**
- Child 12-17 years: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night
- Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night

**INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).

**SIDE-EFFECTS**
- Common or very common Sweating
- Rare Fever, hyperuricaemia, nausea, vasculitis

**PREGNANCY** Manufacturer advises avoid unless essential.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Use half normal dose if eGFR 20–50 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m².

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**
- **RANITIDINE (Non-proprietary)**
  - Ranitidine 150 mg Ranitidine 150 mg capsules | 30 capsule £19.60 DT price = £5.89
  - Ranitidine 300 mg Ranitidine 300 mg capsules | 30 capsule £30.90 DT price = £5.30

Nizatidine

**INDICATIONS AND DOSE**
Benign gastric, duodenal or NSAID-associated ulceration

**BY MOUTH**
- Adult: 300 mg once daily for 4–8 weeks, dose to be taken in the evening, alternatively 150 mg twice daily for 4–8 weeks; maintenance 150 mg once daily, dose to be taken at night

**Gastro-oesophageal reflux disease**

**BY MOUTH**
- Adult: 150–300 mg twice daily for up to 12 weeks

**INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).

**SIDE-EFFECTS**
- Common or very common Sweating
- Rare Fever, hyperuricaemia, nausea, vasculitis

**PREGNANCY** Manufacturer advises avoid unless essential.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
NSAID-associated gastric ulceration

**BY MOUTH**
- Child 12-17 years: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night
- Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

**NSAID-associated duodenal ulcer**

**BY MOUTH**
- Child 12-17 years: 300 mg twice daily for 4 weeks, to achieve a higher healing rate
- Adult: 300 mg twice daily

**Gastro-oesophageal reflux disease**

**BY MOUTH**
- Child 12-17 years: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night
- Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

**Moderate to severe gastro-oesophageal reflux disease**

**BY MOUTH**
- Child 12-17 years: 600 mg daily in 2–4 divided doses for up to 12 weeks
- Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

**Long-term treatment of healed gastro-oesophageal reflux disease**

**BY MOUTH**
- Child 3-11 years: 2.5–5 mg/kg twice daily (max. per dose 300 mg)
- Child 12-17 years: 150 mg twice daily
- Adult: 150 mg twice daily

**Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics**

**BY MOUTH**
- Child 12-17 years: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours
- Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

**Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures**

**INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

**Prophylaxis of stress ulceration**

**INITIALLY BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

---

**Reflex oesophagitis and other conditions where gastric acid reduction is beneficial**

**BY MOUTH**
- Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months-2 years: 2–4 mg/kg twice daily
- Child 3-11 years: 2–4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

**Conditions where reduction of gastric acidity is beneficial and oral route not available**

**BY INTRAMUSCULAR INJECTION**
- Adult: 50 mg every 6–8 hours

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours

**UNLICENSED USE** Oral preparations not licensed for use in children under 3 years. Injection not licensed for use in children under 6 months.

- In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.

**INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).

**SIDE-EFFECTS**

- Uncommon Blurred vision
- Frequency not known Alopecia · Interstitial nephritis · involuntary movement disorders · Pancreatitis

**PREGNANCY** Manufacturer advises avoid unless essential, but not known to be harmful.

**BREAST FEEDING** Significant amount present in milk, but not known to be harmful.

**RENAL IMPAIRMENT**

- In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m²
- In children Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For slow intravenous injection dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.
- With intravenous use in adults For intravenous infusion (Zantac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Ranitidine for acid reflux [www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux](http://www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux)

In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.

**EXCEPTIONS TO LEGAL CATEGORY** Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).
Proton pump inhibitors

Proton pump inhibitors are effective short-term treatments for gastric and duodenal ulcers; they are also used in combination with antibiotics for the eradication of Helicobacter pylori (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of dyspepsia and gastro-oesophageal reflux disease.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur. A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in Zollinger–Ellison syndrome; high doses are often required.

Proton pump inhibitors

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.
- **CAUTIONS** Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) - may increase the risk of gastro-intestinal infections (including Clostridium difficile infection) - may mask the symptoms of gastric cancer - patients at risk of osteoporosis
- **SIDE-EFFECTS** Common or very common Abdominal pain - constipation - diarrhoea - flatulence - gastro-intestinal disturbances - headache - nausea - vomiting Uncommon Arthralgia - dizziness - dry mouth - fatigue - myalgia - paraesthesia - peripheral oedema - pruritus - rash - sleep disturbances Rare Alopecia - anaphylaxis - blood disorders - bronchospasm - confusion - depression - fever - gynaecomastia - hallucinations - hepatitis - hypersensitivity reactions - hypomagnesaemia (usually after 1 year of treatment, but sometimes after 5 months of treatment) - hypotension - intermittent nephritis - jaundice - leucocytosis - leucopenia - pancytopenia - photosensitivity - Stevens-Johnson syndrome - stomatitis - sweating - taste disturbance - thrombocytopenia - toxic epidermal necrolysis - visual disturbances
- **PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

**SIDE-EFFECTS, FURTHER INFORMATION** Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy. Gastric cancer Particular care is required in those presenting with ‘alarm features’, in such cases gastric malignancy should be ruled out before treatment.

**SIDE-EFFECTS, FURTHER INFORMATION** Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy. Gastro-intestinal system

With intravenous use in adults

**DIRECTIONS FOR ADMINISTRATION**

**RENAL IMPAIRMENT**

- Child 1-11 years: 10 mg once daily for 8 weeks
- Child 12-17 years: 20 mg once daily for up to 4 weeks

**HEPATIC IMPAIRMENT**

- Adult: 20 mg once daily for up to 4 weeks

**BREAST FEEDING**

- Adult: 20 mg once daily for up to 4 weeks

**PREGNANCY**

- Adult: 20 mg once daily for up to 4 weeks

**INTERACTIONS**

- Adult: 20 mg once daily for up to 4 weeks

**PATIENT AND CARER ADVICE**

- Oral use

**MEDICINAL FORMS**

- With intravenous use in children

- For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 800 micrograms/mL with Sodium Chloride 0.9%; give over 10–30 minutes.

- With oral use

- Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

- Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

- With oral use

- With intravenous use

**Gastro-resistant tablet**

- **ESOMEPRAZOLE (Non-proprietary)**

| Esomeprazole (as Esomeprazole magnesium trihydrate) | 20 mg | Esomeprazole 20 mg gastro-resistant tablets | 28 tablet | £18.50 DT price = £3.70
| Esomeprazole (as Esomeprazole magnesium trihydrate) | 40 mg | Esomeprazole 40 mg gastro-resistant tablets | 28 tablet | £25.19 DT price = £4.38

**Gastro-resistant capsule**

- **ESOMEPRAZOLE (Non-proprietary)**

| Esomeprazole (as Esomeprazole magnesium dihydrate) | 20 mg | Esomeprazole 20 mg gastro-resistant capsules | 28 capsule | £12.95 DT price = £3.40
| Esomeprazole (as Esomeprazole magnesium dihydrate) | 40 mg | Esomeprazole 40 mg gastro-resistant capsules | 28 capsule | £17.63 DT price = £3.96

**Gastro-resistant granules**

- **EMOZUL (Consilient Health Ltd)**

| Esomeprazole (as Esomeprazole magnesium dihydrate) | 20 mg | Emozul 20 mg gastro-resistant capsules | 28 capsule | £3.40 DT price = £3.40
| Esomeprazole (as Esomeprazole magnesium dihydrate) | 40 mg | Emozul 40 mg gastro-resistant capsules | 28 capsule | £3.96 DT price = £3.96

- **Nexium (AstraZeneca UK Ltd)**

| Esomeprazole (as Esomeprazole magnesium dihydrate) | 10 mg | Nexium 10 mg gastro-resistant granules sachets | 28 sachet | £25.19 DT price = £25.19
| Esomeprazole (as Esomeprazole magnesium dihydrate) | 40 mg | Nexium 40 mg solution for injection vials | 1 vial | £3.07–£3.13 (Hospital only)

- **Nexium (AstraZeneca UK Ltd)**

| Esomeprazole (as Esomeprazole sodium) | 40 mg | Nexium 40 mg powder for solution for injection vials | 1 vial | £4.25 (Hospital only)

**With intravenous use in adults**

- For intravenous infusion (Nexium®), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.

**UNLICENSED USE** Tablets and capsules not licensed for use in children 1–12 years.

**INTERACTIONS**

- Appendix 1 (proton pump inhibitors).

**PREGNANCY**

- Manufacturer advises caution—no information available.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

- In adults

  - Severe hepatic impairment max. 20 mg daily.

  - Severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours.

  - In children 1–11 years max. 10 mg daily in severe impairment. 12–18 years max. 20 mg daily in severe impairment.

**RENAL IMPAIRMENT**

- Manufacturer advises caution in severe renal insufficiency.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in adults

  - For intravenous infusion (Nexium®), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.
Lansoprazole

**INDICATIONS AND DOSE**

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

**BY MOUTH**

- Adult: 30 mg twice daily

**Benign gastric ulcer**

**BY MOUTH**

- Adult: 30 mg once daily for 8 weeks, dose to be taken in the morning

**Duodenal ulcer**

**BY MOUTH**

- Adult: 30 mg once daily for 4 weeks, dose to be taken in the morning
- Maintenance: 15 mg once daily

**NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer**

**BY MOUTH**

- Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed

**Prophylaxis of NSAID-associated duodenal ulcer | Prophylaxis of NSAID-associated gastric ulcer**

**BY MOUTH**

- Adult: 15–30 mg once daily

**Zollinger-Ellison syndrome (and other hypersecretory conditions)**

**BY MOUTH**

- Adult: Initially 60 mg once daily, adjusted according to response, daily doses of 120 mg or more given in two divided doses

**Gastro-oesophageal reflux disease**

**BY MOUTH**

- Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg once daily, doses to be taken in the morning

**Acid-related dyspepsia**

**BY MOUTH**

- Adult: 15–30 mg once daily for 2-4 weeks, doses to be taken in the morning

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

**Orodispersible tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Lansoprazole 15 mg Lansoprazole 15mg orodispersible tablets | 28 tablet (Pfizer) £3.99 DT price = £3.35
- Lansoprazole 30 mg Lansoprazole 30mg orodispersible tablets | 28 tablet (Pfizer) £6.99 DT price = £6.01
- Zoton FasTab (Pfizer Ltd) Lansoprazole 15 mg Zoton FasTab 15mg | 28 tablet (Pfizer) £2.99 DT price = £1.35
- Lansoprazole 30 mg Zoton FasTab 30mg | 28 tablet (Pfizer) £5.50 DT price = £4.80

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS**

- Lansoprazole 15 mg Lansoprazole 15mg gastro-resistant capsules | 28 capsule (Pfizer) £12.92 DT price = £11.17
- Lansoprazole 30 mg Lansoprazole 30mg gastro-resistant capsules | 28 capsule (Pfizer) £23.63 DT price = £13.52

Omeprazole

**INDICATIONS AND DOSE**

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

**BY MOUTH**

- Adult: 20 mg twice daily

**Eradication failure of Helicobacter pylori infection in combination with tripotassium dicitratobismuthate, tetracycline and metronidazole**

**BY MOUTH**

- Adult: 20 mg twice daily

**Benign gastric ulceration**

**BY MOUTH**

- Adult: 20 mg once daily for 8 weeks, increased if necessary to 40 mg once daily, in severe or recurrent cases

**Duodenal ulceration**

**BY MOUTH**

- Adult: 20 mg once daily for 4 weeks, increased if necessary to 40 mg once daily, in severe or recurrent cases

**Prevention of relapse in gastric ulcer**

**BY MOUTH**

- Adult: 20 mg once daily, increased if necessary to 40 mg once daily

**Prevention of relapse in duodenal ulcer**

**BY MOUTH**

- Adult: 20 mg once daily, dose may range between 10–40 mg daily

**NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer | NSAID-associated gastroduodenal erosions**

**BY MOUTH**

- Adult: 20 mg once daily for 4 weeks, continued for a further 4 weeks if not fully healed
Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment
Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment
Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment
Prophylaxis in patients with a history of NSAID-associated dyspeptic symptoms who require continued NSAID treatment

**DIRECTIONS FOR ADMINISTRATION**

**BREAST FEEDING**

**INTERACTIONS**

**UNLICENSED USE** Treatment of major peptic ulcer bleeding (following endoscopic treatment) is an unlicensed indication.

**INTERACTIONS** → Appendix 1 (proton pump inhibitors).

**SIDE-EFFECTS** Agitation - impotence

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT** Not more than 20 mg daily should be needed.

**DIRECTIONS FOR ADMINISTRATION** For administration by mouth, swallow whole, or disperse Losec MUPS tablets in water, or mix capsule contents or Losec MUPS tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened.

With intravenous use For intravenous infusion (Losec®), give intermittently or continuously in Glucose 5% or Sodium chloride 0.9%; reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%

**PATIENT AND CARER ADVICE**

**With oral use** Counselling on administration advised.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary
Gastro-resistant omeprazole capsules may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets.

**MEDITICAL FORMS**

Pantoprazole

INDICATIONS AND DOSE

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with clarithromycin and metronidazole

**BY MOUTH**
- Adult: 40 mg twice daily

Benign gastric ulcer

**BY MOUTH**
- Adult: 40 mg daily for 8 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

Gastric ulcer

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

Duodenal ulcer

**BY MOUTH**
- Adult: 40 mg daily for 4 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment

**BY MOUTH**
- Adult: 20 mg daily

Gastro-oesophageal reflux disease

**BY MOUTH**
- Adult: 20–80 mg daily for 4 weeks, continued for further 4 weeks if not fully healed, dose to be taken in the morning; maintenance 20 mg daily and increased to 40 mg daily, increased only if symptoms return

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

Zollinger-Ellison syndrome (and other hypersecretory conditions)

**BY MOUTH**
- Adult: Initially 80 mg daily (max. per dose 80 mg), adjusted according to response
- Elderly: 40 mg daily

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: Initially 80 mg, alternatively 160 mg in 2 divided doses, if rapid acid control required, then 80 mg once daily (max. per dose 80 mg), adjusted according to response

DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion* (*Protium®*), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid; give 40 mg over 15 minutes.

EXCEPTIONS TO LEGAL CATEGORY

Pantoprazole 20 mg tablets can be sold to the public for the short-term treatment of reflux symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Gastro-resistant tablet**

Rabeprazole sodium

INDICATIONS AND DOSE

Benign gastric ulcer

**BY MOUTH**
- Adult: 20 mg daily for 8 weeks, dose to be taken in the morning

Duodenal ulcer

**BY MOUTH**
- Adult: 20 mg daily for 4 weeks, dose to be taken in the morning

Gastro-oesophageal reflux disease

**BY MOUTH**
- Adult: 20 mg once daily for 4-8 weeks; maintenance 10–20 mg daily

Gastro-oesophageal reflux disease (symptomatic treatment in the absence of oesophagitis)

**BY MOUTH**
- Adult: 10 mg daily for up to 4 weeks, then 10 mg daily if required

Zollinger-Ellison syndrome

**BY MOUTH**
- Adult: Initially 60 mg once daily, adjusted according to response, doses above 100 mg daily given in 2 divided doses; maximum 120 mg per day

*Helicobacter pylori* eradication in combination with amoxicillin or metronidazole and clarithromycin

**BY MOUTH**
- Adult: 20 mg twice daily

INTERACTIONS

Appendix 1 (proton pump inhibitors).

SIDE-EFFECTS

- Hyperlipidaemia - weight changes
- *Pregnancy* Manufacturer advises avoid unless potential benefit outweighs risk – fetotoxic in animals.
- *Breast Feeding* Manufacturer advises avoid unless potential benefit outweighs risk – small amount present in milk.
- *Hepatic Impairment* Max. 20 mg daily in severe impairment and cirrhosis. Monitor liver function in hepatic impairment (discontinue if deterioration).
- *Renal Impairment* Max. oral dose 40 mg daily.
Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be helpful followed if necessary by treatment with an alginate-containing preparation. Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H2-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H2-receptor blockade, the proton pump inhibitor omeprazole p. 69 can be tried.

4.4 Helicobacter pylori diagnosis

DIAGNOSTICS

Urea (13c)

INDICATIONS AND DOSE
Diagnosis of gastro-duodenal Helicobacter pylori infection

BY MOUTH

Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- diabact UBT (Seahorse Laboratories Ltd)
  - Urea [13-C] 50 mg diabact UBT 50mg tablets | 1 tablet PON £21.25 | 10 tablet PON no price available (Hospital only)

Soluble tablet

- Pylobactell (Torbet Laboratories Ltd)
  - Urea [13-C] 100 mg Pylobactell breath test kit | 1 kit PON £20.75

Powder

- UREA (13C) (Non-proprietary)
  - Urea [13-C] 45 mg Helicobacter Test INFAI for children breath test kit (sugar-free) | 1 kit PON £12.20
  - Urea [13-C] 75 mg Helicobacter Test INFAI breath test kit (sugar-free) | 1 kit PON £19.20

5 Food allergy

Food allergy

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as cow’s milk or shellfish should be managed by strict avoidance. The
condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. Sodium cromoglicate p. 234 may be helpful as an adjunct to dietary avoidance.

6 Gastro-intestinal smooth muscle spasm

ANTIMUSCARINICS

Dicycloverine hydrochloride

(Dicyclomine hydrochloride)

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p. 668.

INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

BY MOUTH

- Child 6 months–1 year: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
- Child 2–11 years: 10 mg 3 times a day
- Child 12–17 years: 10–20 mg 3 times a day
- Adult: 10–20 mg 3 times a day

- CONTRA-INDICATIONS Child under 6 months
- PREGNANCY Not known to be harmful; manufacturer advises use only if essential.
- BREAST FEEDING Avoid—present in milk; apnoea reported in infant.
- EXCEPTIONS TO LEGAL CATEGORY Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- DICYCLOVERINE HYDROCHLORIDE (Non-proprietary) Dicycloverine hydrochloride 10 mg Dicycloverine 10 mg tablets | 100 tablet | £141.68 DT price = £117.22
- Dicycloverine hydrochloride 20 mg Dicycloverine 20 mg tablets | 84 tablet | £149.66 DT price = £123.91

Oral solution

- DICYCLOVERINE HYDROCHLORIDE (Non-proprietary) Dicycloverine hydrochloride 2 mg per 1 ml Dicycloverine 10 mg | 120 ml no price available | 100 ml (sugar-free) no price available | £138.30 DT price = £115.41 | 300 ml (sugar-free) no price available

Aluminium hydroxide with dicycloverine hydrochloride, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, dicycloverine hydrochloride above, simeticone p. 60.

INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

BY MOUTH

- Child 12–17 years: 10–20 mL every 4 hours as required
- Adult: 10–20 mL every 4 hours as required

Hyoscine butylbromide

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p. 668.

INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

BY MOUTH

- Child 6–11 years: 10 mg 3 times a day
- Child 12–17 years: 20 mg 4 times a day
- Adult: 20 mg 4 times a day

Irritable bowel syndrome

BY MOUTH

- Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day

Acute spasm | Spasm in diagnostic procedures

INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

- Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day

Excessive respiratory secretions (in palliative care)

BY MOUTH

- Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 2–4 years: 5 mg 3–4 times a day
- Child 5–11 years: 10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Child 1 month–3 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 5–11 years: 5–10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

BY SUBCUTANEOUS INJECTION

- Adult: 20 mg every 4 hours if required, increased according to response, up to 20 mg every hour

BY SUBCUTANEOUS INFUSION

- Adult: 20–120 mg/24 hours

Bowel colic (in palliative care)

BY MOUTH

- Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 2–4 years: 5 mg 3–4 times a day
- Child 5–11 years: 10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Child 1 month–3 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 5–11 years: 5–10 mg 3–4 times a day
- Child 12–17 years: 10–20 mg 3–4 times a day

BY SUBCUTANEOUS INJECTION

- Adult: 20 mg every 4 hours if required, increased according to response, up to 20 mg every hour

BY SUBCUTANEOUS INFUSION

- Adult: 20–300 mg/24 hours

PHARMACOKINETICS

Administration by mouth is associated with poor absorption.
Gastro-intestinal smooth muscle spasm

INDICATIONS AND DOSE
Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

BY MOUTH
- Child 12-17 years: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day
- Adult: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day

Propantheline bromide

INDICATIONS AND DOSE
Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

BY MOUTH
- Child 12-17 years: 60–120 mg 1–3 times a day
- Adult: 60–120 mg 1–3 times a day

Alverine citrate

INDICATIONS AND DOSE
Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

BY MOUTH
- Child 12-17 years: 60–120 mg 1–3 times a day
- Adult: 60–120 mg 1–3 times a day

Antispasmodics

Antimuscarinics
The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome and in diverticular disease. Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They can be used for the management of irritable bowel syndrome and diverticular disease. However, their value has not been established and response varies.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1099 and dicycloverine hydrochloride p. 73 and the quaternary ammonium compounds propantheline bromide above and hyoscine butylbromide p. 73. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other indications for antimuscarinic drugs include arrhythmias, asthma and airways disease, motion sickness, parkinsonism, urinary incontinence, mydriasis and cycloplegia, premedication, and as an antidote to organophosphorus poisoning.

Other antispasmodics
Alverine citrate below, mebeverine hydrochloride p. 75, and peppermint oil p. 40 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome and diverticular disease. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.
Mebeverine hydrochloride

INDICATIONS AND DOSE

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▷ Child 10-17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

▷ Adult: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

Irritable bowel syndrome

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▷ Child 12-17 years: 200 mg twice daily

▷ Adult: 200 mg twice daily

UNLICENSED USE

Granules not licensed for use in children under 12 years. Modified-release capsules not licensed for use in children under 18 years.

CONTRA-INDICATIONS

Paralytic ileus

SIDE-EFFECTS

Allergic reactions • angioedema • rash • urticaria

PREGNANCY

Not known to be harmful—manufacturers advise avoid.

BREAST FEEDING

Manufacturers advise avoid—no information available.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on the timing of administration of mebeverine hydrochloride tablets and oral suspension.

Medicines for Children leaflet: Mebeverine for intestinal spasm www.medicinesforchildren.org.uk/mebeverine-for-intestinal-spasms

EXCEPTIONS TO LEGAL CATEGORY

Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Tablet

▷ MEBEVERINE HYDROCHLORIDE (Non-proprietary)

Mebeverine hydrochloride 135 mg Boots IBS Relief 135mg tablets | 15 tablet [P] no price available

Mebeverine 135 mg tablets | 15 tablet [P] no price available

15 tablet [P] £4.50 | 100 tablet [P] £33.67 DT price = £8.44

Colofac (BGP Products Ltd)

Mebeverine hydrochloride 135 mg Colofac 135mg tablets | 100 tablet [P] £9.02 DT price = £8.44

Colofac IBS 135mg tablets | 15 tablet [P] £2.83

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 25

Colofac MR (BGP Products Ltd)

Mebeverine hydrochloride 200 mg Colofac MR 200mg capsules | 60 capsule [P] £6.92 DT price = £6.92

Oral suspension

▷ MEBEVERINE HYDROCHLORIDE (Non-proprietary)

Mebeverine hydrochloride (as Mebeverine pamoate) 10 mg per 1 ml Mebeverine 50mg/5ml oral suspension sugar free (sugar-free) | 300 ml [P] DT price = £14.43

7 Liver disorders and related conditions

7.1 Biliary disorders

Biliary disorders

Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid ursodeoxycholic acid p. 76 in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment. Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain.

A terpene mixture (Rowachol®) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.
Bile acid sequestrants
Colestyramine p. 173 is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine.

Pancreatin
Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gastrectomy, or chronic pancreatitis. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

**BILE ACIDS**

**Ursodeoxycholic acid**

**INDICATIONS AND DOSE**

**Dissolution of gallstones**

**BY MOUTH**

- Adult: 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

**Primary biliary cirrhosis**

**BY MOUTH**

- Adult: 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

**SIDE-EFFECTS**

- Common or very common Diarrhoea
- Very rare Abdominal pain, gallstone calcification, pruritus
- Frequency not known Nausea, pruritus, vomiting
- **PREGNANCY** No evidence of harm but manufacturer advises avoid.
- **BREAST FEEDING** Not known to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in chronic liver disease (but used in primary biliary cirrhosis).
- **MONITORING REQUIREMENTS** In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.

**PATIENT AND CARER ADVICE**

- Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet CAUTIONARY AND ADVISORY LABELS 21**

- **URSOODEOXYCHOLIC ACID (Non-proprietary)**

  - Ursodeoxycholic acid 50 mg per 1 ml Ursolfak 250mg/5ml oral suspension (sugar-free) | 250 ml (Ref) £26.98 DT price = £26.98

**TERPENES**

**Borneol with camphene, cineole, menthol, menthone and pinene**

**INDICATIONS AND DOSE**

**Biliary disorders**

**BY MOUTH**

- Adult: 1–2 capsules 3 times a day, to be taken before food

**LESS SUITABLE FOR PRESCRIBING**

- Rowachol® is less suitable for prescribing.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
7.2 Oesophageal varices

**VASOPRESSIN AND ANALOGUES**

Drugs used for Oesophageal varices not listed below; Vasopressin, p. 576

---

Terlipressin acetate

**INDICATIONS AND DOSE**

**Glypressin® INJECTION**

**Bleeding from oesophageal varices**

**BY INTRAVENOUS INJECTION**

- Adult (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
- Adult (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

**Variquel® INJECTION**

**Bleeding from oesophageal varices**

**BY INTRAVENOUS INJECTION**

- Adult (body-weight up to 49 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Adult (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Adult (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

**CAUTIONS** Arrhythmia - elderly - electrolyte and fluid disturbances - heart disease - history of QT-interval prolongation - respiratory disease - septic shock - uncontrolled hypertension - vascular disease

**INTERACTIONS** Caution with concomitant use of drugs that prolong the QT-interval.

**SIDE-EFFECTS**

- Common or very common: Abdominal cramps - arrhythmia - bradycardia - diarrhoea - headache - hypertension - hypotension - pallor - peripheral ischaemia
- Rare: Dyspnoea
- Very rare: Hyperglycaemia - stroke
- Frequency not known: Heart failure - skin necrosis

**PREGNANCY** Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.

**BREAST FEEDING** Avoid unless benefits outweigh risk—no information available.

**RENAL IMPAIRMENT** Use with caution in chronic renal failure.

---

8 Obesity

**Obesity**

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual, with appropriate support and encouragement; the individual should also be advised to increase physical activity. Smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss since cigarette smoking may be more harmful than obesity. Attendance at weight loss groups helps some individuals. Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity; the individual should receive advice on diet and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions.

An anti-obesity drug should be considered only for those with a body mass index (BMI, individual’s bodyweight divided by the square of the individual’s height) of 30 kg/m² or greater in whom at least 3 months of managed care involving supervised diet, exercise and behaviour modification fails to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of 28 kg/m² or greater. Drugs should never be used as the sole element of treatment. The individual should be monitored on a regular basis; drug treatment should be discontinued if the individual regains weight at any time whilst receiving drug treatment.

Combination therapy involving more than one anti-obesity drug is contra-indicated by the manufacturers; there is no evidence-base to support such treatment.

Thyroid hormones have no place in the treatment of obesity except in biochemically proven hypothyroid patients. The use of diuretics, choriionic gonadotrophin, or amphetamines is not appropriate for weight reduction.

**Anti-obesity drugs acting on the gastro-intestinal tract**

Orlistat p. 78 should be used in conjunction with other lifestyle measures to manage obesity; treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss.
Some of the weight loss in those taking orlistat below probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea.

Methylcellulose p. 45 is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.

**Centrally acting appetite suppressants**

Phentermine and diethylpropion are central stimulants; they are not recommended for the treatment of obesity. Phentermine has been associated with a risk of pulmonary hypertension.

Sibutramine, dexfenfluramine, and fenfluramine have been withdrawn because the benefit of treatment does not outweigh the risk of serious adverse effects.

**LIPASE INHIBITORS**

**Orlistat**

- **DRUG ACTION** Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

**INDICATIONS AND DOSE**

Adjuvant in obesity (in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 28 kg/m² or more in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia)

**BY MOUTH**

- **Adult:** 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes), if a meal is missed or contains no fat, the dose of orlistat should be omitted

- **CONTRA-INDICATIONS** Cholestasis - chronic malabsorption syndrome

- **CAUTIONS** Chronic kidney disease - may impair absorption of fat-soluble vitamins - volume depletion

**CAUTIONS, FURTHER INFORMATION**

Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

- **INTERACTIONS** → Appendix 1 (orlistat).

- **Interactive effects**
  - **Multivitamins** If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension (gastro-intestinal effects minimised by reduced fat intake) - abdominal pain (gastro-intestinal effects minimised by reduced fat intake) - anxiety - faecal incontinence - faecal urgency - flatulence - gingival disorders - headache - hypoglycaemia - liquid stools - malaise - menstrual disturbances - oily leakage from rectum - oily stools - respiratory infections - tooth disorders - urinary tract infection
  - **Frequency not known** Bullous eruptions - cholelithiasis - diverticulitis - hepatitis - hypothyroidism - oxalate nephropathy - rectal bleeding

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Avoid—no information available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

---

**9 Rectal and anal disorders**

**Rectal and anal disorders**

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories. These conditions occur commonly in patients suffering from haemorrhoids, fistulas, and proctitis. Cleansing with attention to any minor faecal soilings, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulphasalazine p. 37.

When necessary, topical preparations containing local anaesthetics or corticosteroids are used, provided perianal thrush has been excluded. Perianal thrush is treated with a topical antifungal preparation.

**Soothing haemorrhoidal preparations**

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

**Local anaesthetics** are used to relieve pain associated with haemorrhoids and pruritus ani but good evidence is lacking. Lidocaine hydrochloride ointment is used before emptying the bowel to relieve pain associated with anal fissure. Alternative local anaesthetics include tetracaine, cinchocaine (dibucaine), and pramocaine (pramoxine), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be avoided, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

**Compound haemorrhoidal preparations with corticosteroids**

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin.

**Rectal sclerosants**

**Oily phenol injection** is used to inject haemorrhoids particularly when unprolapsed.

**Anal fissures**

The management of anal fissures requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help. If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment p. 190) may be considered. Before considering surgery, topical diltiazem hydrochloride 2%
may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrates.

Rectal and anal disorders in children
Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child’s fear of defaecation.

9.1 Haemorrhoids

CORTICOSTEROIDS

Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

**INDICATIONS AND DOSE**

**Haemorrhoids** | **Pruritus ani**
---|---
**BY RECTUM USING SUPPOSITORIES**
- Adult: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose should be applied after a bowel movement

**BY RECTUM USING CREAM**
- Adult: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement

**CAUTIONS** Local anaesthetic component may be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) • local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**PRESCRIBING AND DISPENSING INFORMATION**

A proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- BENZYL BENZOATE WITH BISMUTH OXIDE, HYDROCORTISONE ACETATE, PERU BALSAM, PRAMOCAINE HYDROCHLORIDE AND ZINC OXIDE (Non-proprietary)
  Benzyl benzoate 12 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Hydrocortisone acetate 5 mg per 1 gram, Peru Balsam 18.5 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram, Zinc oxide 123.5 mg per 1 gram Anugesic-HC cream | 30 gram | £3.71

**Benzyl benzoate with bismuth oxide, hydrocortisone acetate, peru balsam, pramocaine hydrochloride and zinc oxide**

**INDICATIONS AND DOSE**

**Haemorrhoids** | **Pruritus ani**
---|---
**BY RECTUM USING SUPPOSITORIES**
- Adult: Apply twice daily for no longer than 7 days, to be applied morning and night and after a bowel movement

**CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) • local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suppository**

- BENZYL BENZOATE WITH BISMUTH OXIDE, BISMUTH SUBGALLATE, HYDROCORTISONE ACETATE, PERU BALSAM AND ZINC OXIDE (Non-proprietary)
  Benzyl benzoate 33 mg, Bismuth oxide 24 mg, Bismuth subgallate 59 mg, Hydrocortisone acetate 10 mg, Peru Balsam 49 mg, Zinc oxide 296 mg Anusol HC suppositories | 12 suppository | £1.74
  Anusol Plus HC suppositories | 12 suppository | £3.03

**Ointment**

- BENZYL BENZOATE WITH BISMUTH OXIDE, BISMUTH SUBGALLATE, HYDROCORTISONE ACETATE, PERU BALSAM AND ZINC OXIDE (Non-proprietary)
  Benzyl benzoate 12.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Hydrocortisone acetate 2.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram Anusol Plus HC ointment | 15 gram | £3.03

**Cinchoacaine hydrochloride with fluocortolone caproate and fluocortolone pivalate**

**INDICATIONS AND DOSE**

**Haemorrhoids** | **Pruritus ani**
---|---
**BY RECTUM USING OINTMENT**
- Adult: Apply twice daily for 5–7 days, apply 3–4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared

**BY RECTUM USING SUPPOSITORIES**
- Adult: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

**Haemorrhoids (severe cases)** | **Pruritus ani (severe cases)**
---|---
**BY RECTUM USING SUPPOSITORIES**
- Adult: Initially 1 suppository 2–3 times a day for 5–7 days, then 1 suppository once daily on alternate days for 1 week

**CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) • local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suppository**

- Ultraproct (Meadow Laboratories Ltd)
  Cinchoacaine hydrochloride 1 mg, Fluocortolone caproate 630 microgram, Fluocortolone pivalate 610 microgram Ultraproct suppositories | 12 suppository | £2.15

**Cinchoacaine hydrochloride with fluocortolone caproate and fluocortolone pivalate**

**INDICATIONS AND DOSE**

**Haemorrhoids** | **Pruritus ani**

**Cinchocaine with hydrocortisone**

**INDICATIONS AND DOSE**

**UNIROID-HC**® **SUPPOSITORIES**

- **Haemorrhoids** | **Pruritus ani**
  BY RECTUM
  - Child 12-17 years: 1 suppository, insert twice daily and after a bowel movement, do not use for longer than 7 days
  - Adult: 1 suppository, insert twice daily and after a bowel movement, do not use for longer than 7 days

**PROCTOSEDYL**® **SUPPOSITORIES**

- **Haemorrhoids** | **Pruritus ani**
  BY RECTUM
  - Child 12-17 years: 1 suppository, insert suppository night and morning and after a bowel movement, do not use for longer than 7 days
  - Adult: 1 suppository, insert suppository night and morning and after a bowel movement, do not use for longer than 7 days

**UNIROID-HC**® **OINTMENT**

- **Haemorrhoids** | **Pruritus ani**
  TO THE SKIN OR BY RECTUM
  - Child 12-17 years: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
  - Adult: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

**PROCTOSEDYL**® **OINTMENT**

- **Haemorrhoids** | **Pruritus ani**
  TO THE SKIN OR BY RECTUM
  - Child: Apply twice daily, to be administered morning and night and after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
  - Adult: Apply twice daily, to be administered morning and night and after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

**CAUTIONS**
- Local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Suppository**
  - **Cinchocaine with Hydrocortisone** (Non-proprietary)
    Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg | 12 suppository [PDR] no price available
  - **Proctosedyl** (Sanofi)
    Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg | 12 suppository [PDM] £5.08
  - **Uniroid HC** (Chemidex Pharma Ltd)
    Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg | 12 suppository [PDR] £1.91

**Ointment**
- **CINCHOCAINS WITH HYDROCORTISONE** (Non-proprietary)
  Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram
  Cinchocaine 0.5% / Hydrocortisone 0.5% ointment | 30 gram [PDR] no price available
  - **Proctosedyl** (Sanofi)
    Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram
    Proctosedyl ointment | 30 gram [PDR] £10.34
  - **Uniroid HC** (Chemidex Pharma Ltd)
    Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram
    Uniroid HC ointment | 30 gram [PDR] £4.23

**Hydrocortisone with lidocaine**

**INDICATIONS AND DOSE**

- **Haemorrhoids** | **Pruritus ani**
  ▶ **BY RECTUM USING SUPPOSITORIES**
  - Adult: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement
  - Haemorrhoids (severe cases) | **Pruritus ani (severe cases)**
    **INITIALLY BY RECTUM USING SUPPOSITORIES**
    - Adult: Initially 1 suppository 2–3 times a day, then (by rectum) 1 suppository daily for a total of 5–7 days, to be inserted after a bowel movement

**CAUTIONS**
- Local anaesthetic component may be absorbed through the rectal mucosa (avoid excessive application - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Suppository**
  - **Schepiroc** (Bayer Plc)
    Cinchocaine hydrochloride 1 mg, Prednisolone hexanoate 1.3 mg | 12 suppository [PDR] £1.38
  - **Ointment**
    - **Schepiroc** (Bayer Plc)
      Cinchocaine hydrochloride 5 mg per 1 gram, Prednisolone hexanoate 1.9 mg per 1 gram | 30 gram [PDR] £2.94

**INDICATIONS AND DOSE**

- **Haemorrhoids** | **Pruritus ani**
  ▶ **BY RECTUM USING AEROSOL SPRAY**
  - Adult: 1 spray up to 3 times a day for no longer than 7 days without medical advice, spray once over the affected area
  - ▶ **BY RECTUM USING OINTMENT**
  - Adult: Apply several times daily, for short term use only

**CAUTIONS**
- Local anaesthetic component may be absorbed through the rectal mucosa (avoid excessive application - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash.
10 Reduced exocrine secretions

PANCREATIC ENZYMES

Pancreatin

● **DRUG ACTION** Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

### INDICATIONS AND DOSE

**PANCREX® V TABLETS**

Pancreatic insufficiency

**BY MOUTH**

- Child: 2–17 years: 5–15 capsules, to be taken 30 minutes before meals
- Adult: 5–15 capsules, to be taken 30 minutes before meals

**PANCREX® V TABLETS FORTE**

Pancreatic insufficiency

**BY MOUTH**

- Child: 2–17 years: 6–10 capsules, to be taken before meals
- Adult: 6–10 capsules, to be taken before meals

**PANCREX® V**

Pancreatic insufficiency

**BY MOUTH**

- Child: 1–11 months: 1–2 capsules, contents of capsule to be mixed with feeds
- Child: 1–7 years: 2–6 capsules, dose to be taken with each meal
- Child: 8–11 years: 2–6 capsules, dose to be taken with each meal
- Adult: 2–6 capsules, dose to be taken with each meal

**CREON® 10000**

Pancreatic insufficiency

**BY MOUTH**

- Child: Initially 1–2 capsules, dose to be taken with each meal
- Adult: Initially 1–2 capsules, dose to be taken with each meal

**CREON® 40000**

Pancreatic insufficiency

**BY MOUTH**

- Child: 2–17 years: 1–2 capsules, dose to be taken with each meal
- Adult: 1–2 capsules, dose to be taken with each meal

---

**INDICATIONS AND DOSE**

**HYDROCORTISONE WITH LIDOCAINE (Non-proprietary)**

Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram

**BY RECTUM**

- Adult: 1 applicable 2–3 times a day and 1 applicable, after a bowel movement, do not use for longer than 7 days; maximum 4 applicatorfuls per day

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Foam**
  - Proctofoam HC (Meda Pharmaceuticals Ltd)
    - Hydrocortisone acetate 10 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram

- **Ointment**
  - Hydrocortisone with pramocaine

**INDICATIONS AND DOSE**

**INDICATIONS AND DOSE**

**Haemorrhoids | Proctitis**

**BY RECTUM**

- Adult: 1 applicable 2–3 times a day and 1 applicable, after a bowel movement, do not use for longer than 7 days; maximum 4 applicatorfuls per day

- **CAUTIONS** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Oily phenol**
  - Phenol 50 mg per 1 ml

- **Solution for injection**
  - Phenol 50 mg per 1 ml
  - Oily phenol 5% solution for injection 5ml

- **Spray**
  - Perinal (Dermal Systems Ltd)
  - Hydrocortisone 2 mg per 1 gram, Lidocaine hydrochloride 10 mg per 1 gram

**RECED SCLEORSANTS**

Phenol

**INDICATIONS AND DOSE**

**Haemorrhoids (particularly when unprolapsed)**

**BY SUBMUCOSAL INJECTION**

- Adult: 2–3 ml, dose (using phenol 5%) to be injected into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 ml at any one time

- **SIDE-EFFECTS** Irritation • tissue necrosis

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Oily Phenol Injection, BP consists of phenol 5% in a suitable fixed oil.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cutaneous solution, liquid

**Solution for injection**

- Phenol 50 mg per 1 ml
  - Oily phenol 5% solution for injection 5ml
  - Oily phenol 5% solution for injection 2ml

- **Spray**
  - Perinal (Dermal Systems Ltd)
  - Hydrocortisone 2 mg per 1 gram, Lidocaine hydrochloride 10 mg per 1 gram
NUTRIZYM 22® GASTRO-RESISTANT CAPSULES

Pancreatic insufficiency

BY MOUTH

- Child: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing

- Adult: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing

Dose equivalence and conversion

100 mg granules = one measured scoopful (scoop supplied with product).

PANCREASE HL

Pancreatic insufficiency

BY MOUTH

- Child: 2–17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water

- Adult: 5–10 g, to be taken just before meals, washed down or mixed with milk or water

PANCREASE HL gastro-resistant capsules

Pancreatic insufficiency

BY MOUTH

- Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

CREON® 25000

Pancreatic insufficiency

BY MOUTH

- Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

11 Stoma care

Stoma care
Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release preparations are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives
Enemas and washouts should not be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes. Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs should be tried. If they are insufficient, as small a dose as possible of senna p. 53 should be used.

Antidiarrhoeals
Drugs such as loperamide hydrochloride p. 56, codeine phosphate p. 360, or co-phenotrope p. 55 (diphenoxylate with atropine) are effective. Bulk-forming drugs may be tried but it is often difficult to adjust the dose appropriately. Antibacterials should not be given for an episode of acute diarrhoea.

Antacids
The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

Diuretics
Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

Digoxin
Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin p. 94 therapy and potassium supplements or a potassium-sparing diuretic may be advisable.

Potassium supplements
Liquid formulations are preferred to modified-release formulations.

Analgesics
Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required paracetamol p. 354 is usually suitable but anti-inflammatory analgesics may cause gastric irritation and bleeding.

Iron preparations
Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Care of stoma
Patients are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.
1 Arrhythmias

Arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats

If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation

Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate (‘rate control’) or by attempting to restore and maintain sinus rhythm (‘rhythm control’). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation

All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion has been agreed, intravenous amiodarone hydrochloride p. 88, or alternatively flecainide acetate p. 91, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 156 can be given intravenously.

Cardioversion

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment

Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, heart failure secondary to atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 93) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156 as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 94 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

If drug treatment is required to maintain sinus rhythm (‘rhythm control’) post-cardioversion, a standard beta-
blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride p. 93, flecainide acetate p. 91, propafenone hydrochloride p. 92, or amiodarone hydrochloride p. 88; dronedarone p. 90 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochloride should not be given when there is known ischaemic or structural heart disease. Control of heart rate; the management of patients with left ventricular impairment or heart failure.

Paroxysmal atrial fibrillation
In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is not appropriate, an oral anti-arrhythmic drug such as sotalol hydrochloride p. 93, flecainide acetate p. 91, propafenone hydrochloride p. 92, or amiodarone hydrochloride p. 88 can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the ‘pill-in-the-pocket’ approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs. 

Stroke prevention
All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient’s risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014). Atrial fibrillation: The management of atrial fibrillation) recommends using the CHA2DS2-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA2DS2-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA2DS2-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulant treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g warfarin sodium p. 121, or in non-valvular atrial fibrillation with apixaban p. 108, dabigatran etexilate p. 117, or rivaroxaban p. 109. Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 104 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contraindicated or not tolerated, left atrial appendage occlusion can be considered.

Atrial flutter
Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation. 

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 94 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 91 or propafenone hydrochloride p. 92 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156. Amiodarone hydrochloride p. 88 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

Paroxysmal supraventricular tachycardia
This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring. If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 87 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride p. 156 is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found). Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride p. 149, verapamil hydrochloride p. 156, beta-blockers including sotalol hydrochloride p. 93, flecainide acetate p. 91 or propafenone hydrochloride p. 92.
Arrhythmias after myocardial infarction

In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atropine sulfate p. 949 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine sulfate, adrenaline/epinephrine p. 196 should be given by intravenous infusion, and the dose adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride p. 88 should be administered and direct current cardioversion repeated.

For episodes of sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate p. 91, propafenone hydrochloride p. 92, and, although less effective, lidocaine hydrochloride p. 91 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride p. 93 (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de points

*Torsade de points* is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 858 is usually effective. A beta-blocker (but not sotalol hydrochloride p. 93) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride p. 156), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride p. 88), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride p. 91).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- **Class I**: membrane stabilising drugs (e.g. lidocaine, flecainide)
- **Class II**: beta-blockers
- **Class III**: amiodarone, sotalol (also Class II)
- **Class IV**: calcium-channel blockers (includes verapamil but not dicypropiridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine p. 87 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 107), most side-effects are short lived. Unlike verapamil hydrochloride p. 156, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a *cardiac glycoside* (such as digoxin p. 94) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a *beta-blocker* such as esmolol hydrochloride p. 143 or propranolol hydrochloride p. 146, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 88, *beta-blockers*, disopyramide p. 89, flecainide acetate p. 91, *procainamide* (available from ‘special-order’ manufacturers or specialist importing companies), and propafenone hydrochloride p. 92.

Supraventricular and ventricular arrhythmias

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular
fibrillation or pulseless tachycardia unresponsive to other interventions.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely. **Beta-blockers** act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride p. 93 has a role in the management of ventricular arrhythmias.

Disopyramide p. 89 can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride p. 91), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate p. 91 belongs to the same general class as lidocaine hydrochloride p. 91 and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride p. 92 is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine below, **cardiac glycosides**, and verapamil hydrochloride p. 156. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

Mexiteline and procainamide are both available from ‘special-order’ manufacturers or specialist importing companies. Mexiteline can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

**Ventricular arrhythmias**

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, **beta-blockers**, disopyramide, flecainide acetate, **procainamide** (available from ‘special-order’ manufacturers or specialist importing companies), and propafenone hydrochloride.

**Mexiteline** is available from ‘special-order’ manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.  

---

**ANTIARRHYTHMICS**

**Adenosine**

**INDICATIONS AND DOSE**

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolf-Parkinson-White syndrome)** | **Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias**

**BY RAPID INTRAVENOUS INJECTION**

- Adult: Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose.

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolf-Parkinson-White syndrome) in patients with a heart transplant** | **Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant**

**BY RAPID INTRAVENOUS INJECTION**

- Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine

**Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate**

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**Dose adjustments due to interactions**

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

**UNLICENSED USE** Adenosine doses in the BNF may differ from those in the product literature.

**CONTRA-INDICATIONS** Asthma; chronic obstructive lung disease; decompenated heart failure; long QT syndrome; second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); severe hypertension.

**CAUTIONS** Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) - atrial flutter with accessory pathway (conduction down anomalous pathway may increase) - autonomic dysfunction - bundle branch block - first-degree AV block - heart transplant - left main coronary artery stenosis - left to right shunt - pericardial effusion - pericarditis - QT-interval prolongation - recent myocardial infarction - severe heart failure - stenotic carotid artery disease with cerebrovascular insufficiency - stenotic valvar heart disease - uncorrected hypovolaemia

**INTERACTIONS**

- Appendix 1 (adenosine); also possibility of interaction with drugs tending to impair myocardial conduction.

**SIDE-EFFECTS**

- **Common or very common** Angina (discontinue) - apprehension - arrhythmia (discontinue if asystole or severe bradycardia occur) - AV block - dizziness - dyspnoea - flushing - headache - nausea - sinus pause.

- **Uncommon** Blurred vision - hyperventilation - metallic taste - palpitation - sweating - weakness.

- **Very rare** Bronchospasm - injection-site reactions - transient worsening of intracranial hypertension.

- **Frequency not known** Cardiac arrest - convulsions - hypotension (discontinue if severe) - respiratory failure (discontinue) - syncope - vomiting.
CARDIOVASCULAR SYSTEM

CONTRA-INDICATIONS

MONITORING REQUIREMENTS

BREAST FEEDING

PREGNANCY

SPECIFIC CONTRA-INDICATIONS

With intravenous use Avoid bolus injection in cardiomyopathy - avoid bolus injection in congestive heart failure - avoid in circulatory collapse - avoid in severe arterial hypotension - avoid in severe respiratory failure

CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 864 - conduction disturbances (in excessive dosage) - elderly - heart failure - hypokalaemia - severe bradycardia (in excessive dosage)

SPECIAL CAUTIONS

With intravenous use Moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity

INTERACTIONS ➔ Appendix 1 (amiodarone). Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Use extreme caution or avoid concomitant use of drugs that prolong QT interval. Risk of severe bradycardia or heart block when amiodarone is used in combination with sofosbuvir and daclatasvir for hepatitis C.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Bradycardia - hyperthyroidism - hypothyroidism - jaundice - nausea - persistent slate grey skin discoloration - phototoxicity - pulmonary toxicity (including pneumonitis and fibrosis) - raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) - reversible corneal microdeposits (sometimes with night glare) - sleep disorders - taste disturbances - tremor - vomiting

Uncommon Conduction disturbances - onset or worsening of arrhythmia - peripheral myopathy (usually reversible on withdrawal) - peripheral neuropathy (usually reversible on withdrawal)

Very rare Alopecia - aplastic anaemia - ataxia - benign intracranial hypertension - bronchospasm (in patients with severe respiratory failure) - chronic liver disease - cirrhosis - epididymo-orchitis - exfoliative dermatitis - haemolytic anaemia - headache - hypersensitivity - impaired vision due to optic neuritis or optic neuropathy (including blindness) - impotence - rash - sinus arrest - thrombocytopenia - vasculitis - vertigo

Frequency not known Hot flushes - hypotension - respiratory distress syndrome - sweating

SPECIFIC SIDE-EFFECTS

Common or very common With intravenous use injection-site reactions

Very rare

With intravenous use anaphylaxis on rapid injection

SIDE-EFFECTS, FURTHER INFORMATION

Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if

BNF 70

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Foremost available from special-order manufacturers include: solution for injection, solution for infusion, infusion

Solution for injection

ELECTROLYTES: May contain Sodium

> ADENOSINE (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 6mg/2ml solution for injection vials | 6 vial | £22.00–£29.24 (Hospital only)

Adenoscan (Sanofi)

Adenosine 3 mg per 1 ml Adenoscan 6mg/ml solution for injection vials | 6 vial | £29.94 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

> ADENOSINE (Non-proprietary)

Adenosine 3 mg per 1 ml Adenosine 30mg/10ml solution for infusion vials | 6 vial | £65.00–£85.57 (Hospital only)

> Adenoscan (Sanofi)

Adenoscan 3mg/1ml solution for infusion vials | 6 vial | £65.57

Amiodarone hydrochloride

INDICATIONS AND DOSE

Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)

BY MOUTH

Adult: 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, following by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation initially by intravenous injection

Adult: Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 ml Glucose 5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in severe conduction disturbances (unless pacemaker fitted) - avoid in sinus node disease (unless pacemaker fitted) - iodine sensitivity - sino-atrial heart block (except in cardiac arrest) - sinus bradycardia (except in cardiac arrest) - thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

With intravenous use Avoid bolus injection in cardiomyopathy - avoid bolus injection in congestive heart failure - avoid in circulatory collapse - avoid in severe arterial hypotension - avoid in severe respiratory failure

CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 864 - conduction disturbances (in excessive dosage) - elderly - heart failure - hypokalaemia - severe bradycardia (in excessive dosage)

SPECIAL CAUTIONS

With intravenous use Moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity

INTERACTIONS ➔ Appendix 1 (amiodarone). Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Use extreme caution or avoid concomitant use of drugs that prolong QT interval. Risk of severe bradycardia or heart block when amiodarone is used in combination with sofosbuvir and daclatasvir for hepatitis C.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Bradycardia - hyperthyroidism - hypothyroidism - jaundice - nausea - persistent slate grey skin discoloration - phototoxicity - pulmonary toxicity (including pneumonitis and fibrosis) - raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) - reversible corneal microdeposits (sometimes with night glare) - sleep disorders - taste disturbances - tremor - vomiting

Uncommon Conduction disturbances - onset or worsening of arrhythmia - peripheral myopathy (usually reversible on withdrawal) - peripheral neuropathy (usually reversible on withdrawal)

Very rare Alopecia - aplastic anaemia - ataxia - benign intracranial hypertension - bronchospasm (in patients with severe respiratory failure) - chronic liver disease - cirrhosis - epididymo-orchitis - exfoliative dermatitis - haemolytic anaemia - headache - hypersensitivity - impaired vision due to optic neuritis or optic neuropathy (including blindness) - impotence - rash - sinus arrest - thrombocytopenia - vasculitis - vertigo

Frequency not known Hot flushes - hypotension - respiratory distress syndrome - sweating

SPECIFIC SIDE-EFFECTS

Common or very common With intravenous use injection-site reactions

Very rare

With intravenous use anaphylaxis on rapid injection

SIDE-EFFECTS, FURTHER INFORMATION

Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if
severe liver function abnormalities or clinical signs of liver disease develop.

**Pulmonary toxicity** Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

**Peripheral neuropathy** Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

- **PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.

- **BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

- **MONITORING REQUIREMENTS**
  - Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T<sub>4</sub>) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T<sub>3</sub>), T<sub>4</sub>, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T<sub>3</sub> and T<sub>4</sub> with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
  - Liver function tests required before treatment and then every 6 months.
  - Serum potassium concentration should be measured before treatment.
  - Chest x-ray required before treatment.
  - If concomitant use of amiodarone with sofosbuvir and daclatasvir cannot be avoided because other anti-arrhythmics are not tolerated or contraindicated, patients should be closely monitored, particularly during the first weeks of treatment.
  - Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment.
  - Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir should be monitored.
  - With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intravenous infusion (Cordarone X®)*, give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 ml given over 20~120 minutes; for repeat infusions up to 1.2 g in max. 500 ml; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP).
  - With oral use For administration by *mouth*, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

- **PATIENT AND CARER ADVICE** Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used. If taking amiodarone with sofosbuvir and daclatasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

### Disopyramide

**INDICATIONS AND DOSE**

Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction | Maintenance of sinus rhythm after cardioversion

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 300–800 mg daily in divided doses

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 250–375 mg every 12 hours

**CONTRA-INDICATIONS** Bundle-branch block associated with first-degree AV block - second- and third-degree AV block or bifascicular block (unless pacemaker fitted) - severe heart failure (unless secondary to arrhythmia) - severe sinus node dysfunction

**CAUTIONS** Atrial flutter or atrial tachycardia with partial block - avoid in Acute porphyrias p. 864 - elderly - heart failure (avoid if severe) - myasthenia gravis - prostatic enlargement - structural heart disease - susceptibility to angle-closure glaucoma

**INTERACTIONS** → Appendix 1 (disopyramide).

**SIDE-EFFECTS** Angle-closure glaucoma - antimuscarinic effects - AV block - blurred vision - cholestatic jaundice - dry mouth - gastro-intestinal irritation - hypoglycaemia - hypotension - myocardial depression - psychosis - urinary retention - ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval)

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.

**BREAST FEEDING** Present in milk—use only if essential. Monitor infant for antimuscarinic effects.

**HEPATIC IMPAIRMENT** Half-life prolonged—may need dose reduction. Avoid modified-release preparation.

**RENAL IMPAIRMENT** Reduce dose by increasing dose interval; adjust according to response. Avoid modified-release preparation.
Dronedarone

**DRUG ACTION** Dronedarone is a multi-channel blocking anti-arrhythmic drug.

**INDICATIONS AND DOSE**

Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)

**BY MOUTH**
- Adult: 400 mg twice daily

**CONTRA-INDICATIONS** Atrial conduction defects - bradycardia - complete bundle branch block - distal block - existing or previous heart failure or left ventricular systolic dysfunction - haemodynamically unstable patients - liver toxicity associated with previous amiodarone use - permanent atrial fibrillation - prolonged QT interval - second- or third-degree AV block - sick sinus syndrome (unless pacemaker fitted) - sinus node dysfunction

**CAUTIONS** Coronary artery disease - correct hypokalaemia and hypomagnesaemia before starting and during treatment

**INTERACTIONS** → Appendix 1 (dronedarone).

**SIDE-EFFECTS**
- Common or very common: Bradycardia - gastro-intestinal disturbances - heart failure - malaise - pruritus - QT-interval prolongation - raised serum creatinine - rash
- Uncommon: Dermatitis - eczema - erythema - interstitial lung disease (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - photosensitivity - pneumonitis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - pulmonary fibrosis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - taste disturbance
- Rare: Liver injury (including life-threatening acute liver failure)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Liver injury** Liver injury, including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

**MONITORING REQUIREMENTS**
- Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur).
- Monitor serum potassium.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablet containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablet containing the same drug.

- **Modified-release tablet**
  - CAUTIONARY AND ADVISORY LABELS 25
    - Rythmodan Retard (Sanofi)
      - Disopyramide (as Disopyramide phosphate) 250 mg Rythmodan Retard 250mg tablets | 60 tablet [PBR] £32.08 DT price = £32.08
    - DISOPYRAMIDE (Non-proprietary)
      - Disopyramide 100 mg Disopyramide 100mg capsules | 84 capsule [PBR] £25.00 DT price = £22.09
      - Disopyramide 150 mg Disopyramide 150mg capsules | 84 capsule [PBR] £33.40 DT price = £27.58
    - Rythmodan (Sanofi)
      - Disopyramide 100 mg Rythmodan 100mg capsules | 84 capsule [PBR] £14.14 DT price = £22.09

**DISOPYRAMIDE (Non-proprietary)**

- **Rythmodan**
- **Rythmodan Retard**
  - 25

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Ongoing monitoring should occur under specialist supervision.
- Monitor for heart failure.
- Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
- Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
- Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

**PATIENT AND CARER ADVICE**

Heart failure Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012) NICE TA197**
  - Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:
  - who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older and
  - who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure
  - Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA197

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Arrhythmias**
Flecainide acetate

**INDICATIONS AND DOSE**

AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily) (specialist supervision in hospital) | Ventricular tachyarrhythmias resistant to other treatment (specialist supervision in hospital)

**INITIALLY BY SLOW INTRAVENOUS INJECTION**
- **Adult:** Initially 2 mg/kg (max. per dose 150 mg), to be given over 10–30 minutes with ECG monitoring, followed by (by intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by intravenous infusion) reduced to 100–250 micrograms/kg/hour for up to 24 hours, maximum cumulative dose of 600 mg in first 24 hours, then transfer to oral treatment

**Supraventricular arrhythmias**

**INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** Initially 50 mg twice daily, (by mouth) increased if necessary up to 300 mg daily
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- **Adult:** 200 mg daily

**Ventricular arrhythmias (initiated under direction of hospital consultant)**
- **Adult:** Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients, then (by mouth) maintenance, reduce to the lowest dose that controls the arrhythmia

**Dose equivalence and conversion**

Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

**UNLICENSED USE**

Capsules, tablets and injections: AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily). Immediate-release tablets only: symptomatic sustained ventricular tachycardia, disabling symptoms of pre- mature ventricular contractions or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy. Injection only: ventricular tachyarrhythmias resistant to other treatment.

**CONTRA-INDICATIONS**

Abnormal left ventricular function - atrial conduction defects (unless pacing rescue available) - bundle branch block (unless pacing rescue available) - control of arrhythmias in acute situations (for modified-release forms only) - distal block (unless pacing rescue available) - haemodynamically significant valvular heart disease - heart failure - history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia - long-standing atrial fibrillation where conversion to sinus rhythm not attempted - second-degree or greater AV block (unless pacing rescue available) - sinus node dysfunction (unless pacing rescue available)

**CAUTIONS**

Atrial fibrillation following heart surgery - elderly (accumulation may occur) - patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)

**INTERACTIONS**

> Appendix 1 (flecainide).

**SIDE-EFFECTS**

- **Common or very common** Asthenia - dizziness - dyspnoea - fatigue - fever - oedema - pro-arrhythmic effects - visual disturbances
- **Rare** Amnesia - confusion - convulsions - depression - dyskinesia - hallucinations - peripheral neuropathy - pneumonitis
- **Frequency not known** Anaemia - anorexia - anxiety - ataxia - corneal deposits - drowsiness - flushing - gastrointestinal disturbances - headache - hepatic dysfunction - hypersensitivity reactions - increased antinuclear antibodies - increased sweating - insomnia - leucopenia - paraesthesia - photosensitivity - rash - syncope - thrombocytopenia - tinnitus - tremor - urticaria - vertigo

**PREGNANCY**

Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinaemia also reported.

**BREAST FEEDING**

Significant amount present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT**

Avoid or reduce dose in severe impairment.

**RENAL IMPAIRMENT**

Reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

With intravenous use ECG monitoring and resuscitation facilities must be available.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Tambocor®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Minimum volume in infusion fluids containing chlorides 500 mL.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **FLECAINIDE ACETATE (Non-proprietary)**
  - Flecainide acetate 50 mg Flecainide 50mg tablets | 60 tablet [PDR] £19.50 DT price = £3.25

  - Flecainide acetate 10 mg per 1 ml Tambocor 150mg/15ml solution for injection ampoules | 3 ampoule [PDR] £21.99

Lidocaine hydrochloride

(Lignocaine hydrochloride)

**INDICATIONS AND DOSE**

Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)

**BY INTRAVENOUS INJECTION**
- **Adult:** 1 mg/kg, do not exceed 3 mg/kg over the first hour

continued
Ventricular arrhythmias, especially after myocardial infarction in patients without gross circulatory impairment

INITIALLY BY INTRAVENOUS INJECTION
- Adult: 100 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Ventricular arrhythmias, especially after myocardial infarction in lighter patients or those whose circulation is severely impaired

INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 50 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

- CONTRA-INDICATIONS All grades of atioventricular block - severe myocardial depression - sino-attrial disorders
- CAUTIONS Acute prophyria (consider infusion with glucose for its anti-porphyrinogetic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose)
- INTERACTIONS → Appendix 1 (lidocaine).
- SIDE-EFFECTS
  - Common or very common Bradycardia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression
  - Rare Anaphylaxis
- PREGNANCY Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.
- BREAST FEEDING Present in milk but amount too small to be harmful.
- HEPATIC IMPAIRMENT Caution—increased risk of side-effects.
- RENAL IMPAIRMENT Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- MONITORING REQUIREMENTS Monitor ECG and have resuscitation facilities available.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- LIDOCAINE HYDROCHLORIDE (Non-proprietary)
  - Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule £0.70
  - Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule £10.89
  - Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule £4.50 DT price = £4.01
  - Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule £8.80

  - Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule £2.35–3.10 DT price = £2.38
  - Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule £3.50 DT price = £2.00
  - Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule £6.00
  - Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule £2.40–3.80 DT price = £2.43
  - Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial (P) £18.50–19.50
  - Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule (P) £14.52
  - Lidocaine 400mg/2ml (2%) solution for injection ampoules | 10 ampoule (P) £4.00 DT price = £2.13
  - Lidocaine 100mg/5ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule (P) £6.00
  - Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule (P) £18.00–19.00 DT price = £9.07

Propafenone hydrochloride

INDICATIONS AND DOSE

Ventricular arrhythmias (specialist supervision in hospital) | Paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital) BY MOUTH

- Adult: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 3 days, reduce total daily dose for patients under 70 kg
- Elderly: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 5 days, reduce total daily dose for patients under 70 kg

- CONTRA-INDICATIONS Atrial conduction defects (unless adequately paced) - Brugada syndrome - bundle branch block (unless adequately paced) - cardiogenic shock (except arrhythmia induced) - distal block (unless adequately paced) - electrolyte disturbances - marked hypotension - myasthenia gravis - myocardial infarction within last 3 months - second degree or greater AV block (unless adequately paced) - severe bradycardia - severe obstructive pulmonary disease (due to weak beta-blocking activity) - sinus node dysfunction (unless adequately paced) - uncontrolled congestive heart failure with left ventricular ejection fraction less than 35%
Arrhythmias

Sotalol hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see Beta-blockers, p. 139.

INDICATIONS AND DOSE

Symptomatic non-sustained ventricular tachyarrhythmias | Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery | Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

BY MOUTH

Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days

Life-threatening arrhythmias including ventricular tachyarrhythmias (under expert supervision)

BY MOUTH

Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 480–640 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days

Important safety information

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).

CONTRA-INDICATIONS

Long QT syndrome (congenital or acquired) | torsade de points

CAUTIONS

Diarrhoea (severe or prolonged)

INTERACTIONS

Extreme caution or avoid concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

Arrhythmogenic (pro-arrhythmic) effect (torsade de points—increased risk in females)

BREAST FEEDING

Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

RENAL IMPAIRMENT

Use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

BETA-ADRENOCEPTOR BLOCKERS

Sotalol hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see Beta-blockers, p. 139.
arrhythmias or bradycardias unresponsive to atropine
sulfate p. 949 and when measures beyond the withdrawal of
digoxin and correction of any electrolyte abnormalities are
considered necessary.

Digoxin is most useful for controlling ventricular response
in persistent and permanent atrial fibrillation and atrial
flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance
dose of digoxin can usually be determined by the ventricular
rate at rest, which should not usually be allowed to fall
persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate
(seen management of supraventricular arrhythmias). Even
with intravenous administration, response may take many
hours; persistence of tachycardia is therefore not an
indication for exceeding the recommended dose. The
intravenous route is not recommended.

In patients with heart failure who are in sinus rhythm a
loading dose is not required, and a satisfactory plasma-
digoxin concentration can be achieved over a period of
about a week.

Digoxin has a long half-life and maintenance doses need
to be given only once daily (although higher doses may
divided to avoid nausea); renal function is the most
important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of
digoxin in the plasma and on the sensitivity of the
conducting system or of the myocardium, which is often
increased in heart disease. It can sometimes be difficult to
distinguish between toxic effects and clinical deterioration
because symptoms of both are similar. The plasma
concentration alone cannot indicate toxicity reliably, but
the likelihood of toxicity increases progressively through
the range 1.5 to 3 micrograms/litre for digoxin. Digoxin
should be used with special care in the elderly, who may be
particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration
during maintenance treatment is not necessary unless
problems are suspected. Hypokalaemia predisposes the
patient to digitalis toxicity; it is managed by giving a
potassium-sparing diuretic or, if necessary, potassium
supplementation.

If toxicity occurs, digoxin should be withdrawn; serious
manifestations require urgent specialist management.
Digoxin-specific antibody fragments are available for
reversal of life-threatening overdosage.

Digoxin

***DRUG ACTION*** Digoxin is a cardiac glycoside that increases
the force of myocardial contraction and reduces
conductivity within the atrioventricular (AV) node.

**INDICATIONS AND DOSE**

<table>
<thead>
<tr>
<th>Rapid digitalisation, for atrial fibrillation or flutter</th>

</tr>
<tr>
<td>in the elderly</td>
</tr>
</tbody>
</table>

Emergency loading dose, for atrial fibrillation or flutter
INITIALLY BY INTRAVENOUS INFUSION
▶ Adult: Loading dose 0.75–1 mg, to be given over at
least 2 hours, then (by mouth) maintenance, start on
the following day, reduce dose in the elderly

**Dose equivalence and conversion**
Dose may need to be reduced if digoxin (or another
cardiac glycoside) has been given in the preceding 2
weeks. When switching from intravenous to oral route may
need to increase dose by 20–33% to maintain the same
plasma-digoxin concentration.

**SIDE-EFFECTS**

- Hypercalcaemia (risk of digitalis toxicity)
- Hypokalaemia (risk of digitalis toxicity)
- Hypomagnesaemia (risk of digitalis toxicity)
- Hypoxia (risk of digitalis toxicity)
- Recent myocardial infarction
- Severe respiratory disease
- Sick sinus syndrome
- Thyroid disease
- Wolff-Parkinson-White syndrome

**INTERACTIONS** → Appendix 1 (cardiac glycosides).

**CONTRA-INDICATIONS**
- Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—
  but use with caution)
- Hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—
  but use with caution)
- Intermittent complete heart block
- Myocarditis
- Second degree AV block
- Supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy)
- Ventricular tachycardia or fibrillation

**CAUTIONS**
- Hypercalcaemia
- Hypokalaemia
- Hypomagnesaemia
- Hypoxia
- Recent myocardial infarction
- Severe respiratory disease
- Sick sinus syndrome
- Thyroid disease

**OVERDOSE**
- If toxicity occurs, digoxin should be withdrawn; serious
  manifestations require urgent specialist management.

- PREGNANCY
  - May need dosage adjustment.

- BREAST FEEDING
  - Amount too small to be harmful.

- RENAL IMPAIRMENT
  - Reduce dose. Monitor plasma-digoxin concentration in renal impairment.

- MONITORING REQUIREMENTS
  - For plasma-digoxin concentration assay, blood should be
    taken at least 6 hours after a dose.
  - Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use Avoid rapid intravenous
    administration (risk of hypertension and reduced
    coronary flow). For intravenous infusion (Lanoxin®), give
    intermittently in Glucose 5% or Sodium chloride 0.9%;
    dilute to a concentration of not more than
    62.5 micrograms/mL. To be given over at least 2 hours.
  - With oral use For oral administration, oral solution must
    not be diluted.

- PATIENT AND CARER ADVICE
  - Patient counselling is advised for digoxin elixir (use pipette).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: solution for injection, oral suspension,
oral solution.
**2 Bleeding disorders**

### Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of tranexamic acid, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemorrhage) and in the management of menorrhagia. Tranexamic acid below may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin p. 574 is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

Etamsylate p. 96 reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

### ANTIFIBRINOLYTICS

#### Tranexamic acid

**INDICATIONS AND DOSE**

**Inhibition of fibrinolysis (local)**

**BY MOUTH**

- Adult: 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day

**INITIALLY BY SLOW INTRAVENOUS INJECTION**

- Adult: 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, dose may be followed by continuous infusion; (by continuous intravenous infusion) 25–50 mg/kg, dose to be given over 24 hours

#### Menorrhagia

**BY MOUTH**

- Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

#### Hereditary angioedema

**BY MOUTH**

- Adult: 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

#### Epistaxis

**BY MOUTH**

- Adult: 1 g 3 times a day for 7 days

#### General fibrinolysis

**BY SLOW INTRAVENOUS INJECTION**

- Adult: 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

---

**UNLICENSED USE** Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.

**CONTRA-INDICATIONS** Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) - history of convulsions - thromboembolic disease

**CAUTIONS** Irregular menstrual bleeding (establish cause before initiating therapy) - massive haematuria (avoid if risk of ureteric obstruction) - patients receiving oral contraceptives (increased risk of thrombosis)

**CAUTIONS, FURTHER INFORMATION**

**Menorrhagia** Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea (reduce dose) - nausea - vomiting
- **Uncommon** Dermatitis
- **Rare** Impairment of colour vision (discontinue) - thromboembolic events - visual disturbances (discontinue)
- **Frequency not known** Convulsions (usually with high doses) - hypotension (on rapid intravenous injection) - malaise (on rapid intravenous injection)

**PREGNANCY** No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

**BREAST FEEDING** Small amount present in milk—antifibrinolytic effect in infant unlikely.

**RENAL IMPAIRMENT** Reduce dose—consult product literature for details.

**MONITORING REQUIREMENTS** Regular liver function tests in long-term treatment of hereditary angioedema.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cyklokapron\textsuperscript{®}), give continuously in Glucose 5% or Sodium chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

**Tablet**

- **DIOXIN (Non-proprietary)**
  - **Digoxin 62.5 microgram** Digoxin 62.5 microgram tablets | 28 tablet (PPh £5.68 DT price = £1.49 | 500 tablet (PPh) no price available

HAEMOSTATICS

Etamsylate
(Ethamsylate)

INDICATIONS AND DOSE
Short-term blood loss in menorrhagia
BY MOUTH
- Adult: 500 mg 4 times a day during menstruration

- CONTRA-INDICATIONS: Acute porphyrias p. 864
- CAUTIONS: Exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment
- SIDE-EFFECTS: Diarrhoea - fever (discontinue treatment), headache - nausea - rashes - vomiting
- BREAST FEEDING: Present in milk - manufacturer advises avoid.
- LESS SUITABLE FOR PRESCRIBING: Less suitable for prescribing.
- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

2.1 Coagulation factor deficiencies

BLOOD COAGULATION FACTORS

Dried prothrombin complex
(Human prothrombin complex)

INDICATIONS AND DOSE
Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available.
Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)
BY INTRAVENOUS INJECTION
- Adult: (consult haematologist)
Major bleeding in patients on warfarin following phymenadione
BY INTRAVENOUS INJECTION
- Adult: 25–50 units/kg

- CONTRA-INDICATIONS: Angina - history of heparin induced thrombocytopenia - recent myocardial infarction (except in life-threatening haemorrhage following overdose of oral anticoagulants, and before induction of fibrinolytic therapy)
- CAUTIONS: Disseminated intravascular coagulation - history of myocardial infarction or coronary heart disease - postoperative use - risk of thrombosis
- SIDE-EFFECTS
  - Rare: Headache

- FREQUENCY not known: Disseminated intravascular coagulation - nephrotic syndrome - thrombotic events
- HEPATIC IMPAIRMENT: Monitor closely in hepatic impairment (risk of thromboembolic complications).
- PRESCRIBING AND DISPENSING INFORMATION: Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.
  Available from CSL Behring (Beriplex®P/N) Octapharma (Octaplex®)

Factor IX fraction, dried

INDICATIONS AND DOSE
Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)
BY INTRAVENOUS INJECTION OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: (consult haematologist)

- CONTRA-INDICATIONS: Disseminated intravascular coagulation
- CAUTIONS: Risk of thrombosis - principally with former low purity products
- SIDE-EFFECTS: Allergic reactions - chills - dizziness - fever - gastro-intestinal disturbances - headache
- PRESCRIBING AND DISPENSING INFORMATION: Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
- AlphaNine (Grifols UK Ltd)
  Factor IX high purity 500 unit AlphaNine 500 unit powder and solvent for solution for injection vials | 1 vial (Grifols) no price available
  Factor IX high purity 1000 unit AlphaNine 1000 unit powder and solvent for solution for injection vials | 1 vial (Grifols) £390.00
  Factor IX high purity 1500 unit AlphaNine 1500 unit powder and solvent for solution for injection vials | 1 vial (Grifols) no price available

- Mononine (CSL Behring UK Ltd)
  Factor IX high purity 1000 unit Mononine 1000 unit powder and solvent for solution for injection vials | 1 vial (Grifols) £478.43

- Repleni-VF (Bio Products Laboratory Ltd)
  Factor IX high purity 500 unit Repleni-VF 500 unit powder and solvent for solution for injection vials | 1 vial (Pfizer) £180.00 | 10 vial (Pfizer) no price available
  Factor IX high purity 1000 unit Repleni-VF 1000 unit powder and solvent for solution for injection vials | 1 vial (Pfizer) £360.00 | 10 vial (Pfizer) no price available

Powder and solvent for solution for infusion
- BeneFIX (Pfizer Ltd)
  Nonacog alfa 250 unit BeneFIX 250 unit powder and solvent for solution for infusion vials | 1 vial (Pfizer) £151.80
  Nonacog alfa 500 unit BeneFIX 500 unit powder and solvent for solution for infusion vials | 1 vial (Pfizer) £363.60

- BeneFIX (Pfizer Ltd)
  Nonacog alfa 1000 unit BeneFIX 1000 unit powder and solvent for solution for infusion vials | 1 vial (Pfizer) £607.70

- BeneFIX (Pfizer Ltd)
  Nonacog alfa 2000 unit BeneFIX 2000 unit powder and solvent for solution for infusion vials | 1 vial (Pfizer) £1,214.40

- BeneFIX (Pfizer Ltd)
  Nonacog alfa 3000 unit BeneFIX 3000 unit powder and solvent for solution for infusion vials | 1 vial (Pfizer) £1,821.60
Coagulation factor deficiencies

Factor VIIa (recombinant)
(Eptacog alfa (activated))

INDICATIONS AND DOSE
Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

BY INTRAVENOUS INJECTION OR BY CONTINUOUS INTRAVENOUS INFUSION
> Adult: (consult haematologist)

● CAUTIONS Disseminated intravascular coagulation - risk of thrombosis
● SIDE-EFFECTS
  ▶ Uncommon Deep vein thrombosis - fever - pulmonary embolism - rash - venous thromboembolic events
  ▶ Rare Angina - arterial thrombotic events - cerebrovascular accident - coagulation disorders - headache - myocardial infarction - nausea
  ▶ Frequency not known Anaphylaxis - angioedema - flushing

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

> NovoSeven (Novo Nordisk Ltd)
  Eptacog alfa activated 50000 unit NovoSeven 1mg (50,000units)
  powder and solvent for solution for injection pre-filled syringes
  1 pre-filled disposable injection (PFS) £525.20 (Hospital only)
  NovoSeven 1mg (50,000units) powder and solvent for solution for injection vials | 1 vial (PFS) £525.20 (Hospital only)
  Eptacog alfa activated 100000 unit NovoSeven 2mg (100,000units) powder and solvent for solution for injection vials | 1 vial (PFS) £1,050.40 (Hospital only)
  NovoSeven 2mg (100,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £1,050.40 (Hospital only)
  Eptacog alfa activated 250000 unit NovoSeven 5mg (250,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £2,626.00 (Hospital only)
  NovoSeven 5mg (250,000units) powder and solvent for solution for injection vials | 1 vial (PFS) £2,626.00 (Hospital only)
  Eptacog alfa activated 400000 unit NovoSeven 8mg (400,000units) powder and solvent for solution for injection vials | 1 vial (PFS) £4,201.60 (Hospital only)
  NovoSeven 8mg (400,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £4,201.60 (Hospital only)

Factor VIII fraction, dried
(Human coagulation factor VIII, dried)

INDICATIONS AND DOSE
Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand's disease

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY CONTINUOUS INTRAVENOUS INFUSION
> Adult: (consult haematologist)

● CAUTIONS Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates

● SIDE-EFFECTS

● MONITORING REQUIREMENTS Monitor for development of factor VIII inhibitors.

● PRESCRIBING AND DISPENSING INFORMATION
Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

> Advate (Baxter Healthcare Ltd)
  Octocog alfa 250 unit Advate 250unit powder and solvent for solution for injection vials | 1 vial (PFS) no price available
  Octocog alfa 500 unit Advate 500unit powder and solvent for solution for injection vials | 1 vial (PFS) no price available

> Fanhdi (Griifols Uk Ltd)
  Factor VII high purity 500 unit Fanhdi 500unit powder and solvent for solution for injection vials | 1 vial (PFS) £165.00 (Hospital only)
  Factor VII high purity 1000 unit Fanhdi 1,000unit powder and solvent for solution for injection vials | 1 vial (PFS) £330.00 (Hospital only)

> Helixate NexGen (CSL Behring Uk Ltd)
  Octocog alfa 250 unit Helixate NexGen 250unit powder and solvent for solution for injection vials | 1 vial (PFS) £118.57
  Octocog alfa 500 unit Helixate NexGen 500unit powder and solvent for solution for injection vials | 1 vial (PFS) £237.15
  Octocog alfa 1000 unit Helixate NexGen 1000unit powder and solvent for solution for injection vials | 1 vial (PFS) £474.30
  Octocog alfa 2000 unit Helixate NexGen 2,000unit powder and solvent for solution for injection vials | 1 vial (PFS) £948.60

> Kogenate (Bayer Plc)
  Octocog alfa 250 unit Kogenate Bayer 250unit powder and solvent for solution for injection vials | 1 vial (PFS) £157.50
  Octocog alfa 500 unit Kogenate Bayer 500unit powder and solvent for solution for injection vials | 1 vial (PFS) £315.00
  Octocog alfa 1000 unit Kogenate Bayer 1,000unit powder and solvent for solution for injection vials | 1 vial (PFS) £630.00
  Octocog alfa 2000 unit Kogenate Bayer 2,000unit powder and solvent for solution for injection vials | 1 vial (PFS) £1,260.00

Powder and solvent for solution for infusion

> Advate (Baxter Healthcare Ltd)
  Octocog alfa 1500 unit Advate 1,500unit powder and solvent for solution for infusion vials | 1 vial (PFS) no price available
  Octocog alfa 3000 unit Advate 3,000unit powder and solvent for solution for infusion vials | 1 vial (PFS) no price available

> Kogenate (Bayer Plc)
  Octocog alfa 3000 unit Kogenate Bayer 3,000unit powder and solvent for solution for injection vials | 1 vial (PFS) £1,890.00

Factor VIII inhibitor bypassing fraction

INDICATIONS AND DOSE
Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors | Treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
> Adult: (consult haematologist)

● CONTRA-INDICATIONS
Disseminated intravascular coagulation

● SIDE-EFFECTS
Anaphylaxis - disseminated intravascular coagulation - flushing - hypersensitivity - hypotension - myocardial infarction - paraesthesia - pyrexia - rash - thrombosis - urticaria

● PRESCRIBING AND DISPENSING INFORMATION
Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.
Factor XIII fraction, dried
(Human fibrin-stabilising factor, dried)

**INDICATIONS AND DOSE**
Congenital factor XIII deficiency
BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: (consult haematologist)

**SIDE-EFFECTS**
Rare Allergic reactions · fever

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- FEIBA Immuno (Baxter Healthcare Ltd)
  Factor VIII inhibitor bypassing fraction 500 unit FEIBA 500unit powder and solvent for solution for injection vials | 1 vial £90.59 no price available

**Powder and solvent for solution for infusion**
- FEIBA Immuno (Baxter Healthcare Ltd)
  Factor VIII inhibitor bypassing fraction 1000 unit FEIBA 1,000unit powder and solvent for solution for infusion vials | 1 vial £90.59 no price available

**Fibrinogen, dried (Human fibrinogen)**

**INDICATIONS AND DOSE**
Treatment of haemorrhage in congenital hypofibrinogenenaemia or afibrinogenenaemia
BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: (consult haematologist)

**CAUTIONS** Risk of thrombosis

**SIDE-EFFECTS**
- Rare Allergic reactions · fever
  - Very rare Myocardial infarction · pulmonary embolism · thromboembolic events

**PREGNANCY**
Manufacturer advises not known to be harmful—no information available.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**PREScribing AND DISPensing INFORMATION**
Fibrinogen is prepared from human plasma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Riastap (CSL Behring UK Ltd) Fibrinogen 1 gram Riastap 1g powder for solution for infusion vials | 1 vial £340.00

**Solution for sealant**
- FIBRINOGEN, DRIED (Non-proprietary) Fibrinogen 91 mg Fibrinogen 91mg powder for solution for sealant vials | 1 vial £90.59 no price available
- Fibrinogen 182 mg Fibrinogen 182mg powder for solution for sealant vials | 1 vial £90.59 no price available
- Fibrinogen 70 mg per 1 ml Fibrinogen 350mg/5ml solution for sealant vials | 1 vial £90.59 no price available (Hospital only)
  - Fibrinogen 140mg/2ml solution for sealant vials | 1 vial £90.59 no price available (Hospital only)

**BLOOD PRODUCTS**

**Fresh frozen plasma**

**INDICATIONS AND DOSE**
Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced
BY INTRAVENOUS INFUSION
Adult: (consult haematologist)
- Major bleeding in patients on warfarin following phytomenadione
  - Adult: 15 mL/kilogram

**Dose equivalence and conversion**
Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

**CONTRA-INDICATIONS** Avoid use as a volume expander · IgA deficiency with confirmed antibodies to IgA

**CAUTIONS**
Cardiac decompensation · need for compatibility · pulmonary oedema · severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®)

**SIDE-EFFECTS**
- Common or very common Nausea · pruritus · rash
- Uncommon Oedema · vomiting
- Rare Agitation · allergic reactions · bronchospasm · cardiorespiratory collapse · chills · fever · tachycardia
  - Very rare Arrhythmia · hypertension · thromboembolism

**PREScribing AND DISPensing INFORMATION**
Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood. A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG®)

**Protein C concentrate**

**INDICATIONS AND DOSE**
Congenital protein C deficiency
BY INTRAVENOUS INJECTION
Adult: (consult haematologist)

**CAUTIONS**
Hypersensitivity to heparins

**SIDE-EFFECTS**
- Very rare Bleeding · dizziness · fever · hypersensitivity reactions

**PREScribing AND DISPensing INFORMATION**
Protein C is prepared from human plasma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Ceprotin (Baxter Healthcare Ltd) Protein C 500 unit Ceprotin 500unit powder and solvent for solution for injection vials | 1 vial £90.59 no price available

- Ceprotin 1000 unit Ceprotin 1000unit powder and solvent for solution for injection vials | 1 vial £90.59 no price available

**Fibrinogen 455 mg** Fibrinogen 455mg powder for solution for sealant vials | 1 vial £90.59 no price available
2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

Nimodipine

The properties listed below are those particular to the drug. For properties common to the class, see Calcium-channel blockers, p. 147.

» DRUG ACTION Nimodipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE

Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

BY MOUTH

Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

BY INTRAVENOUS INFUSION

Adult (body-weight up to 70 kg): Initially 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure

BY INTRAVENOUS INFUSION

Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

» CONTRA-INDICATIONS Acute porphyrias p. 864 · unstable angina · within 1 month of myocardial infarction

» CAUTIONS Cerebral oedema · hypotension · severely raised intracranial pressure

» INTERACTIONS ➔ Appendix 1 (calcium-channel blockers, alcohol (infusion only)). Avoid concomitant administration with other calcium-channel blockers, beta-blocker and nephrotoxic drugs.

» SIDE-EFFECTS Flushing · gastro-intestinal disorders · headache · hypotension · ileus · nausea · sweating and feeling of warmth · thrombocytopenia · variation in heart-rate

» PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

» BREAST FEEDING Manufacturer advises avoid—present in milk.

» HEPATIC IMPAIRMENT Elimination reduced in cirrhosis—monitor blood pressure.

» RENAL IMPAIRMENT

» With intravenous use Manufacturer advises monitor renal function closely in renal impairment.

» DIRECTIONS FOR ADMINISTRATION Avoid concomitant administration of nimodipine infusion and tablets.

» With oral use For administration by mouth, tablets may be crushed or halved but are light sensitive—administer immediately.

» With intravenous use For intravenous infusion, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light. Polyethylene, polypropylene, or glass apparatus should be used. PVC should be avoided.

» MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

» Nimotop (Bayer Plc) Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet PFR £40.00

Solution for infusion

» Nimotop (Bayer Plc) Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 5 vial PFR £68.00 (Hospital only)

3 Blood clots

3.1 Blocked catheters and lines

Drugs used for Blocked catheters and lines not listed below; Heparin (unfractionated), p. 114 · Urokinase, p. 119

PROSTAGLANDINS (CARDIOVASCULAR)

Epoprostenol

(Prostacyclin)

» DRUG ACTION Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

INDICATIONS AND DOSE

Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated | Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

BY CONTINUOUS INTRAVENOUS INFUSION

» Adult: (consult product literature)

PHARMACOKINETICS

Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

» CONTRA-INDICATIONS Severe left ventricular dysfunction

» CAUTIONS Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) · extreme caution in coronary artery disease · haemorrhagic diathesis · pulmonary veno-occlusive disease · reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) · risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)

» INTERACTIONS Caution with concomitant use of drugs that increase risk of bleeding.
Prophylaxis of venous thromboembolism

All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmaceutical prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. NICE clinical guideline 92 (January 2010) provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health (www.gov.uk/dh).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition.

Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism, should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 114 is preferred for patients in renal failure. Fondaparinux sodium p. 109 is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastro-intestinal, bariatric, or day surgery procedures. The oral anticoagulants apixaban p. 108, dabigatran etexilate p. 117, and rivaroxaban p. 109 are indicated for thromboprophylaxis following hip or knee replacement surgery.

Pharmacological prophylaxis in general surgery should usually continue for 5–7 days, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen or pelvis. Hip or knee replacement surgery, and hip fracture surgery, require an extended duration of pharmacological prophylaxis, depending on the preparation used (consult product literature).

General medical patients who are considered to be at high risk of venous thromboembolism should be offered pharmacological prophylaxis on admission. Choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, heparin (unfractionated) (if patient in renal failure), or fondaparinux sodium prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Treatment of venous thromboembolism

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 121 is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is ≥2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated),

3.2 Thromboembolism

Venous thromboembolism

Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.
preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

Management of venous thromboembolism in pregnancy

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 112, enoxaparin sodium p. 113, and tinzaparin sodium p. 115. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1133 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Management of stroke

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

Transient ischaemic attack

Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 104 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 106 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

Ischaemic stroke

Initial management

Alteplase p. 194 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolytics and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 121 should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis.

Long-term management

Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a transient ischaemic attack, long-term treatment with modified-release dipyridamole in combination with aspirin is recommended. If patients are intolerant of aspirin, or it is contra-indicated, then modified-release dipyridamole p. 107 alone is recommended; if patients are intolerant of dipyridamole, or it is contra-indicated, then aspirin alone is recommended.

Patients who are intolerant of both aspirin and dipyridamole should receive clopidogrel alone [unlicensed use].

Following an ischaemic stroke (not associated with atrial fibrillation), clopidogrel is recommended as long-term treatment. If clopidogrel is contra-indicated or not tolerated, patients should receive modified-release dipyridamole in combination with aspirin; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin sodium or an alternative anticoagulant (see Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation.

A statin should be initiated 48 hours after stroke symptom onset, irrespective of the patient’s serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of < 130/80 mmHg. Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

Intracerebral haemorrhage

Initial Management

Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed; anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of
deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

Long-term management
Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

Oral anticoagulants
The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Coumarins and phenindione
The oral anticoagulants warfarin sodium p. 121, acenocoumarol p. 120 and phenindione p. 120, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 104 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 104) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

Dose
The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

Target INR
The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. Br J Haematol 2011; 154: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:
• treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium p. 121)
• atrial fibrillation
• cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
• dilated cardiomyopathy
• mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
• bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
• acute arterial embolism requiring embolectomy (consider long-term treatment)
• myocardial infarction
INR 3.5 for:
• recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2:
  • Mechanical prosthetic heart valves:
    • the recommended target INR depends on the type and location of the valve, and patient-related risk factors
    • consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Duration

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

Haemorrhage
The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytomenadione p. 889 (vitamin K₁) by slow intravenous injection; give dried prothrombin complex p. 96 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium p. 121; give phytomenadione p. 889 (vitamin K₁) by slow intravenous injection; repeat dose of phytomenadione p. 889 if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by mouth using the intravenous preparation orally (funs of the use); repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin when INR <5.0
● INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phenytoin mononitrone (vitamin K₃) by slow intravenous injection; restart warfarin sodium when INR <5.0
● INR 5.0–8.0, no bleeding— withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
● Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

**Peri-operative anticoagulation**
Warfarin sodium should usually be stopped 5 days before elective surgery; phenytoin mononitrone (vitamin K₃) by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is >1.5. If haemostasis is adequate, warfarin sodium can be resumed at the normal maintenance dose on the evening of surgery or the next day.

Patients stopping warfarin sodium prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy ('bridging') with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin sodium who require emergency surgery that can be delayed for 6–12 hours can be given intravenous phenytoin mononitrone (vitamin K₃) to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex p. 96 can be given in addition to intravenous phenytoin mononitrone (vitamin K₃) and the INR checked before surgery.

**Combined anticoagulant and antiplatelet therapy**
Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated. The addition of warfarin sodium, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient’s risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin p. 104 and warfarin sodium) or triple therapy (e.g. aspirin with clopidogrel p. 106 and warfarin sodium) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin sodium dual therapy is lower than with clopidogrel and warfarin sodium. Depending on the indications being treated and the patient’s risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin sodium therapy is complete, or vice versa (on specialist advice) in order to reduce the length of time on dual or triple therapy.

**Antiplatelet drugs**
Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin p. 104 in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

Clopidogrel p. 106 is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation; in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation; the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin. Patients who are not already taking clopidogrel should receive a loading dose prior to procedure.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance). Clopidogrel also has uses in stroke.

Dipyridamole is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 188, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 188, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

**Antiplatelet drugs and coronary stents**
Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

**Glycoprotein IIb/IIIa inhibitors**
Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab p. 183 is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin
Cardiovascular system

Venous thromboembolism.

Healthcare professionals experienced in the treatment of and for the prevention of clotting in extracorporeal circuits.

A duration of patients with solid tumours; treatment is recommended for treatment and prophylaxis of venous thromboembolism in patients with ST-segment elevation myocardial infarction. Tirofiban is also licensed for the extended use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatide p. 183 and tirofiban should be used by specialists only.

Epoprostenol p. 99 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

Parenteral anticoagulants

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or heparin (unfractionated) p. 114 to distinguish it from the low molecular weight heparins, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins

Low molecular weight heparins (dalteparin sodium p. 112, enoxaparin sodium p. 113, and tinzaparin sodium p. 115) are usually preferred over heparin (unfractionated) in the prevention of Venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and once-daily subcutaneous administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the treatment of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under Acute coronary syndromes p. 186) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids

Danaparoid sodium p. 111 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban

An oral anticoagulant can be given with argatroban monohydrate p. 116, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also Myocardial infarction: ST-segment elevation p. 186).

Heparin flushes

The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) p. 99 can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux

Fondaparinux sodium p. 109 is a synthetic pentasaccharide that inhibits activated factor X.

Aspirin

(Acetylsalicylic Acid)

Acute ischaemic stroke
BY MOUTH
▶ Adult: 300 mg daily for 14 days, to be initiated 24 hours after thrombolysis or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis

Atrial fibrillation following a disabling ischaemic stroke
BY MOUTH
▶ Adult: 300 mg daily for 14 days
Following disabling ischaemic stroke in patients receiving anticoagulation for a prosthetic heart valve
BY MOUTH
▶ Adult: 300 mg daily, anticoagulant treatment stopped for 7 days and to be substituted with aspirin

Following coronary by-pass surgery
BY MOUTH
▶ Adult: 75–300 mg daily
Mild to moderate pain
BY MOUTH
▶ Adult: 300–900 mg every 4–6 hours as required; maximum 4 g per day
BY RECTUM
▶ Adult: 450–900 mg every 4 hours; maximum 3.6 g per day

CONTRA-INDICATIONS Active peptic ulceration - bleeding disorders (antiplatelet dose) - children under 16 years (risk of Reye’s syndrome) - haemophilia - previous peptic ulceration (analgesic dose) - severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION
Reye’s syndrome Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

CAUTIONS Allergic disease - anaemia - asthma - dehydration - elderly - G6PD deficiency - preferably avoid during fever or viral infection in children (risk of Reye’s syndrome) - previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) - thyrotoxicosis - uncontrolled hypertension

INTERACTIONS → Appendix 1 (aspirin).
Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS Blood disorders (with analgesic doses) - bronchospasm - confusion (with analgesic doses) - gastrointestinal haemorrhage (occasionally major) - gastrointestinal irritation (with slight asymptomatic blood loss at higher doses) - haemorrhage including subconjunctival haemorrhage (reported with antiplatelet doses) - increased bleeding time - skin reactions in hypersensitive patients - tinnitus (with analgesic doses)

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.
For specific details on the management of poisoning, see Aspirin, under Emergency treatment of poisoning p. 1123.

ALLERGY AND CROSS-SENSITIVITY Aspirin is contra-indicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

BREAST FEEDING Avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinemia in infant if neonatal vitamin K stores low.

HEPATIC IMPAIRMENT Avoid in severe impairment—increased risk of gastro-intestinal bleeding.

RENAL IMPAIRMENT Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.

PRESCRIBING AND DISPENSING INFORMATION BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Aspirin Dispersible Tablets 300 mg may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder, capsules, liquid

Clopidogrel

INDICATIONS AND DOSE

Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel

BY MOUTH

▶ Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin / Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin

BY MOUTH

▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke

BY MOUTH

▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)

BY MOUTH

▶ Adult: Initially 300 mg, then 75 mg daily for up to 12 months

Prevention of atherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)

BY MOUTH

▶ Adult 18-75 years: Initially 300 mg, then 75 mg for at least 4 weeks
▶ Adult 76 years and over: 75 mg daily

Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (with aspirin) and for whom warfarin is unsuitable

BY MOUTH

▶ Adult: 75 mg once daily

UNLICENSED USE 600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose. Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.

CONTRA-INDICATIONS Active bleeding

CAUTIONS Discontinue 7 days before elective surgery if antiplatelet effect not desirable - patients at risk of increased bleeding from trauma, surgery, or other pathological conditions

INTERACTIONS → Appendix 1 (clopidogrel).

Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

▶ Abdominal pain - bleeding disorders (including gastro-intestinal and intracranial) - diarrhoea - dyspepsia

▶ Constipation - decreased platelets - dizziness - duodenal ulcers - eosinophilia - flatulence - gastric ulcer - gastritis - headache - leucopenia - nausea - paraesthesia - pruritus - rash - vomiting

Rare Vertigo

ALLERGY AND CROSS-SENSITIVITY Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

PREGNANCY Manufacturer advises avoid — no information available.

HEPATIC IMPAIRMENT Manufacturer advises caution (risk of bleeding). Avoid in severe impairment.

RENAL IMPAIRMENT Manufacturer advises caution.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Clopidogrel and modified-release dipyramidole in the prevention of occlusive vascular events (December 2010) NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures. Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

▶ an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or
▶ a myocardial infarction, only if aspirin is contraindicated or not tolerated. www.nice.org.uk/TA210

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only.

The Scottish Medicines Consortium has also advised (July 2007) that clopidogrel be accepted for restricted use for patients at ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder for suspension.

Tablet

▶ CLOPIDOGREL (Non-proprietary)

Clopidogrel 75 mg Plavix 75mg tablets | 28 tablet £30.54 DT price = £1.82 | 30 tablet £32.71

Clopidogrel 75 mg Grepid 75mg tablets | 30 tablet £32.28

Plavix (Sanofi)

Clopidogrel 75 mg Plavix 75mg tablets | 30 tablet £35.64

Clopidogrel (as Clopidogrel hydrogen sulfate) 300 mg Plavix 300mg tablets | 30 tablet £142.54 DT price = £142.54
Dipyridamole

INDICATIONS AND DOSE
Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin) | Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 200 mg twice daily, to be taken preferably with food

BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: 300–600 mg daily in 3–4 divided doses

Myocardial imaging—diagnostic use only
Adult: (consult product literature)

CAUTIONS
Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of exacerbation) · rapidly worsening angina · recent myocardial infarction

INTERACTIONS Appendix 1 (dipyridamole). Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS
Angioedema · dizziness · gastro-intestinal effects · hot flushes · hypersensitivity reactions · hypotension · increased bleeding after surgery · increased bleeding during surgery · myalgia · rash · severe bronchospasm · tachycardia · throbbing headache · thrombocytopnea · urticaria · worsening symptoms of coronary heart disease

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Manufacturers advise use only if essential—small amount present in milk.

PRESCRIBING AND DISPENSING INFORMATION
Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:
- a transient ischaemic attack, or
- an ischaemic stroke, only if clopidogrel is contraindicated or not tolerated.

Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:
- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
- a transient ischaemic attack, only if aspirin is contraindicated or not tolerated. www.nice.org.uk/TA210

Aspirin with dipyridamole

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 104, dipyridamole above.

INDICATIONS AND DOSE
Secondary prevention of ischaemic stroke and transient ischaemic attacks

BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: 25/200 mg twice daily

PRESCRIBING AND DISPENSING INFORMATION
Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening.

**Cardiovascular system**

When used for prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and/or pulmonary embolism in adults following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism. Use with caution if creatinine clearance < 30 mL/minute—no information available.

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism following knee replacement surgery**

**BY MOUTH**

- Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery.

**Prophylaxis of venous thromboembolism following hip replacement surgery**

**BY MOUTH**

- Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery.

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

**BY MOUTH**

- Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily.

**Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism**

**BY MOUTH**

- Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment.

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age ≥ 75 years**

**BY MOUTH**

- Adult: 2.5 mg twice daily.
- Adult 18-79 years: 5 mg twice daily.
- Adult 80 years and over (body-weight up to 61 kg): 2.5 mg twice daily.

**Dose equivalence and conversion**

For information on changing from, or to, other anticoagulants, consult product literature.

**CONTRA-INDICATIONS**

Active bleeding, malignant neoplasms, oesophageal varices, recent brain surgery, recent gastro-intestinal ulcer, recent intracranial haemorrhage, recent ophthalmic surgery, recent spine surgery, significant risk of major bleeding, vascular aneurysm.

**CAUTIONS**

Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal), prosthetic heart valve (efficacy not established)—risk of bleeding.

**INTERACTIONS**

Appendix 1 (apixaban). Caution in concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- Common or very common: Anaemia, bruising, haemorrhage, nausea.
- Uncommon: Hypotension, rash, thrombocytopenia.
- PREGNANCY: Manufacturer advises avoid—no information available.
- BREAST FEEDING: Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT: Avoid in severe impairment and in hepatic disease associated with coagulopathy.
- RENAL IMPAIRMENT:

  - When used for prophylaxis of stroke and systemic embolism in atrial fibrillation: Reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute, or if serum-creatinine ≥ 133 micromol/ litre and age ≥ 80 years or body-weight < 60 kg.

  - When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism: Use with caution if creatinine clearance 15–29 mL/minute. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available.

**MONITORING REQUIREMENTS**

- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

**PRESCRIBING AND DISPENSING INFORMATION**

Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation. Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012) NICE TA245

Apixaban is an option for the prevention of venous thromboembolism in adults following elective hip or knee replacement surgery. www.nice.org.uk/TA245

- Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013) NICE TA275

Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:

- previous stroke or transient ischaemic attack
- symptomatic heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient. www.nice.org.uk/TA275

- Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015) NICE TA341

Apixaban is an option for the treatment and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA341

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

  - Apixaban 5 mg: Eliquis 5 mg tablets | 28 tablet [P] £30.75 | 56 tablet [P] £61.50 DT price = £61.50
Fondaparinux sodium

**DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery**

**BY SUBCUTANEOUS INJECTION**
- Adult: Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily.

**Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness**

**BY SUBCUTANEOUS INJECTION**
- Adult: 2.5 mg once daily.

**Treatment of superficial-vein thrombosis**

**BY SUBCUTANEOUS INJECTION**
- Adult (body-weight 50 kg and above): 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively.

**Treatment of unstable angina and non-ST-segment elevation myocardial infarction**

**BY SUBCUTANEOUS INJECTION**
- Adult: 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively.

**Treatment of ST-segment elevation myocardial infarction initially by intravenous injection or by intravenous infusion**

- Adult: Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively.

**Treatment of deep-vein thrombosis and pulmonary embolism**

**BY SUBCUTANEOUS INJECTION**
- Adult (body-weight up to 50 kg): 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours).
- Adult (body-weight 50-100 kg): 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours).
- Adult (body-weight 101 kg and above): 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours).

**CONTRA-INDICATIONS** Active bleeding - bacterial endocarditis

**CAUTIONS** Active gastro-intestinal ulcer disease - bleeding disorders - brain surgery - elderly patients - low body-weight - ophthalmic surgery - recent intracranial haemorrhage - risk of catheter thrombus during percutaneous coronary intervention - spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) - spinal surgery

**INTERACTIONS** → Appendix 1 (fondaparinux).

Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**
- **Common or very common** Anaemia - bleeding - purpura
- **Uncommon** Chest pain - dyspnoea - gastro-intestinal disturbances - hepatic impairment - oedema - pruritus - rash - thrombocytopenia - thrombocytopenia
- **Rare** Anxiety - confusion - cough - dizziness - drowsiness - flushing - headache - hyperbilirubinaemia - hypokalaemia - hypotension - injection-site reactions - vertigo
- **Frequency not known** Atrial fibrillation - pyrexia - tachycardia

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Caution in severe impairment (increased risk of bleeding).

**RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.

- When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m².
- When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Avoid if eGFR less than 20 mL/minute/1.73 m².
- When used for treatment of venous thromboembolism Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Arixtra®), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Arixtra (Aspen Pharma Trading Ltd)

  Arixtra 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£116.53)
  Arixtra 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£116.53)

**Rivaroxaban**

**DRUG ACTION** Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism following knee replacement surgery**

**BY MOUTH**
- Adult: 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery.

**Prophylaxis of venous thromboembolism following hip replacement surgery**

**BY MOUTH**
- Adult: 10 mg once daily for 5 days, to be started 6–10 hours after surgery (continued).
Initial treatment of deep-vein thrombosis | Initial treatment of pulmonary embolism
BY MOUTH
- Adult: Initially 15 mg twice daily for 21 days, to be taken with food

Continued treatment of deep-vein thrombosis (following initial treatment) | Continued treatment of pulmonary embolism (following initial treatment)
Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism
BY MOUTH
- Adult: 20 mg once daily, to be taken with food

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age ≥75 years, or diabetes mellitus
BY MOUTH
- Adult: 2.5 mg twice daily usual duration 12 months

Dose equivalence and conversion
For information on changing from, or to, other anticoagulants—consult product literature.

- CAUTIONS Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) - bronchiectasis - prostatic heart valve (efficacy not established) - risk of bleeding - rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy - severe hypertension - vascular retinopathy

- INTERACTIONS Appendix 1 (rivaroxaban).

Caution in concomitant use of drugs that increase risk of bleeding.

- SIDE-EFFECTS
  - Common or very common Abdominal pain - constipation - diarrhoea - dizziness - dyspepsia - haemorrhage - headache - hypotenion - nausea - pain in extremities - pruritus - rash - renal impairment - vomiting
  - Uncommon Angioedema - dry mouth - malaise - syncope - tachycardia - thrombocytopenia
  - Rare Jaundice - oedema

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT Avoid in liver disease with coagulopathy.

- RENAL IMPAIRMENT When used for treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism Initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15–49 mL/minute.

- When used for prophylaxis of stroke and systemic embolism in atrial fibrillation Reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute.

- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery and prophylaxis of atherothrombotic events in acute coronary syndrome Use with caution if creatinine clearance 15–29 mL/minute. Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).

Avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance.

- MONITORING REQUIREMENTS
  - Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
  - No routine anticoagulant monitoring required (INR tests are unreliable).

- DIRECTIONS FOR ADMINISTRATION Tablets may be crushed and mixed with water or apple puree just before administration.

- PRESCRIBING AND DISPENSING INFORMATION Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009) NICE TA170 Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. www.nice.org.uk/TA170

- Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation (May 2012) NICE TA256 Rivaroxaban is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: previous stroke or transient ischaemic attack - congestive heart failure - age ≥75 years - diabetes mellitus - hypertension

The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient. www.nice.org.uk/TA256

- Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013) NICE TA287 Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA287
Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015)

NICE TA335

Rivaroxaban is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers. The patient’s risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient. A decision on continuation of treatment should be taken no later than 12 months after starting treatment.

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2012) that rivaroxaban (Xarelto®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Xarelto (Bayer Plc) ▼
  - Rivaroxaban 2.5 mg: Xarelto 2.5mg tablets | 56 tablet £58.80
  - Rivaroxaban 10 mg: Xarelto 10mg tablets | 10 tablet £21.00 | 30 tablet £63.00
  - Rivaroxaban 15 mg: Xarelto 15mg tablets | 14 tablet £29.40 | 28 tablet £58.80 | 42 tablet £88.20 | 100 tablet £210.00
  - Rivaroxaban 20 mg: Xarelto 20mg tablets | 28 tablet £58.80 | 100 tablet £210.00

**HEPARINOIDs**

**Danaparoid sodium**

**INDICATIONS AND DOSE**

Prevention of deep-vein thrombosis in general or orthopaedic surgery

**BY SUBCUTANEOUS INJECTION**

- Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

**CONTRA-INDICATIONS**

Active peptic ulcer (unless this is the reason for operation) • acute bacterial endocarditis • diabetic retinopathy • epidural anaesthesia (with treatment doses) • haemophilia and other haemorrhagic disorders • recent cerebral haemorrhage • severe hypertension • spinal anaesthesia (with treatment doses) • thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

**CAUTIONS**

Antibodies to heparins (risk of antibody-induced thrombocytopenia) • body-weight over 90 kg • recent bleeding • risk of bleeding

**INTERACTIONS**

Appendix 1 (danaparoid).

Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

Bleeding • hypersensitivity reactions • rash

**PREGNANCY**

Manufacturer advises avoid—limited information available but not known to be harmful.

**BREAST FEEDING**

Amount probably too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

**RENAL IMPAIRMENT**

Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Orgaran (Aspen Pharma Trading Ltd)
  - Danaparoid sodium 1250 unit per 1 ml
  - Orgaran 750units/0.6ml solution for injection ampoules | 10 ampoule £266.73

**Heparins**

**CONTRA-INDICATIONS**

Acute bacterial endocarditis • after major trauma • epidural anaesthesia with treatment doses • haemophilia and other haemorrhagic disorders • peptic ulcer • recent cerebral haemorrhage • recent surgery to eye • recent surgery to nervous system • severe hypertension • spinal anaesthesia with treatment doses • thrombocytopenia (including history of heparin-induced thrombocytopenia)

**CAUTIONS**

Elderly

**INTERACTIONS**

Appendix 1 (heparins).

Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- Rare Alopecia (on prolonged use) • anaphylaxis • angioedema • hyperkalaemia • hypersensitivity reactions • injection-site reactions • osteoporosis (risk lower with low molecular weight heparins) • priapism • rebound hyperlipidaemia (following unfractonated heparin withdrawal) • skin necrosis • urticaria
- Frequency not known Haemorrhage • thrombocytopenia
SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw unfracti"oned or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfracti"oned or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

- Allergy and cross-sensitivity Hypersensitivity to unfracti"oned or low molecular weight heparin.

• Monitoring requirements
  - Heparin-induced thrombocytopenia Platelet counts should be measured just before treatment with unfracti"oned or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. Br J Haematol 2012; 159: 528–540.
  - Hyperkalaemia Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

Dalteparin sodium

Indications and dose Fragmin® graduated syringes

Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) BY SUBCUTANEOUS INJECTION
- Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 69 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days)
- Adult: (body-weight up to 79 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days)
- Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days)
- Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days)

Fragmin® single-dose syringes

Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk BY SUBCUTANEOUS INJECTION
- Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

Prophylaxis of deep-vein thrombosis in surgical patients—high risk BY SUBCUTANEOUS INJECTION
- Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients BY SUBCUTANEOUS INJECTION
- Adult: 5000 units every 24 hours

Treatment of deep-vein thrombosis, with oral anticoagulant treatment / Treatment of pulmonary embolism, with oral anticoagulant treatment BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 45 kg): 7500 units daily until adequate oral anticoagulation established
- Adult (body-weight 46–56 kg): 10 000 units daily until adequate oral anticoagulation established
- Adult (body-weight 57–68 kg): 12 500 units daily until adequate oral anticoagulation established
- Adult (body-weight 69–82 kg): 15 000 units daily until adequate oral anticoagulation established
- Adult (body-weight 83 kg and above): 18 000 units daily until adequate oral anticoagulation established

Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours
- Adult (body-weight 40–45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 46–56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult: (body-weight 57–68 kg): 12 500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 69–82 kg): 15 000 units once daily for 30 days, then 12 500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
- Adult (body-weight 83 kg and above): 18 000 units once daily for 30 days, then 18 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
Treatment of venous thromboembolism in pregnancy

**BY SUBCUTANEOUS INJECTION**
- Adult (body-weight up to 49 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
- Adult (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
- Adult (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
- Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

**FRAGMIN®**

Treatment of deep-vein thrombosis, with oral anticoagulant treatment

**BY SUBCUTANEOUS INJECTION**
- Adult: 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation established

Treatment of deep-vein thrombosis, with oral anticoagulant treatment (in patients at increased risk of haemorrhage)

**BY SUBCUTANEOUS INJECTION**
- Adult: 100 units/kg twice daily until adequate oral anticoagulation established

**UNLICENSED USE**

Not licensed for treatment of venous thromboembolism in pregnancy.

**PREGNANCY**

Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.

**BREAST FEEDING**

Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.

**HEPATIC IMPAIRMENT**

Dose reduction may be required in severe impairment—risk of bleeding may be increased.

**RENAL IMPAIRMENT**

Risk of bleeding may be increased—dose reduction may be required. Use of unfractionated heparin may be preferable.

**MONITORING REQUIREMENTS**

- For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.
- Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (SMC) has advised (February 2011) that dalteparin (Fragmin®) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism and prevention of its recurrence in patients with solid tumours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- Fragmin (Pfizer Ltd)
  - Dalteparin sodium 2500 unit per 1 ml Fragmin 10,000 units/4ml solution for injection ampoules | 10 ampoule (PFS) £51.22
  - Dalteparin sodium 10000 unit per 1 ml Fragmin 10,000 units/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) £28.23
  - Fragmin 10,000units/1ml solution for injection ampoules | 10 ampoule (PFS) £51.22

  - Fragmin 5,000units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £28.23
  - Fragmin 12,500units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) £35.25
  - Fragmin 7,500units/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £42.34
  - Fragmin 100,000units/4ml solution for injection vials | 1 vial (PFS) £48.66
  - Fragmin 10,000units/0.4ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PFS) £28.23

**Enoxaparin sodium**

**INDICATIONS AND DOSE**

Treatment of venous thromboembolism in pregnancy

**BY SUBCUTANEOUS INJECTION**
- Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
- Adult (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
- Adult (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
- Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

**Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk**

**BY SUBCUTANEOUS INJECTION**
- Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

**Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)**

**BY SUBCUTANEOUS INJECTION**
- Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

**Prophylaxis of deep-vein thrombosis in medical patients**

**BY SUBCUTANEOUS INJECTION**
- Adult: 40 mg every 24 hours

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

**BY SUBCUTANEOUS INJECTION**
- Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

**Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)**

**INITIALLY BY INTRAVENOUS INJECTION**
- Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours...
(max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only

- **BY SUBCUTANEOUS INJECTION**
  - Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only

**Treatment of acute ST-segment elevation myocardial infarction (patients undergoing percutaneous coronary intervention)**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

- **INITIALLY BY SUBCUTANEOUS INJECTION**
  - Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, dose to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously

**Unstable angina | Non-ST-segment-elevation myocardial infarction**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 1 mg/kg every 12 hours usually for 2–8 days (minimum 2 days)

**Prevention of clotting in extracorporeal circuits**

- **TO THE DEVICE AS A FLUSH**
  - Adult: (consult product literature)

**Dose equivalence and conversion**

1 mg equivalent to 100 units.

---

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- **Clexane (Sanofi)**
  - Enoxaparin sodium 100 mg per 1 ml Clexane 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £45.65 DT price = £45.65
  - Clexane 300mg/3ml solution for injection multidose vials | 1 vial | £21.33
  - Clexane 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £64.86 DT price = £64.86
  - Clexane 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £30.27 DT price = £30.27
  - Clexane 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £80.33 DT price = £80.33
  - Clexane 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £22.72 DT price = £22.72

- **Enoxaparin sodium 150 mg per 1 ml**
  - Clexane Forte 120mg/0.8ml solution for injection pre-filled syringes | £97.70 DT price = £97.70
  - Clexane Forte 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £111.01 DT price = £111.01

**Heparin (unfractionated)**

**INDICATIONS AND DOSE**

- **Treatment of mild to moderate pulmonary embolism**
  - **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

- **Treatment of unstable angina | Treatment of acute peripheral arterial occlusion**
  - **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

- **Treatment of deep-vein thrombosis**
  - **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

**Thromboprophylaxis in medical patients**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 5000 units every 8–12 hours

**Thromboprophylaxis in surgical patients**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8–12 hours

**Thromboprophylaxis during pregnancy**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 5000–10 000 units every 12 hours, to be administered with monitoring. **Important:** prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management

**Haemodialysis**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour

**Prevention of clotting in extracorporeal circuits**

- **TO THE DEVICE AS A FLUSH**
  - Adult: (consult product literature)
Thromboembolism

**Tinzaparin sodium**

**INDICATIONS AND DOSE**

**INNOHEP® 10,000 UNITS/ML**

Prophylaxis of deep-vein thrombosis (general surgery)
- Adult: 3500 units for 1 dose, dose to be given 2 hours before surgery, then 3500 units every 24 hours

Prophylaxis of deep-vein thrombosis (orthopaedic surgery)
- Adult: Initially 50 units/kg for 1 dose, dose to be given 2 hours before surgery, then 50 units/kg every 24 hours, alternatively initially 4500 units for 1 dose, dose to be given 12 hours before surgery, then 4500 units every 24 hours

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism
- **BY SUBCUTANEOUS INJECTION**
  - Adult: 175 units/kg once daily for up to 6 months

Treatment of venous thromboembolism in patients with solid tumours | Prophylaxis of venous thromboembolism in patients with solid tumours
- **BY SUBCUTANEOUS INJECTION**
  - Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

**SIDE-EFFECTS**
- Uncommon: Headache

**UNLICENSED USE**
- Not licensed for the treatment of venous thromboembolism in pregnancy.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, solution for infusion

---

**Sniff**

To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices

- **TO THE DEVICE AS A FLUSH**
  - Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use

---

#### PREGNANCY
- Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.

#### BREAST FEEDING
- Not excreted into milk due to high molecular weight.

#### HEPATIC IMPAIRMENT
- Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).

#### RENAL IMPAIRMENT
- Risk of bleeding increased in severe impairment—dose may need to be reduced.

#### DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.

#### PRESCRIBING AND DISPENSING INFORMATION
- Doses listed take into account the guidelines of the British Society for Haematology.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, solution for infusion

---

**Solution for injection**

**EXCIPIENTS:** May contain Benzy alcohol

- **HEPARIN (UNFRACTIONATED) (Non-proprietary)**
  - Heparin sodium 1000 unit per 1 ml: Heparin sodium 1000 units/1ml solution for injection ampoules | 10 ampoule (POM) £14.85

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
Argatroban monohydrate

INDICATIONS AND DOSE
Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment

INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased up to 10 micrograms/kg/minute maximum duration of treatment 14 days

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)

BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: (consult product literature)

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: Dose should be temporarily reduced to 2 micrograms/kg/minute, and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

CAUTIONS
- Bleeding disorders - diabetic retinopathy - gastro-intestinal ulceration - immediately after lumbar puncture - major surgery (especially of brain, spinal cord, or eye) - risk of bleeding - severe hypertension - spinal anaesthesia

INTERACTIONS
- Appendix 1 (argatroban). Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS
- Common or very common Haemorrhage - nausea - purpura

PREGNANCY
- Manufacturer advises avoid unless essential—limited information available.

BREAST FEEDING
- Avoid—no information available.

HEPATIC IMPAIRMENT
- Reduce initial dose to 500 nanograms/kg/minute in moderate impairment. Avoid in severe impairment or in patients with hepatic impairment undergoing percutaneous coronary intervention.

MONITORING REQUIREMENTS
- Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.

DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Exembol®) give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute each 2.5–mL vial with 250 mL infusion fluid.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- EXCEPT FOR: May contain Ethanol
- Exembol (Mitsubishi Pharma Europe Ltd)
- Argatroban monohydrate 100 mg per 1 ml Exembol 250mg/2.5ml concentrate for solution for infusion vials | 1 vial (Post) no price available

Bivalirudin

DRUG ACTION
- Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

INDICATIONS AND DOSE
Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel) INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour (for up to 72 hours in medically managed patients)

Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 100 micrograms/kg for 1 dose, then (by intravenous injection) 500 micrograms/kg for 1 dose, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4–12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin
Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)

INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion) 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour may be continued for a further 4–12 hours if necessary

CONTRA-INDICATIONS Active bleeding - bleeding disorders - severe hypertension - subacute bacterial endocarditis

CAUTIONS Brachytherapy procedures - previous exposure to lepirudin (theoretical risk from lepirudin antibodies)

INTERACTIONS → Appendix 1 (bivalirudin).
Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS
- Common or very common Bleeding (discontinue) - ecchymosis
- Uncommon Allergic reactions - anemia - headache - hypotension - isolated reports of anaphylaxis - nausea - thrombocytopenia
- Rare Back pain - bradycardia - dyspnoea - tachycardia - thrombosis - vomiting

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

BREAST FEEDING Manufacturer advises caution—no information available.

RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².
- When used for percutaneous coronary intervention Reduce rate of infusion to 1.4 mg/kg/hour and monitor blood clotting parameters if eGFR 30–60 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Angiox®), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.

NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230

Bivalirudin in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. www.nice.org.uk/TA230

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2008) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

The Scottish Medicines Consortium has advised (August 2010) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Angiox (The Medicines Company UK Ltd)
  - Bivalirudin 250 mg Angiox 250mg powder for solution for injection vials 10 vial (£39) no price available

Dabigatran etexilate
- DRUG ACTION Dabigatran etexilate is a direct thrombin inhibitor with a rapid onset of action.

INDICATIONS AND DOSE
Prophylaxis of venous thromboembolism following total knee replacement surgery
BY MOUTH
- Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 9 days, to be followed 12–24 hours after initial dose
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 9 days, to be followed 12–24 hours after initial dose

Prophylaxis of venous thromboembolism following total knee replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil
BY MOUTH
- Adult: 110 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 9 days, to be followed 12–24 hours after initial dose

Prophylaxis of venous thromboembolism following total hip replacement surgery
BY MOUTH
- Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 27–34 days, to be followed 12–24 hours after initial dose
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 27–34 days, to be followed 12–24 hours after initial dose

Prophylaxis of venous thromboembolism following total hip replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil
BY MOUTH
- Adult: 110 mg, to be taken 1–4 hours after surgery, followed by 150 mg daily for 27–34 days, to be followed 12–24 hours after initial dose

TREATMENT OF DEEP-VEIN THROMBOSIS | TREATMENT OF PULMONARY EMBOLISM | PROPHYLAXIS OF RECURRENT DEEP-VEIN THROMBOSIS | PROPHYLAXIS OF RECURRENT PULMONARY EMBOLISM
BY MOUTH
- Adult 18–74 years: 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Adult 75–79 years: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Adult 80 years and over: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

continued
Treatment of deep-vein thrombosis in patients with moderate renal impairment | Treatment of deep-vein thrombosis in patients at increased risk of bleeding | Treatment of pulmonary embolism in patients with moderate renal impairment | Treatment of pulmonary embolism in patients at increased risk of bleeding | Prophylaxis of recurrent deep-vein thrombosis in patients with moderate renal impairment | Prophylaxis of recurrent deep-vein thrombosis in patients at increased risk of bleeding | Prophylaxis of recurrent pulmonary embolism in patients with moderate renal impairment | Prophylaxis of recurrent pulmonary embolism in patients at increased risk of bleeding

**BY MOUTH**
- Adult: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Treatment of deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Treatment of pulmonary embolism in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent pulmonary embolism in patients receiving concomitant treatment with verapamil

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation**
- with and one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension

**BY MOUTH**
- Adult 18–74 years: 150 mg twice daily
- Adult 75–79 years: 110–150 mg twice daily
- Adult 80 years and over: 110 mg twice daily

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation**
- with and one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients at increased risk of bleeding | Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation

**Dose equivalence and conversion**
For information on changing from, or to, other anticoagulants, consult product literature.

**CONTRA-INDICATIONS**
- Active bleeding | do not use as anticoagulant for prosthetic heart valve | malignant neoplasms | oesophageal varices | recent brain surgery | recent gastro-intestinal ulcer | recent intracranial haemorrhage | recent ophthalmic surgery | recent spine surgery | significant risk of major bleeding | vascular aneurysm

**CAUTIONS**
- Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs) | bacterial endocarditis | bleeding disorders | body-weight less than 50 kg | elderly | gastritis | gastro-oesophageal reflux | oesophagitis | recent biopsy | recent major trauma | thrombocytopenia

**INTERACTIONS**
- Appendix 1 (dabigatran)
- Caution in concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**
- Common or very common Abdominal pain | anaemia | diarrhoea | dyspepsia | haemorrhage | nausea
- Uncommon Dysphagia | gastro-intestinal ulcer | gastro-oesophageal reflux | hepatobiliary disorders | oesophagitis | thrombocytopenia | vomiting

**PREGNANCY**
- Manufacturer advises avoid unless essential—toxicity in animal studies.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- Avoid in severe liver disease, especially if prothrombin time already prolonged.

**RENAL IMPAIRMENT**
- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery Reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil.
- When used for treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation. Consider reduced dose of 110 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding. Avoid if creatinine clearance less than 30 mL/minute. In renal impairment monitor renal function at least annually (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance).

**MONITORING REQUIREMENTS**
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).
- Assess renal function (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.

**DIRECTIONS FOR ADMINISTRATION**
- When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.

**PRESCRIBING AND DISPENSING INFORMATION**
- Dabigatran etexilate is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deep-vein thrombosis or pulmonary embolism.

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
  - Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008) NICE TAs?
  - Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip surgery.
replacement or total knee replacement surgery. www.nice.org.uk/TA157

- Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012) NICE TA249

Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:

- previous stroke, transient ischaemic attack, or systemic embolism
- left ventricular ejection fraction <40%
- symptomatic heart failure
- age ≥75 years
- age ≥65 years in patients with diabetes mellitus, coronary artery disease, or hypertension

The risks and benefits of dabigatran compared to warfarin should be discussed with the patient. www.nice.org.uk/TA249

- Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (December 2014) NICE TA327

Dabigatran etexilate is recommended, within its marketing authorisation, as an option for treating and for preventing recurrent deep vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA327

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tissue Plasminogen Activators**

**Urokinase**

The properties listed below are those particular to the drug only. For properties common to the class, see fibrinolytics, p. 154.

**INDICATIONS AND DOSE**

**Deep-vein thrombosis (thromboembolic occlusive vascular disease)**

**BY INTRAVENOUS INFUSION**

- Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

**Pulmonary embolism (thromboembolic occlusive vascular disease)**

**BY INTRAVENOUS INFUSION**

- Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

**Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)**

**BY INTRA-ARTERIAL INFUSION**

- Adult: (consult product literature)

**Occluded central venous catheters**

**BY INTRA-ARTERIAL INJECTION**

- Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/ml; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

**Occluded arteriovenous haemodialysis shunts**

**BY INTRAVENOUS INFUSION OR BY INTRA-ARTERIAL INFUSION**

- Adult: (consult product literature)

**SYNER-KINASE®**

**Deep-vein thrombosis (thromboembolic occlusive vascular disease)**

**BY INTRAVENOUS INFUSION**

- Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 ml sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

**Pulmonary embolism (thromboembolic occlusive vascular disease)**

**INITIALLY BY INTRAVENOUS INFUSION**

- Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 ml sodium chloride 0.9%, followed by (by intravenous infusion) 4400 micrograms/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses adjusted according to response; maximum 3 doses per day

**Occlusive peripheral arterial disease**

**BY INTRA-ARTERIAL INFUSION**

- Adult: (consult product literature)

**Occluded catheters and cannulas**

**BY INTRA-ARTERIAL INJECTION OR BY INTRAVENOUS INJECTION**

- Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Dose reduction may be required.

- **RENAL IMPAIRMENT** Dose reduction may be required.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Syner-KINASE®), give continuously or intermittently in Sodium chloride 0.9%.

**VITAMIN K ANTAGONISTS**

**Vitamin K antagonists**

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum - haemorrhagic stroke - significant bleeding

- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) - conditions in which risk of bleeding
is increased · history of gastrointestinal bleeding · peptic ulcer · postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) · recent ischaemic stroke · recent surgery · uncontrolled hypertension

**INTERACTIONS** → Appendix 1 (coumarins, phenindione). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may affect warfarin control. Caution if concomitant use of drugs that increase risk of bleeding. Avoid cranberry juice.

**SIDE-EFFECTS** Alopecia · diarrhoea · haemorrhage · hepatic dysfunction · jaundice · nausea · pancreatitis · purpura · pyrexia · rash · skin necrosis (increased risk in patients with protein C or protein S deficiency) · vomiting · ‘purple toes’

**CONCEPTION AND CONTRACEPTION** Women of childbearing age should be warned of the danger of teratogenicity.

**PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.

**MONITORING REQUIREMENTS**
- The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
- It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
- Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.

**PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chaddington Oldham OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In Scotland, treatment booklets and starter information packs can be obtained by emailing stockholders: dppas@theapsgroup.com or by fax on (0131) 6299 967
Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

## Acenocoumarol
(Nicoumalone)

**INDICATIONS AND DOSE**

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

**BY MOUTH**
- Adult: Initially 2–4 mg once daily for 2 days, alternatively initially 5 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, liver disease, severe heart failure with hepatic congestion, and malnutrition

**CAUTIONS**
- Patients over 65 years

**SIDE-EFFECTS**
- Rare Anorexia
- Very rare Vasculitis

**BREAST FEEDING** Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment, especially if prothrombin time is already prolonged.

**RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

**PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS

- ACENOCOUMAROL (Non-proprietary)
- Acenocoumarol 1 mg Acenocoumarol 1mg tablets | 100 tablet (P)M no price available DT price = £4.62
- Sinthrome (Novartis Pharmaceuticals UK Ltd) Acenocoumarol 1 mg Sinthrome 1mg tablets | 100 tablet (P)M £4.62 DT price = £4.62

**Phenindione**

**INDICATIONS AND DOSE**

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism

**BY MOUTH**
- Adult: Initially 200 mg on day 1, then 100 mg on day 2, then, adjusted according to response; maintenance 50–150 mg daily

**SIDE-EFFECTS**
- Agranulocytosis · eosinophilia · exanthema · exfoliative dermatitis · fever · hypersensitivity reactions · leucopenia · micro-adenopathy · renal damage · urine coloured pink or orange

**BREAST FEEDING** Avoid. Risk of haemorrhage; increased by vitamin K deficiency.

**HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.

**RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
● **PATIENT AND CARER ADVICE** Anticoagulant card to be provided. Patient counselling is advised for phenindione tablets (may turn urine pink or orange).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**PATIENT AND CARER ADVICE**

Anticoagulant card to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Warfarin sodium**

**INDICATIONS AND DOSE**

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

BY MOUTH

- Adult: Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time, reported as INR (international normalised ratio), a lower induction dose can be given over 3–4 weeks in patients who do not require rapid anticoagulation, elderly patients to be given a lower induction dose; maintenance 3–9 mg daily, to be taken at the same time each day

- **PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytonadione (vitamin K).

- **BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.

- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. In severe renal impairment, monitor INR more frequently.

- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Hypertension**

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127 (August 2011), Hypertension—Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

**Thresholds and targets for treatment**

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:

- Clinic blood pressure 140/90 mmHg or higher, and ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk >20%; in the absence of these conditions, advise lifestyle changes and review annually. For patients under 40 years with stage 1 hypertension but no overt target-organ damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension

Stage 2 hypertension:

- Clinic blood pressure 160/100 mmHg or higher, and ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- Treat all patients who have stage 2 hypertension, regardless of age

Severe hypertension:

- Clinic systolic blood pressure >180 mmHg or clinic diastolic blood pressure >110 mmHg; treat promptly—see Hypertensive Crises p. 123.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient’s waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly p. 122. A target clinic blood pressure below...
130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drug treatment of hypertension

A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment. Response to drug treatment may be affected by age and ethnicity.

**Patients under 55 years:**

1. **Step 1**
   - ACE inhibitor; if not tolerated, offer an angiotensin-II receptor antagonist. If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a beta-blocker; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes.

2. **Step 2**
   - ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker. If a calcium-channel blocker is not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiazide-related diuretic (see Step 1).

3. **Step 3**
   - ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker and a thiazide-related diuretic.

4. **Step 4 (resistant hypertension)**
   - Consider seeking specialist advice
   - Add low-dose spironolactone [unlicensed indication], or use high-dose thiazide related diuretic if plasma-potassium concentration above 4.5 mmol/litre
   - Monitor renal function and electrolytes
   - If additional diuretic therapy is contra-indicated, ineffective, or not tolerated, consider an alpha-blocker or a beta-blocker

**Patients over 55 years, and patients of any age who are of African or Caribbean family origin:**

1. **Step 1**
   - Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide)

2. **Step 2**
   - Calcium-channel blocker or thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin)

3. **Steps 3 and 4**
   - Treat as for patients under 55 years

**Other measures to reduce cardiovascular risk**

Aspirin p. 104 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. Aspirin also has a role in the prevention of stroke in patients with atrial fibrillation.

Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

**Hypertension in the elderly**

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient’s waking hours) is below 145/85 mmHg.

**Isolated systolic hypertension**

Isolated systolic hypertension (systolic pressure ≥160 mmHg, diastolic pressure < 90 mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

**Hypertension in diabetes**

For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

**Hypertension in renal disease**

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

**Hypertension in pregnancy**

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.
Hypertension

Labetalol hydrochloride p. 143 is widely used for treating hypertension in pregnancy. Methyldopa p. 138 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 154 [unlicensed] are also used.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 104 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged >35 years, BMI ≥ 35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia should receive critical care during pregnancy or after birth. Women with a blood pressure of <150/100 mmHg, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women already receiving antihypertensive treatment should have their treatment options include sodium nitroprusside p. 143, a powerful alpha-blocker, is effective in the management of pheochromocytoma but it has many side-effects. Phentolamine mesilate p. 161 is a short-acting alpha-blocker used mainly during surgery of pheochromocytoma; its use for the diagnosis of pheochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metyrosine (available from ‘special-order’ manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of pheochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metyrosine should not be used to treat essential hypertension.

Antihypertensive drugs

Vasodilator antihypertensive drugs

Vasodilators have a potent hypertensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 157 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 161 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 158 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 201, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 674, doxazosin p. 673, and terazosin p. 675 have alpha-blocking and vasodilator properties.

Ambisentan p. 162, bosentan p. 163, iloprost p. 164, macitentan p. 163, sildenafil p. 699, and tadalafil p. 700 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 99 can be used in patients with primary pulmonary hypertension resistant to other

Pregnant women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg should receive immediate treatment with oral labetalol hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. Labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with pre-eclampsia or gestational hypertension who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of ≥160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 157, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. Also see use of magnesium sulfate in preeclampsia and eclampsia p. 858.

Hypertensive crises

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A hypertensive emergency is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside p. 161 [unlicensed], nicardipine hydrochloride p. 153, labetalol hydrochloride p. 143, glyceryl trinitrate p. 190, phentolamine mesilate p. 161, hydralazine hydrochloride p. 157, or esmolol hydrochloride p. 143; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure ≥ 180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calcium-channel blockers amlopidine p. 148 or felodipine p. 151. Use of sublingual nifedipine is not recommended. Also see advice on short-term management of hypertensive episodes in pheochromocytoma.

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in pheochromocytoma.

Metirosine (available from ‘special-order’ manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of pheochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metyrosine should not be used to treat essential hypertension.
treatments. Bosentan p. 163 is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Riociguat p. 163 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

**Sitaxsentan** has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

**Centrally acting antihypertensive drugs**

Methyldopa p. 138 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 137 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 138, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

**Alpha-adrenoceptor blocking drugs**

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 673, and terazosin have properties similar to those of prazosin. Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

**Prostatic hyperplasia**

Alfuzosin hydrochloride p. 672, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 674, and terazosin are indicated for benign prostatic hyperplasia.

**Angiotensin-converting enzyme inhibitors**

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

**Heart Failure**

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 168 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Prolonged first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide p. 201 80 mg daily or more).

Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

**Hypertension**

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

**Diabetic nephropathy**

ACE inhibitors have a role in the management of diabetic nephropathy.

**Prophylaxis of cardiovascular events**

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

**Initiation under specialist supervision**

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

**Renal effects**

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia. In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe
unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

Cautions
ACE inhibitors need to be initiated with care in patients receiving diuretics.

Concomitant diuretics
ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide p. 201 or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Combination products
Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

Angiotensin-II receptor antagonists
Azilsartan medoxomil p. 132, candesartan cilexetil p. 133, eprosartan p. 133, irbesartan p. 133, losartan potassium p. 134, olmesartan medoxomil p. 135, telmisartan p. 136, and valsartan p. 136 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

Renal effects
Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

Renin inhibitor
Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

Concomitant use of drugs affecting the renin-angiotensin system
Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 158 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

Drugs used for Hypertension not listed below;
Chlortalidone, p. 204 · Cyclopenthiazide, p. 204 · Doxazosin, p. 673 · Furosemide, p. 201 · Indoramin, p. 673 · Metolazone, p. 205 · Prazosin, p. 674 · Spirinolactone, p. 168 · Terazosin, p. 765 · Torasemide, p. 202 · Xipamide, p. 205

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors

CONTRA-INDICATIONS

The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² - the combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus

CAUTIONS

Afro-Caribbean patients (may respond less well to ACE inhibitors) · concomitant diuretics - (first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) · peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) · primary aldosteronism (patients may respond less well to ACE inhibitors) · the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use-with care (or avoid) in those with a history of idiopathic or hereditary angioedema · use with care in patients with hypertrophic cardiomyopathy · use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

CAUTIONS, FURTHER INFORMATION

Anaphylactoid reactions
To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.

INTERACTIONS

Appendix 1 (ACE inhibitors).

SIDE-EFFECTS

Pruritus · abdominal pain · altered liver function tests · angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients) · arthralgia · blood disorders · bronchospasm · cholestatic jaundice ·
constipation · diarrhea · dizziness · dyspepsia ·
onephrophiha · fatigue · fever · fulminant hepatic necrosis ·
haemolytic anaemia · headache · hepatic failure · hepatitis ·
hyperkaemia · hypoglycaemia · leucocytosis ·
leucopenia · malaise · myalgia · nausea · neutropenia ·
pancreatitis · paraesthesia · persistent dry cough ·
photosensitivity · positive antinuclear antibody · profound
hypotension · raised erythrocyte sedimentation rate · rash ·
renal impairment · rhinitis · serositis · sinuses · sore
throat · taste disturbance · thrombocytopenia · urticaria ·
vasculitis · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects In light of reports of cholestatic jaundice, hepatic, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

ALLERGY AND CROSS-SENSITIVITY ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).

PREGNANCY ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect the fetus and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

BREAST FEEDING Information on the use of ACE inhibitors in breast-feeding is limited.

RENAL IMPAIRMENT Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.

MONITORING REQUIREMENTS Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

DIRECTIONS FOR ADMINISTRATION For hypertension the first dose should preferably be given at bedtime.

Captopril

INDICATIONS AND DOSE

Hypertension BY MOUTH

Adult: Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension BY MOUTH

Adult: Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, dosed to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Heart failure BY MOUTH

Adult (under close medical supervision): Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients BY MOUTH

Adult: Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours, increased if tolerated to 50 mg twice daily for 4 weeks

Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision) BY MOUTH

Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses to be increased gradually

Diabetic nephropathy BY MOUTH

Adult: 75–100 mg daily in divided doses

SIDE-EFFECTS

Common or very common Alopecia · dry mouth · dyspnoea · sleep disorder

Uncommon Angina · arthralgia · flushing · pallor · palpitation · Raynaud’s syndrome · tachycardia

Rare Anorexia · stomatitis

Very rare Allergic alveolitis · blurred vision · cardiac arrest · cardiogenic shock · cerebrovascular events · confusion · depression · eosinophilic pneumonia · glossitis · gynaecomastia · hyponatraemia · impotence · peptic ulcer · photosensitivity · Stevens-Johnson syndrome · syncope

BREAST FEEDING Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

RENAL IMPAIRMENT Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, powder, capsule

Enalapril maleate

INDICATIONS AND DOSE
Hypertension
BY MOUTH
adult: Initially 5 mg once daily, lower initial doses may be required when used in addition to diuretic or in renal impairment; maintenance 20 mg once daily; maximum 40 mg per day
Heart failure
BY MOUTH
adult: (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks
Prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction
BY MOUTH
adult: (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

SIDE-EFFECTS
- Common or very common: Asthenia, blurred vision, depression, dyspnoea
- Uncommon: Alopecia, anorexia, arrhythmias, confusion, drowsiness, dry mouth, flushing, hyponatraemia, ileus, impotence, insomnia, muscle cramps, nervousness, palpitation, pericardial pain, sweating, tinnitus, vertigo
- Rare: Abnormal dreams, allergic alveolitis, exfoliative dermatitis, glossitis, gynaecomastia, pemphigus, pulmonary infiltrates, Raynaud’s syndrome, Stevens-Johnson syndrome, stomatitis, toxic epidermal necrolysis
- Very rare: Gastro-intestinal angioedema

BREAST FEEDING
Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

HEPATIC IMPAIRMENT
Enalapril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT
Max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
Tablets may be crushed and suspended in water immediately before use.

Fosinopril sodium

INDICATIONS AND DOSE
Hypertension
BY MOUTH
adult: Initially 10 mg daily for 4 weeks, then increased if necessary up to 40 mg daily, doses over 40 mg not shown to increase efficacy
Congestive heart failure (adjunct) (under close medical supervision)
BY MOUTH
adult: Initially 10 mg once daily, then increased if tolerated to 40 mg once daily, doses to be increased gradually

SIDE-EFFECTS
Chest pain, musculoskeletal pain

BREAST FEEDING
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT
Fosinopril is a prodrug and requires close monitoring in patients with hepatic impairment.
**Imidapril hydrochloride**

**INDICATIONS AND DOSE**

**Essential hypertension**

- Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be increased at intervals of at least 3 weeks, dose to be taken before food; maximum 20 mg per day
- Elderly: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, dose to be increased at intervals of at least 3 weeks

**Essential hypertension in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment**

- Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, dose to be increased at intervals of at least 3 weeks; maximum 20 mg per day

**SIDE-EFFECTS**

- Blurred vision
- Bronchitis
- Confusion
- Depression
- Dry mouth
- Dysphonia
- Glossitis
- Ileus
- Impotence
- Sleep disturbances
- Tinnitus

**BREAST FEEDING**

Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT**

Imidapril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT**

Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Tanatril (Chiesi Ltd)

---

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg**

**BY MOUTH**

- Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg once daily, to be taken 24 hours after second dose, then 10 mg once daily for 5 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment. Withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Renal complications of diabetes mellitus**

**BY MOUTH**

- Adult: Initially 2.5–5 mg once daily, adjusted according to response; maintenance 10–20 mg once daily

**Heart failure (adjunct) (under expert supervision)**

**BY MOUTH**

- Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

**SIDE-EFFECTS**

- Uncommon Raynaud’s syndrome, vertigo, asthenia, cerebrovascular accident, confusion, impotence, mood changes, myocardial infarction, palpitation, sleep disturbances, tachycardia
- Rare Alopecia, dry mouth, gynaecomastia, psoriasis
- Very rare Allergic alveolitis, pemphigus, profuse sweating, pulmonary infiltrates, Stevens-Johnson syndrome, toxic epidermal necrolysis

**BREAST FEEDING**

Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**RENAL IMPAIRMENT**

Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m².

---

**Lisinopril**

**INDICATIONS AND DOSE**

**Hypertension**

- Adult: Initially 10 mg once daily; maintenance 20 mg once daily; maximum 80 mg per day

Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg
Zestoretic 20 tablets | 28 tablet (£0.50) £1.52 DT price = £2.63

MOEXIPRIL HYDROCHLORIDE

INDICATIONS AND DOSE
Essential hypertension (monotherapy)

BY MOUTH

Adult: Initially 7.5 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

Elderly: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

Essential hypertension when used in addition with nifedipine or other antihypertensive drug

BY MOUTH

Adult: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

CAUTIONS
Significant mitral valve stenosis

SIDE-EFFECTS
Very rare
Numbness

Frequency not known
Alopecia, angina, appetite, arrhythmias, blurred vision, cerebrovascular accident, confusion, depression, drowsiness, dry mouth, dyspnoea, flushing, hyperuricaemia, impotence, myocardial infarction, palpitation, pemetrex, sleep disturbance, Stevens-Johnson syndrome, sweating, syncope, tachycardia, tinnitus, toxic epidermal necrolysis, weight changes

BREAST FEEDING
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT
Initial dose 3.75 mg once daily. Moexipril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT
If eGFR less than 40 mL/minute/1.73 m², initial dose 3.75 mg once daily titrated to max. 15 mg once daily.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Perdix (UCB Pharma Ltd)
Moexipril hydrochloride 7.5 mg
Perdix 7.5mg tablets | 28 tablet (£0.10) £0.60
Moexipril hydrochloride 15 mg
Perdix 15mg tablets | 28 tablet (£0.25) £1.42

PERINDOPRIL ARGININE

INDICATIONS AND DOSE
Hypertension

BY MOUTH

Adult: Initially 5 mg once daily for 1 month, then, adjusted according to response; maximum 10 mg per day

Elderly: Initially 2.5 mg once daily, then, adjusted according to response; maximum 10 mg per day

Hypertension, if used in addition to diuretic, or in renal impairment, cardiac decompensation or volume depletion

BY MOUTH

Adult: Initially 2.5 mg once daily, then, adjusted according to response; maximum 10 mg per day

Symptomatic heart failure (adjunct) (under close medical supervision)

BY MOUTH

Adult: Initially 2.5 mg once daily for 2 weeks, then increased if tolerated to 5 mg once daily, dose to be taken in the morning

Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

BY MOUTH

Adult: Initially 5 mg once daily for 2 weeks, then increased if tolerated to 10 mg once daily, dose to be taken in the morning

SIDE-EFFECTS
Asthenia, mood disturbances, sleep disturbances

HEPATIC IMPAIRMENT
Perindopril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT
Max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m².

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 22

Coversyl Arginine (Servier Laboratories Ltd)
Perindopril arginine 2.5 mg
Coversyl Arginine 2.5mg tablets | 30 tablet (£0.35) £4.43 DT price = £4.43
Perindopril arginine 5 mg
Coversyl Arginine 5mg tablets | 30 tablet (£0.70) £6.28 DT price = £6.28
Perindopril arginine 10 mg
Coversyl Arginine 10mg tablets | 30 tablet (£1.05) £10.65 DT price = £10.65
Indapamide with perindopril arginine

The properties listed below are those particular to the combination only. For the properties of the components please consider, perindopril arginine p. 129, indapamide p. 160.

**INDICATIONS AND DOSE**

Hypertension not adequately controlled by perindopril alone

**BY MOUTH**

- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 22

- **PERINDOPRIL ERBUMINE (Non-proprietary)**
  - Perindopril erbumine 2 mg Perindopril erbumine 2mg tablets | 30 tablet [Psd] £4.41 DT price = £1.15 | 56 tablet [Psd] £3.34
  - 60 tablet [Psd] £3.90

- Perindopril erbumine 4 mg Perindopril erbumine 4mg tablets | 30 tablet [Psd] £4.50 DT price = £1.56 | 56 tablet [Psd] £3.38
  - 60 tablet [Psd] £2.80

- Perindopril erbumine 8 mg Perindopril erbumine 8mg tablets | 30 tablet [Psd] £5.95 DT price = £1.52 | 56 tablet [Psd] £3.88 | 60 tablet [Psd] £4.00

Quinapril

**INDICATIONS AND DOSE**

**Essential hypertension**

**BY MOUTH**

- Adult: Initially 10 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day
- Elderly: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

**Essential hypertension if used in addition to diuretic**

**BY MOUTH**

- Adult: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

**Heart failure (adjunct) (under close medical supervision)**

**BY MOUTH**

- Adult: Initially 2.5 mg daily, increased if tolerated to 10–20 mg daily in 1–2 divided doses, doses to be increased gradually; maximum 40 mg per day

**SIDE-EFFECTS** impotence · asthenia · back pain · blurred vision · chest pain · depression · flatulence · insomnia · nervousness · oedema

**BREAST FEEDING** Avoid in the first few weeks after delivery, particularly in preterm infants, due to the risk of profound neonatal hypotension; if essential, may be used in mothers breast-feeding older infants—the infant’s blood pressure should be monitored.

**HEPATIC IMPAIRMENT** Quinapril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT** Max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **QUINAPRIL (Non-proprietary)**
  - Quinapril (as Quinapril hydrochloride) 5 mg Quinapril 5mg tablets | 28 tablet [Psd] £8.59 DT price = £8.47
  - Quinapril (as Quinapril hydrochloride) 10 mg Quinapril 10mg tablets | 28 tablet [Psd] £8.59 DT price = £8.46
  - Quinapril (as Quinapril hydrochloride) 20 mg Quinapril 20mg tablets | 28 tablet [Psd] £6.00 DT price = £1.86
  - Quinapril (as Quinapril hydrochloride) 40 mg Quinapril 40mg tablets | 28 tablet [Psd] £8.00 DT price = £2.41

- **Accupro** (Pfizer Ltd)
  - Quinapril (as Quinapril hydrochloride) 5 mg Accupro 5mg tablets | 28 tablet [Psd] £8.60 DT price = £8.47
  - Quinapril (as Quinapril hydrochloride) 10 mg Accupro 10mg tablets | 28 tablet [Psd] £8.60 DT price = £8.46
  - Quinapril (as Quinapril hydrochloride) 20 mg Accupro 20mg tablets | 28 tablet [Psd] £10.79 DT price = £1.86

Perindopril erbumine

**INDICATIONS AND DOSE**

Hypertension

**BY MOUTH**

- Adult: Initially 4 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 8 mg per day
- Elderly: Initially 2 mg once daily, dose to be taken in the morning, then, adjusted according to response; maximum 8 mg per day

Hypertension, if used in addition to diuretic, in renal impairment, in cardiac decompensation, or in volume depletion

**BY MOUTH**

- Adult: Initially 2 mg once daily, dose to be taken in the morning, then, adjusted according to response; maximum 8 mg per day

**Heart failure (adjunct) (under close medical supervision)**

**BY MOUTH**

- Adult: Initially 2 mg once daily for 2 weeks, dose to be taken in the morning, then increased if necessary up to 4 mg once daily

**Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease**

**BY MOUTH**

- Adult: Initially 4 mg once daily for 2 weeks, dose to be taken in the morning, then increased if tolerated to 8 mg once daily
- Elderly: Initially 2 mg once daily for 1 week, then increased if tolerated to 4 mg once daily for 1 week, then increased if tolerated to 8 mg once daily

**SIDE-EFFECTS** Asthenia · mood disturbances · sleep disturbances

**BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT** Perindopril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT** Max. initial dose 2 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m².
Hydrochlorothiazide with quinapril
The properties listed below are those particular to the combination only. For the properties of the components please consider, quinapril p. 130, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE
Hypertension in patients stabilised on the individual components in the same proportions

BY MOUTH

Adult: (consult product literature)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

HYDROCHLOROTHIAZIDE WITH QUINAPRIL (Non-proprietary)
Hydrochlorothiazide 12.5 mg, Quinapril (as Quinapril hydrochloride) 10 mg Quinapril 10mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet (PSt) £11.75 DT price = £11.75
Accuretic (Pfizer Ltd)
Hydrochlorothiazide 12.5 mg, Quinapril (as Quinapril hydrochloride) 10 mg Accuretic 12.5mg/10mg tablets | 28 tablet (PSt) £11.75 DT price = £11.75

Ramipril

INDICATIONS AND DOSE
Hypertension

BY MOUTH

Adult: Initially 1.25–2.5 mg daily, increased if necessary up to 10 mg daily, dose to be increased at intervals of 2–4 weeks
Symptomatic heart failure (adjunct) (under close medical supervision)

BY MOUTH

Adult: Initially 1.25 mg daily, increased if necessary up to 10 mg daily, preferably taken in 2 divided doses, increase dose gradually at intervals of 1–2 weeks
Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction)

BY MOUTH

Adult: Initially 2.5 mg twice daily for 3 days, then increased to 5 mg twice daily
Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction) when initial dose not tolerated

BY MOUTH

Adult: Initially 1.25 mg twice daily for 2 days, then increased to 2.5 mg twice daily, then increased to 5 mg twice daily, withdraw treatment if dose cannot be increased to 2.5 mg twice daily
Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease

BY MOUTH

Adult: Initially 2.5 mg daily for 1–2 weeks, then increased to 5 mg daily for a further 2–3 weeks, then increased to 10 mg daily
Nephropathy (consult product literature)

BY MOUTH

Adult: Initially 1.25 mg daily for 2 weeks, then increased to 2.5 mg daily for a further 2 weeks, then increased if tolerated to 5 mg daily

SIDE-EFFECTS

- Common or very common Bronchitis · dyspnoea · muscle cramps · stomatitis · syncope
- Uncommon Angina · anxiety · arrhythmias · chest pain · decreased libido · depression · dry mouth · flushing · impotence · loss of appetite · myocardial infarction · nervousness · palpitations · peripheral oedema · sweating · tachycardia · visual disturbances
- Rare Confusion · conjunctivitis · impaired hearing · onycholysis · tinnitus · tremor

Frequency not known Alopoeia · cerebrovascular accident · erythema multiforme · gynaecomastia · hyponatraemia · pempigoid exanthema · precipitation or exacerbation of Raynaud’s syndrome · skin reactions · sleep disturbance · Stevens-Johnson syndrome · toxic epidermal necrolysis

BREAST FEEDING
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT
Max. daily dose 2.5 mg.
Ramipril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT
Max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 mL/minute/1.73 m².

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

RAMIPRIL (Non-proprietary)
Ramipril 1.25 mg Ramipril 1.25mg tablets | 28 tablet (PSt) £5.25 DT price = £5.25
Ramipril 2.5 mg Ramipril 2.5mg tablets | 28 tablet (PSt) £7.49 DT price = £7.49
Ramipril 5 mg Ramipril 5mg tablets | 28 tablet (PSt) £10.40 DT price = £10.40
Ramipril 10 mg Ramipril 10mg tablets | 28 tablet (PSt) £14.20 DT price = £14.20

TRITACE (Sanofi)

TRITACE 2.5 mg Tritace 2.5mg tablets | 28 tablet (PSt) £2.12 DT price = £2.12
TRITACE 5 mg Tritace 5mg tablets | 28 tablet (PSt) £2.72 DT price = £2.72
TRITACE 10 mg Tritace 10mg tablets | 28 tablet (PSt) £3.68 DT price = £3.68

Capsule

RAMIPRIL (Non-proprietary)
Ramipril 1.25 mg Ramipril 1.25mg capsules | 28 capsule (PSt) £1.31 DT price = £1.31
Ramipril 2.5 mg Ramipril 2.5mg capsules | 28 capsule (PSt) £1.24 DT price = £1.24
Ramipril 10 mg Ramipril 10mg capsules | 28 capsule (PSt) £2.10 DT price = £2.10

Oral solution

RAMIPRIL (Non-proprietary)
Ramipril 500 microgram per 1 ml Ramipril 2.5mg/5ml oral solution sugar free (sugar-free) | 150 ml (PSt) £96.00 DT price = £96.00

Feldipine with ramipril
The properties listed below are those particular to the combination only. For the properties of the components please consider, feldipine p. 151, ramipril above.
Cardiovascular system

INDICATIONS AND DOSE
Hypertension in patients stabilised on the individual components in the same proportions

BY MOUTH
Adult: (consult product literature)

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

Triapin (Sanofi)

Feldopine 2.5 mg, Ramipril 2.5 mg Triapin 2.5mg/2.5mg modified-release tablets | 28 tablet | £24.55
Feldopine 5 mg, Ramipril 5 mg Triapin 5mg/5mg modified-release tablets | 28 tablet | £16.13 DT price = £16.13

Trandolapril

INDICATIONS AND DOSE
Mild to moderate hypertension

BY MOUTH
Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day

Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)

BY MOUTH
Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually

● SIDE-EFFECTS
Alopecia • angina • arrhythmias • asthenia • bronchitis • cerebral haemorrhage • dry mouth • dyspnoea • hot flushes • ileus • myocardial infarction • nervousness • palpitation • psoriasis-like efflorescence • skin reactions • sleep disturbances • Stevens-Johnson syndrome • sweating • syncope • tachycardia • toxic epidermal necrolysis • transient ischaemic attacks

SIDE-EFFECTS, FURTHER INFORMATION
Symptomatic hypotension If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

● BREAST FEEDING
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

● HEPATIC IMPAIRMENT
Trandolapril is a prodrug and requires close monitoring in patients with hepatic impairment.

● RENAL IMPAIRMENT
Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

TRANDOLAPRIL (Non-proprietary)

Trandolapril 500 microgram Trandolapril 500microgram capsules | 14 capsule | £1.92 DT price = £1.87
Trandolapril 1 mg Trandolapril 1mg capsules | 28 capsule | £20.00 DT price = £19.99
Trandolapril 2 mg Trandolapril 2mg capsules | 28 capsule | £10.40 DT price = £7.60
Trandolapril 4 mg Trandolapril 4mg capsules | 28 capsule | £14.19 DT price = £14.01

Azilsartan medoxomil

INDICATIONS AND DOSE
Hypertension

BY MOUTH
Adult 18-74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
Adult 75 years and over: Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

Hypertension with intravascular volume depletion

BY MOUTH
Adult: Initially 20–40 mg daily, increased if necessary to 80 mg daily

● CAUTIONS
Heart failure

● SIDE-EFFECTS
Common or very common Diarrhoea • raised creatinine kinase
Uncommon Hyperuricaemia • peripheral oedema • raised creatinine • malaise

● HEPATIC IMPAIRMENT
Manufacturer advises to consider initial dose of 20 mg in mild to moderate impairment (limited information available).
Manufacturer advises avoid in severe impairment (no information available). Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).

ANGIOTENSIN-II RECEPTOR ANTAGONISTS

Angiotensin-II receptor antagonists

● CONTRA-INDICATIONS
The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m². The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with diabetes mellitus

● CAUTIONS
Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) • aortic or mitral valve stenosis—elderly (lower initial doses may be appropriate) • hypertrophic cardiomyopathy—patients with a history of angioedema • patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) • renal artery stenosis

● INTERACTIONS
Appendix 1 (angiotensin-II receptor antagonists).

● SIDE-EFFECTS
Hyperkalaemia • angioedema (may be delayed onset) • symptomatic hypotension including dizziness (particularly in patients with intravascular volume depletion, e.g. those taking high-dose diuretics)

● PREGNANCY
Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

BREAST FEEDING
Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

RENAL IMPAIRMENT
Use with caution, starting with low dose, and adjust according to response.

MONITORING REQUIREMENTS
Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.
Candesartan cilexetil

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 8 mg once daily, increased if necessary up to 32 mg daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

Hypertension with intravascular volume depletion

BY MOUTH

Adult: Initially 4 mg once daily, increased if necessary up to 32 mg daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

Heart failure with impaired left ventricular systolic function when ACE inhibitors are not tolerated: Heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor (under expert supervision)

BY MOUTH

Adult: Initially 4 mg once daily, increased at intervals of at least 2 weeks to ‘target’ dose of 32 mg once daily or to maximum tolerated dose

CONTRA-INDICATIONS

Cholestasis

SIDE-EFFECTS

Common or very common: Headache, vertigo

Very rare: Arthralgia, back pain, blood disorders, cough, hepatitis, hypoglycaemia, myalgia, nausea, pruritus, rash, urticaria

HEPATIC IMPAIRMENT

Initially 4 mg once daily in mild or moderate liver impairment. Avoid in severe hepatic impairment.

RENAL IMPAIRMENT

Initially 4 mg daily. Use with caution if eGFR less than 15 mL/minute/1.73 m²—limited experience.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Candesartan cilexetil 8 mg Amias 8 mg tablets | 28 tablet POM £9.89 DT price = £1.23

Eprosartan

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: 600 mg once daily

SIDE-EFFECTS

Common or very common: Headache, vertigo

Uncommon: Arthralgia, back pain, blood disorders, cough, hepatitis, hypoglycaemia, myalgia, nausea, pruritus, rash, urticaria

HEPATIC IMPAIRMENT

Caution in mild or moderate liver impairment. Avoid in severe impairment.

RENAL IMPAIRMENT

Caution if eGFR less than 30 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Candesartan (as Eprosartan mesilate) 300 mg Eprosartan 300 mg tablets | 28 tablet POM £7.31 DT price = £7.31

Irbesartan

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult 18-74 years: Initially 150 mg once daily, increased if necessary to 300 mg once daily

Adult 75 years and over: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

Hypertension in patients receiving haemodialysis

BY MOUTH

Adult: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

Renal disease in hypertensive type 2 diabetes mellitus

BY MOUTH

Adult 18-74 years: Initially 150 mg once daily, increased if tolerated to 300 mg once daily

Adult 75 years and over: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

Renal disease in hypertensive type 2 diabetes mellitus in patients receiving haemodialysis

BY MOUTH

Adult: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

SIDE-EFFECTS

Common or very common: Fatigue, musculoskeletal pain, nausea, vomiting

Uncommon: Chest pain, cough, diarrhoea, dyspepsia, flushing, sexual dysfunction, tachycardia

Rare: Rash, urticaria
Hydrochlorothiazide with irbesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, irbesartan p. 133, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE
Hypertension not adequately controlled with irbesartan alone
BY MOUTH
- Adult: (consult product literature)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- HYDROCHLOROTHIAZIDE WITH IRBESARTAN (Non-proprietary)

Losartan potassium

INDICATIONS AND DOSE
Diabetic nephropathy in type 2 diabetes mellitus
BY MOUTH
- Adult 18–75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- Adult 76 years and over: Initially 25 mg once daily

Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated
BY MOUTH
- Adult: Initially 12.5 mg once daily, increased if tolerated to up to 150 mg once daily, doses to be increased at weekly intervals

Hypertension
BY MOUTH
- Adult 18–75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- Adult 76 years and over: Initially 25 mg daily

Hypertension with intravascular volume depletion
BY MOUTH
- Adult 18–75 years: Initially 25 mg once daily for several weeks, then increased if necessary up to 100 mg once daily

CAUTIONS
Severe heart failure
SIDE-EFFECTS
- Common or very common Vertigo
- Very rare Arthralgia - cutaneous vasculitis - headache - hepatitis - myalgia - renal dysfunction - taste disturbance - tinnitus

  - Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet (POM) £13.75 DT price = £1.65
  
  - Hydrochlorothiazide 25 mg, Losartan potassium 100 mg / Losartan 100mg / Hydrochlorothiazide 25mg tablets | 28 tablet (POM) £16.18 DT price = £2.06
  
  - Hydrochlorothiazide 12.5 mg, Losartan potassium 100 mg / Losartan 100mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet (POM) £16.18 DT price = £13.69
  
  - **Cozaar-Comp** (Merck Sharp & Dohme Ltd)
  
  - Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg / Cozaar-Comp 50mg/12.5mg tablets | 28 tablet (POM) £12.80 DT price = £1.65
  
  - Hydrochlorothiazide 25 mg, Losartan potassium 100 mg / Cozaar-Comp 100mg/25mg tablets | 28 tablet (POM) £16.18 DT price = £2.06
  
  - Hydrochlorothiazide 12.5 mg, Losartan potassium 100 mg / Cozaar-Comp 100mg/12.5mg tablets | 28 tablet (POM) £16.18 DT price = £13.69

- **SIDE-EFFECTS**

  - **Very common** Headache - abdominal pain - hyponatraemia - hyperkalaemia - hyperuricaemia - liver function tests abnormal
  
  - **Common** Angina - chest pain - cough - myalgia - pruritus - thrombocytopenia - urticaria
  

- **HEPATIC IMPAIRMENT** Dose should not exceed 20 mg daily in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

  **Tablet**

  - **Olmetec** (Daiichi Sankyo UK Ltd)
  
  - Olmesartan medoxomil 10 mg / Olmetec 10mg tablets | 28 tablet (POM) £10.95 DT price = £10.95
  
  - Olmesartan medoxomil 20 mg / Olmetec 20mg tablets | 28 tablet (POM) £12.95 DT price = £12.95
  
  - Olmesartan medoxomil 40 mg / Olmetec 40mg tablets | 28 tablet (POM) £17.50 DT price = £17.50

Amlodipine with olmesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 148, olmesartan medoxomil p. 160.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions

**BY MOUTH**

- Adult: (consult product literature)

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **Sevikar** (Daiichi Sankyo UK Ltd)
  
  - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 20 mg / Sevikar 20mg/5mg tablets | 28 tablet (POM) £16.95
  
  - Amlodipine (as Amlodipine besilate) 10 mg, Olmesartan medoxomil 40 mg / Sevikar 40mg/10mg tablets | 28 tablet (POM) £16.95
  
  - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 40 mg / Sevikar 40mg/5mg tablets | 28 tablet (POM) £16.95

Amlodipine with hydrochlorothiazide and olmesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 148, olmesartan medoxomil p. 160.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions, or for hypertension not adequately controlled with olmesartan and amlodipine

**BY MOUTH**

- Adult: (consult product literature)

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **Sevikar HCT** (Daiichi Sankyo UK Ltd)
  
  - Amlodipine besilate 5 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 20 mg / Sevikar HCT 20mg/5mg/12.5mg tablets | 28 tablet (POM) £16.95
  
  - Amlodipine besilate 5 mg, Hydrochlorothiazide 25 mg, Olmesartan medoxomil 40 mg / Sevikar HCT 40mg/5mg/25mg tablets | 28 tablet (POM) £16.95
  
  - Amlodipine besilate 10 mg, Hydrochlorothiazide 25 mg, Olmesartan medoxomil 40 mg / Sevikar HCT 40mg/10mg/25mg tablets | 28 tablet (POM) £16.95
  
  - Amlodipine besilate 5 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 40 mg / Sevikar HCT 40mg/5mg/12.5mg tablets | 28 tablet (POM) £16.95
Hydrochlorothiazide with olmesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil p. 135, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE

Hypertension not adequately controlled with olmesartan alone

BY MOUTH

Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Olmetec Plus (Daichi Sankyo UK Ltd)
  
  Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil
  
  20 mg Olmetec Plus 20mg/12.5mg tablets | 28 tablet [PMB] £12.95
  DT price = £12.95

  Hydrochlorothiazide 25 mg, Olmesartan medoxomil
  
  20 mg Olmetec Plus 20mg/25mg tablets | 28 tablet [PMB] £12.95
  DT price = £12.95

  Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil
  
  40 mg Olmetec Plus 40mg/12.5mg tablets | 28 tablet [PMB] £17.50
  DT price = £17.50

Telmisartan

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 20–40 mg once daily for at least 4 weeks, increased if necessary up to 80 mg once daily

Prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage

BY MOUTH

Adult: 80 mg once daily

SIDE-EFFECTS

- Common or very common Arthralgia - back pain - chest pain - eczema - gastro-intestinal disturbances - influenza-like symptoms - leg cramps - myalgia - pharyngitis - sinusitis - urinary-tract infection

- Uncommon Abnormal vision - anxiety - dry mouth - flatulence - increased sweating - tendinitis-like symptoms - vertigo

- Rare Blood disorders - bradycardia - depression - dyspnoea - eosinophilia - increase in uric acid - insomnia - pruritus - rash - tachycardia

- Frequency not known Asthenia - syncope

HEPATIC IMPAIRMENT 20–40 mg once daily in mild or moderate impairment. Avoid in severe impairment or biliary obstruction.

RENAL IMPAIRMENT Manufacturer advises initial dose of 20 mg once daily in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- TELMISARTAN (Non-proprietary)
  
  Telmisartan 20 mg Telmisartan 20mg tablets | 28 tablet [PMB] £1.35–£12.93

Valsartan

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 80 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

Hypertension with intravascular volume depletion

BY MOUTH

Adult: Initially 40 mg once daily, increased if necessary up to 320 mg daily, dose to be increased at intervals of 4 weeks
Heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used. Heart failure, in conjunction with an ACE inhibitor when a beta-blocker cannot be used (under expert supervision).

**BY MOUTH**
- **Adult:** Initially 40 mg twice daily, increased to up to 160 mg twice daily, dose to be increased at intervals of at least 2 weeks.

**RENAL IMPAIRMENT**
- Use with caution if eGFR less than 30 ml/minute/1.73 m².

**SIDE-EFFECTS**

**CONTRA-INDICATIONS** Biliary cirrhosis - cholestasis

**SIDE-EFFECTS**
- **Common or very common** Renal impairment
- **Uncommon** Acute renal failure - cough - fatigue - gastrointestinal disturbance - headache - syncope
- **Frequency not known** Hypersensitivity reactions - myalgia - neutropenia - pruritus - rash - serum sickness - thrombocytopenia - vasculitis

**HEPATIC IMPAIRMENT** Max. dose 80 mg daily in mild to moderate impairment. Avoid in severe hepatic impairment.

**RENALE IMPAIRMENT** Use with caution if eGFR less than 10 ml/minute/1.73 m²—no information available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**ANTIHYPERTENSIVES (CENTRALLY ACTING)**

**Clonidine hydrochloride**

**INDICATIONS AND DOSE**

Hypertension by mouth
- **Adult:** Initially 50–100 micrograms 3 times a day, increase initial dose every second or third day, usual maximum dose 1.2 mg daily.

Prevention of recurrent migraine | Prevention of vascular headache by mouth
- **Adult:** Initially 50 micrograms twice daily for 2 weeks, then increased if necessary to 75 micrograms twice daily.

**UNLICENSED USE** Clonidine may also be used for Tourette syndrome and sedation—unlicensed indications.

**CONTRA-INDICATIONS** Severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome.

**CAUTIONS** Cerebrovascular disease - constipation - heart failure - history of depression - mild to moderate bradyarrhythmia - polyneuropathy - Raynaud’s syndrome or other occlusive peripheral vascular disease

**INTERACTIONS** → Appendix 1 (clonidine).

**SIDE-EFFECTS**
- **Common or very common** Constipation - depression - dizziness - drowsiness - dry mouth - headache - malaise - nausea - postural hypotension - salivary gland pain - sexual dysfunction - sleep disturbances - vomiting
- **Uncommon** Bradycardia - delusion - hallucination - paraesthesia - pruritus - rash - Raynaud’s syndrome - urticaria
- **Rare** Alopecia - AV block - colonic pseudo-obstruction - decreased lacrimation - gynaecomastia - nasal dryness
- **Frequency not known** Bradyarrhythmia - confusion - fluid retention - hepatitis - impaired visual accommodation

**PREGNANCY** May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.

**BREAST FEEDING** Avoid—present in milk.

**RENALE IMPAIRMENT** Use with caution in severe impairment—reduce initial dose and increase gradually.
Methyldopa

INDICATIONS AND DOSE

Hypertension

BY MOUTH
- Adult: Initially 250 mg 2–3 times a day, dose should be increased gradually at intervals of at least 2 days; maximum 3 g per day
- Elderly: Initially 125 mg twice daily, dose should be increased gradually; maximum 2 g per day

CONTRA-INDICATIONS
Acute porphyria; depression; phaeochromocytoma

CAUTIONS
History of depression

INTERACTIONS → Appendix 1 (methyldopa).

SIDE-EFFECTS
- Aenorrhoea; arthralgia; asthma; Bell’s palsy; bone-marrow depression; bradycardia; decreased libido; depression; dizziness; drug fever; dry mouth; eosinophilia; exacerbation of angina; failure of ejaculation; gastrointestinal disturbances; gynaecomastia; haemolytic anaemia; headache; hepatitis; hyperprolactinaemia; hypersensitivity reactions; impaired mental acuity; impotence; jaundice; leucopenia; lupus erythematosus-like syndrome; mild psychosis; myalgia; myocarditis; nasal congestion; nightmares; oedema; pancreatitis; paraesthesia; Parkinsonism; pericarditis; postural hypotension; rashes; sedation; siadadenitis; stomatitis; thrombocytopenia; toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects are minimised if the daily dose is kept below 4 g.

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Amount too small to be harmful.

HEPATIC IMPAIRMENT
Manufacturer advises caution in history of liver disease. Avoid in active liver disease.

RENAL IMPAIRMENT
Increased sensitivity to hypertensive and sedative effect. Start with small dose.

MONITORING REQUIREMENTS
Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.

EFFECT ON LABORATORY TESTS
Interference with laboratory tests. Positive direct Coombs’ test in up to 20% of patients (may affect blood cross-matching).

PATIENT AND CARER ADVICE
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, solution for infusion, oral solution, transdermal patch

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

METHYLDOPA (Non-proprietary)

Methyldopa anhydrous 125 mg Methyldopa 125mg tablets | 56 tablet (£0.75–£1.16) DT price = £1.27
Methyldopa anhydrous 250 mg Methyldopa 250mg tablets | 56 tablet (£1.25) DT price = £6.33
Methyldopa anhydrous 500 mg Methyldopa 500mg tablets | 56 tablet (£18.05) DT price = £3.94
Aldomet (Aspen Pharma Trading Ltd) Moxonidine anhydrous 250 mg Aldomet 250mg tablets | 60 tablet (£0.65)
Methyldopa anhydrous 500 mg Aldomet 500mg tablets | 30 tablet (£4.55

Moxonidine

INDICATIONS AND DOSE
Mild to moderate essential hypertension

BY MOUTH
- Adult: 200 micrograms once daily for 3 weeks, dose to be taken in the morning, then increased if necessary to 400 micrograms daily in 1–2 divided doses (max. per dose 400 micrograms); maximum 600 micrograms per day in 2 divided doses

CONTRA-INDICATIONS
Bradyarrhythmia; conduction disorders; second- or third-degree AV block; severe heart failure; sick sinus syndrome; sino-atrial block

CAUTIONS
First-degree AV block; moderate heart failure; severe coronary artery disease; unstable angina

INTERACTIONS → Appendix 1 (moxonidine).

SIDE-EFFECTS
- Common or very common Back pain; diarrhoea; dizziness; dry mouth; dyspepsia; insomnia; nausea; pruritus; rash; somnolence; vomiting
- Uncommon Angioedema; bradycardia; neck pain; nervousness; oedema; tinnitus

PREGNANCY
Manufacturer advises avoid—no information available.

BREAST FEEDING
Present in milk—manufacturer advises avoid.

RENAL IMPAIRMENT
Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

TREATMENT CESSATION
Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3

Moxonidine 400 microgram Moxonidine 400microgram tablets | 28 tablet (£14.24) DT price = £2.38
dosage reduction is often necessary in renal impairment. Water-soluble beta-blockers are excreted by the kidneys and soluble; they are less likely to enter the brain, and may block beta-blockers, such as atenolol, bisoprolol fumarate, metoprolol tartrate, propranolol hydrochloride, and nadolol, have an intrinsically lesser effect on the beta-adrenoceptors in the heart, peripheral vasculature, myocardium; they are contra-indicated in patients with uncontrolled heart failure, hypotension, bradyarrhythmias, and (to a lesser extent) acebutolol, have less effect on the beta; (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardiospecific. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

BETA-ADRENOCEPTOR BLOCKERS

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Oxprenolol hydrochloride, p.145, pindolol p.146, acebutolol p.141, and celiprolol hydrochloride p.143 have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol p.141, celiprolol hydrochloride, nadolol p.145, and sotalol hydrochloride p.93 are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares.

Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as metoprolol tartrate, bisoprolol fumarate p.142, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labeltolol hydrochloride p.143, celiprolol hydrochloride, carvedilol p.142, and nebivolol p.145 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance.

There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate, metoprolol tartrate p.144, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta; (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardiospecific. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with phaeochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p.161 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with angina (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, uncontrolled heart failure, hypotension, bradycardia, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol p.141 and metoprolol tartrate p.144 may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol p.141, metoprolol tartrate, propranolol hydrochloride p.146, and timolol maleate p.147 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less

28 tablet(s) £13.49 DT price = £2.26

Moxonidine 400 microgram Physiotens 400microgram tablets
28 tablet(s) £13.26 DT price = £2.38
convincing; some have not been tested in trials of secondary prevention.

Arrhythmias
Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular arrhythmias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 143 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 93, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure
Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 142 and carvedilol p. 142 reduce mortality in any grade of stable heart failure; nebivolol p. 145 is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis
Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 146 can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

Other uses
Beta-blockers have been used to alleviate some symptoms of anxiety; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the prophylaxis of migraine. Betaxolol p. 963, carteolol hydrochloride p. 963, levobunolol hydrochloride p. 964, and timolol maleate p. 965 are used topically in glaucoma.

Beta-adrenoceptor blockers (systemic)

- CONTRA-INDICATIONS Asthma - cardiogenic shock - hypotension - marked bradycardia - metabolic acidosis - phaeochromocytoma (apart from specific use with alpha-blockers) - Prinzmetal’s angina - second-degree AV block - severe peripheral arterial disease - sick sinus syndrome - third-degree AV block - uncontrolled heart failure

CONTRA-INDICATIONS, FURTHER INFORMATION

Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

- CAUTIONS Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously) - myasthenia gravis - portal hypertension (risk of deterioration in liver function) - psoriasis - symptoms of hypoglycaemia may be masked - symptoms of thyrotoxicosis may be masked

- INTERACTIONS → Appendix 1 (beta-blockers).

- Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved). There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

- SIDE-EFFECTS
  - Rare Dry eyes (reversible on withdrawal) - rashes (reversible on withdrawal)
  - Frequency not known Alopecia - bradycardia - bronchospasm - coldness of the extremities - conduction disorders - dizziness - dyspnœa - exacerbation of intermittent claudication - exacerbation of psoriasis - exacerbation of Raynaud’s phenomenon - fatigue - gastrointestinal disturbances - headache - heart failure - hyperglycaemia (in patients with or without diabetes) - hypoglycaemia (in patients with or without diabetes) - hypotension - paraesthesia - peripheral vasoconstriction - psychoses - purpura - sexual dysfunction - sleep disturbances (with nightmares) - symptoms of hypoglycaemia masked - thrombocytopenia - vertigo - visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

Overdose Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 1123.

- ALLERGY AND CROSS-SENSITIVITY Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).

- PREGNANCY Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.

- BREAST FEEDING With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.

- MONITORING REQUIREMENTS Monitor lung function (in patients with a history of obstructive airway disease).

- TREATMENT CESSATION Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.
Acebutolol

**INDICATIONS AND DOSE**

**Hypertension**
- Adult: Initially 400 mg daily for 2 weeks, alternatively initially 200 mg twice daily for 2 weeks, then increased if necessary to 400 mg twice daily; maximum 1.2 g per day.

**Angina**
- Adult: Initially 400 mg daily, alternatively initially 200 mg twice daily; maximum 1.2 g per day

**Arrhythmias**
- Adult: 0.4–1.2 g daily in 2–3 divided doses

**Severe angina**
- Adult: Initially 300 mg 3 times a day; maximum 1.2 g per day

**BREAST FEEDING**
Acebutolol and water soluble beta-blockers are present in breast milk in greater amounts than other beta-blockers.

**RENAL IMPAIRMENT**
- Half dose if eGFR 25–50 mL/minute/1.73 m²; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 8
  - ACEBUTOLOL (Non-proprietary)
    - Acebutolol (as Acebutolol hydrochloride) 400 mg Acebutolol 400mg tablets 28 | price = £18.62

**Capsule**
- CAUTIONARY AND ADVISORY LABELS 8
  - ACEBUTOLOL (Non-proprietary)
    - Acebutolol (as Acebutolol hydrochloride) 100 mg Acebutolol 100mg tablets 84 | price = £14.97
    - Acebutolol (as Acebutolol hydrochloride) 200 mg Acebutolol 200mg tablets 56 | price = £13.18

**Solution for injection**
- Acebutolol 500 microgram per 1 ml

**Atenolol**

**INDICATIONS AND DOSE**

**Hypertension**
- Adult: 25–50 mg daily, higher doses are rarely necessary

**Angina**
- Adult: 100 mg daily in 1–2 divided doses

**Arrhythmias**
- Adult: 50–100 mg daily

**BY INTRAVENOUS INJECTION**
- Adult: 2.5 mg every 5 minutes (max. per dose 10 mg), repeated if necessary, given at a rate of 1 mg/minute

**BY INTRAVENOUS INFUSION**
- Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

**Migraine prophylaxis**
- Adult: 50–200 mg daily in divided doses

**Early intervention within 12 hours of myocardial infarction initially by intravenous injection**
- Adult: Initially 5 mg, to be given over 5 minutes, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg daily

**UNLICENSED USE**
- Use of atenolol for migraine prophylaxis is an unlicensed indication.

**BREAST FEEDING**
- Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.

**RENAL IMPAIRMENT**
- With oral use Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m².
- With intravenous use Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m²; max. 10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**
- For intravenous infusion (Tenormin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 8
  - ATENOLOL (Non-proprietary)
    - Atenolol 25 mg Atenolol 25mg tablets 28 | price = £1.39
    - Atenolol 50 mg Atenolol 50mg tablets 28 | price = £0.93
    - Atenolol 100 mg Atenolol 100mg tablets 28 | price = £0.93

**Capsule**
- ATENOLOL (Non-proprietary)
  - Atenolol (as Atenolol hydrochloride) 100 mg Atenolol 100mg tablets 56 | price = £0.93
  - Atenolol (as Atenolol hydrochloride) 200 mg Atenolol 200mg tablets 56 | price = £0.93

**Solution for injection**
- ATENOLOL (Non-proprietary)

**Atenolol with nifedipine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, atenolol above, nifedipine p. 154.

**INDICATIONS AND DOSE**

**Hypertension**
- Adult: 1 capsule daily, increased if necessary to 1 capsule twice daily
- Elderly: 1 capsule daily
Cardiovascular system

Bisoprolol fumarate

INDICATIONS AND DOSE

Hypertension | Angina
BY MOUTH
> Adult: Initially 1.25 mg twice daily for 2 days, then increased to 2.5 mg once daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses
> Elderly: Initially 1.25 mg daily, initial dose may provide satisfactory control

Angina
BY MOUTH
> Adult: Initially 1.25 mg twice daily for 2 days, then increased to 2.5 mg twice daily

Adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure
BY MOUTH
> Adult: Initially 3.125 mg twice daily, dose to be taken with food, then increased to 6.25 mg twice daily, then increased to 12.5 mg twice daily, then increased to 25 mg twice daily, dose should be increased at intervals of at least 2 weeks up to the highest tolerated dose, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg; max. 50 mg twice daily in patients over 85 kg

CONTRA-INDICATIONS Acute or decompensated heart failure requiring intravenous inotropes - sino–atrial block

CAUTIONS Ensure heart failure not worsening before increasing dose

SIDE-EFFECTS
> Uncommon Cramp - depression - muscle weakness
> Rare Hearing impairment - hypertriglyceridaemia - syncope
> Very rare Conjunctivitis

HEPATIC IMPAIRMENT Max. 10 mg daily in severe impairment.

RENAL IMPAIRMENT Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily).

Carvedilol

INDICATIONS AND DOSE

Hypertension
BY MOUTH
> Adult: Initially 12.5 mg once daily for 2 days, then increased to 25 mg once daily; increased if necessary up to 50 mg daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses

PREGNANCY Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

BREAST FEEDING Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

HEPATIC IMPAIRMENT Avoid in hepatic impairment.

MONITORING REQUIREMENTS Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository

CONTRA-INDICATIONS Acute or decompensated heart failure requiring intravenous inotropes

SIDE-EFFECTS Allergic skin reactions - angina - AV block - changes in liver enzymes - depressed mood - disturbances of micturition - influenza-like symptoms - leucopenia - nasal stuffiness - postural hypotension - thrombocytopaenia - wheezing

CAUTIONS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Co-tenidone

Also consider properties of the Thiazides class, p. 159

**INDICATIONS AND DOSE**
Hypertension

- Adult: 50/12.5 mg daily, alternatively increased if necessary to 100/25 mg daily, doses higher than 50 mg atenolol rarely necessary

Dose equivalence and conversion
A mixture of atenolol and chlortalidone in mass proportions corresponding to 4 parts of atenolol and 1 part chlortalidone.

- **SIDE-EFFECTS**
  - Allergic interstitial nephritis - jaundice
  - **PREGNANCY**: Avoid. Diuretics not used to treat hypertension in pregnancy.
  - **BREAST FEEDING**: Atenolol present in milk in greater amounts than some other beta-blockers. Possible toxicity due to beta-blockade—monitor infant. Large doses of chlortalidone may suppress lactation.
  - **RENA! IMPAIRMENT**: Avoid if eGFR less than 30 mL/minute/1.73 m²—consider alternative treatment.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- CO-TENIDONE (Non-proprietary)
  - Atenolol 50 mg, Chlortalidone 12.5 mg: Co-tenidone 50mg/12.5mg tablets | 28 tablet [PO] £5.92 DT price = £4.14

  - Tenoret (AstraZeneca UK Ltd)
    - Atenolol 50 mg, Chlortalidone 12.5 mg: Tenoret 50mg/12.5mg tablets | 28 tablet [PO] £3.14 DT price = £2.14
  - Tenoretic (AstraZeneca UK Ltd)
    - Atenolol 100 mg, Chlortalidone 25 mg: Tenoretic 100mg/25mg tablets | 28 tablet [PO] £5.18 DT price = £3.72

Esmolol hydrochloride

**INDICATIONS AND DOSE**
Short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia) Tachycardia and hypertension in peri-operative period

- **BY INTRAVENOUS INFUSION**
  - Adult: 50–200 micrograms/kg/minute, consult product literature for details of dose titration and doses during peri-operative period

- **SIDE-EFFECTS**
  - Thrombophlebitis - venous irritation

- **BREAST FEEDING**: Manufacturer advises avoidance.

- **RENA! IMPAIRMENT**: Manufacturer advises caution.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Brevibloc** (Baxter Healthcare Ltd)
  - Esmolol hydrochloride 10 mg per 1 ml: Brevibloc Premixed 100mg/10ml solution for injection vials | 5 vial [PO] no price available

**Solution for infusion**

- **Brevibloc** (Baxter Healthcare Ltd)
  - Esmolol hydrochloride 10 mg per 1 ml: Brevibloc Premixed 2.5g/250ml infusion bags | 1 bag [PO] £83.89

Labetalol hydrochloride

**INDICATIONS AND DOSE**
Controlled hypotension in anaesthesia

- **BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature or local protocols)

Hypertension of pregnancy

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 20 mg/hour, then increased if necessary to 40 mg/hour after 30 minutes, then increased if necessary to 80 mg/hour after 30 minutes, then increased if necessary to 150 mg/hour after 30 minutes, adjusted according to response; Usual maximum 160 mg/hour

- **BY MOUTH**
  - Adult: Use dose for hypertension

Hypertension following myocardial infarction

- **BY INTRAVENOUS INFUSION**
  - Adult: 15 mg/hour, then increased to up to 120 mg/hour, dose to be increased gradually—continued
**Hypertensive emergencies**

**BY INTRAVENOUS INJECTION**
- Adult: 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course

**BY INTRAVENOUS INFUSION**
- Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

**Hypertension**

**BY MOUTH**
- Adult: Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- Elderly: Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day

**BY INTRAVENOUS INJECTION**
- Adult: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

**BY INTRAVENOUS INFUSION**
- Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

- **CAUTIONS** Liver damage
- **SIDE-EFFECTS**
  - Rare Lichenoid rash
  - Frequency not known Difficulty in micturition · epigastric pain · liver damage · nausea · postural hypotension · vomiting · weakness

- **PREGNANCY** The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta blockade).

- **BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

- **HEPATIC IMPAIRMENT** Avoid—severe hepatocellular injury reported.

- **RENAL IMPAIRMENT** Dose reduction may be required.

- **MONITORING REQUIREMENTS**
  - Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.

- **EFFECT ON LABORATORY TESTS** Interferes with laboratory tests for catecholamines.

- **DIRECTIONS FOR ADMINISTRATION** Avoid upright position during and for 3 hours after intravenous administration. For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

---

### Metoprolol tartrate

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200 mg once daily

**Angina**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 50–100 mg 2–3 times a day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200–400 mg daily

**Arrhythmias**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses

**BY INTRAVENOUS INJECTION**
- Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg

**Migraine prophylaxis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 100–200 mg daily in divided doses

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200 mg daily

**Hyperthyroidism (adjunct)**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 50 mg 4 times a day

**In surgery**

**BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 2–4 mg, given at induction or to control arrhythmias developing during anaesthesia, then 2 mg, repeated if necessary; maximum 10 mg per course

**Early intervention within 12 hours of infarction**

**INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by (by mouth) 50 mg every 6 hours for 48 hours; (by mouth) maintenance 200 mg daily in divided doses

- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment.
Nadolol

**INDICATIONS AND DOSE**

**Hypertension**

- Adult: Initially 80 mg daily, then increased in steps of up to 80 mg every 1 week if required; doses higher than the maximum are rarely necessary; maximum 240 mg per day

- Angina

- Adult: Initially 40 mg daily, then increased if necessary up to 160 mg daily; doses should be increased at weekly intervals; maximum dose rarely is used; maximum 240 mg per day

- Arrhythmias

- Adult: Initially 40 mg daily, then increased if necessary up to 160 mg daily; doses should be increased at weekly intervals; reduced to 40 mg daily if bradycardia occurs

- Migraine prophylaxis

- Adult: Initially 40 mg daily, then increased in steps of 40 mg every 1 week, according to the response of the patient: maintenance 80–160 mg per day

- Thyrotoxicosis (adjunct)

- Adult: 80–160 mg daily

**CONTRA-INDICATIONS**

- Acute or decompensated heart failure requiring intravenous inotropes

**SIDE-EFFECTS**

- Depression - oedema

**BREAST FEEDING**

- Manufacturers advise avoidance.

**HEPATIC IMPAIRMENT**

- No information available—manufacturer advises avoid.

**RENAL IMPAIRMENT**

- Manufacturer advises avoid in heart failure if serum creatinine greater than 250 micromol/litre.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 8**

- **METOPROLOL TARTRATE (Non-proprietary)**

Oxrenolol hydrochloride

**INDICATIONS AND DOSE**

**Hypertension**

- Adult: 80–160 mg daily in 2–3 divided doses, then increased if necessary up to 320 mg daily

- Angina

- Adult: 80–160 mg daily in 2–3 divided doses; maximum 320 mg per day

- Arrhythmias

- Adult: 40–240 mg daily in 2–3 divided doses; maximum 240 mg per day

- Anxiety symptoms (short-term use)

- Adult: 40–80 mg daily in 1–2 divided doses

- **Hypertension / Angina**

- Adult: Initially 160 mg once daily, then increased if necessary up to 320 mg daily

**HEPATIC IMPAIRMENT**

- Reduce dose.
Propranolol hydrochloride

INDICATIONS AND DOSE
Thyrotoxicosis
BY MOUTH
▶ Adult: 10–40 mg 3–4 times a day
Thyrotoxic crisis
BY INTRAVENOUS INJECTION
▶ Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

Hypertension
BY MOUTH
▶ Adult: Initially 80 mg twice daily, dose should be increased at weekly intervals as required; maintenance 160–320 mg daily

Prophylaxis of variceal bleeding in portal hypertension
BY MOUTH
▶ Adult: Initially 40 mg twice daily, then increased to 80 mg twice daily (max. per dose 160 mg twice daily), dose to be adjusted according to heart rate

Phaeochromocytoma (only with an alpha-blocker) in preparation for surgery
BY MOUTH
▶ Adult: 60 mg daily for 3 days before surgery
Phaeochromocytoma (only with an alpha-blocker) in patients unsuitable for surgery
BY MOUTH
▶ Adult: 30 mg daily

Angina
BY MOUTH
▶ Adult: Initially 40 mg 2–3 times a day; maintenance 120–240 mg daily

Hypertrophic cardiomyopathy | Anxiety tachycardia
BY MOUTH
▶ Adult: 10–40 mg 3–4 times a day

Anxiety with symptoms such as palpitation, sweating and tremor
BY MOUTH
▶ Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

Prophylaxis after myocardial infarction
BY MOUTH
▶ Adult: Initially 40 mg 4 times a day for 2–3 days, then 80 mg twice daily, start treatment 5 to 21 days after infarction

Essential tremor
BY MOUTH
▶ Adult: Initially 40 mg 2–3 times a day; maintenance 80–160 mg daily

Migraine prophylaxis
BY MOUTH
▶ Adult: 80–240 mg daily in divided doses

Arrhythmias
BY INTRAVENOUS INJECTION
▶ Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

SIDE-EFFECTS
▶ Rare: Dry eyes (reversible on withdrawal)

HEPATIC IMPAIRMENT
Reduce oral dose.

RENAL IMPAIRMENT
Manufacturer advises caution; dose reduction may be required.
Timolol maleate 10 mg

INDICATIONS AND DOSE

Hypertension
BY MOUTH
- Adult: 10–20 mg daily in 1–2 divided doses

Amiloride with hydrochlorothiazide and timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, amiloride hydrochlorothiazide p. 203, timolol maleate above.

INDICATIONS AND DOSE

Hypertension
BY MOUTH
- Adult: 1–2 tablets daily

Bendroflumethiazide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate above, bendroflumethiazide p. 159.

INDICATIONS AND DOSE

Hypertension
BY MOUTH
- Adult: 1–2 tablets daily; maximum 4 tablets per day

Calcium-channel blockers

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important
differences between verapamil hydrochloride p. 156, diltiazem hydrochloride p. 149, and the dihydropyridine calcium-channel blockers (amlodipine below, felodipine p. 151, lacidipine p. 152, lercanidipine hydrochloride p. 153, nicardipine hydrochloride p. 153, nifedipine p. 154, and nimodipine p. 99). Verapamil hydrochloride and diltiazem hydrochloride should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration. Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers. Constipation is the most common side-effect. Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride, and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nifedipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Isradipine, lacidipine and lercanidipine hydrochloride have similar effects to those of nifedipine and nicardipine hydrochloride; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

**Unstable angina**

Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with beta-blockers.

---

**Calcium-channel blockers**

- **DRUG ACTION** Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

- **SIDE-EFFECTS**
  - **Overdose** Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 1123.
  - **TREATMENT CESSATION** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

**Amlodipine**

- **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

- **Angina**
  - **BY MOUTH**
    - **Adult:** Initially 5 mg once daily; maximum 10 mg per day

- **Hypertension**
  - **BY MOUTH**
    - **Adult:** Initially 5 mg once daily; maximum 10 mg per day

- **Dose equivalence and conversion**
  - Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

- **CONTRA-INDICATIONS** Cardiogenic shock - significant aortic stenosis - unstable angina

- **INTERACTIONS** → Appendix 1 (calcium-channel blockers).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain, dizziness, fatigue, flushing, headache, nausea, oedema, palpitation, sleep disturbances
  - **Uncommon** Alopecia, arthralgia, asthenia, back pain, chest pain, dry mouth, dyspnoea, gastro-intestinal disturbances, gynaecomastia, hypotension, impotence, mood changes, muscle cramps, myalgia, paraesthesia, pruritus, purpura, rashes, rhinitis, skin discoloration, sweating, syncope, taste disturbances, tinnitus, tremor, urinary disturbances, visual disturbances, weight changes
  - **Very rare** Angioedema, arrhythmias, cholestasis, coughing, gastritis, gingival hyperplasia, hepatitis, hyperglycaemia, jaundice, myocardial infarction, pancreatitis, peripheral neuropathy, tachycardia, thrombocytopenia, urticaria, vasculitis
  - **Frequency not known** Erythema multiforme

- **Overdose** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- **PREGNANCY** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.
Diltiazem hydrochloride

**INDICATIONS AND DOSE**

**Angina**

- **BY MOUTH**
  - Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
  - Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

---

**Amlodipine with valsartan**

The properties of the components please consider, amlodipine p. 148, valsartan p. 136.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions

- **BY MOUTH**
  - Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **AMLODIPINE (Non-proprietary)**
  - Amlodipine 5 mg | tablet | £0.98
  - Amlodipine 10 mg | tablet | £1.00

- **Amlostin (Discovery Pharmaceuticals Ltd)**
  - Amlodipine 5 mg | tablet | £0.88
  - Amlodipine 10 mg | tablet | £0.90

- **Istin (Pfizer Ltd)**
  - Amlodipine 5 mg | tablet | £0.98
  - Amlodipine 10 mg | tablet | £1.00

**Oral solution**

- **AMLODIPINE (Non-proprietary)**
  - Amlodipine 1 mg per 1 ml | oral solution | £1.10
  - Amlodipine 2 mg per 1 ml | oral solution | £1.15

Also available in combination with olmesartan, p. 135 - hydrochlorothiazide and olmesartan, p. 135 - valsartan, below

---

**Dose equivalence and conversion**

The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation ‘modified-release’, their duration of action corresponds to that of tablets requiring administration more frequently.

**TILDIEM RETARD**

Mild to moderate hypertension

- **BY MOUTH**
  - Adult: Initially 90–120 mg twice daily; increased if necessary to 360 mg daily in divided doses
  - Elderly: Initially 120 mg daily; increased if necessary to 120 mg twice daily

**ANGINA**

- **BY MOUTH**
  - Adult: Initially 90–120 mg twice daily; increased if necessary to 480 mg daily in divided doses
  - Elderly: Up to 120 mg twice daily, dose form not appropriate for initial dose titration

**ADIZEM-SR**

Mild to moderate hypertension

- **BY MOUTH**
  - Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

**ANGINA**

- **BY MOUTH**
  - Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily, dose form not appropriate for initial dose titration in the elderly

**ADIZEM-SR**

Mild to moderate hypertension

- **CAPSULES**
  - Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

**ANGINA**

- **BY MOUTH**
  - Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily, dose form not appropriate for initial dose titration in the elderly

**TILDIEM LA**

- **ANGINA**| Mild to moderate hypertension
  - **BY MOUTH**
    - Adult: Initially 200 mg daily, to be taken with or before food, increased if necessary to 300–400 mg daily; maximum 500 mg per day
    - Elderly: Initially 200 mg daily, increased if necessary to 300 mg daily

**VIAZEM XL**

- **ANGINA**| Mild to moderate hypertension
  - **BY MOUTH**
    - Adult: Initially 180 mg once daily, adjusted according to response to 240 mg once daily; maximum 360 mg per day
    - Elderly: Initially 120 mg once daily, adjusted according to response

**DILZEM XL**

- **ANGINA**| Mild to moderate hypertension
  - **BY MOUTH**
    - Adult: Initially 180 mg daily; increased if necessary to 360 mg daily
    - Elderly: Initially 120 mg daily; increased if necessary to 360 mg daily
Blood pressure conditions

DILZEM® SR
Angina | Mild to moderate hypertension
BY MOUTH
» Adult: Initially 90 mg twice daily; increased if necessary up to 180 mg twice daily
» Elderly: Initially 60 mg twice daily; increased if necessary up to 180 mg twice daily

ADIZEM-XL®
Angina | Mild to moderate hypertension
BY MOUTH
» Adult: Initially 240 mg daily; increased if necessary to 300 mg daily
» Elderly: Initially 120 mg daily; increased if necessary up to 300 mg daily

ANGITIL® SR
Angina | Mild to moderate hypertension
BY MOUTH
» Adult: Initially 90 mg twice daily; increased if necessary to 120–180 mg twice daily

ZEMTARD®
Angina
BY MOUTH
» Adult: 180–300 mg daily, increased if necessary to 480 mg daily
» Elderly: Initially 120 mg daily, increased if necessary to 480 mg daily

» Elderly: Initially 60 mg twice daily; increased if necessary to 90 mg twice daily

Frequency not known
Depression • extrapyramidal symptoms • gum hyperplasia • gynaecomastia • hepatitis
Overdose
In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

PREGNANCY
Avoid.

BREAST FEEDING
Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

HEPATIC IMPAIRMENT
Reduce dose.

TILDIE RETARD®
Dose for mild to moderate hypertension—initially 120 mg once a day. For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

TILDIE® LA
Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® XL, DILZEM® XL, ADIZEM-XL®, ZEMTARD®, SLOZEM®
Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

ANGITIL® XL
Dose form not appropriate for initial dose titration.

DILCARDIA® SR
Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

RENA IMPAIRMENT
Start with smaller dose.

TILDIE RETARD®
Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day. For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

TILDIE® LA
Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

VIAZEM® XL, DILZEM® XL, ADIZEM-XL®, ZEMTARD®, SLOZEM®
Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

ANGITIL® XL
Dose form not appropriate for initial dose titration.

DILCARDIA® SR
Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

PRESCRIBING AND DISPENSING INFORMATION
Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed.

PATIENT AND CARER ADVICE
TILDIE RETARD®
Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

CONTRA-INDICATIONS
Acute porphyrias p. 864 • left ventricular failure with pulmonary congestion • second- or third-degree AV block (unless pacemaker fitted) • severe bradycardia • sick sinus syndrome

CAUTIONS
Bradycardia (avoid if severe) • first degree AV block • heart failure • prolonged PR interval • significantly impaired left ventricular function

INTERACTIONS
Appendix 1 (calcium-channel blockers).

SIDE-EFFECTS
Common or very common • Asthenia • AV block • bradycardia • dizziness • gastro-intestinal disturbances • headache • hot flushes • hypotension • malaise • oedema (notably of ankles) • palpitation • sino-atrial block

Rare
Erythema multiforme • exfoliative dermatitis • photosensitivity • rashes

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 25

DILTIAZEM HYDROCHLORIDE (Non-proprietary)
Diltiazem hydrochloride 60 mg
Diltiazem 60mg modified-release tablets | 84 tablet [GBP] £36.26 DT price = £30.55 | 100 tablet [GBP] £43.16

## Hypertension 151

### Felodipine

**Drug Action** Felodipine is a dihydropyridine calcium-channel blocker.

### INDICATIONS AND DOSE

#### Angina

**BY MOUTH**

- **Adult:** Initially 5 mg daily; increased if necessary to 10 mg daily, to be taken in the morning.
- **Elderly:** Initially 2.5 mg daily; increased if necessary to 10 mg daily, to be taken in the morning.

#### Hypertension

**BY MOUTH**

- **Adult:** Initially 5 mg daily, to be taken in the morning; usual maintenance 5–10 mg once daily, doses above 20 mg daily rarely needed.
- **Elderly:** Initially 2.5 mg daily, to be taken in the morning; usual maintenance 5–10 mg once daily, doses above 20 mg daily rarely needed.

### CONTRA-INDICATIONS

Cardiac outflow obstruction - significant cardiac valvular obstruction (e.g. aortic stenosis) - uncontrolled heart failure - unstable angina - within 1 month of myocardial infarction.

Isradipine

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH**

- **Adult:** 2.5 mg twice daily for 3–4 weeks, then increased if necessary to 5 mg twice daily, dose increased exceptionally up to 10 mg twice daily
- **Elderly:** 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance 2.5–5 mg once daily

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864 • aortic stenosis • avoid within 1 month of myocardial infarction • cardiogenic shock • unstable angina
- **CAUTIONS**

  - Cardiac conduction abnormalities • poor cardiac reserve
  - **INTERACTIONS**

    → Appendix 1 (calcium-channel blockers).
  - **SIDE-EFFECTS**

    - **Common or very common** Abdominal discomfort • dizziness • dyspnoea • fatigue • flushing • headache • palpitation • peripheral oedema • polyuria • rash • tachycardia
    - **Uncommon** Hypotension • weight gain
    - **Very rare** Anaemia • anorexia • anxiety • arrhythmia • arthralgia • blood disorders • bradycardia • cough • depression • drowsiness • erectile dysfunction • gum hyperplasia • heart failure • hypersensitivity reactions • leucopenia • nausea • paraesthesia • thrombocytopenia • visual disturbance • vomiting

  - **Frequency not known** Gynaecomastia • hepatitis

  - **Overdose** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.
  - **PREGNANCY** May inhibit labour. Risk to fetus should be balanced against risk of uncontrolled maternal hypertension.
  - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
  - **HEPATIC IMPAIRMENT** 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance dose of 2.5 mg or 5 mg once daily may be sufficient.
  - **RENAL IMPAIRMENT** Use with caution.

**MEDITINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **ISRADIPINE (Non-proprietary)**

  Isradipine 2.5 mg Isradipine 2.5mg tablets | 56 tablet p. 131

  DT price = £184.01–£211.01 DT price = £185.94

**Lacidipine**

**DRUG ACTION**

Lacidipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH**

- **Adult:** Initially 2 mg daily; increased if necessary to 4 mg daily, then increased if necessary to 6 mg daily, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning

  - **CONTRA-INDICATIONS**

    - Acute porphyrias p. 864 • aortic stenosis • avoid within 1 month of myocardial infarction • cardiogenic shock • unstable angina
    - **CAUTIONS**

      - Cardiac conduction abnormalities • poor cardiac reserve
      - **INTERACTIONS**

        → Appendix 1 (calcium-channel blockers).
      - **SIDE-EFFECTS**

        - **Common or very common** Dizziness • flushing • headache • oedema • palpitation
        - **Rare** Aggravation of angina • asthenia • erythema • gastro-intestinal disturbances • gum hyperplasia • mood disturbances • muscle cramps • polyuria • pruritus • skin rash

  - **Overdose** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.
  - **PREGNANCY** Manufacturer advises avoid may inhibit labour.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT** Antihypertensive effect possibly increased.

**MEDITINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

  Lacidipine 2 mg Lacidipine 2mg tablets | 28 tablet DT price = £2.90

  also available in combination with ramipril, p. 131
Lercanidipine hydrochloride

**DRUG ACTION** Lercanidipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Mild to moderate hypertension**

**BY MOUTH**

- **Adult:** Initially 10 mg once daily; increased if necessary up to 20 mg daily, dose can be adjusted after 2 weeks

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864
- Aortic stenosis
- Uncontrolled heart failure
- Unstable angina
- within 1 month of myocardial infarction

**CAUTIONS**

- Left ventricular dysfunction
- Sick sinus syndrome (if pacemaker not fitted)

**INTERACTIONS**

- Appendix 1 (calcium-channel blockers)

**SIDE-EFFECTS**

- **Uncommon**
  - Dizziness, flushing, headache, palpitation, peripheral oedema, tachycardia
- **Rare**
  - Angina, asthenia, drowsiness, gastrointestinal disturbances, myalgia, polyuria, rash
- **Very rare**
  - Gingival hyperplasia
  - Hypotension
  - Myocardial infarction

**Overdose**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**

Manufacturer advises avoid—no information available.

**BREAST FEEDING**

Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Avoid in severe disease.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Nicardipine hydrochloride

**DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Prophylaxis of angina**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

- Acute porphyrias p. 864
- Aortic stenosis
- Significant or advanced aortic stenosis
- Unstable or acute attacks of angina

**SPECIFIC CONTRA-INDICATIONS:**

- With intravenous use
  - Avoid within 8 days of myocardial infarction
- With oral use
  - Avoid within 1 month of myocardial infarction

**CAUTIONS**

- Congestive heart failure
- Elderly–elevated intracranial pressure
- Portal hypertension
- Pulmonary oedema
- Significantly impaired left ventricular function

**SIDE-EFFECTS**

- Atrophic ventricular block
- Depression
- Dizziness
- Drowsiness
- Dyspnoea
- Flushing
- Frequency of micturition
- Gastro-intestinal disturbances
- Gingival hyperplasia
- Headache
- Hypotension
- Impotence
- Insomnia
- Nausea
- Palpitations
- Paraesthesia
- Paralytic ileus
- Peripheral oedema
- Pruritus
- Pulmonary oedema
- Rash
- Tachycardia
- Thrombocytopenia
- Tinnitus
- Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypotension and reflex tachycardia**

Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur—during intravenous use consider stopping infusion or decreasing dose by half.

**OVERDOSE**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**

For treatment of acute life-threatening hypertension only. May inhibit labour. Not to be used in...
multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in animal studies. Risk of severe maternal hypotension and fatal foetal hypoxia—avoid excessive decrease in blood pressure.

- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

- **HEPATIC IMPAIRMENT**
  - With oral use Use with caution—consider using lowest initial dose and extending dosing interval according to individual response.
  - With intravenous use Use with caution—use lower initial dose.

- **RENAL IMPAIRMENT**
  - With intravenous use Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored. For intravenous infusion give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution via central venous line only) and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Capsule**
  - NICARDINE HYDROCHLORIDE (Non-proprietary)
    - Nicardipine hydrochloride 20 mg Nicardipine 20mg capsules | 56 capsule [Price] £8.38 DT price = £6.00
    - Nicardipine hydrochloride 30 mg Nicardipine 30mg capsules | 56 capsule [Price] £9.73 DT price = £6.37
  - Cardene (Astellas Pharma Ltd)
    - Nicardipine hydrochloride 20 mg Cardene 20mg capsules | 56 capsule [Price] £6.00 DT price = £6.00
    - Nicardipine hydrochloride 30 mg Cardene 30mg capsules | 56 capsule [Price] £6.96 DT price = £6.37

- **Modified-release capsule**
  - CAUTIONARY AND ADVISORY LABELS 25
  - Cardene SR (Astellas Pharma Ltd)
    - Nicardipine hydrochloride 30 mg Cardene SR 30mg capsules | 56 capsule [Price] £7.15 DT price = £7.15
    - Nicardipine hydrochloride 45 mg Cardene SR 45mg capsules | 56 capsule [Price] £10.40 DT price = £10.40

- **Solution for infusion**
  - NICARDINE HYDROCHLORIDE (Non-proprietary)
    - Nicardipine hydrochloride 1 mg per 1 ml Nicardipine 10mg/10ml solution for injection ampoules | 5 ampoule [Price] £5.00

**Nifedipine**

- **DRUG ACTION** Nifedipine is a dihydropyridine calcium-channel blocker.
**TENSIPINE**® MR
Hypertension | Angina prophylaxis
BY MOUTH
▶ Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

**CORACTEN**® SR
Hypertension | Angina prophylaxis
BY MOUTH
▶ Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

**CORACTEN**® XL
Hypertension | Angina prophylaxis
BY MOUTH
▶ Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily

**UNLICENSED USE** Not licensed for use in postponing premature labour.

**CONTRA-INDICATIONS** Acute attacks of angina - cardiogenic shock - significant aortic stenosis - unstable angina - within 1 month of myocardial infarction

**CAUTIONS** Diabetes mellitus - elderly - heart failure - poor cardiac reserve - severe hypotension - short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia - significantly impaired left ventricular function (heart failure deterioration observed) - withdrawn if ischaemic pain occurs or existing pain worsens shortly after initiating treatment

**ADALAT**® LA
Crohn's disease - decreased lumen diameter of the gastro-intestinal tract - history of gastro-intestinal obstruction - inflammatory bowel disease

**CAUTIONS, FURTHER INFORMATION**
**ADALAT**® LA, **VALNI**® XL
Dose form not appropriate for use where there is a history of oesophageal obstruction - inflammatory bowel disease (including Crohn's disease).

**INTERACTIONS** → Appendix 1 (calcium-channel blockers).

**SIDE-EFFECTS**
▶ Common or very common Asthenia - dizziness - gastrointestinal disturbance - headache - hypotension - lethargy - oedema - palpitation - vasodilatation
▶ Rare Anorexia - gum hyperplasia - hyperglycaemia - male infertility - mood disturbances - photosensitivity reactions - purpura
▶ Frequency not known Agranulocytosis - anaphylaxis - bezoar formation (with some modified-release preparations) - dysphagia - gynaecomastia - intestinal obstruction - intestinal ulcer

**Overdose** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY** May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

**BREAST FEEDING** Amount too small to be harmful but manufacturers advise avoid.

**HEPATIC IMPAIRMENT** Dose reduction may be required in severe liver disease. Some modified-release formulations may not be suitable for dose titration in hepatic disease—consult product literature.

**ADALAT**® LA, **VALNI**® XL. Dose form not appropriate.

**DIRECTIONS FOR ADMINISTRATION**
**FORTIPINE** LA 40 Take with or just after food, or a meal.

**PRESCRIBING AND DISPENSING INFORMATION** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

**PATIENT AND CARER ADVICE**
**ADALAT**® LA. Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops

Verapamil hydrochloride

INDICATIONS AND DOSE

Treatment of supraventricular arrhythmias
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: 40–120 mg 3 times a day
BY SLOW INTRAVENOUS INJECTION
▶ Adult: 5–10 mg, to be given over 2 minutes, preferably with ECG monitoring
▶ Elderly: 5–10 mg, to be given over 3 minutes, preferably with ECG monitoring

Paroxysmal tachyarrhythmias
BY SLOW INTRAVENOUS INJECTION
▶ Adult: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 2 minutes, preferably with ECG monitoring
▶ Elderly: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 3 minutes, preferably with ECG monitoring

Angina
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: 80–120 mg 3 times a day

Hypertension
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: 240–480 mg daily in 2–3 divided doses

Prophylaxis of cluster headache (initiated under specialist supervision)
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: 240–960 mg daily in 3–4 divided doses

HALF SECURON® SR
Hypertension (in patients new to verapamil)
BY MOUTH
▶ Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Hypertension
BY MOUTH
▶ Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Angina
BY MOUTH
▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

Prophylaxis after myocardial infarction where beta-blockers not appropriate
BY MOUTH
▶ Adult: 360 mg daily in divided doses, started at least 1 week after infarction, given as either 240 mg in the morning and 120 mg in the evening or 120 mg 3 times daily

SECURON® SR
Hypertension (in patients new to verapamil)
BY MOUTH
▶ Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Hypertension
BY MOUTH
▶ Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

Angina
BY MOUTH
▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

Prophylaxis after myocardial infarction where beta-blockers not appropriate
BY MOUTH
▶ Adult: 360 mg daily; maximum 480 mg per day

VERTAB® SR 240
Mild to moderate hypertension
BY MOUTH
▶ Adult: 240 mg daily, increased if necessary to 240 mg twice daily

Angina
BY MOUTH
▶ Adult: 240 mg twice daily, dose frequency may sometimes be reduced to once daily

VERAPRESS® MR
Hypertension
BY MOUTH
▶ Adult: 240 mg daily, increased if necessary to 240 mg twice daily

Angina
BY MOUTH
▶ Adult: 240 mg twice daily, may sometimes be reduced to once daily

UNIVER®
Hypertension (in patients new to verapamil)
BY MOUTH
▶ Adult: 120 mg daily; maximum 480 mg per day

Hypertension
BY MOUTH
▶ Adult: 240 mg daily; maximum 480 mg per day

Angina
BY MOUTH
▶ Adult: 360 mg daily; maximum 480 mg per day

● UNLICENSED USE
  ● With oral use Prophylaxis of cluster headaches is an unlicensed indication.

● CONTRA-INDICATIONS  Acute porphyrias p. 864 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · history of heart failure (even if controlled by therapy) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

● CAUTIONS  Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · first-degree AV block

● INTERACTIONS → Appendix 1 (calcium-channel blockers).
Verapamil and beta-blockers  Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

SIDE-EFFECTS

Common or very common  Constipation
Uncommon  Ankle oedema, dizziness, fatigue, flushing, headache, nausea, vomiting
Rare  Allergic reactions - angioedema, arthralgia, asystole, bradycardia, erythema, erythrocalalgia, gingival hyperplasia after long-term treatment, gynaecomastia after long-term treatment, heart block, heart failure, hypotension, increased prolactin concentration, myalgia, paraesthesia, pruritus, Stevens-Johnson syndrome, urticaria

SIDE-EFFECTS, FURTHER INFORMATION

Intravenous administration or high doses  Hypotension, heart failure, bradycardia, heart block, and asystole are side-effects associated with intravenous administration or high doses.

Overdose  In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

PREGNANCY  May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.

BREAST FEEDING  Amount too small to be harmful.

HEPATIC IMPAIRMENT  Oral dose may need to be reduced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Univer (Teva UK Ltd)
Verapamil hydrochloride 120 mg Univer 120mg modified-release capsules 28 capsule (£4.86 DT price = £4.86

Hydralazine hydrochloride

INDICATIONS AND DOSE

BY MOUTH

Moderate to severe hypertension (adjunct)

Adult: Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision)

BY MOUTH

Adult: Initially 25 mg 3–4 times a day, then increased if necessary to every 2 days; maintenance 50–75 mg 4 times a day

Hypertensive emergencies (including during pregnancy)

Hypertension with renal complications

BY INTRAVENOUS INFUSION

Adult: Initially 200–300 micrograms/minute; maintenance 50–150 micrograms/minute

Hypertensive emergencies (including during pregnancy)

Hypertension with renal complications

BY SLOW INTRAVENOUS INJECTION

Adult: 5–10 mg, to be diluted with 10 mL sodium chloride 0.9%, dose may be repeated after 20–30 minutes

CONTRA-INDICATIONS

Acute porphyrias

Pulmonary

Dissecting aortic aneurysm

High output heart failure

Idiopathic systemic lupus erythematosus

Myocardial insufficiency due to mechanical obstruction

Severe tachycardia

CAUTIONS

Cerebrovascular disease - coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) - occasionally blood pressure reduction too rapid even with low parenteral doses

INTERACTIONS  Appendix 1 (hydralazine)

SIDE-EFFECTS

Rare  Rash

Frequency not known

Abnormal liver function - agitation - anorexia - anxiety - arthralgia - blood disorders - dizziness - dyspnoea - fever - fluid retention - flushing - gastrointestinal disturbances - haematuria - haemolytic anaemia - headache - hypotension - increased lactation - jaundice - leucopenia - myalgia - nasal congestion - palpitation - paraesthesia - peripheral neuritis - polyneuritis - proteinuria - raised plasma creatinine - systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) - tachycardia - thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.
Minoxidil

INDICATIONS AND DOSE
Severe hypertension, in addition to a diuretic and a beta-blocker

BY MOUTH
- Adult: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day
- Elderly: Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Acute porphyrias p. 864 · after myocardial infarction (until stabilised) · angina

INTERACTIONS Appendix 1 (vasodilator antihypertensives).

SIDE-EFFECTS Breast tenderness · gastro-intestinal disturbances · hypertrichosis · hyperpigmentation · rashes · reversible rise in creatinine and blood urea nitrogen · sodium retention · tachycardia · water retention · weight gain

PREGNANCY Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

BREAST FEEDING Present in milk but not known to be harmful.

RENAI IMPAIRMENT Use with caution in significant impairment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Thiazides and related diuretics

- **CONTRA-INDICATIONS** Addison’s disease, hypercalcaemia, hypernatraemia, refractory hypokalaemia, symptomatic hyperuricaemia
- **CAUTIONS** Diabetes, gout, hyperaldaosteronism, malnourishment, nephrotic syndrome, systemic lupus erythematosus

**CAUTIONS, FURTHER INFORMATION**

**Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements. Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension. In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

**Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

**Existing conditions** Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

**INTERACTIONS** → Appendix 1 (diuretics).

**SIDE-EFFECTS**
- **Common or very common** Altered plasma-lipid concentrations - gout - hypercalcaemia - hyperglycaemia - hyperuricaemia - hypochloraemic alkalosis - hypokalaemia - hypomagnesaemia - hyponatraemia - metabolic and electrolyte disturbances - mild gastrointestinal disturbances - postural hypotension
- **Uncommon** Agranulocytosis - blood disorders - impotence - leucopenia - thrombocytopenia

**Frequency not known** Cardiac arrhythmias - dizziness - headache - hypersensitivity reactions - intrahepatic cholestasis - pancreatitis - paraesthesia - photosensitivity - pneumonitis - pulmonary oedema - severe skin reactions - visual disturbances

**PREGNANCY** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

**HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.

**RENAL IMPAIRMENT** Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolozane remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis. Electrolytes should be monitored in renal impairment.

**MONITORING REQUIREMENTS** Electrolytes should be monitored, particularly with high doses and long-term use.

#### Bendroflumethiazide (Bendrofluzide)

**INDICATIONS AND DOSE**

- **Oedema**
  - **BY MOUTH**
    - Adult: Initially 5–10 mg once daily or on alternate days, dose to be taken in the morning, then maintenance 5–10 mg 1–3 times a week
  - **Hypertension**
    - **BY MOUTH**
      - Adult: 2.5 mg daily, dose to be taken in the morning, higher doses are rarely necessary

**BREAST FEEDING** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **BENDROFLUMETHIAZIDE (Non-proprietary)**
  - Bendroflumethiazide 2.5 mg Bendroflumethiazide 2.5mg tablets | 28 tablet (PS) £3.68 DT price = 10.08 | 500 tablet (PS) £65.71
  - Bendroflumethiazide 5 mg Bendroflumethiazide 5mg tablets | 28 tablet (PS) £7.36 DT price = 0.97 | 500 tablet (PS) £73.60
  - Aprinox (AMCo)
    - Bendroflumethiazide 2.5 mg Aprinox 2.5mg tablets | 500 tablet (PS) £27.31
Co-amilozide

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 2.5/25 mg daily, increased if necessary up to 5/50 mg daily

**Congestive heart failure**
- **BY MOUTH**
  - Adult: Initially 2.5/25 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

**Oedema and ascites in cirrhosis of the liver**
- **BY MOUTH**
  - Adult: Initially 5/50 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

**Dose equivalence and conversion**
A mixture of amiloride hydrochloride and hydrochlorothiazide in the mass proportions of 1 part amiloride hydrochloride to 10 parts hydrochlorothiazide.

**CONTRA-INDICATIONS**
- Anuria - hyperkalaemia

**CAUTIONS**
- Diabetes mellitus - elderly

**SIDE-EFFECTS**

**BREAST FEEDING**
- Avoid—no information regarding amiloride component available. Amount of hydrochlorothiazide in milk probably too small to be harmful. Large doses of hydrochlorothiazide may suppress lactation.

**RENAral IMPAIRMENT**
- Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS**
- Monitor electrolytes.

**MEDICINAL FORMS**
- Present in milk—manufacturer advises avoid.

**Hydrochlorothiazide**

**INDICATIONS AND DOSE**

**Essential hypertension**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 2.5 mg daily, dose to be taken preferably in the morning
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 1.5 mg daily, dose to be taken preferably in the morning

**SIDE-EFFECTS**
- Diuresis (with doses above 2.5 mg daily) - paresthesia

**ALLERGY AND CROSS-SENSITIVITY**
- Contraindicated if history of hypersensitivity to sulfonamides.

**BREAST FEEDING**
- Present in milk—manufacturer advises avoid.

**INDAPAMIDE**

**INDICATIONS AND DOSE**

**Essential hypertension**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 2.5 mg daily, dose to be taken preferably in the morning
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 1.5 mg daily, dose to be taken preferably in the morning

**SIDE-EFFECTS**
- Acute porphyrias p. 864

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution suspended

**Tablet**
- **INDAPAMIDE (Non-proprietary)**
  - Indapamide hemihydrate 2.5 mg Indapamide 2.5mg tablets | 28 tablet (PO) £40.99 DT price = £1.56 | 30 tablet (PO) £27.99 | 56 tablet (PO) £52.00
4.2 Hypertension associated with phaeochromocytoma

**Drugs used for Hypertension associated with phaeochromocytoma not listed below; Propranolol hydrochloride, p. 146**

**ALPHA-ADRENOCEPTOR BLOCKERS**

### Phenoxbenzamine hydrochloride

**INDICATIONS AND DOSE**

**Hypertension in phaeochromocytoma**

**BY MOUTH**

- **Adults:** Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1–2 mg/kg daily in 2 divided doses

- **SIDE-EFFECTS**
  - Gastro-intestinal disturbances
  - Frequency not known: Inhibition of ejaculation, lassitude, miosis, nasal congestion, postural hypotension (with dizziness and marked compensatory tachycardia)
  - PREGNANCY Hypotension may occur in newborn.

- **CAUTIONS**
  - Avoid contact with skin (risk of contact sensitisation) - avoid in acute porphyrias p. 864.
  - Carcinogenic in animals. Cerebrovascular disease, congestive heart failure, elderly, severe ischaemic heart disease. Avoid contact with skin (risk of contact sensitisation) - avoid in acute porphyrias p. 864.

- **CONTRA-INDICATIONS**
  - History of cerebrovascular accident

- **INTERACTIONS**
  - Appendix 1 (alpha-blockers).

- **MEDICINAL FORMS**
  - Medicines not identified.

**INDICATIONS AND DOSE**

**Hypertensive crises**

**PERIPHERAL VASODILATORS**

### Sodium nitroprusside

**INDICATIONS AND DOSE**

**Hypertensive emergences**

**BY INTRAVENOUS INFUSION**

- **Adults:** Initially 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of up to 1.5 micrograms/kg/minute has been used.

- **Controlled hypotension in anaesthesia during surgery**

- **BY INTRAVENOUS INFUSION**
  - **Adults:** Up to 1.5 micrograms/kg/minute.

- **Heart failure**

- **BY INTRAVENOUS INFUSION**
  - **Adults:** Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary, usual dose 10–200 micrograms/minute normally for max. 3 days.
Guanethidine monosulfate

**INDICATIONS AND DOSE**

**Hypertensive crisis (but no longer recommended)**

**BY INTRAMUSCULAR INJECTION**

- Adult: 10–20 mg, dose may be repeated after 3 hours if necessary

**CONTRA-INDICATIONS** Heart failure, phaeochromocytoma

**CAUTIONS** Asthma, cerebral arteriosclerosis, coronary arteriosclerosis, history of peptic ulceration

**INTERACTIONS** Appendix 1 (adrenergic neurone blockers).

**SIDE-EFFECTS** Diarrhoea, drowsiness, failure of ejaculation, fluid retention, headache, nasal congestion, postural hypotension

**PREGNANCY** Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.

**RENAI IMPAIRMENT** Reduce dose if eGFR 40–65 mL/minute/1.73 m². Avoid if eGFR less than 40 mL/minute/1.73 m².

**LESS SUITABLE FOR PRESCRIBING** Guanethidine monosulfate is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

GUANETHIDINE MONOSULFATE (Non-proprietary) Guanethidine monosulfate 10 mg per 1 ml

10mg/1ml solution for injection ampoules | 5 ampoule £224.15

**ENDOTHELIN RECEPTOR ANTAGONISTS**

**Ambrisentan**

**INDICATIONS AND DOSE**

Pulmonary arterial hypertension

**BY MOUTH**

- Adult: 5 mg once daily, increased if necessary to 10 mg once daily

Dose adjustments due to interactions

Max. 5 mg daily with concomitant ciclosporin.

**CONTRA-INDICATIONS** Idiopathic pulmonary fibrosis

**CAUTIONS** Not to be initiated in significant anaemia

**INTERACTIONS** Appendix 1 (ambrisentan).

**SIDE-EFFECTS**

- Common or very common Abdominal pain, anaemia, chest pain, constipation, diarrhoea, dizziness, dyspnoea, epistaxis, flushing, headache, heart failure, hypotension, malaise, nausea, palpitation, peripheral oedema, upper respiratory tract disorders, vomiting

- Uncommon Autoimmune hepatitis, hepatic injury, syncope

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

**PREGNANCY** Avoid (teratogenic in animal studies).

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAI IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor haemoglobin concentration or haematocrit observed). Treatment if significant decrease in haemoglobin concentration or haematocrit observed.

- Discontinue if liver enzymes raised

- Monthly pregnancy tests advised.

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium (SMC) Decisions has advised (October 2008) that ambrisentan (Vlibris®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.
**Bosentan**

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension**

BY MOUTH

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

BY MOUTH

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily

**SIDE-EFFECTS**

- Common or very common Anaemia, diarrhoea, flushing, gastro-oesophageal reflux, headache, hypotension, oedema, palpititation, syncope

- Uncommon Leucopenia, neutropenia, thrombocytopenia

- Rare Liver cirrhosis, liver failure

**CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

**PREGNANCY** Avoid (teratogenic in animal studies).

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid if serum transaminases exceed 3 times upper limit of normal. Avoid in moderate and severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available). In renal impairment consider monitoring blood pressure (risk of hypotension).

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg

**INTERACTIONS** → Appendix 1 (bosentan).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Volibris (GlaxoSmithKline UK Ltd)
  - Bosentan 5 mg Volibris 5mg tablets | 30 tablet [POM] £1,618.08
  - Bosentan 10 mg Volibris 10mg tablets | 30 tablet [POM] £1,618.08

**Macitentan**

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension**

BY MOUTH

- Adult: 10 mg daily

**CONTRA-INDICATIONS** Severe anaemia

**CAUTIONS** Patients over 75 years - pulmonary veno-occlusive disease

**INTERACTIONS** → Appendix 1 (macitentan).

**SIDE-EFFECTS**

- Common or very common Anaemia, bronchitis, headache, hypotension, upper respiratory-tract disorders - urinary-tract infection

- Frequency not known Leucopenia, thrombocytopenia

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.

**PREGNANCY** Toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Do not initiate if serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury.

**RENAL IMPAIRMENT** Toxin studies.

**CONTRA-INDICATIONS** Severe anaemia

**CAUTIONS** Patients over 75 years - pulmonary veno-occlusive disease

**INTERACTIONS** → Appendix 1 (macitentan).

**SIDE-EFFECTS**

- Common or very common Anaemia, bronchitis, headache, hypotension, upper respiratory-tract disorders - urinary-tract infection

- Frequency not known Leucopenia, thrombocytopenia

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.

**PREGNANCY** Toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Do not initiate if serum transaminases exceed 3 times upper limit of normal. Avoid in moderate and severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available). In renal impairment consider monitoring blood pressure (risk of hypotension).

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg

**INTERACTIONS** → Appendix 1 (bosentan).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Tracleer (Actelion Pharmaceuticals UK Ltd)
  - Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5mg tablets | 56 tablet [POM] £1,510.21
  - Bosentan (as Bosentan monohydrate) 125 mg Tracleer 125mg tablets | 56 tablet [POM] £1,510.21

**Riociguat**

**INDICATIONS AND DOSE**

Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision) | Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)

**BY MOUTH**

- Adult: Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased up to 2.5 mg 3 times a day, increase up to maximum dose continued
only if systolic blood pressure > 95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

- **CONTRA-INDICATIONS** History of serious haemoptysis - previous bronchial artery embolisation - pulmonary veno-occlusive disease
- **CAUTIONS** Autonomic dysfunciton - elderly (risk of hypotension) - hypotension (do not initiate if systolic blood pressure below 95 mmHg) - hypovolaemia - severe left ventricular outflow obstruction

**SIDE-EFFECTS**
- **Common or very common** Anaemia - constipation - diarrhoea - dizziness - dyspepsia - dysphagia - epistaxis - gastritis - gastro-oesophageal reflux - haemoptysis - headache - hypotension - nasal congestion - nausea - palpatation - peripheral oedema - vomiting
- **Uncommon** Pulmonary haemorrhage

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment. Monthly pregnancy tests advised.

**PREGNANCY** Avoid — toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid — present in milk in animal studies.

**HEPATIC IMPAIRMENT** Titrate dose cautiously in moderate impairment. Manufacturer advises avoid in severe impairment — no information available.

**RENAL IMPAIRMENT** Titrate dose cautiously — risk of hypotension. Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m² — limited information available.

**PATIENT AND CARER ADVICE** Smoking cessation advised (response possibly reduced). Patients should inform prescriber if smoking started or stopped during treatment; dose adjustment may be necessary.

**NATIONAL FUNDING/ACCESS DECISIONS**

### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2014) that riociguat (Adempas®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in patients for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **Adempas** (Bayer Plc)
    - Riociguat 500 microgram 42 tablet [£997.36] | 84 tablet [£1,994.72]
    - Riociguat 1 mg 42 tablet [£997.36] | 84 tablet [£1,994.72]
    - Riociguat 1.5 mg 42 tablet [£997.36] | 84 tablet [£1,994.72]
    - Riociguat 2 mg 42 tablet [£997.36] | 84 tablet [£1,994.72]

**PROSTAGLANDINS (CARDIOVASCULAR)**

### Iloprost

**INDICATIONS AND DOSE**

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

- **Adult**
  - Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, if tolerated maintain at 5 micrograms 6–9 times a day, according to response; reduced if higher dose not tolerated to 2.5 micrograms 6–9 times a day

- **CONTRA-INDICATIONS** Conditions which increase risk of haemorrhage - congenital or acquired valvular defects of the myocardium - decompensated cardiac failure (unless under close medical supervision) - pulmonary veno-occlusive disease - severe arrhythmias - unstable angina - within 3 months of cerebrovascular events - within 6 months of myocardial infarction

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Hypotension (do not initiate if systolic blood pressure below 85 mmHg) - unstable pulmonary hypertension with advanced right heart failure - acute pulmonary infection - chronic obstructive pulmonary disease - severe asthma
  - **INTERACTIONS** to Appendix 1 (Iloprost).
  - **SIDE-EFFECTS**
    - **Common or very common** Chest pain - cough - diarrhoea - dyspnoea - haemorrhage - headache - hypotension - jaw pain - nausea - oral irritation - rash - throat pain - vomiting
    - **Frequency not known** Bronchospasm - taste disturbance - thrombocytopenia - wheezing
  - **PREGNANCY** Use if potential benefit outweighs risk.
  - **BREAST FEEDING** Manufacturer advises avoid — no information available.
  - **HEPATIC IMPAIRMENT** Elimination reduced. Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature).
  - **DIRECTIONS FOR ADMINISTRATION** To minimise accidental exposure use only with nebulisers listed in Ventavis® product literature in a well ventilated room.
  - **PRESCRIBING AND DISPENSING INFORMATION** Delivery characteristics of nebuliser devices may vary — only switch devices under medical supervision.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **Scottish Medicines Consortium (SMC) Decisions**
      - The Scottish Medicines Consortium has advised (November 2005) that ioprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Nebuliser liquid**
  - **Ventavis** (Bayer Plc)
    - Iloprost (as ioprost trometamol) 10 microgram per 1 ml Ventavis 10 micrograms/ml nebuliser solution 1ml ampoules | 30 ampoule [£1,400.19] | 168 ampoule [£2,241.08]
4.5 Hypotension and shock

**Sympathomimetics**

**Inotropic sympathomimetics**

**Shock**

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine, dobutamine, or dopamine hydrochloride below. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock on p. 242.

**Vasoconstrictor sympathomimetics**

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed. The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 237. As well as constricting peripheral vessels ephedrine hydrochloride p. 237 also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride p. 237 to manage associated bradycardia (although intravenous injection of atropine sulfate p. 949 may also be required if bradycardia persists).

---

**Drugs used for Hypotension and shock not listed below; Dopamine hydrochloride 800 mg/5 ml concentrate for solution for infusion ampoule £19.42–£20.00 Dopamine hydrochloride 160 mg per 1 ml solution for infusion ampoule £4.2–£4.49**

---

**Sympathomimetics (Inotropic)**

**Dopamine hydrochloride**

**Drug Action**

Dopamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

**Indications and Dose**

Cardiogenic shock in infarction or cardiac surgery

BY INTRAVENOUS INFUSION

- Adult: Initially 2–5 micrograms/kg/minute

---

**Contra-Indications**

Phaeochromocytoma, tachyarrhythmia

**Caution**

Correct hypovolaemia, hyperthyroidism, low dose in shock due to acute myocardial infarction

**Interactions**

Appendix 1 (sympathomimetics)

**Side-effects**

- Common or very common Chest pain, dyspnoea, headache, hypotension, nausea, palpitation, tachycardia, vasoconstriction, vomiting

- Uncommon Bradycardia, gangrene, hypertension, mydriasis

- Rare Fatal ventricular arrhythmias

**Pregnancy**

No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**Breastfeeding**

May suppress lactation—not known to be harmful.

**Directions for Administration**

For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate. Dopamine concentrate for intravenous infusion to be diluted before use.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for Infusion**

- Dopamine hydrochloride (Non-proprietary)
  - Dopamine hydrochloride 40 mg per 1 ml
  - Dopamine 200 mg/5 ml solution for infusion ampoules
    - 5 ampoules [BNF] £19.42–£20.00
  - Dopamine hydrochloride 160 mg per 1 ml
    - 5 ampoules [BNF] £4.2–£4.49

**Sympathomimetics (Vasoconstrictor)**

**Metaraminol**

**Indications and Dose**

Acute hypotension

BY INTRAVENOUS INFUSION

- Adult: 15–100 mg, adjusted according to response

Emergency treatment of acute hypotension

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)

BY INTRACAVERNOSAL INJECTION

- Adult: 1 mg every 15 minutes

**Unlicensed Use**

Use for priapism is an unlicensed indication.

**Contra-Indications**

Hypertension

**Caution**

General Caution: Cirsosis, coronary vascular thrombosis, diabetes mellitus, elderly, extravasation at injection site may cause necrosis, following myocardial infarction, hypercapnia, hyperthyroidism, hypoxia, mesenteric vascular thrombosis, peripheral vascular thrombosis, Prinzmetal’s variant angina, uncorrected hypovolaemia

**Specific Caution:**

- With intracavernosal use Associated with fatal hypertensive crises

**Caution, Further Information**

Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive
vasoressor response may cause a prolonged rise in blood pressure.

- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS** Angle-closure glaucoma, anorexia, anxiety, arrhythmias, bradycardia, confusion, dyspnoea, fatal ventricular arrhythmia reported in Lennec’s cirrhosis, headache, hypertension, hypoxia, insomnia, nausea, palpitation, peripheral ischaemia, psychosis, tachycardia, tremor, urinary retention, vomiting, weakness
- **PREGNANCY** May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aramine®), give continuously or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Suggested volume 500 mL.

For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL metaraminol injection to 5 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5–10 mL injections.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Solution for infusion**

- **NORADRENALINE/NOREPINEPHRINE (Non-proprietary)**
  - Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 ml Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule (£8) no price available
  - Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule (£22) (Hospital only)
  - Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule (£22) (Hospital only)
  - Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule (£8) no price available

---

**Phenylephrine hydrochloride**

**INDICATIONS AND DOSE**

**Acute hypotension**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 2–5 mg, followed by further doses of 1–10 mg, after at least 15 minutes if required.

- **BY INTRAVENOUS INFUSION**
  - Adult: 100–500 micrograms, repeated as necessary after at least 15 minutes; a 1 mg/1 mL solution to be used

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

**Priapism**

- **BY INTRACAVERNOSAL INJECTION**
  - Adult: 100–200 micrograms every 5–10 minutes; maximum 1 mg per course

**UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.

**CONTRA-INDICATIONS** Hypertension, severe hyperthyroidism

**CAUTIONS** Coronary disease, severe hypertension, severe peripheral ischaemia, peripheral vascular thrombosis, Prinzmetal’s variant angina, uncorrected hypovolaemia

**INTERACTIONS** → Appendix 1 (sympathomimetics).

**SIDE-EFFECTS** Angle-closure glaucoma, anorexia, anxiety, arrhythmias, bradycardia, confusion, dyspnoea, headache, hypertension, hypoxia, insomnia, nausea, palpitation, peripheral ischaemia, psychosis, tachycardia, tremor, urinary retention, vomiting, weakness

**PREGNANCY** Avoid—may reduce placental perfusion.

**MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION** For treatment of acute hypotension in adults, use a solution containing noradrenaline 40 micrograms (base)/mL. For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride and glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalis.

**PRESCRIBING AND DISPENSING INFORMATION** For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.

**MONITORING REQUIREMENTS**
5 Heart failure

Heart failure

Drug treatment of heart failure associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An ACE inhibitor, titrated to a ‘target dose’ (or the maximum tolerated dose if lower), together with a beta-blocker, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An angiotensin-II receptor antagonist may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan cilexetil p. 133 or valsartan p. 136 may be given under specialist supervision as adjuncts to an ACE inhibitor in the treatment of heart failure when other treatments are unsuitable; the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

The beta-blockers bisoprolol fumarate p. 142 and carvedilol p. 142 are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol p. 145 is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone p. 168 can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone below may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient’s clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate p. 191 with hydralazine hydrochloride p. 157 but this combination may be poorly tolerated. The combination of isosorbide dinitrate p. 191 and hydralazine hydrochloride p. 157 may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

Digoxin p. 94 improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan cilexetil, or isosorbide dinitrate with hydralazine hydrochloride.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A thiazide diuretic may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m²) and a loop diuretic is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone p. 205 may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

Drugs used for Heart failure not listed below; Bendroflumethiazide, p. 159 · Bisoprolol fumarate, p. 142 · Candesartan cilexetil, p. 133 · Captopril, p. 126 · Chlortalidone, p. 204 · Co-amoxiclav, p. 150 · Cyclopenthiazide, p. 204 · Digoxin, p. 94 · Enalapril maleate, p. 127 · Glyceryl trinitrate, p. 190 · Hydralazine hydrochloride, p. 157 · Isosorbide dinitrate, p. 191 · Isosorbide mononitrate, p. 192 · Ibubradine, p. 185 · Lisinopril, p. 128 · Losartan potassium, p. 134 · Metoprolol tartrate, p. 144 · Nebivolol, p. 145 · Perindopril arginine, p. 129 · Perindopril erbumine, p. 130 · Prazosin, p. 674 · Quinapril, p. 130 · Ramipril, p. 131 · Sodium nitroprusside, p. 161 · Valsartan, p. 136

ALDOSTERONE ANTAGONISTS

Eplerenone

INDICATIONS AND DOSE

Adjunct in stable patients with left ventricular ejection fraction <40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) | Adjunct in chronic mild heart failure with left ventricular ejection fraction ≤30%

BY MOUTH

- Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment

CONTRA-INDICATIONS

Hyperkalaemia

CAUTIONS

Elderly

INTERACTIONS

→ Appendix 1 (diuretics).

Concomitant use of potassium-sparing diuretics or potassium supplements is contra-indicated.

SIDE-EFFECTS

- Common or very common Azotaemia · constipation · cough · diarrhoea · dizziness · hyperkalaemia · hypotension

Cardiovascular system
Spironolactone

INDICATIONS AND DOSE

Oedema / Ascites in cirrhosis of the liver
BY MOUTH
Adult: 100–400 mg daily, adjusted according to response

Malignant ascites
BY MOUTH
Adult: Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

Nephrotic syndrome
BY MOUTH
Adult: 100–200 mg daily

Oedema in congestive heart failure
BY MOUTH
Adult: Initially 100 mg daily, alternatively initially 25–200 mg daily, dose may be taken as a single dose or divided doses, maintenance dose adjusted according to response

Moderate to severe heart failure (adjunct)
BY MOUTH
Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

Resistant hypertension (adjunct)
BY MOUTH
Adult: 25 mg once daily

Primary hyperaldosteronism in patients awaiting surgery
BY MOUTH
Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

- UNLICENSED USE Resistant hypertension (adjunct) unlicensed indication.
- CONTRA-INDICATIONS Addison’s disease - anuria - hyperkalaemia
- CAUTIONS Acute porphyrias p. 864 - elderly - potential metabolic products carcinogenic in rodents
- INTERACTIONS → Appendix 1 (diuretics).
  Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

PREGNANCY
Use only if potential benefit outweighs risk—feminisation of male fetus in animal studies.

BREAST FEEDING
Metabolites present in milk, but amount probably too small to be harmful.

RENAL IMPAIRMENT
Avoid in acute renal insufficiency or severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

MONITORING REQUIREMENTS
Monitor electrolytes—discontinue if hyperkalaemia occurs (in severe heart failure monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

MALIGNANCY
Avoid in patients with bone marrow depression.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- EPLERENONE (Non-proprietary)
  Eplerenone 25 mg Eplerenone 25mg tablets | 28 tablet [POM] £35.45-£42.72 DT price = £39.04
  Eplerenone 50 mg Eplerenone 50mg tablets | 28 tablet [POM] £35.45-£42.72 DT price = £38.95
  → Inspira (Pfizer Ltd)
  Eplerenone 25 mg Inspira 25mg tablets | 28 tablet [POM] £42.72 DT price = £39.04
  Eplerenone 50 mg Inspira 50mg tablets | 28 tablet [POM] £42.72 DT price = £38.95

Co-flumactone

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone above and Thiazides, p. 159.
**INDICATIONS AND DOSE**

**Congestive heart failure**

**BY MOUTH**

- Adult: Initially 100/100 mg daily; maintenance 25/25–200/200 mg daily, maintenance dose not recommended because spironolactone generally given in lower dose

**LESS SUITABLE FOR PRESCRIBING** Co-flumactone tablets are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Aldactide (Pfizer Ltd)
  - Hydroflumethiazide 25 mg, Spironolactone 25 mg Aldactide 25 tablets | 100 tablet (Primacor®) £20.23 DT price = £20.23
  - Hydroflumethiazide 50 mg, Spironolactone 50 mg Aldactide 50 tablets | 28 tablet (Primacor®) £10.70 | 100 tablet (Primacor®) £38.23 DT price = £38.23

**PHOSPHODIESTERASE TYPE-3 INHIBITORS**

**Enoximone**

**DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE**

Congestive heart failure where cardiac output reduced and filling pressures increased

**BY SLOW INTRAVENOUS INJECTION (RATE NOT EXCEEDING 12.5 MG/MINUTE)**

- Adult: Initially 0.5–1 mg/kg, then 500 micrograms/kg every 30 minutes until a satisfactory response is achieved or a total dose of 3 mg/kg is reached; maintenance, initial dose of up to 3 mg/kg every 3–6 hours as required

**BY INTRAVENOUS INFUSION**

- Adult: Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day

**CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvar disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS**

- Chills
- Diarrhoea
- Ectopic beats
- Fever
- Headache
- Hypotension
- Insomnia
- Nausea
- Oliguria
- Supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias)
- Upper and lower limb pain
- Urinary retention
- Ventricular tachycardia (more likely in patients with pre-existing arrhythmias)
- Vomiting

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Dose reduction may be required.

**RENAL IMPAIRMENT**

Consider dose reduction.

**MONITORING REQUIREMENTS**

Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION**

Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

---

For intravenous infusion (Primacor®), give continuously or intermittently in Sodium chloride 0.9% or Water for injections; dilute to a concentration of 2.5 mg/mL.

**PRESCRIBING AND DISPENSING INFORMATION**

Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Alcohol, propylene glycol

- **Perfan** (Myogen GmbH)
  - Enoximone 5 mg per 1 ml Perfan 100mg/20ml solution for injection ampoules | 10 ampoule (Primacor®) no price available (Hospital only)

---

**Milrinone**

**DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE**

Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) / Acute heart failure, including low output states following heart surgery

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

**CONTRA-INDICATIONS**

Severe hypovolaemia

**CAUTIONS**

Correct hypokalaemia - heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvar disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS**

- Common or very common
  - Ectopic beats
  - Headache
  - Hypotension
  - Supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias)
  - Upper and lower limb pain
  - Urinary retention
  - Ventricular tachycardia (more likely in patients with pre-existing arrhythmias)
  - Vomiting

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENSAL IMPAIRMENT**

Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.

**MONITORING REQUIREMENTS**

Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION**

Avoid extravasation. For intravenous injection, may be given either undiluted or diluted before use. For intravenous infusion (Primacor®) give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.
### Hyperlipidaemia

**Lipid-regulating drugs**

**Primary and secondary prevention of cardiovascular disease**

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

**Primary prevention**

Individuals at high risk of developing cardiovascular disease include those who have diabetes mellitus, chronic kidney disease (eGFR < 60 mL/minute/1.73 m²) and/or albuminuria, and those with familial hypercholesterolaemia. The risk also increases with age; those aged 85 years and over are at particularly high risk, especially if they smoke or have hypertension. Preventative measures are also required for other individuals who are considered to be at high risk of developing atherosclerotic cardiovascular disease based on risk estimated using risk calculators (see Risk calculators); those with a 10-year risk of cardiovascular disease of 10% or more stand to benefit most from drug treatment. Patients with a 10-year cardiovascular risk of less than 10% may benefit from an assessment of their lifetime risk (using the JBS3 tool—see Risk calculators for more detail), discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

**Risk calculators**

Risk assessment calculators are recommended by both NICE (clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) and JBS3 (Joint British Societies’ consensus recommendations for the prevention of cardiovascular disease 2014). They should not be used in patients at high cardiovascular risk. Both calculators are unsuitable for assessing risk in those aged 85 years and over, and NICE advises against using a risk assessment tool in those with type 1 diabetes mellitus.

The QRISK² risk calculator [www.qrisk.org/](http://www.qrisk.org/) is recommended by NICE clinical guideline 181, and the JBS3 risk calculator [www.jbs3risk.com/pages/risk_calculator.htm](http://www.jbs3risk.com/pages/risk_calculator.htm) is endorsed by JBS3. Both tools assess cardiovascular risk—coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack, on the basis of lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease, diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, or a family history of premature cardiovascular disease. Risk assessment tools underestimate risk in patients with additional risk due to existing conditions or medication, such as:

- serious mental disorder
- autoimmune disorders such as systemic lupus erythematosus and other systemic inflammatory disorders
- antiretroviral treatment
- medication causing dyslipidaemia as a side-effect e.g. antipsychotics, corticosteroids, or immunosuppressants
- triglyceride concentration > 4.5 mmol/litre

Cardiovascular disease risk is also underestimated in those who are already taking antihypertensive or lipid-regulating drugs, and in those who have recently stopped smoking. Severe obesity (BMI > 40 kg/m²) also increases cardiovascular risk; the need for further treatment of risk...
factors in patients below the cardiovascular risk threshold for treatment should be based on clinical judgement.

**Preventative measures for primary prevention**

All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation. Offer a statin as first-line drug treatment if lifestyle modifications are inappropriate or ineffective (see also Statins for the prevention of cardiovascular disease). Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

**Secondary prevention**

Statins should be offered to all patients, including the elderly, with cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

**Preventative measures for secondary prevention**

Patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation, however, initiation of lipid-regulating drug treatment should not be delayed to manage modifiable risk factors, and must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

**Statins for the prevention of cardiovascular disease**

A statin reduces the risk of cardiovascular disease events, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. Before starting treatment with statins, secondary causes of dyslipidaemia should be addressed; these include uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, and excessive alcohol consumption. Patients with hypothyroidism should receive adequate thyroid replacement therapy (before assessing the requirement for lipid-regulating treatment if for primary prevention) because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

For the purpose of reducing cardiovascular risk, NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) defines statins by the percentage reduction in LDL-cholesterol they achieve:

For primary prevention, NICE Clinical Guideline 181 recommends that atorvastatin p. 179 a high-intensity statin (when prescribed at a dose of at least 20 mg/day), should be offered to those with a 10-year risk of cardiovascular disease of 10% or more; patients aged 85 years and over may benefit from atorvastatin to reduce the risk of non-fatal myocardial infarction. For secondary prevention, atorvastatin is also recommended. Patients taking a low- or medium-intensity statin should discuss the benefits and risks of switching to a high intensity statin at their next medication review.

A statin should be considered for all adults with type 1 diabetes mellitus, particularly those aged 40 years and over, or who have had diabetes for more than 10 years, or who have established nephropathy, or other risk factors for cardiovascular disease. JBS3 recommendations (Joint British Societies’ consensus recommendations for the prevention of cardiovascular disease (JBS3) 2014) in diabetes mellitus differ in certain respects from NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease)—see JBS3 recommendations for further details. In type 2 diabetes, assess level of risk using the risk calculator and treat for primary prevention if necessary.

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high intensity statin. NICE Clinical Guideline 181 recommends aiming for a reduction in non-HDL cholesterol concentration below 2.5 mmol/litre. If these are not achieved, ensure lifestyle modifications are optimised and consider increasing the dose of the statin if started on less than atorvastatin 80 mg and the patient is judged to be at higher risk because of comorbidities, risk score or, using clinical judgement.

Expert advice should be sought about treatment options for patients at high risk of cardiovascular disease or those with existing cardiovascular disease, who are intolerant of three different statins.

**Fibrates** should not be routinely used for primary or secondary prevention. Nicotinic acid p. 177, bile acid sequestrants, and omega-3 fatty acid compounds are not recommended for primary or secondary prevention.

**Hypercholesterolaemia, hypertriglyceridaemia, and familial hypercholesterolaemia**

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 173; such treatment should generally be supervised by a specialist.
A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate p. 175 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A ‘high-intensity’ statin (as defined in NICE Clinical Guideline 71, August 2008. Identification and management of familial hypercholesterolaemia) e.g. rosuvastatin p. 180 (initiated by a specialist) or atorvastatin should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a ‘high-intensity’ statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe p. 173. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Bile acid sequestrants
Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Treatment with bile acid sequestrants may be appropriate under specialist supervision if statins and ezetimibe are inappropriate, and when LDL-cholesterol is severely raised, for example in familial hypercholesterolaemia.

Fibrates
Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Lomitapide
Lomitapide p. 176 is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozygous familial hypercholesterolaemia.

Nicotinic acid group
The value of nicotinic acid p. 177 is limited by its side-effects, especially vasodilatation. Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol).

Acipimox p. 177 seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

Omega-3 fatty acid compounds
There is no evidence that omega-3 fatty acid compounds reduce the risk of cardiovascular disease.

Statins
Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

BILE ACID SEQUESTRANTS

Bile acid sequestrants

• **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.

• **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).

• **SIDE-EFFECTS** Constipation, diarrhoea, gastro-intestinal discomfort, hypertriglyceridaemia (aggravation), hypoprothrombinaemia associated with vitamin K deficiency, increased risk of bleeding, nausea, vomiting.

• **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

• **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

Coleselam hydrochloride

**INDICATIONS AND DOSE**
Primary hypercholesterolaemia as an adjunct to dietary measures (monotherapy)

**BY MOUTH**

- **Adult:** 3.75 g daily in 1–2 divided doses; maximum 4.375 g per day

Primary hypercholesterolaemia as an adjunct to dietary measures, in combination with a statin **Primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin**

**BY MOUTH**

- **Adult:** 2.5–3.75 g daily in 1–2 divided doses, may be taken at the same time as the statin and ezetimibe

• **CONTRA-INDICATIONS** Biliary obstruction · bowel obstruction

• **CAUTIONS** Gastro-intestinal motility disorders · inflammatory bowel disease · major gastro-intestinal surgery

• **INTERACTIONS** → Appendix 1 (coleselam).

• **SIDE-EFFECTS** Headache · myalgia

• **HEPATIC IMPAIRMENT** Manufacturer advises caution.

• **MONITORING REQUIREMENTS** Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with coleselam.

• **DIRECTIONS FOR ADMINISTRATION** Other drugs should be taken at least 4 hours before or after coleselam to reduce possible interference with absorption.

• **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for coleselam hydrochloride tablets (avoid other drugs at same time).
Colestipol hydrochloride

INDICATIONS AND DOSE
Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH
- Adults: Initially 5 g 1–2 times a day, increased in steps of 5 g every 1 month if required, total daily dose may be given in 1–2 divided doses; maximum 30 g per day

INTERACTIONS → Appendix 1 (colestipol).

DIRECTIONS FOR ADMINISTRATION The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content. Alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided. Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.

PATIENT AND CARER ADVICE Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Granules
- Colestipol hydrochloride 5 gram Colestipol 5 g granules sachets plain (sugar-free) | 30 sachet (£15.05)
- Colestipol Orange 5 g granules sachets (sugar-free) | 30 sachet (£15.05)

Cholestagel

- Tablet
  - Colestipol hydrochloride 625 mg Cholestel 625 mg tablets | 180 tablet (£96.10 DT price = £96.10

Colestyramine

(Cholestyramine)

INDICATIONS AND DOSE
Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH
- Adult: Initially 4 g daily, increased in steps of 4 g every 1 week; 12–24 g daily in 1–4 divided doses, adjusted according to response; maximum 36 g per day

PRURITUS ASSOCIATED WITH PARTIAL BILIARY OBSTRUCTION AND PRIMARY BILIARY CIRRHOSIS

BY MOUTH
- Adult: 4–8 g once daily

DIARRHOEA ASSOCIATED WITH CROHN’S DISEASE, ILEAL RESECTION, VOGATOMY, DIABETIC VAGAL NEUROPATHY, AND RADIATION

BY MOUTH
- Adult: Initially 4 g daily, increased in steps of 4 g every 1 week; 12–24 g daily in 1–4 divided doses, adjusted according to response, if no response within 3 days an alternative therapy should be initiated; maximum 36 mg per day

Accelerated elimination of teriflunomide

BY MOUTH
- Adult: 8 g 3 times a day for 11 days; reduced to 4 g 3 times a day, dose should only be reduced if not tolerated

Accelerated elimination of leflunomide (washout procedure)

BY MOUTH
- Adult: 8 g 3 times a day for 11 days

CONTRA-INDICATIONS Complete biliary obstruction (not likely to be effective)

INTERACTIONS → Appendix 1 (colestipol).

SIDE-EFFECTS
- Rare Intestinal obstruction
- Frequency not known Hyperchloraemic acidosis (on prolonged use)

DIRECTIONS FOR ADMINISTRATION The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content. Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption.

PATIENT AND CARER ADVICE Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, cream

Powder
- Colestyramine (Non-proprietary) Colestyramine 4g oral powder sachets sugar free (sugar-free) | 50 sachet (£30.00–£32.78 DT price = £31.85
- Questran (Bristol-Myers Squibb Pharmaceuticals Ltd) Colestyramine anhydrous 4 gram Questran 4g oral powder sachets | 50 sachet (£10.76
- Questran Light (Bristol-Myers Squibb Pharmaceuticals Ltd) Colestyramine anhydrous 4 gram Questran Light 4g oral powder sachets (sugar-free) | 50 sachet (£16.15 DT price = £31.85

CHOLESTEROL ABSORPTION INHIBITORS

Ezetimibe

- DRUG ACTION Ezetimibe inhibits the intestinal absorption of cholesterol. If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

INDICATIONS AND DOSE
Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

BY MOUTH
- Adult: 10 mg daily

INTERACTIONS → Appendix 1 (ezetimibe).

There is an increased risk of rhabdomyolysis if ezetimibe is used in combination with a statin.

SIDE-EFFECTS
- Common or very common Fatigue · gastro-intestinal disturbances · headache · myalgia
Hyperlipidaemia

Fibrates

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE** Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 200 mg 3 times a day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 400 mg once daily, modified-release dose form is not appropriate in patients with renal impairment

**CONTRA-INDICATIONS** Gall bladder disease · hyperalimentation - nephrotic syndrome · photosensitivity to fibrates

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1 (fibrates).

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

**SIDE-EFFECTS**

- Common or very common Abdominal distension · anorexia · diarrhoea · nausea

- Uncommon Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · photosensitivity reactions · pruritus · rash · renal failure · urticaria

- Rare Pancreatitis · peripheral neuropathy

- Very rare Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis

**PREGNANCY** Manufacturers advise avoid—no information available.

**LIVER FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment—may accumulate.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ezetimibe for the treatment of primary hypercholesterolaemia (November 2007) NICE TA132

Ezetimibe, used in accordance with the licensed indications for Ezetrol®, is an option for the treatment of adults with primary hypercholesterolaemia. www.nice.org.uk/TA132

**MEDICINAL Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Ezetrol (Merck Sharp & Dohme Ltd)
  - Ezetimibe 10 mg Ezetrol 10mg tablets | 28 tablet | £26.31 DT price = £26.31

Also available in combination with simvastatin, p. 182

Ciprofibrate

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE** Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia

BY MOUTH

- Adult: 100 mg daily

**CONTRA-INDICATIONS** Gall bladder disease · hyperalimentation - nephrotic syndrome · photosensitivity to fibrates

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1 (fibrates).

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

**SIDE-EFFECTS**

- Common or very common Abdominal distension · anorexia · diarrhoea · nausea
• **Uncommon** Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment - photosensitivity reactions - pruritus - rash - renal failure - urticaria

• **Rare** Pancreatitis - peripheral neuropathy

• **Very rare** Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancytopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis

• **Frequency not known** Pneumonitis - pulmonary fibrosis

• **PREGNANCY** Manufacturers advise avoid—■ toxicity in animal studies.

• **BREAST FEEDING** Manufacturer advises avoid—■ in milk in animal studies.

• **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

• **RENAL IMPAIRMENT** Reduce dose to 100 mg on alternate days in moderate impairment. Avoid in severe impairment.

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

• **MONITORING REQUIREMENTS**

º Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).

º Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

• **PRESCRIBING AND DISPENSING INFORMATION**

Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

º **CIPROFIBRATE (Non-proprietary)**

Ciprofibrate 100 mg Ciprofibrate 100mg tablets | 28 tablet £6.69 DT price = £10.31

**Fenofibrate**

• **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contraindicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk

**BY MOUTH USING CAPSULES**

º Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin; 200 mg capsules not appropriate for use in renal impairment; 267 mg capsules not appropriate for initial dose titration or in renal impairment

**BY MOUTH USING TABLETS**

º Adult: 160 mg daily, tablets not appropriate in renal impairment

• **CONTRA-INDICATIONS** Gall bladder disease - pancreatitis (unless due to severe hypertriglyceridaemia) - photosensitivity to ketoprofen

• **CAUTIONS** Correct hypothyroidism before initiating treatment

• **INTERACTIONS** → Appendix 1 (fibrates).

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

• **SIDE-EFFECTS**

º **Common or very common** Abdominal distension - anorexia - diarrhoea - nausea

º **Uncommon** Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment - pancreatitis - photosensitivity reactions - pruritus - pulmonary embolism - rash - renal failure - urticaria

º **Rare** Hepatitis - peripheral neuropathy

º **Very rare** Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancytopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis

º **Frequency not known** Interstitial pneumopathies

º **PREGNANCY** Avoid—■embryotoxicity in animal studies.

º **BREAST FEEDING** Manufacturers advise avoid—no information available.

• **HEPATIC IMPAIRMENT** Avoid.

• **RENAL IMPAIRMENT** Reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m². Reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

• **MONITORING REQUIREMENTS**

º Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).

º Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

• **PRESCRIBING AND DISPENSING INFORMATION**

Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

º **CAUTIONARY AND ADVISORY LABELS 21**

º **FENOFIBRATE (Non-proprietary)**

Fenofibrate micronised 160 mg Fenofibrate micronised 160mg tablets | 28 tablet £6.69 DT price = £6.69

Supralip (BGP Products Ltd) Fenofibrate micronised 160 mg Supralip 160mg tablets | 28 tablet £6.69 DT price = £6.69

**Capsule**

º **CAUTIONARY AND ADVISORY LABELS 21**

º **FENOFIBRATE (Non-proprietary)**

Fenofibrate micronised 67 mg Fenofibrate micronised 67mg capsules | 90 capsule £23.30 DT price = £13.00

Fenofibrate micronised 200 mg Fenofibrate micronised 200mg capsules | 28 capsule £21.75 DT price = £14.57

Fenofibrate micronised 267 mg Fenofibrate micronised 267mg capsules | 28 capsule £21.75 DT price = £5.29

Lipantil Micro (BGP Products Ltd) Lipantil Micro 67 capsules | 90 capsule £23.30 DT price = £19.00

Fenofibrate micronised 200 mg Lipantil Micro 200 capsules | 28 capsule £14.23 DT price = £14.57

Fenofibrate micronised 267 mg Lipantil Micro 267 capsules | 28 capsule £21.75 DT price = £5.29
Gemfibrozil

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**
Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia.

**CONTRA-INDICATIONS** History of gall-bladder or biliary tract disease including gallstones, photosensitivity to fibrates.

**CAUTIONS** Correct hypothyroidism before initiating treatment - elderly.

**INTERACTIONS** Appendix 1 (fibrates).

The combination of gemfibrozil and a statin should preferably be avoided; high risk of muscle effects (especially rhabdomyolysis).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain, constipation, diarrhoea, dyspepsia, eczema, fatigue, flatulence, headache, nausea, rash, vertigo, vomiting.
- **Uncommon** Atrial fibrillation.
- **Rare** Hepatitis, paraesthesia, alopecia, anaemia, angioedema, appendicitis, blurred vision, bone-marrow suppression, cholestatic jaundice, depression, disturbances in hepatic function, dizziness, drowsiness, eosinophilia, exfoliative dermatitis, leucopenia, myalgia, myasthenia, myopathy, myositis accompanied by increase in creatine kinase (discontinue if raised significantly), pancreatitis, photosensitivity, pruritus, sexual dysfunction, thrombocytopenia, urticaria.

**PREGNANCY** Manufacturers advise avoid unless essential — toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**RENALError** Avoid.

**RENAL IMPAIRMENT** Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**Myotoxicity** Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

**MONITORING REQUIREMENTS**
- Monitor blood counts for first year.
- Monitor liver-function (discontinue treatment if abnormalities persist).
- Consider monitoring creatine kinase if used in combination with a statin.

**PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**MICROSOMAL TRIGLYCERIDE TRANSFER PROTEIN INHIBITORS**

Lomitapide

**DRUG ACTION** Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

**INDICATIONS AND DOSE**
Adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

**BY MOUTH**
- Adult: Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

**CONTRA-INDICATIONS** Significant or chronic bowel disease.

**CAUTIONS** Concomitant use of hepatotoxic drugs - lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required - patients over 65 years.

**INTERACTIONS** Appendix 1 (fibrates).

**SIDE-EFFECTS**
- **Common or very common** Bloating, abdominal pain, appetite changes, constipation, diarrhoea, dizziness, dyspepsia, eczema, erythematous rash, flatulence, gastro-oesophageal reflux disease, gastroenteritis, haemorrhoids, headache, hepatic steatosis, hepatomegaly, hyperkalaemia, leucopenia, malaise, migraine, muscle spasms, nausea, neutropenia, raised serum transaminases, tenesmus, vomiting, weight loss.
- **Uncommon** Abnormal gait, anaemia, arthralgia, chest pain, drowsiness, dry mouth, dry skin, eye swelling, gastro-intestinal haemorrhage, haematemeses, haematuria, hyperbilirubinaemia, joint swelling, myalgia, pain in extremities, paraesthesia, proteinuria, pyrexia, sweating, vertigo.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Raised transaminases** Reduce dose if serum transaminases raised during treatment (consult product literature).

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.

**PREGNANCY** Avoid — teratogenicity and embryotoxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Reduce dose if serum transaminases raised during treatment (consult product literature). Max. 40 mg daily in mild impairment.
Avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.

- **RENAL IMPAIRMENT** Max. 40 mg daily in end-stage renal disease.

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
  - Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Lojuxta (Aegerion Pharmaceuticals Ltd)
      - Lojuxta 5 mg capsules | 28 capsule [POD]

    - Lojuxta 20 mg Lojuxta 20 mg capsules | 28 capsule [POD]
      - £17,765.00

### NICOTINIC ACID DERIVATIVES

#### Acipimox

**INDICATIONS AND DOSE**
Adjunct or alternative treatment in hyperlipidaemias of types IIb and IV in patients who have not responded adequately to other lipid-regulating drugs such as a statin or fibrate, and lifestyle changes (including diet, exercise, and weight reduction)

**BY MOUTH**
- Adult: 250 mg 2–3 times a day

- **CONTRA-INDICATIONS** Peptic ulcer
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · dyspepsia · flushing · headache · malaise · rash · urticaria
  - Uncommon Anaphylactoid reaction · arthralgia · bronchospasm · erythema · myalgia · myositis · pruritus · rash
  - Frequency not known Diarrhoea · dry eyes · vasodilatation

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 250 mg 1–2 times daily if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Olbetam (Pfizer Ltd)
    - Acipimox 250 mg Olbetam 250 mg capsules | 90 capsule [POD]
      - £46.33 DT price = £46.33

#### Nicotinic acid

- **DRUG ACTION** In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis, it also increases HDL-cholesterol.

### SIDE-EFFECTS

- **COMMON**
  - Rash
  - Headache
  - Cardiovascular system

- **FURTHER INFORMATION**

- **OMEGA-3 FATTY ACIDS**

#### Omega-3-acid ethyl esters

**INDICATIONS AND DOSE**
Adjunct to diet and statin in type IIb or III hypertriglyceridaemia | Adjunct to diet in type IV hypertriglyceridaemia

**BY MOUTH**
- Adult: Initially 2 capsules daily, dose to be taken with food, increased if necessary to 4 capsules daily

Adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

**BY MOUTH**
- Adult: 1 capsule daily, dose to be taken with food

- **CAUTIONS** Anticoagulant treatment (bleeding time increased) · haemorrhagic disorders

- **SIDE-EFFECTS**
  - Common or very common Dyspepsia · nausea
  - Uncommon Abdominal pain · dizziness · gastritis · taste disturbances
  - Rare Acne · headache · hepatic disorders · hyperglycaemia · rash
  - Very rare Gastro-intestinal haemorrhage · hypotension · increased white cell count · nasal dryness · urticaria
HYPERLIPIDAEMIA

Cardiovascular system

- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risks—no information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Monitor liver function in hepatic impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **SCOTTISH MEDICATIONS CONSORTIUM (SMC) DECISIONS** The Scottish Medicines Consortium has advised (November 2002) that omega-3 acid ethyl esters are not recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS**

              - **SIDE-EFFECTS** Further Information
              - **CONCEPTION AND CONTRACEPTION**
            - **Hypothyroidism**
              - **SIDE-EFFECTS** Further Information
              - **CONCEPTION AND CONTRACEPTION**
            - **Drug Action**
              - Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.
            - **Caution**
              - Elderly, high alcohol intake, history of liver disease, hypothyroidism, patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake).
            - **Caution, Further Information**
              - **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.
              - In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

- **STATINS**
  - **Drug Action** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.
  - **Caution** Elderly, high alcohol intake, history of liver disease, hypothyroidism, patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake).
  - **Caution, Further Information**
    - **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.
    - In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

**SIDE-EFFECTS**
- Rare
  - Hepatitis, jaundice
- Very rare
  - Hepatic failure, interstitial lung disease, lupus erythematosus-like reactions, pancreatitis
- Frequency not known
  - Alopeica, altered liver function tests
  - Anemia, arthralgia, asthenia, depression, dizziness, fatigue, gastrointestinal disturbances, headache, hyperglycaemia, hypersensitivity reactions may be associated with the development of diabetes mellitus (particularly in those already at risk of the condition), myalgia, myopathy, myositis, paraesthesia, peripheral neuropathy, pruritus, rash, rhabdomyolysis, sexual dysfunction, sleep disturbance, thrombocytopenia, urticaria, visual disturbance

**SIDE-EFFECTS, FURTHER INFORMATION**
- Muscle effects The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses.
- If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.
- Statins should not be discontinued if there is an increase in the blood-glucose concentration or HbA1C as the benefits continue to outweigh the risks.
- **INTERSTITIAL LUNG DISEASE** If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.
- **CONCEPTION AND CONTRACEPTION** Adequate contraception is required during treatment and for 1 month afterwards.
- **PREGNANCY** Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.
Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event

BY MOUTH

Adult: 20 mg daily, dose can be increased if necessary

Secondary prevention of cardiovascular events

BY MOUTH

Adult: 80 mg once daily

Dose adjustments due to interactions

Reduced dose required (max. 10 mg daily) with concomitant ciclosporin, or tipranavir combined with ritonavir—seek specialist advice.

Maximum dose of 40 mg once daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.

**UNLICENSED USE** Not licensed for use in secondary prevention of cardiovascular events. Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events.

**CAUTIONS** Haemorrhagic stroke

**SIDE-EFFECTS**

Common or very common

Back pain, epistaxis, hyperglycaemia, nasopharyngitis, pharyngolaryngeal pain.

Uncommon

Anorexia, blurred vision, chest pain, hypoglycaemia, malaise, neck pain, peripheral oedema, pyrexia, tinnitus, weight gain.

Rare

Cholestasis, Stevens-Johnson syndrome, toxic epidermal necrolysis.

Very rare

Cynaesmaostasia, hearing loss.

**BREAST FEEDING** Manufacturer advises avoid—for no information available.

**RENAL IMPAIRMENT** In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in primary prevention; unlicensed in secondary prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/L.73 m²); max. 80 mg once daily.

**PATIENT AND CARER ADVICE** Patient counselling is advised for atorvastatin tablets (muscle effects).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

**Tablet**

- ATORVASTATIN (Non-proprietary)
  - 10 mg: Atorvastatin 10mg tablets | 28 tablet | £13.00 DT price = £1.18 | 90 tablet | £41.78

- Lipitor (Atorvastatin calcium trihydrate) 40 mg: Lipitor 40mg tablets | 28 tablet | £24.64 DT price = £1.59
Fluvastatin

INDICATIONS AND DOSE

Adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIA and IIB)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 20–40 mg daily, dose to be taken in the evening, increased if necessary up to 80 mg daily in 2 divided doses, dose to be adjusted at intervals of at least 4 weeks
- Adult: 80 mg daily
- Adult: 80 mg daily, dose is not appropriate for initial dose titration

Prevention of coronary events after percutaneous coronary intervention
- Adult: 80 mg daily
- Adult: 80 mg daily
- Adult: 80 mg daily, dose is not appropriate for initial dose titration

SIDE-EFFECTS
- Very rare Vasculitis
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Manufacturer advises doses above 40 mg daily should be initiated with caution if eGFR less than 30 mL/minute/1.73 m²
- PATIENT AND CARER ADVICE Patient counselling is advised for fluvastatin tablets/capsules (main side effects).
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25
- FLUVASTATIN (Non-proprietary)
  Fluvastatin (as Fluvastatin sodium) 80 mg Fluvastatin 80mg modified-release tablets 28 tablet (PO) no price available DT price = £13.20
  Lescol XL (Novartis Pharmaceuticals UK Ltd) Fluvastatin (as Fluvastatin sodium) 80 mg Lescol XL 80mg tablets 28 tablet (PO) £13.20 DT price = £13.20
  Brands may include Dorisil XL; Lescol XL; Luvivista XL; Nandovar XL; Pinnmatix; Stefluvin XL

Capsule

  Fluvastatin (as Fluvastatin sodium) 40 mg Lescol 40mg capsules 28 capsule (PO) £15.26 DT price = £2.72

Pravastatin sodium

INDICATIONS AND DOSE

Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control

BY MOUTH
- Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks
- Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina
- Adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia

BY MOUTH
- Adult: 40 mg daily, dose to be taken at night
- Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

BY MOUTH
- Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

SIDE-EFFECTS
- Uncommon Abnormal urination · dysuria · nocturia · urinary frequency
- Very rare Fulminant hepatic necrosis

BREAST FEEDING Manufacturer advises avoid—small amount of drug present in breast milk.

RENA L IMPAIRMENT Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.

PATIENT AND CARER ADVICE Patient counselling is advised for pravastatin tablets (muscle effects).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

Tablet
- PRAVASTATIN SODIUM (Non-proprietary)
  Pravastatin sodium 10 mg Pravastatin 10mg tablets 28 tablet (PO) £6.62 DT price = £1.31

Rosuvastatin

INDICATIONS AND DOSE

Primary hypercholesterolaemia (type IIA including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIB), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH
- Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary to 20 mg once daily, dose to be increased at intervals of at least 4 weeks
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks.
Hyperlipidaemia

**INDICATIONS AND DOSE**

**Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures**

**BY MOUTH**

- Adult: Initially 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

**Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus**

- Adult: Initially 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

**Dose adjustments due to interactions**

Max. 10 mg daily with concomitant bezafibrate or ciprofibrate.

Max. 20 mg daily with concomitant amiodarone, verapamil, diltiazem, amiodipine, or ranolazine.

Max. 40 mg daily with concomitant lomitapide.

**SIDE-EFFECTS**

- Rare  Anaemia
- Frequency not known  Tendinopathy

**BREAST FEEDING**  Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**  Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**  Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

**EXCEPTIONS TO LEGAL CATEGORY**  Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15 % risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- SIMVASTATIN (Non-proprietary) 10 mg | Simvastatin 10mg tablets | 28 tablet | £18.00 DT price = £0.90
- SIMVASTATIN (Non-proprietary) 20 mg | Simvastatin 20mg tablets | 28 tablet | £29.60 DT price = £1.02
Acute attacks of stable angina should be managed with risk of cardiovascular events. Management to prevent angina attacks and to reduce the exertion and relieved by rest. Treatment involves plaques in the coronary arteries that restrict blood flow and angina.

Stable angina

Myocardial ischaemia

Ezetimibe with simvastatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ezetimibe p. 173, simvastatin p. 181.

**INdications and dose**

Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone

**By mouth**

- Adult: (consult product literature)

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

7 Myocardial ischaemia

Stable angina

It is important to distinguish stable angina from unstable angina. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long term management to prevent angina attacks and to reduce the risk of cardiovascular events.

**Management**

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 190 which can be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a beta-blocker or a calcium-channel blocker. In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amlodipine p. 148, felodipine p. 151, modified-release nifedipine p. 154) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, addition of a long-acting nitrate, ivabradine p. 185, nicorandil p. 185, or ranolazine p. 184 can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nicorandil, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events.

**Antiangular drugs**

Nitrates, calcium-channel blockers, and potassium channel activators (use in adults only) have a vasodilating and, consequently, blood pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Nicorandil p. 185, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antiangular drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antiangular drugs [unlicensed indication].

Ivabradine p. 185 lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contraindicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm.

Ranolazine p. 184 is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antiangular drugs.

**Drugs used for Myocardial ischaemia not listed below**

- Acebutolol, p. 141
- Amlodipine, p. 148
- Atenolol, p. 141
- Bisoprolol fumarate, p. 142

- Carvedilol, p. 142
- Diltiazem hydrochloride, p. 149
- Felodipine, p. 151
- Fondaparinux sodium, p. 109
- Metoprolol tartrate, p. 144
- Nadolol, p. 145
- Nicardipine hydrochloride, p. 153
- Nifedipine, p. 154
- Oxeprolol hydrochloride, p. 145
- Pindolol, p. 146
- Propranolol hydrochloride, p. 146
- Timolol maleate, p. 147
- Venctamyl hydrochloride, p. 156
### Glycoprotein IIB/IIIa Inhibitors

**Abciximab**

**INDICATIONS AND DOSE**
Prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention (specialist use only)

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. 10 micrograms/minute), to be started 10–60 minutes before percutaneous coronary intervention and continue for 12 hours

**Short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (specialist use only)**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

**SIDE-EFFECTS**
Common or very common Back pain · bleeding manifestations · bradycardia · chest pain · fever · headache · hypotension · nausea · puncture site pain · thrombocytopenia · vomiting

- Rare Adult respiratory distress · cardiac tamponade · hypersensitivity reactions

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING** Manufacturer advises avoid — no information available.

**HEPATIC IMPAIRMENT** Avoid in severe liver disease — increased risk of bleeding.

**RENAI IMPAIRMENT** Caution in severe impairment — increased risk of bleeding.

**MONITORING REQUIREMENTS**
- Measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit.
- Monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (ReoPro®), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution through a non-pyrogenic low protein-binding 0.2 or 0.22, or 5 micron filter or upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter

**CONTRA-INDICATIONS**
- Active internal bleeding · arteriovenous malformation or aneurysm · haemorrhagic diathesis · hypertensive retinopathy · intracranial neoplasm · intracranial or intraspinal surgery or trauma within last 2 months · major surgery within last 2 months · severe hypertension · stroke within last 2 years · thrombocytopenia · vasculitis

**CAUTIONS** Discontinue if uncontrolled serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) · elderly

**INTERACTIONS**
Caution with concomitant use of drugs that increase risk of bleeding.

**CONTRA-INDICATIONS**
Abnormal bleeding within 30 days · aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia

**CAUTIONS** Discontinue if emergency cardiac surgery necessary · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · risk of bleeding — discontinue immediately if uncontrolled serious bleeding

**INTERACTIONS**
Caution with concomitant drugs that increase risk of bleeding — discontinue immediately if uncontrolled serious bleeding.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**SOLUTION FOR INJECTION**
- **ReoPro** (Eli Lilly and Company Ltd)
  - Abciximab 2 mg per 1 ml ReoPro 10mg/5ml solution for injection vials | 1 vial (Rx) £15.50

**Eptifibatide**

**INDICATIONS AND DOSE**
In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

**CONTRA-INDICATIONS**
Abnormal bleeding within 30 days · aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia

**CAUTIONS**
Discontinue if emergency cardiac surgery necessary · discontinue if intra-aortic balloon pump necessary · discontinue if thrombolytic therapy necessary · risk of bleeding — discontinue immediately if uncontrolled serious bleeding

**INTERACTIONS**
Caution with concomitant drugs that increase risk of bleeding — discontinue immediately if uncontrolled serious bleeding.

**SIDE-EFFECTS**
Common or very common Bleeding manifestations

- Rare Anaphylaxis · rash

**PREGNANCY**
Manufacturer advises use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING**
Manufacturer advises avoid — no information available.

**HEPATIC IMPAIRMENT**
Avoid in severe liver disease — increased risk of bleeding.

**RENAL IMPAIRMENT**
Reduce infusion to 50–100 micrograms/kg · monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment

**MONITORING REQUIREMENTS**
- Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
- Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**SOLUTION FOR INJECTION**
- **Integrillin** (GlaxoSmithKline UK Ltd)
  - Eptifibatide 2 mg per 1 ml Integrillin 20mg/10ml solution for injection vials | 1 vial (Rx) £13.61 (Hospital only)

**Solution for infusion**
- **Integrillin** (GlaxoSmithKline UK Ltd)
  - Eptifibatide 750 microgram per 1 ml Integrillin 75mg/100ml solution for infusion vials | 1 vial (Rx) £42.79 (Hospital only)
Tirofiban

**INDICATIONS AND DOSE**

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTE-MI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis (initiated under specialist supervision))

BY INTRAVENOUS INFUSION

- Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTE-MI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision) INITIALLY BY INTRAVENOUS INJECTION

- Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

**CONTRA-INDICATIONS**

Abnormal bleeding within 30 days - history of aneurysm - history of arteriovenous malformation - history of haemorrhagic stroke - history of intracranial disease - history of neoplasm - increased INR - increased prothrombin time - severe hypertension - stroke within 50 days - thrombocytopenia

**CAUTIONS**

- Active peptic ulcer (within 3 months) - acute pericarditis - anaemia - aortic dissection - cardiogenic shock - discontinue if intra-aortic balloon pump necessary - discontinue if thrombolytic therapy necessary - discontinue immediately if serious or uncontrollable bleeding occurs - discontinue if emergency cardiac surgery necessary - elderly - faecal occult blood - haematuria - haemorrhagic retinopathy - low body-weight - major surgery within 5 months (avoid if within 6 weeks) - organ biopsy or lithotripsy within last 2 weeks - puncture of non-compressible vessel within 24 hours - risk of bleeding (within 3 months) - severe heart failure - severe trauma within 5 months (avoid if within 6 weeks) - traumatic or protracted cardiopulmonary resuscitation within last 2 weeks - uncontrollable severe hypertension - vasculitis

**INTERACTIONS**

Appendix 1 (tirofiban).

Concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration).

**SIDE-EFFECTS**

- Bleeding manifestations - fever - headache - nausea - reversible thrombocytopenia

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Caution in mild to moderate liver disease. Avoid in severe liver disease—increased risk of bleeding.

**RENAL IMPAIRMENT**

Increased risk of bleeding. Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

Monitor carefully if eGFR less than 60 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

ELECTROLYTES: May contain Sodium 

- Aggrastat (Correvio GmbH)

  Tirofiban (as Tirofiban hydrochloride) 50 microgram per 1 mL Aggrastat 12.5mg/250ml infusion bags 1 bag.price no price available (Hospital only)

**Solution for infusion**

ELECTROLYTES: May contain Sodium 

- Aggrastat (Correvio GmbH)

  Tirofiban (as Tirofiban hydrochloride) 250 microgram per 1 mL Aggrastat 12.5mg/50ml concentrate for solution for infusion vials 1 vial.price no price available (Hospital only)

**Piperazine derivatives**

Ranolazine

**INDICATIONS AND DOSE**

As adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies

BY MOUTH

- Adult: Initially 375 mg twice daily for 2–4 weeks, then increased to 500 mg twice daily, then increased if necessary up to 750 mg twice daily; reduced if not tolerated to 375–500 mg twice daily

**CAUTIONS**

Body-weight less than 60 kg - elderly - moderate to severe congestive heart failure - QT interval prolongation

**INTERACTIONS**

Appendix 1 (ranolazine).

**SIDE-EFFECTS**

- Common or very common Asthenia - constipation - dizziness - headache - nausea - vomiting

- Rare Allergic dermatitis - anemia - angioedema - cold extremities - erectile dysfunction - erogenous dysesthesia - impaired hearing - loss of consciousness - pancreatitis - parosmia - rash - renal failure - throat tightness - urticaria - Weight loss

**PREGNANCY**

Manufacturer advises avoid unless essential—no information available.
PATIENT AND CARER ADVICE

BREAST FEEDING
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Use with caution in mild impairment; avoid in moderate and severe impairment.

RENAL IMPAIRMENT
Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Patient alert card to be provided.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (October 2012) that ranolazine (Ranexa) is not recommended for use within NHS Scotland.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

Ranolazine 375 mg Ranexa 375 mg modified-release tablets
60 tablet $48.98 DT price = $48.98

Ranolazine 500 mg Ranexa 500 mg modified-release tablets
60 tablet $48.98 DT price = $48.98

Ranolazine 750 mg Ranexa 750 mg modified-release tablets
60 tablet $48.98 DT price = $48.98

HEPATIC IMPAIRMENT

CAUTIONS
Acute myocardial infarction with acute left ventricular failure and low filling pressures - acute pulmonary oedema - hypovolaemia - low systolic blood pressure

INTERACTIONS
Appendix 1 (nicorandil).

SIDE-EFFECTS
Common or very common Cutaneous vasodilation with flushing - dizziness - headache (especially on initiation, usually transitory) - increase in heart rate (at high doses) - nausea - rectal bleeding - vomiting - weakness

Uncommon Angioedema - hypotension - myalgia - oral ulceration

Rare Abdominal pain - anal ulceration - cholestasis - hepatitis - intestinal ulceration - jaundice - pruritus - rash - skin ulceration

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk—no information available.

BREAST FEEDING
No information available—manufacturer advises avoid.

PATIENT AND CARER ADVICE
Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

SELECTIVE SINUS NODE I F INHIBITORS

Ivabradine

INDICATIONS AND DOSE
Treatment of angina in patients in normal sinus rhythm

BY MOUTH

Adult: Initially 5 mg twice daily for 2–4 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

Elderly: Initially 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

Mild to severe chronic heart failure

BY MOUTH

Adult: Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

CONTRA-INDICATIONS
Acute myocardial infarction - cardiogenic shock - congenital QT syndrome - do not initiate for angina if heart rate below 70 beats per minute - do not initiate for chronic heart failure if heart rate below 75 beats per minute - immediately after cerebrovascular accident - patients dependent on pacemaker - second- and third-degree heart block - severe hypotension - sick-sinus syndrome - sino-atrial block - unstable angina - unstable or acute heart failure

CAUTIONS
Atrial fibrillation or other arrhythmias (treatment ineffective) - elderly - in angina, consider stopping if there is no or limited symptom improvement after 5 months - intraventricular conduction defects - mild to moderate hypotension (avoid if severe) - retinitis pigmentosa

INTERACTIONS
Appendix 1 (ivabradine).

SIDE-EFFECTS
Common or very common Atrial fibrillation - blurred vision - bradycardia - dizziness - first-degree heart block - headache - phosphates - ventricular extrasystoles - visual disturbances

Uncommon Angioedema - constipation - diarrhoea - dysphonia - eosinophilia - hyperuricaemia - muscle cramps - nausea - palpitations - raised plasma-creatinine concentration - rash - supraventricular extrasystoles - vertigo

Very rare Second and third-degree heart block - sick sinus syndrome

PREGNANCY
Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING
Present in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate impairment. Avoid in severe impairment.
Evidence of myocardial necrosis, whereas in NSTEMI, severe angina. Patients with unstable angina have no recurring or prolonged angina at rest, or new onset of ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hypoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

NitrateS are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 190 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 191 is given. If pain continues, drowsiness, hydrochloride p. 361 or morphine p. 367 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 347 should also be given.

Aspirin p. 104 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 106 should also be given.

Prasugrel p. 188 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance p. 188). Ticagrelor p. 188 is also an alternative to clopidogrel (see NICE guidance p. 188).

Patients should also receive either heparin (unfractionated) p. 114, a low molecular weight heparin, or fondaparinux sodium p. 109. Patients without contra-indications should receive beta-blockers which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 149 or verapamil hydrochloride p. 156 can be given.

The glycoprotein Ib/IIa inhibitors epifibatide p. 183 (in combination with heparin (unfractionated) p. 114 and aspirin) and tirofiban p. 184 (in combination with heparin (unfractionated) aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab or epifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 116 can be considered as an alternative to the combination of a glycoprotein Ib/IIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle,
occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

**Management of ST-segment elevation myocardial infarction (STEMI)**

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diphosphonate hydrochloride p. 361 or morphine p. 367 can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

**Initial management**

**Oxygen** should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diphosphonate hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride p. 347 (or, if left ventricular function is not compromised, cyclizine p. 343) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 106, should also be given. Prasugrel p. 188, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance p. 188). Ticagrelor p. 188, is also an alternative to clopidogrel (see NICE guidance p. 188).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a thrombolytic drug, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a glycoprotein IIb/IIIa inhibitor can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 113); bivalirudin p. 116 is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance p. 117). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting p. 103.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

**Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 190 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 191 is given. Early administration of some beta-blockers has been shown to be of benefit and should be given to patients without contra-indications.

**ACE inhibitors**, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment). All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 603.

**Long-term management**

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital. Aspirin should be given to all patients, unless contra-indicated. The addition of clopidogrel has been shown to reduce morbidity and mortality. Prasugrel p. 188 or ticagrelor are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 121 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 109, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events p. 187. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents p. 103.

**Beta-blockers** should be given to all patients in whom they are not contra-indicated. Acebutolol p. 141, metoprolol tartrate p. 144, propranolol hydrochloride p. 146 and timolol maleate p. 147 are suitable; for patients with left ventricular dysfunction, carvedilol p. 142, bisoprolol fumarate p. 142, or long-acting metoprolol tartrate may be appropriate.

Diltiazem hydrochloride p. 149 [unlicensed] or verapamil hydrochloride p. 156 can be considered if a beta-blocker cannot be used; however they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

**Nitrates** are used for patients with angina. Eplerenone p. 167 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure. See also the role of **statins** in preventing recurrent cardiovascular events p. 178.

**Prevention of cardiovascular events**

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of lifestyle changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.
In patients with stable angina, addition of an ACE inhibitor should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel below or ticagrelor below are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban p. 109, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

**ANTIPLATELETS**

**Prasugrel**

**INDICATIONS AND DOSE**

In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

**BY MOUTH**

- Adult 18-74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
- Adult 18-74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
- Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI

**BY MOUTH**

- Adult: Initially 60 mg, to be administered at the time of percutaneous coronary intervention to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate

**Alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention**

**BY MOUTH**

- Adult: 60 mg as a single dose

- **CONTRA-INDICATIONS** Active bleeding - history of stroke or transient ischaemic attack

- **CAUTIONS** Body-weight less than 60 kg - discontinue at least 7 days before elective surgery if antplatelet effect not desirable - elderly patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastrointestinal bleeding, or active peptic ulcer disease)

- **INTERACTIONS → Appendix 1 (prasugrel).** Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE-EFFECTS**

  - Common or very common Anaemia, gastro-intestinal haemorrhage, haematoma, haematuria, haemorrhage, intracranial haemorrhage, rash
  - Uncommon Angioedema, hypersensitivity reactions
  - Rare Thrombocytopenia
  - Frequency not known Thrombotic thrombocytopenic purpura

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment—increased risk of bleeding. Avoid in severe impairment.

- **RENAI IMPAIRMENT** Use with caution—increased risk of bleeding.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**

    - Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317

    Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention. [www.nice.org.uk/TA317](http://www.nice.org.uk/TA317)

- **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (August 2009) that prasugrel (Efient®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**

  - **Efient** (Eli Lilly and Company Ltd)

    - Prasugrel (as Prasugrel hydrochloride) 5 mg Efient 5mg tablets | 28 tablet [Pack] £27.56 GT price = £27.56
    - Prasugrel (as Prasugrel hydrochloride) 10 mg Efient 10mg tablets | 28 tablet [Pack] £47.56 GT price = £47.56

- **Ticagrelor**

  **INDICATIONS AND DOSE**

  In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome

  **BY MOUTH**

  - Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months

  **Alternative to clopidogrel in patients undergoing percutaneous coronary intervention**

  **BY MOUTH**

  - Adult: 180 mg as a single dose

- **CONTRA-INDICATIONS** Active bleeding - history of intracranial haemorrhage

- **CAUTIONS** Asthma - bradycardia (unless pacemaker fitted) - chronic obstructive pulmonary disease - discontinue 7 days before elective surgery if antplatelet effect not desirable - history of hyperuricaemia - patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastrointestinal bleeding, or coagulation disorders) - second- or third-degree AV block (unless pacemaker fitted) - sick sinus syndrome (unless pacemaker fitted)

- **INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE-EFFECTS**

  - Common or very common Bruising - dyspnoea - haemorrhage
Uncommon Abdominal pain · diarrhoea · dizziness · dyspepsia · gastritis · headache · nausea · pruritus · rash · vomiting

Rare Confusion · constipation · hyperuricaemia · paraesthesia · raised serum creatinine · vertigo

PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Avoid in moderate or severe impairment—no information available.

MONITORING REQUIREMENTS Monitor renal function 1 month after initiation.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Ticagrelor for the treatment of acute coronary syndromes (October 2011) NICE TA236

Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:

- with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, or
- with non-ST-segment elevation myocardial infarction (NSTEMI), or
- admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist.

Characteristics to be used in defining treatment with ticagrelor for unstable angina are:

- age 60 years or older;
- previous myocardial infarction or previous coronary artery bypass grafting;
- coronary artery disease with stenosis of 50% or more in at least two vessels;
- previous ischaemic stroke;
- previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation;
- diabetes mellitus;
- peripheral arterial disease, or
- chronic renal dysfunction (creatinine clearance less than 60 mL/minute/1.73 m²).

NITRATES

Nitrates

Nitrates have a useful role in angina. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate p. 190 is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by transdermal preparations (but tolerance may develop).

Isosorbide dinitrate p. 191 is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 192. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available. Glyceryl trinitrate p. 190 or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

CONTRA-INDICATIONS Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

CAUTIONS Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

CAUTIONS, FURTHER INFORMATION

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

INTERACTIONS Appendix 1 (nitrates).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Dizziness · postural hypotension · tachycardia · throbbing headache
- Uncommon Flushing · heartburn · nausea · rash · syncope · temporary hypoxaemia · vomiting
- Very rare Angle-closure glaucoma
- Frequency not known Paradoxical bradycardia

SPECIFIC SIDE-EFFECTS

- Uncommon
  - With transdermal use application site reactions with transdermal patches
  - Frequency not known
Glycerel trinitrate

INDICATIONS AND DOSE
Prophylaxis and treatment of angina
BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
Adult: 0.3–1 mg; dose may be repeated as required.
Control of hypertension and myocardial ischaemia during and after cardiac surgery | Induction of controlled hypotension during surgery | Congestive heart failure | Unstable angina
BY INTRAVENOUS INFUSION
Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response, consult product literature for recommended starting doses specific to indication
Treatment or prophylaxis of angina
BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
Adult: 1–2 sprays, dose be administered under tongue and then close mouth
NITRO-DUR®
Prophylaxis of angina
BY TRANSDERMAL APPLICATION
Adult: One '0.2mg/5h' patch to be applied to chest or outer upper arm and replaced every 24 hours, sitting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day
DEPONIT®
Prophylaxis of angina
BY TRANSDERMAL APPLICATION
Adult: One '5' or one '10' patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two '10' patches every 24 hours if necessary, to be replaced every 24 hours, sitting replacement patch on different area
MINITRAN®
Prophylaxis of angina
BY TRANSDERMAL APPLICATION
Adult: One '5' patch to be applied to chest or upper arm; replace every 24 hours, sitting replacement patch on different area, dose to be adjusted according to response
Maintenance of venous patency ('5' patch only)
BY TRANSDERMAL APPLICATION
Adult: (consult product literature)

SIDE-EFFECTS
With intravenous use | abdominal pain | apprehension | diaphoresis | muscle twitching | palpitation | prolonged administration has been associated with methaemoglobinemia | restlessness | retrosternal discomfort | severe hypotension

SIDE-EFFECTS, FURTHER INFORMATION
With intravenous use | Side-effects may be associated with over rapid administration (reduce rate of injection).

ALLERGY AND CROSS-SENSITIVITY
Contraindicated in nitrate hypersensitivity.

BREAST FEEDING
No information available—manufacturers advise use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT
Caution in severe impairment.

RENAL IMPAIRMENT
Manufacturers advise use only if potential benefit outweighs risk.

TREATMENT REQUIREMENTS
Monitor blood pressure and heart rate during intravenous infusion.

PREGNANCY
Not known to be harmful.

DIRECTIONS FOR ADMINISTRATION
With intravenous use | Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. For intravenous infusion (Nitrocin®, Nitronal®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For Nitrocine®, suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as Viaflex® or Steriflex®; use glass or polyethylene containers or give via a syringe pump.
Glycerel trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glycerel trinitrate 5 mg/ml to be diluted before use.

PRESCRIBING AND DISPENSING INFORMATION
With sublingual use | Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.

PATIENT AND CARER ADVICE
Rectal ointment should be discarded 8 weeks after first opening.

PERCUTOL®
Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

MEDECIN FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

TRANSDERM-NITRO®
Prophylaxis of angina
BY TRANSDERMAL APPLICATION
Adult: One '5' or one '10' patch to be applied to lateral chest wall and replaced every 24 hours, sitting replacement patch on different area, max. two '10' patches daily
Prophylaxis of phlebitis and extravasation ('5' patch only)
BY TRANSDERMAL APPLICATION
Adult: (consult product literature)
PERCUTOL®
Prophylaxis of angina (to determine dose)
TO THE SKIN
Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, approx. 800 micrograms/hour absorbed from 1 inch of ointment
Prophylaxis of angina
TO THE SKIN
Adult: 1–2 inches every 3–4 hours as required, to be measured on to Applipure® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

Anal fissure
BY RECTUM USING RECTAL OINTMENT
Adult: Apply 2.5 centimetres every 12 hours until pain stops. Max. duration of use 8 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

SIDE-EFFECTS
With rectal use | Burning | diarrhoea | itching | rectal bleeding

PREGNANCY
Not known to be harmful.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

Cardiovascular system

Isosorbide mononitrate

INDICATIONS AND DOSE

Prophylaxis of angina | Adjunct in congestive heart failure

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

MONOMIL® XL
Prophylaxis of angina

BY MOUTH

Adult: Initially 0.5 tablet daily for 2–4 days, to be taken if headache occurs, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

ISMO RETAR®
Prophylaxis of angina

BY MOUTH

Adult: 1 tablet daily, to be taken in the morning

ISIB® 60XL
Prophylaxis of angina

BY MOUTH

Adult: Initially 0.5 tablet daily for 2–4 days, to be taken in the morning

MONOSORB® XL60
Prophylaxis of angina

BY MOUTH

Adult: Initially 0.5 tablet daily for the first 2–4 days, to minimise the possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, to be taken in the morning

IMDUR®
Prophylaxis of angina

BY MOUTH

Adult: Initially 0.5 tablet daily, to be taken if headache occurs; 1 tablet daily, then increased if necessary to 2 tablets daily, dose to be taken in the morning

MONOMAX® XL
Prophylaxis of angina

BY MOUTH

Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, to be taken in the morning

ZEMON®
Prophylaxis of angina

BY MOUTH

Adult: Initially 30 mg daily for 2–4 days, to minimise possibility of headache, then 40–60 mg daily, increased if necessary to 80–120 mg once daily, to be taken in the morning

PREGNANCY

Manufacturers advise avoid unless potential benefit outweighs risk.

Cardiovascular system

Do not hallucinate.

Dobutamine

**DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

**INDICATIONS AND DOSE**

Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation

**BY INTRAVENOUS INFUSION**

- Adult: Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

**Cardiac stress testing**

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**CONTRA-INDICATIONS** Phaeochromocytoma

**CAUTIONS** Acute heart failure - acute myocardial infarction - arrhythmias - correct hypercapnia before starting and during treatment - correct hypovolaemia before starting and during treatment - correct hypoxia before starting and during treatment - correct metabolic acidosis before starting and during treatment - diabetes mellitus - elderly - extravasation may cause tissue necrosis - extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) - hypothyroidism - ischaemic heart disease - obliterrative vascular disease - severe hypotension - susceptibility to angle-closure glaucoma - tachycardia - tolerance may develop with continuous infusions longer than 72 hours

**INTERACTIONS** → Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- Rare Psychosis

- Very rare Angle-closure glaucoma - AV block - bradycardia - cardiac arrest - coronary artery spasm - hypokalaemia - myocardial infarction - petechial bleeding

- Frequency not known Anxiety - arrhythmias - bronchospasm - cerebral haemorrhage - chest pain - dyspnoea - eosinophilia - fever - headache - hypertension (marked increase in systolic blood pressure indicates overdose) - hypotension - increased urinary urgency - myoclonic spasm - nausea - palpitation - paraesthesia - phlebitis - puritus of scalp - pulmonary oedema - rash - reduced platelet aggregation (on prolonged use) - tachycardia - tremor - vomiting

**PREGNANCY** No evidence of harm in animal studies— manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**MONITORING REQUIREMENTS** Monitor serum-potassium concentration.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions. Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Sulfites

- Dobutamine (Non-proprietary)
  - Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 mL Dobutamine 250mg/50ml solution for infusion vials | 1 vial (£0.75)
  - Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 mL Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule (£26.00-£26.25)

**Fibrinolytic drugs**

The value of thrombolytic drugs for the treatment of myocardial infarction has been established. Streptokinase p. 195 and alteplase p. 194 have been shown to reduce mortality. Retepase p. 195 and tenecteplase p. 195 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest
Alteplase
(rt-PA; Tissue-type plasminogen activator)

INDICATIONS AND DOSE
Acute myocardial infarction, accelerated regimen
INITIALLY BY INTRAVENOUS INJECTION
▶ Adult (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
▶ Adult (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

Acute myocardial infarction
INITIALLY BY INTRAVENOUS INJECTION
▶ Adult: Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

Pulmonary embolism
INITIALLY BY INTRAVENOUS INJECTION
▶ Adult: Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg

Acute stroke (under specialist neurology physician only)
BY INTRAVENOUS INFUSION
▶ Adult 18-79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment must begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose is to be administered by intravenous injection and the remainder by intravenous infusion

ACTILYSE CATHFL®
Thrombolytic treatment of occluded central venous access devices
BY INTRAVENOUS INJECTION
▶ Adult: (consult product literature)

CONTRA-INDICATIONS
▶ When used for acute ischaemic stroke Convulsion accompanying stroke. history of stroke in patients with diabetes. hyperglycaemia. hypoglycaemia. severe stroke. stroke in last 5 months

INTERACTIONS
Contra-indicated if concomitant treatment with oral anticoagulants.

SIDE-EFFECTS
Risk of cerebral bleeding increased in acute stroke

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

MONITORING REQUIREMENTS
When used for acute ischaemic stroke Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in

Fibrinolytics

DRUG ACTION
Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

CONTRA-INDICATIONS
Active pulmonary disease with cavitation. acute pancreatitis. aneurysm. aortic dissection. bacterial endocarditis. bleeding diatheses. coagulation defects. coma. heavy vaginal bleeding. history of cerebrovascular disease (especially recent events or with any residual disability). oesophageal varices. pericarditis. recent haemorrhage. recent surgery (including dental extraction). recent symptoms of possible peptic ulceration. recent trauma. severe hypertension.

CAUTIONS
Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation). elderly. external chest compression. hypertension. risk of bleeding (including that from venepuncture or invasive procedures).

INTERACTIONS
Caution with recent or concomitant use of drugs that increase the risk of bleeding.

SIDE-EFFECTS
Allergic reactions. anaphylaxis. angina. (when used in myocardial infarction). back pain. bleeding. breathing difficulty (usually limited to the site of injection, but can occur from other sites). cerebral oedema (caused by reperfusion). convulsions. fever. flushing. hypotension. intracerebral haemorrhage. nausea. pulmonary oedema (caused by reperfusion). rash. recurrent ischaemia (when used in myocardial infarction). reperfusion arrhythmias. (when used in myocardial infarction). urticaria. vomiting.

SIDE-EFFECTS, FURTHER INFORMATION
BLEEDING
Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).

Hypotension
Hypotension can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.

PREGNANCY
Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

HEPATIC IMPAIRMENT
Avoid in severe hepatic impairment as there is an increased risk of bleeding.

in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 119 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase p. 119 is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Hypotension
Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).

Hypotension
Hypotension can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.

PREGNANCY
Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

Urokinase p. 119 is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.
the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Alteplase for the treatment of acute ischaemic stroke (September 2012) NICE TA264
    - Alteplase is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:
      - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, and
      - intracranial haemorrhage has been excluded by appropriate imaging techniques. [www.nice.org.uk/TA264](http://www.nice.org.uk/TA264)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
    - **Powder and solvent for solution for injection**
      - Actilyse (Boehringer Ingelheim Ltd)
        - Alteplase 10 mg: Actilyse 10mg powder and solvent for solution for injection vials | 1 vial [PPI] £144.00
        - Alteplase 20 mg: Actilyse 20mg powder and solvent for solution for injection vials | 1 vial [PPI] £216.00
      - Actilyse Cathflo (Boehringer Ingelheim Ltd)
        - Alteplase 2 mg: Actilyse Cathflo 2mg powder and solvent for solution for injection vials | 5 vial [PPI] £225.00 (Hospital only)
  - **Powder and solvent for solution for infusion**
    - Actilyse (Boehringer Ingelheim Ltd)
      - Alteplase 50 mg: Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial [PPI] £360.00

- **Retepase**
  - **INDICATIONS AND DOSE**
    - Acute myocardial infarction
      - Adult: 10 units, initiated within 12 hours of onset of symptoms, dose to be given over not more than 2 minutes, followed by 10 units after 30 minutes
  - **BREAST FEEDING**
    - Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder and solvent for solution for injection**
      - Rapilysin (Actavis UK Ltd)
        - Retepase 10 unit: Rapilysin 10unit powder and solvent for solution for injection vials | 2 vial [PPI] £566.00

- **Streptokinase**
  - **INDICATIONS AND DOSE**
    - Acute myocardial infarction
      - Adult: 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes
      - Deep-vein thrombosis | Pulmonary embolism | Acute arterial thromboembolism | Central retinal venous or arterial thrombosis
        - **BY INTRAVENOUS INJECTION**
          - Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)

- **SIDE-EFFECTS**
  - Rare: Guillain-Barré syndrome

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Streptase®), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder for solution for infusion**
      - STREPTOKINASE (Non-proprietary)
        - Streptokinase 1.5 mega u: Biofactor Streptokinase 1.5million unit powder for solution for infusion vials | 1 vial [PPI] £83.44
        - Streptokinase 250000 unit: Biofactor Streptokinase 250,000unit powder for solution for infusion vials | 1 vial [PPI] £15.91
        - Streptokinase 750000 unit: Biofactor Streptokinase 750,000unit powder for solution for infusion vials | 1 vial [PPI] £41.72

### Tenecteplase

- **INDICATIONS AND DOSE**
  - Acute myocardial infarction
    - **BY INTRAVENOUS INJECTION**
      - Adult: 30–50 mg (max. per dose 50 mg), dose to be given over 10 seconds and initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature
  - **BREAST FEEDING**
    - Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder and solvent for solution for injection**
      - Metalyse (Boehringer Ingelheim Ltd)
        - Tenecteplase 8000 unit: Metalyse 8,000unit powder and solvent for solution for injection vials | 1 vial [PPI] £502.25
        - Tenecteplase 10000 unit: Metalyse 10,000unit powder and solvent for solution for injection vials | 1 vial [PPI] £502.25

### 7.2 Cardiac arrest

**Cardiopulmonary resuscitation**

The algorithm for cardiopulmonary resuscitation (Life support algorithm) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at [www.resus.org.uk](http://www.resus.org.uk).

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine p. 196 1 in 10000 (100 micrograms/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest...
Adrenaline/epinephrine

**DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta, effects); it can cause peripheral vasodilation (a beta, effect) or vasoconstriction (an alpha effect).

**INDICATIONS AND DOSE**

**Cardiopulmonary resuscitation**

*BY INTRAVENOUS INJECTION*
- Adult: 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended

**Acute hypotension**

*BY CONTINUOUS INTRAVENOUS INFUSION*
- Neonate: Initially 100 nanograms/kg/minute (up to 1.5 micrograms/kg/minute has been used), adjusted according to response
- Child: Initially 100 nanograms/kg/minute (up to 1.5 micrograms/kg/minute has been used), adjusted according to response

**Emergency treatment of acute anaphylaxis (under expert supervision) Angioedema (if laryngeal oedema is present)**

*BY INTRAMUSCULAR INJECTION*
- Child 1 month–5 years: 150 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, repeated if necessary, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function
- Child 6–11 years: 300 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function
- Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function
- Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function

Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) Angioedema (if laryngeal oedema is present) (specialist use only)

*BY SLOW INTRAVENOUS INJECTION*
- Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine

*BY INTRAVENOUS INFUSION*
- Adult: 2–10 micrograms/minute, adjusted according to response

**EMERADE® 150 MICROGRAMS**

Acute anaphylaxis (for self-administration)

*BY INTRAMUSCULAR INJECTION*
- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**EMERADE® 300 MICROGRAMS**

Acute anaphylaxis (for self-administration)

*BY INTRAMUSCULAR INJECTION*
- Child (body-weight up to 15 kg): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EMERADE® 500 MICROGRAMS**

Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)

*BY INTRAMUSCULAR INJECTION*
- Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
- Adult: 500 micrograms, then 500 micrograms after 5–15 minutes as required

**EPIPEN® JR AUTO-INJECTOR 0.15MG**

Acute anaphylaxis (for self-administration)

*BY INTRAMUSCULAR INJECTION*
- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**EPIPEN® AUTO-INJECTOR 0.3MG**

Acute anaphylaxis (for self-administration)

*BY INTRAMUSCULAR INJECTION*
- Child (body-weight up to 15 kg): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**JEXT® 150 MICROGRAMS**

Acute anaphylaxis (for self-administration)

*BY INTRAMUSCULAR INJECTION*
- Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
- Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**SYMPATHOMIMETICS (VASOCONSTRICTOR)**

**Adrenaline/epinephrine**

- Drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation.
- Intravenous injection of amiodarone hydrochloride should be considered after adrenaline/epinephrine below to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride. Lidocaine hydrochloride p. 91, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 949 is no longer recommended in the treatment of asystole or pulseless electrical activity.
- During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.
- For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 241.

- For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 241.
**MONITORING REQUIREMENTS**

- **Blood pressure and pulse:** Monitor blood pressure and pulse; maximum 100 micrograms per course

**JEXT® 300 MICROGRAMS**

**Acute anaphylaxis** (for self-administration)

- **By intramuscular injection**
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  - Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)**

- **By intracavernosal injection**
  - Adult: 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution. **Important:** if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

**Unlicensed Use**

- With intravenous use: Adrenaline 1 in 1000 (1mg/mL) solution is not licensed for intravenous administration. Auto-injector delivering 150-microgram dose of adrenaline not licensed for use in children body-weight under 15 kg.

**Important safety information**

**Safe Practice**

Intravenous route should be used with extreme care by specialists only.

**Cautions**

- Arteriosclerosis, arrhythmias, cerebrovascular disease, cor pulmonale, diabetes mellitus, elderly, hypercalcaemia, hypereflexia, hypertension, hyperthyroidism, hypokalaemia, ischaemic heart disease, obstructive cardiomyopathy, oesophageal vascular disease, organic brain damage, phaeochromocytoma, prostate disorders, psychosis, severe angina, susceptibility to angle-closure glaucoma

**Cautions, further information**

Cautions listed are only for non-life-threatening situations.

**Interactions**

- Appendix 1 (sympathomimetics)

Severe anaphylaxis in patients taking beta-blockers may not respond to adrenaline—consider bronchodilator therapy. Furthermore, adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers.

**Side-effects**

- Angina, angle-closure glaucoma, anorexia, anxiety, arrhythmias, cold extremities, confusion, difficulty in micturition, dizziness, dry mouth, dysphonia, headache, hyperglycaemia, hypersalivation, hypertension (risk of cerebral haemorrhage), hypokalaemia, insomnia, metabolic acidosis, mydriasis, myocardial infarction, nausea, pallor, palpitation, psychosis, pulmonary oedema (on excessive dosage or extreme sensitivity), restlessness, sweating, tachycardia, tissue necrosis at injection site, tissue necrosis of bowel, tissue necrosis of extremities, tissue necrosis of kidneys, tissue necrosis of liver, tremor, urination retention, vomiting, weakness

**Pregnancy**

May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

**Breast feeding**

Present in milk but unlikely to be harmful as poor oral bioavailability.

**Renal impairment**

Manufacturers advise use with caution in severe impairment.

**Monitoring Requirements**

Monitor blood pressure and ECG.

---

**Directions for Administration**

- With intravenous use in children: Acute hypotension (same text as above) For **continuous intravenous infusion,** dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solutions.

- With intravenous use: Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL. Sodium Chloride 0.9% injection to aid entry into the central circulation.

**Prescribing and dispensing information**

It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access. Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

 Packs for self-administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called at every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone. Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Emerade®, EpiPen®, or Jext®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

**Patient and carer advice**

Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance when and how to inject it.

Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis

**EpiPen® Auto-injector 0.15mg, 0.3mg**

1.7 mL of the solution remains in the auto-injector device after use.

**Emerade® 500 Micrograms**

No solution remains in the auto-injector device after use.
EMERADE® 150 MICROGRAMS
0.35 mL of the solution remains in the auto-injector device after use.

EMERADE® 300 MICROGRAMS
0.2 mL of the solution remains in the auto-injector device after use.

JEXT® 300 MICROGRAMS
1.1 mL of the solution remains in the auto-injector device after use.

JEXT® 150 MICROGRAMS
1.25 mL of the solution remains in the auto-injector device after use.

● EXCEPTIONS TO LEGAL CATEGORY POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing 500 micrograms/ml and from special-order manufacturers include: solution for injection

Solution for injection
EXCIPIENTS: May contain Sulfites

Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 mL Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection ampoules | 1 ampoule (POM) £43.53 | 10 ampoule (POM) £40.30
Adrenaline (base) 500 micrograms/ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (POM) £55.43
Adrenaline 100 microgram per 1 mL Adrenaline (base) 100 micrograms/ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (POM) £52.03
Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £6.67-
Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £6.99

Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 mL Adrenaline (base) 5mg/5ml (1 in 1000) solution for injection ampoules | 10 ampoule (POM) £63.77
Adrenaline (base) 500micrograms/0.5ml (1 in 1000) solution for injection ampoules | 10 ampoule (POM) £50.57 DT price = £50.57
Adrenaline (base) 1mg/10ml (1 in 1000) solution for injection ampoules | 10 ampoule (POM) £4.43 DT price = £4.41

Adrenaline 1 mg per 1 mL Adrenaline (base) for anaphylaxis
1mg/1ml (1 in 1000) solution for injection pre-filled syringes | 1 pre-
Adrenaline (base) 1mg/ml (1 in 1000) solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £10.40
Adrenaline (base) 1mg/ml (1 in 1000) solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £15.00
Adrenaline (base) 1mg/ml (1 in 1000) solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £13.90

Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 mL Emerade (Imed Systems Ltd)
150 micrograms/ml (0.15ml) solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £26.94
Emerade 500micrograms/0.5ml (1 in 1000) solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £27.74

Adrenaline 1 mg per 1 mL Emerade (Imed Systems Ltd)
300 micrograms/ml (0.3ml) in 1 in 1000 solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £26.94

EpiPen (Meda Pharmaceuticals Ltd)
Adrenaline 500 microgram per 1 mL EpiPen Jr.
150 micrograms/ml (0.3ml) solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £26.45 | 2 pre-filled disposable injection (POM) £52.90

Adrenaline 1 mg per 1 mL EpiPen 300 micrograms/ml (0.3ml) in 1 in 1000 solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £26.45 | 2 pre-filled disposable injection (POM) £52.90

Jext (ALK-Abello Ltd)
Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 mL Jext
150 micrograms/ml (0.15ml) solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £23.99

Adrenaline 1 mg per 1 ml Jext 300 micrograms/ml (0.3ml) in 1 in 1000 solution for injection auto-injectors | 1 pre-filled disposable injection (POM) £23.99

8 Oedema

Diuretics

Overview
Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure. Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure. Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Thiazides and related diuretics
Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlorothalidone p. 204 and indapamide p. 160 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 159 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 205 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metholozane p. 205 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, cyclopenhiazide p. 204, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics
Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and
Oedema due to peripheral venous stasis or calcium-channel blockers can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide and bumetanide are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide p. 202 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists
Amiloride hydrochloride p. 203 and triamterene p. 203 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Aldosterone antagonists
Spironolactone p. 168 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication]. Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 167 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must not be given with aldosterone antagonists

Potassium-sparing diuretics with other diuretics
Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

Other diuretics
Mannitol p. 202 is an osmotic diuretic that can be used to treat cerebral oedema and raised intraocular pressure. Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 965 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide p. 966 and brinzolamide p. 965 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium
Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

LOOP DIURETICS

Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

- **CONTRA-INDICATIONS** Anuria · comatose and precomatose states associated with liver cirrhosis · renal failure due to nephrotic or hepatotoxic drugs · severe hypokalaemia · severe hyponatraemia

- **CAUTIONS** Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) · can exacerbate gout · hypotension should be corrected before initiation of treatment · hypovolaemia should be corrected before initiation of treatment · urinary retention can occur in prostatic hyperplasia

**CAUTIONS, FURTHER INFORMATION**

**Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

**Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

**Urinary retention** If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

- **INTERACTIONS** → Appendix 1 (diuretics).

- **SIDE-EFFECTS**
  - **Very rare** Hyperuricaemia
  - **Frequency not known** Acute urinary retention · blood disorders · bone-marrow depression · deafness (usually with high doses and rapid intravenous administration, and in renal impairment) · electrolyte disturbances · hepatic encephalopathy · hyperglycaemia (less common than with thiazides) · hypersensitivity reactions ·
hypocalcaemia • hypochloraemia • hypokalaemia • hypomagnesaemia • hyponatraemia • leucopenia • metabolic alkalosis • mild gastro-intestinal disturbances • pancreatitis • photosensitivity • postural hypotension • pruritus • rash • temporary increase in serum-cholesterol and triglyceride concentration • thrombocytopenia • tinnitus (usually with high doses and rapid intravenous administration, and in renal impairment) • visual disturbances

HEPATIC IMPAIRMENT Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.

RENAL IMPAIRMENT High doses of loop diuretics may occasionally be needed in renal impairment. High doses or rapid intravenous administration can cause tinnitus and deafness.

MONITORING REQUIREMENTS Monitor electrolytes during treatment.

Bumetanide

INDICATIONS AND DOSE

Oedema

BY MOUTH

• Adult: 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required

• Elderly: 500 micrograms daily, this lower dose may be sufficient in elderly patients

Oedema, severe cases

BY MOUTH

• Adult: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

SIDE-EFFECTS Breast pain • gynaecomastia • musculoskeletal pain (associated with high doses in renal failure)

PREGNANCY Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

BREAST FEEDING No information available. May inhibit lactation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

• BUMETANIDE (Non-proprietary)
  Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet £2.50 DT price = £1.35
  Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet £7.00 DT price = £6.98

Oral solution

• BUMETANIDE (Non-proprietary)
  Bumetanide 200 microgram per ml Bumetane 1mg/5ml oral solution sugar free (sugar-free) | 150 ml (PO) £128.00 DT price = £128.00

Also available in combination with amiloride, p. 203

Co-amilofruse

INDICATIONS AND DOSE

Oedema

BY MOUTH

• Adult: 2.5/20–10/80 mg daily, dose to be taken in the morning

Dose equivalence and conversion

A mixture of amiloride hydrochloride and furosemide (frusemide) in the mass proportions of 1 part amiloride hydrochloride to 8 parts furosemide (frusemide).

CONTRA-INDICATIONS Addison’s disease • anuria • comatose or precomatose states associated with liver cirrhosis • dehydration • hyperkalaemia • hypovolaemia • renal failure • severe hypokalaemia • severe hyponatraemia

CAUTIONS Correct hypovolaemia before using in oliguria • diabetes mellitus • elderly • gout • hepatorenal syndrome • hypoproteinaemia • hypotension • impaired micturition • prostatic enlargement

INTERACTIONS ➔ Appendix 1 (diuretics).

SIDE-EFFECTS Agranulocytosis • anaphylaxis • aplastic anaemia • blood disorders • bone marrow depression (withdraw treatment) • confusion • deafness (usually in renal impairment or in hypoproteinaemia) • dry mouth • eosinophilia • exfoliative dermatitis • gastrointestinal disturbances • gout • haemolytic anaemia • hepatic encephalopathy • hyperglycaemia • hypersensitivity reactions • hyperuricaemia • hypokalaemia • hypopkaemia (due to furosemide—may be followed by hyperkalaemia due to amiloride) • hypomagnesaemia • hyponatraemia • hypotension • intrahepatic cholestasis • leucopenia • metabolic alkalosis or acidosis • pancreatitis • paraesthesia • photosensitivity • purpura • rashes • Stevens–Johnson syndrome • temporary increase in serum cholesterol and triglyceride concentrations • thrombocytopenia • tinnitus • toxic epidermal necrolysis

PREGNANCY Not used to treat hypertension in pregnancy.

BREAST FEEDING Manufacturers advise avoid—no information regarding amiloride component available. Amount of furosemide in milk too small to be harmful. Furosemide may inhibit lactation.

HEPATIC IMPAIRMENT Increased risk of hypomagnesaemia in alcoholic cirrhosis.

RENAL IMPAIRMENT Risk of hyperkalaemia in renal impairment but may need higher doses. Monitor plasma-potassium concentration. Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Monitor electrolytes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

• CO-AMILOFRUSE (Non-proprietary)
  Amiloride hydrochloride 2.5 mg, Furosemide 20 mg Co-amilofruse 2.5mg/20mg tablets | 28 tablet (PO) £10.95 DT price = £3.93 | 56 tablet (PO) £8.64
  Amiloride hydrochloride 5 mg, Furosemide 40 mg Co-amilofruse 5mg/40mg tablets | 28 tablet (PO) £13.95 DT price = £5.09 | 56 tablet (PO) £10.18
  Amiloride hydrochloride 10 mg, Furosemide 80 mg Co-amilofruse 10mg/80mg tablets | 28 tablet (PO) £30.00 DT price = £15.51

• Frumil (Sanofi)
  Amiloride hydrochloride 2.5 mg, Furosemide 20 mg Frumil 5LS 20mg/2.5mg tablets | 28 tablet (PO) £4.32 DT price = £3.93 | 56 tablet (PO) £8.49
  Amiloride hydrochloride 5 mg, Furosemide 40 mg Frumil 40mg/5mg tablets | 28 tablet (PO) £5.29 DT price = £5.09 | 56 tablet (PO) £10.35
Furosemide (Fresmide)

**INDICATIONS AND DOSE**

**Oedema**
- **BY MOUTH**
  - Initial: Initially 40 mg daily, dose to be taken in the morning, then maintenance 20–40 mg daily
  - **INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

**Resistant oedema**
- **BY MOUTH**
  - Adult: 80–120 mg daily
  - **INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

**Resistant hypertension**
- **BY MOUTH**
  - Adult: 40–80 mg daily
  - **INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

**CAUTIONS** Hepatorenal syndrome - hypoproteinaemia may reduce diuretic effect and increase risk of side-effects

**SIDE-EFFECTS** Gout - intrahepatic cholestasis

**PREGNANCY** Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

**BREAST FEEDING** Amount too small to be harmful. May inhibit lactation.

**DIRECTIONS FOR ADMINISTRATION** Intravenous administration rate should not usually exceed 4 mg/minute however single doses of up to 80 mg may be administered more rapidly. A lower rate of infusion may be necessary in renal impairment. For **Intravenous infusion (Lasix®)**, give continuously in Sodium chloride 0.9%; infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, spray, oral solution

**Tablet**
- **Furosemide 20 mg**
  - **Furosemide 40 mg**
  - **Furosemide 500 mg**
  - **Brands may include:**
    - **Duressal**

**Solution for injection**
- **Furosemide 8 mg per 1 ml**
  - **Furosemide 40 mg/5 ml oral solution**
  - **Furosemide 10 mg per 1 ml**

**Brands may include:**
- **Frusol**

**Solution for injection**
- **Furosemide 8 mg per 1 ml**
  - **Furosemide 40 mg/5 ml oral solution**
  - **Furosemide 10 mg per 1 ml**

**Brands may include:**
- **Frusol**

**Furosemide with potassium chloride**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, potassium chloride p. 863.

**INDICATIONS AND DOSE**

**Oedema**
- **BY MOUTH**
  - Adult: (consult product literature)

**DIRECTIONS FOR ADMINISTRATION** Furosemide with modified-release potassium chloride tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer furosemide with potassium chloride tablets.

**LESS SUITABLE FOR PRESCRIBING** Furosemide with potassium chloride tablets are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- **Diumide-K Continus** (Teofarma)
  - **Furosemide 40 mg, Potassium chloride 600 mg**
  - **Diumide-K Continus tablets**
  - **30 tablet**

**Furosemide with spironolactone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, spironolactone p. 168.

**INDICATIONS AND DOSE**

**Resistant oedema**
- **BY MOUTH**
  - Adult: 20/50–80/200 mg daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **Lasilactone** (Sanofi)
  - **Furosemide 20 mg, Spironolactone 50 mg**

**Capsule**
- **Lasilactone** (Sanofi)
  - **Furosemide 20 mg, Spironolactone 50 mg**

**Furosemide with triamterene**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, triamterene p. 203.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
# Osmotic Diuretics

## Mannitol

### INDICATIONS AND DOSE

**Cerebral oedema**

**BY INTRAVENOUS INFUSION**

- Adult: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

**Raised intra-ocular pressure**

**BY INTRAVENOUS INFUSION**

- Adult: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

### CONTRA-INDICATIONS

- Anuria
- Intracranial bleeding (except during craniotomy)
- Severe cardiac failure
- Severe dehydration
- Severe pulmonary oedema

### CAUTIONS

- Extravasation causes inflammation and thrombophlebitis

### INTERACTIONS

See Appendix 1 (mannitol).

### SIDE-EFFECTS

- Uncommon
  - Electrolyte imbalance
  - Fluid imbalance
  - Hypotension
  - Thrombophlebitis
- Rare
  - Anaphylaxis
  - Arrhythmia
  - Blurred vision
  - Chest pain
  - Chills
  - Convulsions
  - Cramp
  - Dehydration
  - Dizziness
  - Dry mouth
  - Fever
  - Focal osmotic nephrosis
  - Headache
  - Hypersensitivity reactions
  - Hypertension
  - Nausea
  - Oedema
  - Pulmonary oedema
  - Raised intracranial pressure
  - Rhinitis
  - Skin necrosis
  - Thirst
  - Urinary retention
  - Urticaria
  - Vomiting

- Very rare
  - Acute renal failure
  - Congestive heart failure

### MEDICINAL FORMS

### DIRECTIONS FOR ADMINISTRATION

For mannitol 20%, an in-line filter is recommended (15-micron filters have been used).
Amiloride hydrochloride

**INDICATIONS AND DOSE**

**Oedema (monotherapy)**  
**BY MOUTH**  
- Adult: Initially 10 mg daily, alternatively initially 5 mg twice daily, adjusted according to response; maximum 20 mg per day

Potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension or congestive heart failure  
**BY MOUTH**  
- Adult: Initially 5–10 mg daily

Potassium conservation when used as an adjunct to thiazide or loop diuretics for hepatic cirrhosis with ascites  
**BY MOUTH**  
- Adult: Initially 5 mg daily

**CONTRA-INDICATIONS**  
Addison’s disease • anuria • hyperkalaemia

**CAUTIONS**  
Diabetes mellitus • elderly

**INTERACTIONS**  
Appendix 1 (diuretics).

**SIDE-EFFECTS**  
Abdominal pain • agitation • alopecia • angina • anorexia • arthralgia • confusion • constipation • cough • diaphoresis • dizziness • dry mouth • dyspepsia • dysuria • encephalopathy • flatulence • gastrointestinal bleeding • headache • hyperkalaemia • insomnia • jaundice • malaise • muscle cramp • nasal congestion • nausea • palpitation • paraesthesia • postural hypotension • pruritus • raised intracranial pressure • rash • sexual dysfunction • thirst • tinnitus • tremor • urinary disturbances • visual disturbance • vomiting • weakness

**PREGNANCY**  
Not to be used to treat gestational hypertension.

**BREAST FEEDING**  
Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**  
Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS**  
Monitor electrolytes.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**INFUSION**

---

**Amiloride with bumetanide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, amiloride hydrochloride above, bumetanide p. 200.

**INDICATIONS AND DOSE**

**Oedema**  
**BY MOUTH**
- Adult: 1–2 tablets daily

**Triamterene**

**INDICATIONS AND DOSE**

**Oedema | Potassium conservation with thiazide and loop diuretics**  
**BY MOUTH**  
- Adult: Initially 150–250 mg daily in 2 divided doses, to be taken after breakfast and lunch, lower initial dose when given with other diuretics, then reduced to 150–250 mg once daily on alternate days in 2 divided doses, to be taken after breakfast and lunch, after one week of initial treatment

**CONTRA-INDICATIONS**  
Addison’s disease • anuria • hyperkalaemia

**CAUTIONS**  
Diabetes mellitus • elderly • gout • may cause blue fluorescence of urine

**INTERACTIONS**  
Appendix 1 (triamterene).

**SIDE-EFFECTS**  
Common or very common • Diarrhoea • hyperkalaemia • nausea • vomiting
- Uncommon • Dry mouth • headache • hyperuricaemia • rash
- Rare • Megaloblastic anaemia • pancytopenia • photosensitivity • serum-sickness
- Very rare • Renal failure (reversible on discontinuation) • triamterene found in kidney stones

**FREQUENCY NOT KNOWN**  
Jaundice • malaise • slight decrease in blood pressure

**PREGNANCY**  
Not used to treat gestational hypertension. Avoid unless essential.

**BREAST FEEDING**  
Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**  
Use with caution. Avoid in progressive impairment.

**RENAL IMPAIRMENT**  
Avoid in progressive impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS**  
Monitor electrolytes.
Cardiovascular system

**Thiazides and related diuretics**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
CAUTIONARY AND ADVISORY LABELS 14, 21

▶ TRIAMTERENE (Non-proprietary)
Triamterene 50 mg, Triamterene 50mg capsules | 30 capsule | £41.90 DT price = £41.90

Also available in combination with furosemide, p. 201

**PATIENT AND CARER ADVICE**
Urine may look slightly blue in some lights.

**Chlortalidone with triamterene**
The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene p. 203, chlortalidone below.

**INDICATIONS AND DOSE**
Hypertension | Oedema
BY MOUTH
▶ Adult: 1–2 tablets daily, dose to be taken in the morning

**SIDE-EFFECTS**
▶ Rare Allergic interstitial nephritis · jaundice
▶ BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
CAUTIONARY AND ADVISORY LABELS 14, 21

▶ Chlortalidone 50 mg, Triamterene 50 mg | Kalspare tablets | 28 tablet | £9.90

**Co-triamterzide**
The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene p. 203, hydrochlorothiazide p. 160.

**INDICATIONS AND DOSE**
Hypertension
BY MOUTH
▶ Adult: 1 tablet daily, increased if necessary up to 4 tablets daily, dose to be taken after breakfast

**SIDE-EFFECTS**
▶ Rare Depression
▶ BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
CAUTIONARY AND ADVISORY LABELS 14, 21

▶ Hydrochlorothiazide 25 mg, Triamterene 50 mg | Dyazide 50mg/25mg tablets | 30 tablet | £0.95 DT price = £0.95

**Chlortalidone**
(Chlorthalidone)
The properties listed below are those particular to the drug only. For properties common to the class, see thiazides and related diuretics, p. 159.

**INDICATIONS AND DOSE**
Ascites due to cirrhosis in stable patients (under close supervision) | Oedema due to nephrotic syndrome
BY MOUTH
▶ Adult: Up to 50 mg daily

Hypertension
BY MOUTH
▶ Adult: 25 mg daily, dose to be taken in the morning, then increased if necessary to 50 mg daily

Mild to moderate chronic heart failure
BY MOUTH
▶ Adult: 25–50 mg daily, dose to be taken in the morning, then increased if necessary to 100–200 mg daily, reduce to lowest effective dose for maintenance

Nephrogenic diabetes insipidus | Partial pituitary diabetes insipidus
BY MOUTH
▶ Adult: Initially 100 mg twice daily, then reduced to 50 mg daily

**SIDE-EFFECTS**
▶ Rare Depresssion
▶ BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
EXCIPIENTS: May contain Gluten

▶ Navidrex (AMCo)
Cyclopenthiazide 500 microgram | Navidrex 500microgram tablets | 28 tablet | £1.27

Metolazone

The properties listed below are those particular to the drug only. For properties common to the class, see thiazides and related diuretics, p. 159.

INDICATIONS AND DOSE
Oedema
BY MOUTH
» Adult: 5–10 mg daily, dose to be taken in the morning; dose may be increased in resistant oedema; increased if necessary to 20 mg daily; maximum 80 mg per day

Hypertension
BY MOUTH
» Adult: Initially 5 mg daily, dose to be taken in the morning; maintenance 5 mg once daily on alternate days

● CAUTIONS Acute porphyrias p. 864
● SIDE-EFFECTS Chest pain · chills
● BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.
● DIRECTIONS FOR ADMINISTRATION Tablets may be crushed and mixed with water immediately before use.

Xipamide

The properties listed below are those particular to the drug only. For properties common to the class, see thiazides and related diuretics, p. 159.

INDICATIONS AND DOSE
Oedema
BY MOUTH
» Adult: Initially 40 mg daily, dose to be taken in the morning, increased if necessary to 80 mg daily, higher dose to be used in resistant cases; maintenance 20 mg daily, dose to be taken in the morning

Hypertension
BY MOUTH
» Adult: 20 mg daily, dose to be taken in the morning

● CAUTIONS Acute porphyrias p. 864
● BREAST FEEDING No information available.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablet

9 Vascular disease

Peripheral vascular disease

Peripheral vascular disease can be either occlusive (e.g. intermittent claudication) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. Raynaud’s syndrome). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation, effective control of blood pressure, regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 104 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Naftidrofuryl oxalate p. 206 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl oxalate p. 206 should be assessed for improvement after 3–6 months.

Cilostazol p. 206 is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate p. 206 and pentoxifylline p. 207 are not established as being effective for the treatment of intermittent claudication.

Management of Raynaud’s syndrome includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine p. 154 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl oxalate p. 206 may produce symptomatic improvement; inositol nicotinate p. 206 (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 674, and moxisylyte below are not established as being effective for the treatment of Raynaud’s syndrome.

Vasodilator therapy is not established as being effective for chilblains.

ALPHA-ADRENOCEPTOR BLOCKERS

Moxisylyte
(Thymoxamine)

INDICATIONS AND DOSE
Primary Raynaud’s syndrome (short-term treatment)
BY MOUTH
» Adult: Initially 40 mg 4 times a day, increased if necessary to 80 mg 4 times a day, increase dose if poor initial response, discontinue after 2 weeks if no response

● CONTRA-INDICATIONS Active liver disease
● CAUTIONS Diabetes mellitus
● SIDE-EFFECTS Cholestatic jaundice · diarrhoea · dizziness · flushing · headache · hepatic reactions · hepatitis · nausea
● PREGNANCY Manufacturer advises avoid.
● LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Blood Disorders

A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

Pregnancy

Avoid - toxicity in animal studies.

Breast Feeding

Present in milk in animal studies - manufacturer advises avoid.

Hepatic Impairment

Avoid in moderate or severe liver disease.

Renal Impairment

Avoid if eGFR less than 25 mL/minute/1.73 m².

Patient and Carer Advice

Blood disorders. Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.

National Funding/Access Decisions

NICE Technology Appraisals (TAs)

Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223

Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA223

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Cilostazol (Non-proprietary)

Cilostazol 50 mg | 56 tablet POM £40.05 DT price = £39.91
Cilostazol 100 mg | 56 tablet POM £31.70 DT price = £31.70

XANTHINNES

Pentoxifylline (Oxpentifylline)

INDICATIONS AND DOSE

Peripheral vascular disease | Venous leg ulcer (adjunct)

BY MOUTH

Adult: 400 mg 2–3 times a day

Unlicensed Use

Use of pentoxifylline as adjunct therapy for venous leg ulcers is an unlicensed indication.

Contra-Indications

Acute myocardial infarction - cerebral haemorrhage - extensive retinal haemorrhage - severe cardiac arrhythmias

CAUTIONS

Avoid in Acute porphyrias p. 864 - coronary artery disease - hypotension

INTERACTIONS

Rare - Angina - hypotension

Very rare - Bleeding

Frequency not known - Agitation - diarrhoea - dizziness - flushing - headache - intra-hepatic cholestasis - nausea - sleep disturbances - tachycardia - thrombocytopenia - vomiting

Pregnancy

Manufacturer advises avoid — no information available.

Breast Feeding

Present in milk - manufacturer advises use only if potential benefit outweighs risk.

Hepatic Impairment

Manufacturer advises reduce dose in severe impairment.

Renal Impairment

Reduce dose by 30–50% if eGFR less than 30 mL/minute/1.73 m².

National Funding/Access Decisions

Respiratory system

Inhalation
This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Inhaler devices
These include pressurised metered-dose inhalers, breath-actuated inhalers, and dry powder inhalers. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. Spacer devices can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

Pressurised metered-dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

Spacer devices
Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices
Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nebulisers
Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital.

Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta, agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta, agonist or ipratropium bromide p. 217 to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- a beta2, agonist, corticosteroid, or ipratropium bromide on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 489) or a mucolytic to a patient with cystic fibrosis;
- budesonide p. 228 or adrenaline/epinephrine p. 196 to a child with severe croup;
- pentamidine isetionate p. 523 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease p. 214) and the patient’s ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on...
nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lungs. Droplets with a mass median diameter of the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine isetionate p. 523 to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as dornase alfa p. 256 and nebulised suspensions.

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral

The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta2 agonists, corticosteroids, theophylline p. 238, and leukotriene receptor antagonists.

Parenteral

Drugs such as beta2 agonists, corticosteroids, and aminophylline p. 237 can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

NICE technology appraisals (TAs)

Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10

A child’s needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered. www.nice.org.uk/TA10

Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38

A child’s needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored. www.nice.org.uk/TA38

1 Airways disease, obstructive

Asthma

Drugs used in the management of asthma include beta2 agonists, antimuscarinic bronchodilators, theophylline p. 238, corticosteroids, sodium cromoglicate p. 234 and nedocromil sodium p. 234, leukotriene receptor antagonists, and, in specialist centres, omalizumab p. 235.

Management of acute asthma

Important: Patients with severe or life-threatening acute asthma may not be distressed and may not have all these abnormalities; the presence of any should alert the doctor to regard each emergency consultation as being for severe acute asthma until shown otherwise.

See medical emergencies, for doses of drugs used for the management of acute asthma.

Moderate acute asthma

- Able to talk
- Respiration (breaths/minute) < 25; child 2–5 years < 40, 5–12 years ≤ 30
- Pulse (beats/minute) < 110; child 2–5 years ≤ 140, 5–12 years ≤ 125
- Arterial oxygen saturation ≥ 92%
- Peak flow > 50% of predicted or best; child 5–12 years ≥ 50%

Treat at home or in surgery and assess response to treatment

Treatment

- Inhaled short-acting beta2 agonist via a large-volume spacer or oxygen-driven nebuliser (if available); give salbutamol 100 micrograms/metered inhalation p. 222, and repeat at 10–20 minute intervals if necessary or give nebulised salbutamol or terbutaline sulfate p. 225, and repeat at 20–30 minute intervals if necessary.
Management of severe acute asthma

Important
Regard each emergency consultation as being for severe acute asthma until shown otherwise. Failure to respond adequately at any time requires immediate transfer to hospital.

Severe acute asthma can be fatal and must be treated promptly. All patients with severe acute asthma should be given high-flow oxygen (if available) and an inhaled short-acting beta agonist via a large-volume spacer or nebuliser; give salbutamol 100 micrograms/minute inhalation p. 222, each puff inhaled separately via a large volume spacer, and repeat at 10–20 minute intervals or as necessary. If there are life-threatening features, give salbutamol or terbutaline sulfate p. 225 via an oxygen-driven nebuliser every 20–30 minutes or as necessary. In all cases, a systemic corticosteroid should be given. For adults, give prednisolone by mouth for at least 5 days, or intravenous hydrocortisone (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. For children, give prednisolone by mouth for up to 3 days, or longer if necessary, or intravenous hydrocortisone (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. If the child has been taking an oral corticosteroid for more than a few days, then give prednisolone at the upper end of the dose range. In severe or life-threatening asthma, also consider initial treatment with ipratropium bromide by nebuliser.

Most patients do not require and do not benefit from the addition of intravenous aminophylline or of intravenous beta agonist; both cause more adverse effects than nebulised beta agonists. Nevertheless, an occasional patient who has not been taking theophylline may benefit from aminophylline infusion. A single dose of magnesium sulfate [unlicensed indication] by intravenous infusion over 20 minutes can be used for patients with severe acute asthma, but evidence of benefit is limited.

Treatment of severe acute asthma is safer in hospital where resuscitation facilities are immediately available. Treatment should never be delayed for investigations, patients should never be sedated, and the possibility of a pneumothorax should be considered.

If the patient’s condition deteriorates despite pharmacological treatment, intermittent positive pressure ventilation may be needed.

Follow up in all cases
Episodes of acute asthma should be regarded as a failure of preventative therapy. A careful history should be taken to establish the reason for the exacerbation. Monitor symptoms and peak flow. Inhaler technique should be checked and regular treatment should be reviewed, see Management of chronic asthma below. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future exacerbations. Follow-up within 48 hours should be arranged with the general practitioner or appropriate primary care health professional. Patients should also be reviewed by a respiratory specialist within one month of the exacerbation.

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at www.brit-thoracic.org.uk.

Management of chronic asthma

Important: Start at step most appropriate to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations.
Advice on the management of chronic asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at www.brit-thoracic.org.uk

**Respiratory system**

**Lung function measurements cannot be used to guide management of those under 5 years.**

**Step 1: occasional relief bronchodilator**
- Inhaled short-acting beta; agonist as required (up to once daily).
- Move to step 2 if needed more than twice a week, or if night-time symptoms at least once a week, or if exacerbation in the last 2 years.

**Step 2: regular inhaled preventer therapy**
- Inhaled short-acting beta; agonist as required **plus**
- Regular standard-dose inhaled corticosteroid **plus**
- Regular long-acting beta; agonist (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled sodium cromoglicate, or inhaled nedocromil sodium, but are considerably less effective)
**Step 3: inhaled corticosteroid + long-acting inhaled beta; agonist**
- Inhaled short-acting beta; agonist as required **plus**
- Regular standard-dose inhaled corticosteroid **plus**
- Regular inhaled long-acting beta; agonist (salmeterol p. 222 or formoterol fumarate p. 220); if *asthma not controlled* increase dose of inhaled corticosteroid to upper end of standard dose range and **Either** stop long-acting beta; agonist if of no benefit or continue long-acting beta; agonist if of some benefit; if *asthma still not controlled* and long-acting beta; agonist stopped, add one of:
  - Leukotriene receptor antagonist
  - Modified-release oral theophylline
  - Modified-release oral beta; agonist (child under 12 years not recommended).

**Step 4: high-dose inhaled corticosteroid + regular bronchodilators**
- Inhaled short-acting beta; agonist as required **with**
- Regular high-dose inhaled corticosteroid **plus**
- Inhaled long-acting beta; agonist **plus**
- In adults 6-week sequential therapeutic trial of one or more of:
  - Leukotriene receptor antagonist
  - Modified-release oral theophylline
  - Modified-release oral beta; agonist

**Step 5: regular corticosteroid tablets (refer to a respiratory specialist)**
- Inhaled short-acting beta; agonist as required **with**
- Regular high-dose inhaled corticosteroid **and**
- One or more long-acting bronchodilators (see step 4) **plus**
- Regular prednisolone p. 585 tablets (as single daily dose); in addition to regular prednisolone, continue high-dose inhaled corticosteroid (in exceptional cases may exceed licensed doses); these patients should normally be referred to an asthma clinic

**Step 2: regular preventer therapy**
- Inhaled short-acting beta; agonist as required **plus**
- *Either* regular standard-dose inhaled corticosteroid
- 0r (if inhaled corticosteroid cannot be used) leukotriene receptor antagonist.

**Step 3: add-on therapy**
- Child under 2 years: Refer to respiratory paediatrician
- Child 2–5 years: Inhaled short-acting beta, agonist as required **plus**
- Regular inhaled corticosteroid in standard dose **plus**
- Leukotriene receptor antagonist

**Step 4: persistent poor control**
- Refer to respiratory paediatrician.

**Step down**
- Regularly review need for treatment.

**Standard-dose inhaled corticosteroids**

**Beclometasone dipropionate or budesonide:**
- Adult and child over 12 years 100–400 micrograms twice daily
- Child under 12 years 100–200 micrograms twice daily

**Fluticasone propionate:**
- Adult and child over 12 years 50–200 micrograms twice daily
- Child 4–12 years 50–100 micrograms twice daily

**Mometasone furoate:**
- Adult and child over 12 years 400 micrograms as a single dose in the evening or in 2 divided doses
- Child under 12 years not recommended

Dose adjustments may be required for some inhaler devices, see individual preparations.

**High-dose inhaled corticosteroids**

**Beclometasone dipropionate or budesonide:**
- Adult and child over 12 years 0.4–1 mg twice daily
- Child 5–12 years 200–400 micrograms twice daily

**Fluticasone propionate:**
- Adult and child over 12 years 200–500 micrograms twice daily
- Child 5–12 years 100–200 micrograms twice daily

**Mometasone furoate:**
- Adult and child over 12 years 400 micrograms twice daily
- Child under 12 years not recommended

Dose adjustments may be required for some inhaler devices, see individual preparations.

Failure to achieve control with these doses is unusual.

**Pregnancy and breast-feeding**

It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Inhaled drugs, theophylline p. 236, and prednisolone can be taken as normal during pregnancy and breast-feeding. See individual leukotriene receptor antagonists for information on their use during pregnancy. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

Severe acute exacerbations of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta2 agonist and oral or parenteral administration of a corticosteroid; prednisolone is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia. An intravenous beta, agonist, aminophylline p. 237, or magnesium sulfate p. 858 can be used during pregnancy if necessary; parenteral beta2 agonists can affect the myometrium.
**Peak flow meters**

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

3M Security Print and Systems Limited, Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

GP practices can obtain supplies through their Area Team stores.

NHS Hospitals can order supplies from [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or by emailing nhsforms@mmm.com.

In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

---

**Bronchodilators**

**Adrenoceptor agonists (sympathomimetics)**

Selective $\beta_2$ agonists produce bronchodilation. A short-acting $\beta_2$ agonist is used for immediate relief of asthma symptoms while some long-acting $\beta_2$ agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

The selective $\beta_2$ agonists (selective $\beta_2$-adrenoceptor agonists, selective $\beta_2$ stimulants) such as salbutamol p. 222 or terbutaline sulfate p. 225 are the safest and most effective short-acting $\beta_2$ agonists for asthma. Less selective $\beta_2$ agonists such as ephedrine hydrochloride p. 226 is less suitable and less safe for use as a bronchodilator than the selective $\beta_2$ agonists, because it is more likely to cause arrhythmias and other side-effects; it should be avoided whenever possible.

Adrenaline/epinephrine p. 196 (which has both alpha- and beta-$\alpha$-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, in cardiopulmonary resuscitation, and in the management of severe croup.

**Short-acting $\beta_2$ agonists**

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting $\beta_2$ agonist such as salbutamol or terbutaline sulfate. If $\beta_2$ agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last year, then prophylactic treatment should be considered using a stepped approach.

A short-acting $\beta_2$ agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

**Long-acting $\beta_2$ agonists**

Formoterol fumarate p. 220 (eformoterol) and salmeterol p. 222 are longer-acting $\beta_2$ agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma.

Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline sulfate. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Combination inhalers that contain a long-acting $\beta_2$ agonist and a corticosteroid ensure that long-acting $\beta_2$ agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.

Indacaterol p. 221 and olodaterol p. 222 are long-acting $\beta_2$ agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm.

Vilanterol is a long-acting $\beta_2$ agonist available only in a combination inhaler with fluticasone furoate or with umectidinum p. 219.

**Oral**

Oral preparations of $\beta_2$ agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled $\beta_2$ agonists are more effective and have fewer side-effects. The long-acting oral preparations, including bambuterol hydrochloride p. 220, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting $\beta_2$ agonists are usually preferred.

**Parenteral**

Salbutamol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of $\beta_2$ agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. In adults, $\beta_2$ agonists may also be given by intramuscular injection.

**Children**

Selective $\beta_2$ agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A $\beta_2$ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled $\beta_2$ agonist may be used where appropriate. In severe attacks nebulisation using a selective $\beta_2$ agonist or ipratropium bromide is advisable.

**Antimuscarinic bronchodilators**

Ipratropium bromide p. 217 can provide short-term relief in chronic asthma, but short-acting $\beta_2$ agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy.

The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Aclidinium bromide p. 217, glycopyronium bromide p. 217, tiotropium p. 218, and umecldinum p. 219 are licensed for the treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm. Tiotropium p. 218 (via Respimat® device) is also licensed as an adjunct to inhaled corticosteroids and long-acting $\beta_2$ agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year.

**Theophylline**

Theophylline p. 238 is a xanthine used as a bronchodilator in asthma and stable chronic obstructive pulmonary disease; it
is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta-agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 227, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

**Compound bronchodilator preparations**

In general, patients are best treated with single-ingredient preparations, such as a selective beta-2 agonist or ipratropium bromide p. 217, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

**Chronic obstructive pulmonary disease**

Smoking cessation reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine p. 1089 and influenza vaccine p. 1085).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting beta-2 agonist or a short-acting antimuscarinic bronchodilator used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV1) is 50% of predicted or more, *either* a long-acting antimuscarinic bronchodilator or a long-acting beta-2 agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting beta-2 agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting beta-2 agonist.

If FEV1 is less than 50% of predicted, *either* a long-acting antimuscarinic bronchodilator or a long-acting beta-2 agonist with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta-2 agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting beta-2 agonist (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, p. 215).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 237 or theophylline p. 238 can be used.

Indacaterol p. 221 is a long-acting beta-2 agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast p. 236 is licensed as an adjunct to existing bronchodilator treatment.

A mucolytic drug may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

**Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)**

**Oxygen**

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (Paco2), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (Pao2) is usually associated with low or
normal arterial carbon dioxide ($P_{aCO_2}$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_{aCO_2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{aCO_2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:
- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card.

Domiciliary oxygen
Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

Air travel
Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.
Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours/day) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:
- chronic obstructive pulmonary disease with $P_{aO_2} < 7.3$ kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with $P_{aO_2} 7.3–8$ kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with $P_{aO_2}<7.3$ kPa or persistent disabling breathlessness;
- interstitial lung disease with $P_{aO_2}<8$ kPa and in patients with $P_{aD<8}$ kPa with disabling dyspnoea;
- cystic fibrosis when $P_{aO_2}<7.3$ kPa or if $P_{aO_2} 7.3–8$ kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when $P_{aO_2}<8$ kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime $P_{aO_2}<7.3$ kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occurs.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with ‘medium’ (2 litres/minute) and ‘high’ (4 litres/minute) settings.

Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:
- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient’s details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London, East Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In Scotland refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In Scotland and Northern Ireland prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.
### Antimuscarinics (inhaled)

**Antimuscarinics**

- **CAUTIONS**
  - Bladder outflow obstruction - prostatic hyperplasia - susceptibility to angle-closure glaucoma
  - **INTERACTIONS**
    - See Appendix 1 (antimuscarinics).
    - However, note that interactions do not **generally** apply to antimuscarinics used by inhalation.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Constipation - cough - diarrhoea - dry mouth - gastro-intestinal motility disorder - headache
  - **Uncommon**
  - **Rare**
    - Dental caries - dry skin

#### Glycopyrronium bromide

**INDICATIONS AND DOSE**

Maintenance treatment of chronic obstructive pulmonary disease

**BY INHALATION OF POWDER**

- **Child 1 month**
  - Adult: 375 micrograms twice daily

**Dose equivalence and conversion**

Each 375 microgram inhalation of glycopyrronium bromide delivers 322 micrograms of acilinium bromide.

**CAUTIONS**

- Hospitalisation with moderate or severe heart failure within last 6 months - myocardial infarction within last 6 months - newly diagnosed arrhythmia within last 3 months - unstable angina

**SIDE-EFFECTS**

- Sinusitis

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**

Use with caution eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer glycopyrronium for inhalation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Inhalation powder**
  - Seebri Breezhaler (Novartis Pharmaceuticals UK Ltd)
  - Glycopyrronium bromide 55 microgram
  - Seebri Breezhaler 44 microgram inhalation powder capsules with device

- **Capsule**
  - 6 capsule 55 microgram £1.50 | 30 capsule 55 microgram £27.50

#### Aclidinium bromide

**INDICATIONS AND DOSE**

Maintenance treatment of chronic obstructive pulmonary disease

**BY INHALATION OF NEBULISED SOLUTION**

- **Child 1 month**
  - Adult: 50 micrograms every 6 hours as required

**INDICATIONS AND DOSE**

Reversible airways obstruction, particularly in chronic obstructive pulmonary disease

**BY INHALATION OF AEROSOL**

- **Child 1 month**
  - Adult: 20–40 micrograms 3–4 times a day

**Dose equivalence and conversion**

Each 1 microgram of aclidinium bromide delivers 0.6 microgram of glycopyrronium bromide.

**CAUTIONS**

- Asthma - allergic rhinitis - angioedema - bronchospasm - diarrhoea - gastro-oesophageal reflux disease - mydriasis - nasopharyngitis - nausea - palpitation - paradoxical bronchospasm - pharyngitis - tachycardia - throat irritation - urinary retention

**SIDE-EFFECTS**

- **Common or very common**
  - Constipation - cough - diarrhoea - dry mouth - gastro-intestinal motility disorder - headache

- **Uncommon**

- **Rare**
  - Dental caries - dry skin

#### Ipratropium bromide

**INDICATIONS AND DOSE**

Reversible airways obstruction

**BY INHALATION OF AEROSOL**

- **Child 1 month**
  - Adult: 500 micrograms 3–4 times a day

**Dose equivalence and conversion**

Each 1 microgram of aclidinium bromide delivers 0.6 microgram of glycopyrronium bromide.

**CAUTIONS**

- Cystic fibrosis

**INTERACTIONS**

**Glaucoma**

Acute angle-closure glaucoma has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta₂ agonists); care needed to protect the patient’s eyes from nebulised drug or from drug powder.

**SIDE-EFFECTS**

- **Common or very common**
  - Dizziness - headache - nasal congestion

- **Uncommon**
  - Atrial fibrillation

- **Rare**
  - Atrial fibrillation - ocular accommodation disorder

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Inhalation powder**
  - Eklira (AstraZeneca UK Ltd)
  - Aclidinium bromide 375 microgram per 1 dose Eklira

- **Capsule**
  - 6 capsule 375 microgram £2.75 | 30 capsule 375 microgram £27.50

**Pharmacokinetics**

The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.
**218 Airways disease, obstructive**

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE** Advise patient not to exceed prescribed dose and to follow manufacturer’s directions.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

- **IPRATROPNIUM BROMIDE (Non-proprietary)**
  - Ipratropium bromide 20 microgram per 1 dose **Combivent** (Boehringer Ingelheim Ltd)
  - Atrovent (Boehringer Ingelheim Ltd)
  - Ipratropium bromide 20 microgram per 1 dose Atrovent
  - Salbutamol sulfate) 1 mg per 1 ml Salbutamol 2.5mg/2.5ml

- **IPRATROPNIUM BROMIDE (Non-proprietary)**
  - Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Combivent nebuliser liquid

- **IPRATROPIUM WITH SALBUTAMOL (Non-proprietary)**
  - Ipratropium bromide 20 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Combivent nebuliser liquid

**Indications and dose**

**Maintenance treatment of chronic obstructive pulmonary disease**

BY INHALATION OF POWDER

- Adult: 18 micrograms once daily

SPIRIVA RESPIMAT®

Maintenance treatment of chronic obstructive pulmonary disease | Adjunct to inhaled corticosteroids and long-acting beta; agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year

BY INHALATION OF AEROSOL

- Adult: 5 micrograms once daily

- **CAUTIONS** Cardiac arrhythmia requiring intervention in the previous 12 months - hospitalisation for moderate to severe heart failure in the previous 12 months - life-threatening cardiac arrhythmia - myocardial infarction in the previous 6 months - unstable cardiac arrhythmia

- **SIDE-EFFECTS**
  - Common or very common Dizziness - epistaxis - oropharyngeal candidiasis - pruritus - taste disturbance
  - Rare Gingivitis - glossitis - insomnia - gastrointestinal obstruction - paralytic ileus - sinusitis - stomatitis
  - Frequency not known Dehydration - joint swelling
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Plasma-tiotropium concentration raised. Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 50 mL/ minute/1.73 m².

- **PATIENT AND CARER ADVICE** Counselling Advise patients to report any worsening of cardiac symptoms during treatment. Patients or carers should be given advice on how to administer tiotropium powder inhalation and pressurised inhalation.

**National funding/access decisions**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2007) that Spiriva Respimat® is restricted for use in chronic obstructive pulmonary disease in patients who have poor manual dexterity and difficulty using the Handihaler® device.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

- **TIOTROPIUM (Non-proprietary)**
  - Tiotropium (as Tiotropium bromide) 2.5 microgram per 1 dose Tiotropium bromide 2.5micrograms/dose solution for inhalation with device CFC free | 60 unit dose (£94) no price available DT price = £34.00

- **SPIRIVA RESPIMAT®**
  - Tiotropium bromide 2.5 microgram per 1 dose Tiotropium Respimat 2.5micrograms/dose solution for inhalation with device | 60 dose (£50) £33.50 DT price = £33.50

**Ipratropium with salbutamol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, salbutamol p. 222, ipratropium bromide p. 217.

**INDICATIONS AND DOSE**

Bronchospasm in chronic obstructive pulmonary disease

- Adult: 0.5/2.5 mg 3–4 times a day

**Prescribing and dispensing information**

A mixture of ipratropium bromide and salbutamol (as sulphate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of ipratropium and salbutamol respectively.

**Less suitable for prescribing** Ipratropium bromide with salbutamol nebuliser solution is considered less suitable for prescribing.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser liquid**

- **IPRATROPIUM WITH SALBUTAMOL (Non-proprietary)**
  - Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulphate) 1 mg per 1 ml Salbutamol 2.5mg/2.5ml

- **Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulphate) 1 mg per 1 ml**

- **IPRATROPIUM BROMIDE (Non-proprietary)**
  - Ipratropium bromide 250 microgram per 1 ml Ipratropium 250micrograms/1ml nebuleiser liquid Steri-Neb unit dose vials | 20 unit dose (£6.60) DT price = £5.23
  - Ipratropium bromide 50micrograms/1ml nebuleiser liquid unit dose Steripoule vials | 20 unit dose (£6.00) DT price = £3.94
  - Ipratropium bromide 25micrograms/1ml nebuleiser liquid unit dose Steripoule vials | 20 unit dose (£2.39) DT price = £1.56

**Brands may include Respontin**
Umeclidinium with vilanterol

**INDICATIONS AND DOSE**

**Maintenance treatment of chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**

- **Adults**: 55 micrograms once daily

**SIDE-EFFECTS**

- **Uncommon**: Arrhythmias, rash, sinusitis, urinary tract infection

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Use with caution in severe impairment.

**PATIENT AND CARER ADVICE**

Patient or carers should be given advice on how to administer umeclidinium inhalation powder.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- **Anoro Ellipta** (GSK) 55 micrograms per dose (single dose)

**Uncommon** Atrial fibrillation, rash, rhythm idioventricular, supraventricular extrasystoles, supraventricular tachycardia, tachycardia

**Frequency not known**

- Angle-closure glaucoma
- Arrhythmias
- Fine tremor (particularly in the hands)
- Hyperglycaemia
- Hypokalaemia
- Paradoxical bronchospasm
- Urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypokalaemia**

Potentially serious hypokalaemia may result from beta agonist therapy.

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**PATIENT AND CARER ADVICE**

Patient or carers should be given advice on how to administer umeclidinium with vilanterol dry powder inhaler.

**BETA₂ AGONISTS (LONG-ACTING)**

**Selective beta₂ agonists**

**CONTRA-INDICATIONS**

Severe pre-eclampsia

**CAUTIONS**

- Arrhythmias
- Cardiovascular disease
- Diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use)
- Hypertension
- Hyperthyroidism
- Hypokalaemia
- Susceptibility to QT-interval prolongation

**CAUTIONS, FURTHER INFORMATION**

**Hypokalaemia**

Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

**INTERACTIONS**

Appendix 1 (sympathomimetics, beta₂). Hypokalaemia may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics.

**SIDE-EFFECTS**

- Angioedema
- Arrhythmias
- Behavioural disturbances
- Collapse
- Fine tremor (particularly in the hands)
- Headache
- Hyperglycaemia (especially when given intravenously)
- Hypersensitivity reactions
- Hypokalaemia (with high doses)
- Hypotension
- Ketoacidosis (especially when given intravenously)
- Muscle cramps
- Myocardial ischaemia
- Nervous tension
- Palpitation
- Paradoxical bronchospasm (occasionally severe)
- Peripheral vasodilation
- Rash
- Sleep disturbances
- Tachycardia
- Urticaria

**PREGNANCY**

Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

**MONITORING REQUIREMENTS**

- In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).

**PATIENT AND CARER ADVICE**

- When used by inhalation, the dose, the frequency, and the maximum number of inhalations in 24 hours of the beta₂
agostin should be stated explicitly to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of β₂-agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers’ instructions on the care and cleansing of inhaler devices.

### Bambuterol hydrochloride

**DRUG ACTION** Bambuterol is a pro-drug of terbutaline.

**INDICATIONS AND DOSE**
- Asthma (patients who have previously tolerated β₂-agonists) OR Other conditions associated with reversible airways obstruction (patients who have previously tolerated β₂-agonists)

**BY MOUTH**
- Adult: 20 mg once daily, dose to be taken at bedtime
- Asthma (patients who have not previously tolerated β₂-agonists) OR Other conditions associated with reversible airways obstruction (patients who have not previously tolerated β₂-agonists)

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAI IMPAIRMENT** Reduce initial dose by half if eGFR less than 50 ml/minute/1.73 m².

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Bambec (AstraZeneca UK Ltd)
  - Bambuterol hydrochloride 10 mg: Bambec 10mg tablets
    - 28 tablet pack £14.46 DT price = £14.46
  - Bambuterol hydrochloride 20 mg: Bambec 20mg tablets
    - 28 tablet pack £15.77 DT price = £15.77

### Formoterol fumarate

(Eformoterol fumarate)

**INDICATIONS AND DOSE**
- Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy
- Nocturnal asthma in patients requiring long-term regular bronchodilator therapy
- Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy
- Chronic asthma in patients who regularly use an inhaled corticosteroid

**BY INHALATION OF POWDER**
- Adult: 20 micrograms twice daily, dose to be increased in more severe airway obstruction; increased to 24 micrograms twice daily

**BY INHALATION OF AEROSOL**
- Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

**Oxis**

**Chronic asthma**

**BY INHALATION OF POWDER**
- Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
- Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

**Chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**
- Adult: 12 micrograms twice daily

**Prophylaxis of exercise-induced bronchospasm**

**BY INHALATION OF POWDER**
- Child 6–17 years: 6–12 micrograms, dose to be taken before exercise
- Adult: 12 micrograms, dose to be taken before exercise

**Chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**
- Adult: 12 micrograms 1–2 times a day (max. per dose 24 micrograms), for symptom relief additional doses up to maximum daily dose can be taken; maximum 48 micrograms per day

**PHARMACOKINETICS**
At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

**Important safety information**

**CHM ADVICE**
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting β₂-agonist (formoterol) should:
- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
Beclometasone with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclometasone dipropionate p. 227, formoterol fumarate p. 220.

INDICATIONS AND DOSE

Asthma maintenance therapy
BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER
Adult: 100/6–200/12 micrograms twice daily; maximum 400/24 micrograms per day

Asthma, maintenance and reliever therapy
BY INHALATION OF AEROSOL
Adult: Maintenance 100/6 micrograms twice daily; 100/6 micrograms as required for relief of symptoms; maximum 800/48 micrograms per day

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted
BY INHALATION OF AEROSOL
Adult: 200/12 micrograms twice daily

Dose equivalence and conversion
For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, Fostair® 100/6 can be prescribed for patients already using beclometasone dipropionate 250 micrograms in another CFC-free inhaler; the dose of Fostair® should be adjusted according to response. For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution, the dose should be adjusted according to response. 1 puff is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

PATIENT AND CARER ADVICE
With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer beclometasone with formoterol inhalation.

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation
CAUTIONARY AND ADVISORY LABELS 8, 10
† Fostair (Chiesi Ltd)
Beclometasone dipropionate 100 microgram per 1 dose, Formoterol fumarate dihydrate 6 microgram per 1 dose Fostair 100micrograms/dose / 6micrograms/dose inhaler | 120 dose (POT) £29.32 DT price = £29.32

Inhalation powder
CAUTIONARY AND ADVISORY LABELS 8, 10
† Fostair NEXThaler (Chiesi Ltd)
Beclometasone dipropionate 100 microgram per 1 dose, Formoterol fumarate dihydrate 6 microgram per 1 dose Fostair NEXThaler 100micrograms/dose / 6micrograms/dose dry powder inhaler | 120 dose (POT) £29.32

Indacaterol

INDICATIONS AND DOSE
Maintenance treatment of chronic obstructive pulmonary disease
BY INHALATION OF POWDER
Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

CAUTIONS
Convulsive disorders
SIDE-EFFECTS
Common or very common Cough · dizziness · nasopharyngitis · oropharyngeal pain · peripheral oedema · rhinorrhea · sinusitis
Uncommon Atrial fibrillation · chest pain · paraesthesia · pruritus
PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Use with caution in severe impairment—no information available.

BREAST FEEDING
Manufacturer advises only if potential benefit outweighs risk.

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder
† Onbrez Breezhaler (Novartis Pharmaceuticals UK Ltd)
Indacaterol (as Indacaterol maleate) 150 microgram Onbrez Breezhaler 150microgram inhalation powder capsules with device | 30 capsule (POT) £29.26 DT price = £29.26
Indacaterol (as Indacaterol maleate) 300 microgram Onbrez Breezhaler 300microgram inhalation powder capsules with device | 30 capsule (POT) £29.26 DT price = £29.26
Olodaterol

INDICATIONS AND DOSE
Maintenance treatment of chronic obstructive pulmonary disease

BY INHALATION
- Adult: 5 micrograms once daily

Dose equivalence and conversion
2 puffs is equivalent to 5 micrograms.

SIDE-EFFECTS
- Uncommon: Dizziness, nasopharyngitis
- Rare: Arthralgia, hypertension

PREGNANCY
Manufacturer advises avoid—no information available.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Use with caution in severe hepatic impairment—no information available.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer olodaterol solution for inhalation.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation
- Striverdi Respimat (Boehringer Ingelheim Ltd)
  Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per 1 dose
  Striverdi Respimat 2.5 micrograms/dose solution for inhalation cartridge with device | 60 dose [POT] £26.35 DT price = £26.35

Salmeterol

INDICATIONS AND DOSE
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)

BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER
- Child 5–11 years: 50 micrograms twice daily
- Child 12–17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
- Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

Chronic obstructive pulmonary disease
BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER
- Adult: 50 micrograms twice daily

PHARMACOKINETICS
At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

UNLICENSED USE
- Neovent® not licensed for use in children under 12 years.

Important safety information
CHM ADVICE
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta_2_ agonist (salmeterol) should:
- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

SIDE-EFFECTS
- Arthralgia, dizziness, nausea

PREGNANCY
Inhaled drugs for asthma can be taken as normal during pregnancy.

BREAST FEEDING
Inhaled drugs for asthma can be taken as normal during breast-feeding.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Salmeterol inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention

Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta_2_ agonist.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation
- SALMETEROL (Non-proprietary)
  Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  Salmeterol 25 micrograms/dose inhaler CFC free | 120 dose [POT] £29.26 DT price = £29.26
  Serevent Evohaler (GlaxoSmithKline UK Ltd)
  Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose
  Serevent 25 micrograms/dose Evohaler | 120 dose [POT] £29.26 DT price = £29.26
  Brands may include Neovent, Vertine

Inhalation powder
- Serevent Accuhaler (GlaxoSmithKline UK Ltd)
  Salmeterol (as Salmeterol xinafoate) 50 microgram per 1 dose
  Serevent 50 micrograms/dose Accuhaler | 60 dose [POT] £29.26 DT price = £29.26

Also available in combination with fluticasone, p. 231

BET_2_ AGONISTS (SHORT-ACTING)

Salbutamol
(Albuterol)

INDICATIONS AND DOSE
Asthma | Other conditions associated with reversible airways obstruction

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 4 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
- Elderly: Initially 2 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: 500 micrograms every 4 hours if required
Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist use only)

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10 micrograms/minute, rate increased gradually according to response to 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

**VENTOLIN ACCUHALER**

**Acute bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 200 micrograms

**SALBUTAMOL**

**Acute bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 200 micrograms

**EASYHALER**

**Acute bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: Initially 200 micrograms, up to 800 micrograms for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 200 micrograms

**ASMASAL CLICKHALER**

**Acute bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 1–2 puffs, up to 4 times daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 1–2 puffs

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

**UNLICENSED USE**
- With oral use: Syrup and tablets not licensed for use in children under 2 years.
- With intravenous use: Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

**CONTRA-INDICATIONS**
- When used for uncomplicated premature labour under specialist supervision: abruptio placenta, antepartum haemorrhage, cord compression, eclampsia, history of cardiac disease, intra-uterine fetal death, intra-uterine infection, placenta praevia, pulmonary hypertension, severe pre-eclampsia.
significant risk factors for myocardial ischaemia • threatened miscarriage

**CAUTIONS**

- With intravenous use mild to moderate pre-eclampsia (when used for uncomplicated premature labour) • suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
Lactic acidosis (with high doses) • nausea

**SPECIFIC SIDE-EFFECTS**
- When used for uncomplicated premature labour bronchospasm • muscle tension • pulmonary oedema • vomiting

**BREATFEEDING**
Inhaled drugs for asthma can be taken as normal during breast-feeding.

**MONITORING REQUIREMENTS**
In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient’s fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).

**DIRECTIONS FOR ADMINISTRATION**
- When used by inhalation For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.
- When used by continuous intravenous infusion For bronchodilation, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. For premature labour, dilute with Glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient’s fluid and electrolyte status essential.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze [www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze](http://www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze)
For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible.
For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **SALBUTAMOL (Non-proprietary)**
  - Salbutamol (as Salbutamol sulfate) 2 mg Salbutamol 2mg tablets | 28 tablet [PSt] £113.05 DT price = £104.95
  - Salbutamol (as Salbutamol sulfate) 4 mg Salbutamol 4mg tablets | 28 tablet [PSt] £115.76 DT price = £107.43

**Modified-release capsule**
CAUTIONARY AND ADVISORY LABELS 25
- Ventmax SR (Chiesi Ltd)
  - Salbutamol (as Salbutamol sulfate) 4 mg Ventmax SR 4mg capsules | 56 capsule [PSt] £8.08 DT price = £8.08

Terbutaline sulfate

**INDICATIONS AND DOSE**

**Asthma | Other conditions associated with reversible airways obstruction**

**BY MOUTH**

- **Adult:** Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth

**BY SUBCUTANEOUS INJECTION OR BY SLOW INTRAVENOUS INJECTION**

- **Adult:** 250–500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**BY CONTINUOUS INTRAVENOUS INFUSION**

- **Adult:** 90–300 micrograms/hour for 8–10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**BY INHALATION OF POWDER**

- **Adult:** 500 micrograms up to 4 times a day, for persistent symptoms

**BY INHALATION OF NEBULISED SOLUTION**

- **Adult:** 5–10 mg 2–4 times a day, additional doses may be necessary in severe acute asthma

**Acute asthma**

**BY SUBCUTANEOUS INJECTION OR BY SLOW INTRAVENOUS INJECTION**

- **Child 2–4 years:** 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

- **Child 5–17 years:** 250–500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**BY CONTINUOUS INTRAVENOUS INFUSION**

- **Child:** Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**Moderate, severe, or life-threatening acute asthma**

**BY INHALATION OF NEBULISED SOLUTION**

- **Child 1 month–4 years:** Initially 5 mg, then 5 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

- **Child 5–11 years:** Initially 5–10 mg, then 5–10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

- **Child 12–17 years:** Initially 10 mg, then 10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

- **Adult:** Initially 10 mg, then 10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

**Exacerbation of reversible airways obstruction (including nocturnal asthma) | Prevention of exercise-induced bronchospasm**

**BY INHALATION OF POWDER**

- **Child 5–17 years:** 500 micrograms up to 4 times a day, for occasional use only

**BY MOUTH**

- **Child 1 month–6 years:** 75 micrograms/kg 3 times a day (max. per dose 2.5 mg)

**Airways disease, obstructive**

- **Child 7–14 years:** 2.5 mg 2–3 times a day

- **Child 15–17 years:** Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day

**Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)**

**BY INTRAVENOUS INFUSION**

- **Adult:** Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

**UNLICENSED USE** Tablets not licensed for use in children under 7 years. Injection not licensed for use in children under 2 years.

**CONTRA-INDICATIONS**

- **When used for uncomplicated premature labour** abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

**CAUTIONS** Mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Nausea

**SPECIFIC SIDE-EFFECTS**

**Respiratory system**

- **Bronchial spasm**

- **Intrigluconic effects**

- **Muscle relaxation**

- **Nausea**

- **Vomiting**

**PREGNANCY**

Inhaled drugs for asthma can be taken as normal during pregnancy.

**BREAST FEEDING**

Inhaled drugs for asthma can be taken as normal during breast-feeding.

**MONITORING REQUIREMENTS**

In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient’s fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).

**DIRECTIONS FOR ADMINISTRATION**

- **When used by inhalation** For nebulisation, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.

- **With intravenous use in children** For continuous intravenous infusion, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.

- **With intravenous use in adults** For bronchodilation by continuous intravenous infusion, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For premature labour by continuous intravenous infusion, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if
Airways disease, use of corticosteroids

Corticosteroids are used for the management of reversible and irreversible airway disease.

Asthma

Inhaled corticosteroids

An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway). An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta, agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the patient has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid. Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary. Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate p. 227, budesonide p. 228, fluticasone p. 230, and mometasone furoate p. 222 appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta<sub>2</sub> agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta<sub>2</sub> agonist for the prophylaxis of asthma, but who are poorly controlled, Symbicort<sup>®</sup> or DuoResp Spiramas<sup>®</sup> (both containing budesonide with formoterol p. 229) can be used as relievers (instead of a short-acting beta<sub>2</sub> agonist), in addition to their regular use for the prophylaxis of asthma. Symbicort<sup>®</sup> can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily, but who are poorly controlled (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. The use of Symbicort<sup>®</sup> for both reliever and maintenance therapy is also used by some specialists in children 12–18 years [unlicensed].

Fostair<sup>®</sup> can also be used in adults as a reliever (instead of a short-acting beta<sub>2</sub> agonist) in addition to its regular use for the prophylaxis of asthma. It may be particularly useful for patients with poorly controlled asthma requiring reliever therapy, or for those who have had previous exacerbations of asthma which needed medical intervention. Patients requiring frequent daily use of Fostair<sup>®</sup> as a reliever should have their maintenance treatment reviewed. This approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta<sub>2</sub> agonists.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta<sub>2</sub> agonist or another long-acting bronchodilator. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Oral corticosteroids

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid
treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

Parenteral corticosteroids

Hydrocortisone p. 583 injection has a role in the emergency treatment of acute severe asthma.

Chronic obstructive pulmonary disease

Inhaled corticosteroids

In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta2 agonist.

Oral corticosteroids

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 585 should be given; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone p. 585 is of no benefit and maintenance treatment is not normally recommended.

Corticosteroids (inhaled)

- **INTERACTIONS**  
  Appendix 1 (corticosteroids). Interactions do not generally apply to corticosteroids used for inhalation unless specified.

- **SIDE-EFFECTS**
  - Very rare  
    - Paradoxical bronchospasm
  - Frequency not known  
    - Adrenal crisis (with prolonged high doses)  
    - Adrenal suppression (with prolonged high doses)  
    - Aggression (particularly in children)  
    - Anxiety  
    - Behavioural changes (particularly in children)  
    - Bruising  
    - Candidiasis of the mouth  
    - Candidiasis of the throat  
    - Catarracts  
    - Coma (with prolonged high doses)  
    - Cushing’s syndrome (with moon face, striae and acne)  
    - Depression  
    - Dysphonia  
    - Glaucoma (with prolonged high doses)  
    - Hoarseness  
    - Hyperactivity (particularly in children)  
    - Hyperglycaemia (usually only with high doses)  
    - Irritability (particularly in children)  
    - Lower respiratory tract infections in older patients with chronic obstructive pulmonary disease (with high doses)  
    - Pneumonia in older patients with chronic obstructive pulmonary disease (with high doses)  
    - Reduced mineral bone density (with long-term treatment of high doses)
  - Side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use
  - Sleep disturbances  
  - Throat irritation

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Candidiasis
    - The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.
  - Paradoxical bronchospasm
    - The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta2 agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).
  - Pregnancy
    - Inhaled drugs for asthma can be taken as normal during pregnancy.
Pressurised inhalation

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

**By inhalation of powder**

- **Child 6-11 years**: 100–400 micrograms twice daily, dose to be adjusted as necessary
- **Child 12-17 years**: 100–800 micrograms twice daily, dose to be adjusted as necessary
- **Adult**: 100–800 micrograms twice daily, dose to be adjusted as necessary

**By inhalation of nebulised suspension**

- **Child 6 months-11 years**: 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day
- **Child 12-17 years**: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day
- **Adult**: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

**Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)**

**By inhalation of powder**

- **Child 6-11 years**: 200–400 micrograms once daily, dose to be given in the evening
- **Child 12-17 years**: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening
- **Adult**: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

- **Adult**: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening
Airways disease, obstructive 229

PULMICORT® RESPULES
Prophylaxis of asthma
BY INHALATION OF NEBULISED SUSPENSION
- Child 3 months-11 years: Initially 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily
- Child 12-17 years: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily
- Adult: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

BUDESONIDE (Non-proprietary)
Prophylaxis of asthma
BY INHALATION OF POWDER
- Adult: 200–800 micrograms twice daily, dose is adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose
BY INHALATION OF POWDER
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

PULMICORT® TURBOHALER
Prophylaxis of asthma
BY INHALATION OF POWDER
- Adult: 100–800 micrograms twice daily, dose to be adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose
BY INHALATION OF POWDER
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

Potency
Dose adjustments may be required for some inhaler devices, see under individual preparations.

Pulmicort® Turbhaler (AstraZeneca UK Ltd)

Budesonide with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, budesonide p. 228, formoterol fumarate p. 220.

INDICATIONS AND DOSE
SYMBICORT 100/6 TURBOHALER®
Asthma, maintenance therapy
BY INHALATION OF POWDER
- Child 6-17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy
BY INHALATION OF POWDER
- Adult: Maintenance 2 puffs daily in 1–2 divided doses; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; max. 8 per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

SYMBICORT 200/6 TURBOHALER®
Asthma maintenance therapy
BY INHALATION OF POWDER
- Child 12-17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy
BY INHALATION OF POWDER
- Adult: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second &lt;50% of predicted
BY INHALATION OF POWDER
- Adult: 2 puffs twice daily

SYMBICORT 400/12 TURBOHALER®
Asthma, maintenance therapy
BY INHALATION OF POWDER
- Child 12-17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1 puff twice daily, increased if necessary up to 2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second &lt;50% of predicted
BY INHALATION OF POWDER
- Adult: 1 puff twice daily

Ciclesonide

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

**CAUTIONARY AND ADVISORY LABELS 8**

- Alvesco (Takeda UK Ltd)
  - Ciclesonide 80 microgram per 1 dose
    - Alvesco 80 inhaler | £32.83 DT price = £32.83
  - Ciclesonide 160 microgram per 1 dose
    - Alvesco 160 inhaler | £38.62 DT price = £38.62

Fluticasone

**INDICATIONS AND DOSE**

Prophylaxis of asthma

**BY INHALATION OF POWDER**

- Child 5–15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- Child 16–17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- Adult: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

**BY INHALATION OF AEROSOL**

- Child 4–15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
- Child 16–17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
- Adult: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist

**SIDE-EFFECTS**

- arthralgia
- dyspepsia

**DIRECTIONS FOR ADMINISTRATION**

Fluticasone nebuliser liquid may be diluted with sterile sodium chloride 0.9%. It is not suitable for use in ultrasonic nebulisers.

**PATIENT AND CARER ADVICE**

With high doses, a steroid card should be supplied. Patient counselling is advised for budesonide with formoterol dry powder inhalation (administration).

Ciclesonide

**INDICATIONS AND DOSE**

Prophylaxis of asthma

**BY INHALATION OF AEROSOL**

- Child 12–17 years: 160 micrograms once daily; reduced to 80 micrograms daily, if control maintained
- Adult: Initially 160 micrograms once daily; reduced to 80 micrograms once daily, if control maintained; increased if necessary up to 320 micrograms twice daily, in severe asthma

**SIDE-EFFECTS**

- Nausea
- Taste disturbance

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer ciclesonide aerosol inhaler.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser liquid**

**CAUTIONARY AND ADVISORY LABELS 8, 10**

- **Flixotide Nebule (GlaxoSmithKline UK Ltd)**
  - Fluticasone propionate 125 microgram per 1 ml Flixotide 125microgram/2ml Nebules | 10 unit dose PPT £3.34
  - Fluticasone propionate 1 microgram per 1 ml Flixotide 2mg/2ml **Nebules | 10 unit dose PPT £37.35**

**Patient and Carer Advice** With high doses, a steroid card should be provided. Patients or carers should be given advice on how to administer fluticasone with formoterol aerosol inhalation.

**Medicinal Forms**

- **Flutiform® 50 micrograms/5 micrograms**
  - **Prophylaxis of asthma**
    - **BY INHALATION OF AEROSOL**
      - Child 5-17 years: 2 puffs twice daily
      - Adult: 2 puffs twice daily
  - **Flutiform® 125 micrograms/5 micrograms**
    - **Prophylaxis of asthma**
      - **BY INHALATION OF AEROSOL**
        - Child 12-17 years: 2 puffs twice daily
        - Adult: 2 puffs twice daily
  - **Flutiform® 250 micrograms/10 micrograms**
    - **Prophylaxis of asthma**
      - **BY INHALATION OF AEROSOL**
        - Adult: 2 puffs twice daily

**Fluticasone with salmeterol**

**INDICATIONS AND DOSE**

**SERETIDE 500 EVOHALER®**

- **Fluticasone propionate 125 microgram per 1 dose, Salmeterol fumarate dihydrate 5 microgram per 1 dose**
  - **Prophylaxis of asthma**
    - **BY INHALATION**
      - Child 5-17 years: 2 puffs twice daily, reduced to 2 puffs once daily, reduce dose if control maintained
      - Adult: 2 puffs twice daily, reduced to 2 puffs once daily, reduce dose if control maintained

**SERETIDE 125 EVOHALER®**

- **Fluticasone propionate 50 microgram per 1 dose, Salmeterol fumarate dihydrate 2.5 microgram per 1 dose**
  - **Prophylaxis of asthma**
    - **BY INHALATION**
      - Child 5-17 years: 2 puffs twice daily
      - Adult: 2 puffs twice daily

**SERETIDE 250 ACCUHALER®**

- **Fluticasone propionate 100 microgram per 1 dose, Salmeterol fumarate dihydrate 5 microgram per 1 dose**
  - **Prophylaxis of asthma**
    - **BY INHALATION**
      - Child 5-17 years: 1 inhalation twice daily, reduced to 1 inhalation daily, reduce dose if control maintained
      - Adult: 1 inhalation twice daily, reduced to 1 inhalation daily, reduce dose if control maintained

**SERETIDE 500 ACCUHALER®**

- **Fluticasone propionate 250 microgram per 1 dose, Salmeterol fumarate dihydrate 12.5 microgram per 1 dose**
  - **Prophylaxis of asthma**
    - **BY INHALATION OF POWDER**
      - Child 5-17 years: 1 inhalation twice daily, reduced to 1 inhalation daily, reduce dose if control maintained
      - Adult: 1 inhalation twice daily, reduced to 1 inhalation daily, reduce dose if control maintained

**Patient and Carer Advice** With preparations containing greater than 100 micrograms fluticasone, a steroid card should be provided. Patients or carers should be given advice on how to administer fluticasone with salmeterol dry powder inhalation and aerosol inhalation.

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2008) that Seretide 500 Accuhaler® is **not** recommended for use within NHS Scotland for chronic obstructive pulmonary disease in patients with a forced expiratory volume in 1 second (FEV1) less than 60% and greater than 50% of the predicted normal value, with significant symptoms despite regular bronchodilator therapy, and a history of repeated exacerbations.

**Medicinal Forms**

- **Fluticasone WITH SALMETEROL (Non-proprietary)**
  - Fluticasone propionate 125 microgram per 1 dose, Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose **Sirdupla**

**BNF 70 Airways disease, obstructive 231**
Fluticasone with vilanterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 230.

INDICATIONS AND DOSE RELVAR ELLIPTA® 92 MICROGRAMS/22 MICROGRAMS Prophylaxis of asthma BY INHALATION OF POWDER

- Adult: 1 inhalation once daily

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted BY INHALATION OF POWDER

- Adult: 1 inhalation once daily RELVAR ELLIPTA® 184 MICROGRAMS/22 MICROGRAMS Prophylaxis of asthma BY INHALATION OF POWDER

- Child 12-17 years: 1 inhalation once daily
- Adult: 1 inhalation once daily

Dose equivalence and conversion

1 inhalation (delivered dose) of fluticasone furoate 92 micrograms once daily is approximately equivalent to fluticasone propionate 250 micrograms twice daily, 1 inhalation (delivered dose) of fluticasone furoate 184 micrograms once daily is approximately equivalent to fluticasone propionate 500 micrograms twice daily.

SIDE-EFFECTS Abdominal pain · back pain

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Max. dose fluticasone furoate 92 micrograms, vilanterol 22 micrograms.

RELVAR ELLIPTA® 184 MICROGRAMS/22 MICROGRAMS Avoid in moderate to severe impairment.

PATIENT AND CARER ADVICE A steroid card should be provided. Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2014) that fluticasone furoate/vilanterol (Relvar Ellipta®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in 1 second (FEV₁) less than 50% of the predicted normal value.

MEDIcularna FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

- Relvar Ellipta (GlaxoSmithKline UK Ltd)
- Fluticasone furoate 92 micrograms per 1 dose, Vilanterol 22 micrograms per 1 dose Relvar Ellipta 92 micrograms/dose / 22 micrograms/dose dry powder inhaler | 30 dose (P&G) £27.80
- Fluticasone furoate 184 micrograms per 1 dose, Vilanterol 22 micrograms per 1 dose Relvar Ellipta 184 micrograms/dose / 22 micrograms/dose dry powder inhaler | 30 dose (P&G) £38.87

Mometasone furoate

INDICATIONS AND DOSE Prophylaxis of asthma BY INHALATION OF POWDER

- Child 12-17 years: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained
- Adult: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained

Prophylaxis of severe asthma BY INHALATION OF POWDER

- Child 12-17 years: Increased if necessary up to 400 micrograms twice daily
- Adult: Increased if necessary up to 400 micrograms twice daily

SIDE-EFFECTS Common or very common Headache

Uncommon Dyspepsia · palpitation · weight gain

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/mometasone-furoate-inhaler-for-asthma-prevention-prophylaxis

Patients or carers should be given advice on how to administer mometasone by inhaler. With high doses, a steroid card should be supplied.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2003) that Asmanex® is restricted for use following failure of first-line inhaled corticosteroids.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

- Asmanex Twisthaler (Merck Sharp & Dohme Ltd)
  - Mometasone furoate 200 micrograms per 1 dose Asmanex 200 micrograms/dose Twisthaler | 30 dose (P&G) £15.70 DT price = £15.70 | 60 dose (P&G) £23.54 DT price = £23.54
  - Mometasone furoate 400 micrograms per 1 dose Asmanex 400 micrograms/dose Twisthaler | 30 dose (P&G) £21.78 DT price = £21.78 | 60 dose (P&G) £36.05 DT price = £36.05
LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonist
The leukotriene receptor antagonists, montelukast below and zafirlukast below, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid. Montelukast below has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Montelukast

INDICATIONS AND DOSE
Prophylaxis of asthma
BY MOUTH
- Child 6 months-5 years: 4 mg once daily, dose to be taken in the evening
- Child 6-14 years: 5 mg once daily, dose to be taken in the evening
- Child 15-17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening
Symptomatic relief of seasonal allergic rhinitis in patients with asthma.
BY MOUTH
- Child 15-17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

INTERACTIONS → Appendix 1 (leukotriene receptor antagonists).

SIDE-EFFECTS
- Common or very common Abdominal pain - headache - hyperkinesia (in young children) - thirst
- Rare Disturbance in attention - increased bleeding tendency - memory impairment - palpitation - tremor
- Very rare Churg-Strauss syndrome - disorientation - erythema multiforme - erythema nodosum - hallucinations - hepatic disorders - hepatic eosinophilic infiltration - suicidal behaviour - suicidal thoughts

SIDE-EFFECTS, FURTHER INFORMATION
Churg-Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

PREGNANCY
Manufacturer advises avoid unless essential.
There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

Bronchial asthma who are also receiving high doses of other drugs.

BREAST FEEDING
Manufacturer advises avoid unless essential.

DIRECTIONS FOR ADMINISTRATION
Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of chewable tablet formulations may include cherry.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-for-asthma Patients or carers should be given advice on how to administer montelukast granules.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2007) that Singulair® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® chewable tablets should be initiated by a specialist in paediatric asthma.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- MONTELUKAST (Non-proprietary)
  Montelukast (as Montelukast sodium) 10 mg Montelukast 10 mg tablets | 28 tablet £26.97 DT price = £2.20
  Singulair (Merck Sharp & Dohme Ltd) Montelukast (as Montelukast sodium) 10 mg Singulair 10 mg tablets | 28 tablet £26.97 DT price = £2.20

Chewable tablet
CAUTIONARY AND ADVISORY LABELS 23, 24 EXCipients: May contain Aspartame
- MONTELUKAST (Non-proprietary)
  Montelukast (as Montelukast sodium) 4 mg Montelukast 4 mg chewable tablets sugar free (sugar-free) | 28 tablet £25.69 DT price = £1.90
  Montelukast (as Montelukast sodium) 5 mg Montelukast 5 mg chewable tablets sugar free (sugar-free) | 28 tablet £25.69 DT price = £2.18
  Singulair (Merck Sharp & Dohme Ltd) Montelukast (as Montelukast sodium) 4 mg Singulair Paediatric 4 mg chewable tablets (sugar-free) | 28 tablet £25.69 DT price = £1.90
  Montelukast (as Montelukast sodium) 5 mg Singulair Paediatric 5 mg chewable tablets (sugar-free) | 28 tablet £25.69 DT price = £2.18

Granules
- MONTELUKAST (Non-proprietary)
  Montelukast (as Montelukast sodium) 4 mg Montelukast 4 mg granules sachets sugar free (sugar-free) | 28 sachet £4.25–£24.41 DT price = £4.25
  Singulair (Merck Sharp & Dohme Ltd) Montelukast (as Montelukast sodium) 4 mg Singulair Paediatric 4 mg granules sachets (sugar-free) | 28 sachet £25.69 DT price = £4.25

Zafirlukast

INDICATIONS AND DOSE
Prophylaxis of asthma
BY MOUTH
- Child 12-17 years: 20 mg twice daily
- Adult: 20 mg twice daily

CAUTIONS
Elderly

INTERACTIONS → Appendix 1 (leukotriene receptor antagonists).
**Respiratory system**

**Dose frequency is adjusted according to response but is in practice, it is difficult to predict who will benefit; they may be of value in asthma with an allergic basis, but, nedocromil sodium below is not completely understood.**

**The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood.**

**Respiratory system**

**Side-effects, further information**

**Hepatic disorder** Patients or their carers should be told how to recognise development of liver disorder and advised to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise, or jaundice develop.

**Churg-Strauss syndrome** has occurred very rarely in association with the use of zafirlukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

**Pregnancy** Manufacturer advises use only if potential benefit outweighs risk. There is limited evidence for the safe use of zafirlukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

**Breast feeding** Present in milk—manufacturer advises avoid.

**Hepatic impairment** Manufacturer advises avoid.

**Renal impairment** Manufacturer advises caution in moderate to severe impairment.

**Patient and carer advice**

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Aurocote** (AstraZeneca UK Ltd)
  - Zafirlukast 20 mg: Accolate 20mg tablets. Price £17.75
  - DT price = £94.94

**MAST CELL STABILISERS**

**Cromoglicate and related therapy**

The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5–12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate below and nedocromil sodium below may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.

**Nedocromil sodium**

**Indications and dose**

**Prophylaxis of asthma**

- **By inhalation of aerosol**
  - Child 5–17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily
  - Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

**Dose equivalence and conversion**

- 2 puffs = 4 mg

**Unlicensed use**

Not licensed for use in children under 6 years.

**Side-effects**

- **Common or very common** Abdominal pain · dyspepsia · nausea · pharyngitis · vomiting
  - Rare: Taste disturbances
  - Frequency not known: Bronchospasm · cough · nausea · pharyngitis · vomiting

**Side-effects, further information**

**Paradoxical bronchospasm** If paradoxical bronchospasm occurs, a short-acting beta agonist such as salbutamol or terbutaline should be used to control symptoms; treatment with nedocromil should be discontinued.

**Pregnancy** Inhaled drugs can be taken as normal during pregnancy.

**Breast feeding** Inhaled drugs can be taken as normal during breast-feeding.

**Treatment cessation** Withdrawal should be done gradually over a period of one week—symptoms of asthma may recur.

**Prescribing and dispensing information**

Flavours of inhalers may include mint.

**Patient and carer advice**

Patient counselling is advised for Nedocromil aerosol for inhalation (administration).

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

- **Tilade** (Sanofi)
  - Nedocromil sodium 2 mg per 1 dose
  - Tilade 2mg/dose inhaler CFC free | 112 dose £39.94

**Sodium cromoglicate**

(Sodium cromoglicate)

**Indications and dose**

**Prophylaxis of asthma**

- **By inhalation of aerosol**
  - Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
  - Adult: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
Food allergy (in conjunction with dietary restriction)

**BY MOUTH**
- Child 2-13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Child 14-17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
- Adult: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

**DIRECTIONS FOR ADMINISTRATION**

**TREATMENT CESSATION**

When used by inhalation Withdrawal of sodium cromoglicate should be done gradually over a period of one week—symptoms of asthma may recur.

**BREAST FEEDING**

- Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.
- Not known to be harmful. Inhaled drugs can be taken as normal during breast-feeding.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Common or very common Abdominal pain · arthralgia · headache · injection-site reactions · pruritis · sinusitis · upper respiratory tract infection
- Uncommon Bronchospasm · cough · diarrhoea · dizziness · drowsiness · dyspepsia · flushing · influenza-like illness · malaise · nausea · paraesthesia · pharyngitis · photosensitivity · postural hypotension · pruritus · rash · syncope · urticaria · weight gain
- Rare Angioedema · antibody formation · laryngoedema · parasitic infection

**SIDE-EFFECTS**

- Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

**INDICATIONS AND DOSE**

**Prophylaxis of severe persistent allergic asthma**

**BY SUBCUTANEOUS INJECTION**

- Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

**Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment**

**BY SUBCUTANEOUS INJECTION**

- Adult: 300 mg every 4 weeks

**CAUTIONS**

- Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

**MEDICINAL FORMS**

- Inhaled: 200 mg pressurized inhalation

**CAUTIONARY AND ADVISORY LABELS 22**

- Nalcrom (Sanofi)
  - Sodium cromoglicate 100 mg Nalcrom 100mg capsules | 100 capsule pack £41.14 OT price = £41.14

- Intal (Sanofi)
  - Sodium cromoglicate 5 mg per 1 dose Intal 5mg/dose inhaler CFC free | 122 dose pack £18.33

**MONOCLONAL ANTIBODIES**

**Omalizumab**

**INDICATIONS AND DOSE**

**Prophylaxis of severe persistent allergic asthma**

**BY SUBCUTANEOUS INJECTION**

- Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

**Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment**

**BY SUBCUTANEOUS INJECTION**

- Adult: 300 mg every 4 weeks

**CAUTIONS**

- Autoimmune disease · susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

**SIDE-EFFECTS**

- Common or very common Abdominal pain · arthralgia · headache · injection-site reactions · pruritis · sinusitis · upper respiratory tract infection
- Uncommon Bronchospasm · cough · diarrhoea · dizziness · drowsiness · dyspepsia · flushing · influenza-like illness · malaise · nausea · paraesthesia · pharyngitis · photosensitivity · postural hypotension · pruritus · rash · syncope · urticaria · weight gain
- Rare Angioedema · antibody formation · laryngoedema · parasitic infection

**SIDE-EFFECTS, FURTHER INFORMATION**

**Churg-Strauss syndrome**

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

**Hypersensitivity reactions**

Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

**PREGNANCY**

- Manufacturer advises avoid unless essential—crosses the placenta.

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution—no information available.

**RENAL IMPAIRMENT**

- Manufacturer advises caution—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339

- Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:
  - the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,
  - the patient’s condition has not responded to standard treatment with H1-antihistamines and leukotriene receptor antagonists,
  - omalizumab is stopped at or before the fourth dose if the condition has not responded,
Respiratory system

CONTRA-INDICATIONS

- Roflumilast
- **PHOSPHODIESTERASE TYPE-4 INHIBITORS**

Omalizumab for severe persistent allergic asthma (April 2013) NICE TA278

Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 12 years or older.

- who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and
- only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.

Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA278

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Xolair** (Novartis Pharmaceuticals UK Ltd)
      - Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection POM £256.15
      - Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection POM £128.07

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Roflumilast

- **DRUG ACTION**
  - Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties.

INDICATIONS AND DOSE

Adjuvant to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations

BY MOUTH

- Adult: 500 micrograms once daily

CONTRA-INDICATIONS

- Cancer (except basal cell carcinoma) - concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids) - history of depression associated with suicidal ideation or behaviour - moderate to severe cardiac failure - severe acute infectious disease - severe immunological disease

- **CAUTIONS**
  - History of psychiatric illness (discontinue if new or worsening psychiatric symptoms occur) - latent infection (such as tuberculosis, viral hepatitis, herpes infection)

- **INTERACTIONS**
  - Caution with concomitant use of drugs likely to cause psychiatric events (discontinue if new or worsening psychiatric symptoms occur).

Appendix 1 (roflumilast).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - decreased appetite - diarrhoea - headache - insomnia - nausea - weight loss
  - **Uncommon** Anxiety - back pain - dizziness - dyspepsia - gastritis - gastro-oesophageal reflux - malaise - muscle spasm - myalgia - palpititation - rash - tremor - vertigo - vomiting
  - **Rare** Constipation - depression - gynaecomastia - haematochezia - nervousness - raised creatine kinase - respiratory tract infections - suicidal behaviour - suicidal ideation - taste disturbances - urticaria

- **CONCEPTION AND CONTRACEPTION**
  - Women of child-bearing age should use effective contraception.

- **PREGNANCY**
  - Manufacturer advises avoidance—毒性 in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoidance—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Caution in mild impairment. Avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor body-weight.

- **PATIENT AND CARER ADVICE**
  - Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Roflumilast for the management of severe chronic obstructive pulmonary disease (January 2012) NICE TA244
      - Roflumilast is recommended only in the context of research as part of a clinical trial for adults with severe chronic obstructive pulmonary disease associated with chronic bronchitis with a history of frequent exacerbations as an add-on to bronchodilator treatment.
      - Patients receiving roflumilast should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA244

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Daxas** (Takeda UK Ltd)

SYMPATHOMIMETICS (VASOCONSTRICTOR)

Ephedrine hydrochloride

- **INDICATIONS AND DOSE**
  - Reversible airways obstruction
    - **BY MOUTH**
      - Adult: 15–60 mg 3 times a day
      - Neuropathic oedema
        - **BY MOUTH**
          - Adult: 30–60 mg 3 times a day
Reversal of hypotension from spinal or epidural anaesthesia by slow intravenous injection
- Adult: 3–6 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/mL; maximum 30 mg per course

- **UNLICENSED USE** Not licensed for neuropathic oedema.

- **CAUTIONS**
  - **GENERAL CAUTIONS** Diabetes mellitus - elderly - hypertension - hyperthyroidism - ischaemic heart disease - prostatic hypertrophy (risk of acute urinary retention)
  - **SPECIFIC CAUTIONS**
    - With intravenous use: susceptibility to angle-closure glaucoma
    - **INTERACTIONS** Appendix 1 (sympathomimetcs).
  - **SIDE-EFFECTS**
    - **Common or very common**
    - With oral use: anxiety - arrhythmias - insomnia - restlessness - tachycardia - tremor
  - **Very rare**
    - With intravenous use: angle-closure glaucoma
    - Frequency not known
    - With intravenous use: bradycardia
    - With oral use: cold extremities - dry mouth
    - With systemic use: increased lacrimation (can have adverse effects on contact lens wear)

- **PREGNANCY** Increased fetal heart rate reported with parenteral ephedrine.
  - With oral use: Manufacturer advises avoid
  - **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
  - **RENAL IMPAIRMENT** Use with caution.
  - **LESS SUITABLE FOR PRESCRIBING** Ephedrine tablets are less suitable and less safe for use as a bronchodilator than the selective beta2 agonists.
  - **EXCEPTIONS TO LEGAL CATEGORY** For exceptions relating to ephedrine tablets see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution

### Tablet
- **EPHEDRINE HYDROCHLORIDE** (Non-proprietary)
  - Ephedrine hydrochloride 15 mg Ephedrine hydrochloride 15 mg tablets | 28 tablet £15.86-£16.38 DT price = £15.86
  - Ephedrine hydrochloride 30 mg Ephedrine hydrochloride 30 mg tablets | 28 tablet £24.87-£25.43 DT price = £24.87

### Solution for injection
- **EPHEDRINE HYDROCHLORIDE** (Non-proprietary)
  - Ephedrine hydrochloride 3 mg per 1 mL Ephedrine hydrochloride 3 mg/10 mL solution for injection ampoules | 10 ampoule £63.38
  - Ephedrine 30 mg/10 mL solution for injection pre-filled syringes | 1 pre-filled disposable injection £7.59 | 12 pre-filled disposable injection £8.86 no price available
  - Ephedrine hydrochloride 30 mg per 1 mL Ephedrine 30 mg/1 mL solution for injection ampoules | 10 ampoule £4.10

### XANTHINES

#### Aminophylline

### INDICATIONS AND DOSE

#### Severe acute asthma by intravenous infusion
- Child: 5 mg/kg/hour, adjusted according to plasma-theophylline concentration
- Elderly: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

#### Severe acute exacerbation of chronic obstructive pulmonary disease by intravenous infusion
- Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

#### Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline by slow intravenous injection
- Adult: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion
- Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

#### Chronic asthma by mouth using modified-release medicines
- Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

#### Reversible airway obstruction by mouth using modified-release medicines
- Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

#### PHYLLOCONTIN CONTINUS® FORTE

#### Reversible airways obstruction | Severe acute asthma by mouth using modified-release medicines
- Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

### Dose adjustments due to interactions
Dose adjustment may be necessary if smoking started or stopped during treatment.

### Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

#### Pharmacokinetics
Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the continued
Airways disease, obstructive

Half-life of aminophylline is important because the toxic dose is close to the therapeutic dose.

- **UNLICENSED USE** Aminophylline injection not licensed for use in children under 6 months.
- **CAUTIONS** Arrhythmias following rapid intravenous injection - cardiac arrhythmias or other cardiac disease - elderly (increased plasma-theophylline concentration) - epilepsy - fever - hypertension - hyperthyroidism - peptic ulcer - risk of hypokalaemia
- **INTERACTIONS** → Appendix 1 (aminophylline).
- **SIDE-EFFECTS** Arrhythmias (especially if given rapidly by intravenous injection) - CNS stimulation - convulsions (especially if given rapidly by intravenous injection) - diarrhoea - gastric irritation - headache - hypotension (especially if given rapidly by intravenous injection) - insomnia - nausea - palpitation - tachycardia - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypokalaemia** Potentially serious hypokalaemia may result from beta agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

**Overdose** Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1123.

- **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis
- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **MONITORING REQUIREMENTS**
  - Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations. Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to children who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity. In most individuals, a plasma-theophylline concentration of 5–10 mg/litre is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
  - If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
  - Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For intravenous infusion, dilute to a concentration of 1 mg/ml with Glucose 5% or Sodium Chloride 0.9%.
  - With intravenous use in adults For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%. For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
  - With intramuscular use Aminophylline is too irritant for intramuscular use.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.
  - Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.
  - Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.
  - **Phylocontin Continus®** Forte tablets are for smokers and other patients where theophylline half-life is shorter.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, suppository
  - **Modified-release tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 25

**Reversible airways obstruction | Chronic asthma**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Adult:** 250–500 mg every 12 hours

**PHARMACOKINETICS**

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose.

- **CAUTIONS** Cardiac arrhythmias or other cardiac disease • elderly (increased plasma-theophylline concentration) • epilepsy • fever • hypertension • hyperthyroidism • peptic ulcer - risk of hypokalaemia
- **INTERACTIONS** Appendix 1 (theophylline).
- **SIDE-EFFECTS** Arrhythmias • CNS stimulation • convulsions • diarrhoea • gastric irritation • headache • insomnia • nauseae • palpitation • tachycardia • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypokalaemia** Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

**Overdose** Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemeses, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly. For details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1123.

- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **MONITORING REQUIREMENTS**
  - In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10-20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
  - Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

**DIRECTIONS FOR ADMINISTRATION**

**SLO-PHYLLIN®** Swallow whole with fluid or swallow enclosed granules with soft food (e.g. yoghurt). Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION** The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

**PATIENT AND CARER ADVICE**

**SLO-PHYLLIN®** Patient or carer should be given advice on how to administer theophylline modified release capsules.

● HYPERTONIC SODIUM CHLORIDE SOLUTIONS

INDICATIONS AND DOSE
MUCOCLEAR® 3%
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)
BY INHALATION OF NEBULISED SOLUTION

Adult: 4 ml 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment to reduce the risk of these adverse effects

Mucoclear 3% inhalation solution 4ml ampoules (Pari Medical Ltd) | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part IXa) | 60 ampoule • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

INDICATIONS AND DOSE
MUCOCLEAR® 6%
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)
BY INHALATION OF NEBULISED SOLUTION

Adult: 4 ml twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment to reduce the risk of these adverse effects

Mucoclear 6% inhalation solution 4ml ampoules (Pari Medical Ltd) | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part IXa) | 60 ampoule • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

INDICATIONS AND DOSE
NEBUSAL®
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)
BY INHALATION OF NEBULISED SOLUTION

Adult: up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment to reduce the risk of these adverse effects

Nebusal 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) | 60 vial • NHS indicative price = £27.00 • Drug Tariff (Part IXa)

Peak flow meters

● LOW RANGE PEAK FLOW METERS
Compliant to standard EN ISO 23747:2007 except for scale range.

MEDI® LOW RANGE
Range 40–420 litres/minute.

Medi peak flow meter low range (Medicareplus International Ltd) | 1 device • NHS indicative price = £6.50 • Drug Tariff (Part IXa) price = £6.50

2 Allergic conditions

**Antihistamines, allergen immunotherapy and allergic emergencies**

**Antihistamines**

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin. Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 245 or promethazine hydrochloride p. 251 are used as an adjunct to adrenaline/epinephrine p. 136 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 342, cyclizine p. 343, and promethazine teoclolate p. 252) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartrate p. 243 and promethazine may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, 'sedating' antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 243, bilastine p. 244, cetirizine hydrochloride p. 244, desloratadine p. 247 (an active metabolite of loratadine p. 250), fexofenadine hydrochloride p. 247 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 249 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

**Allergen immunotherapy**

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax\textsuperscript{®}) is also licensed for disease-modifying treatment of grass pollen–induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 235 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta, agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H\textsubscript{1} antihistamine treatment.
Allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Treatment of anaphylaxis

Adrenaline/epinephrine p. 196 provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

First-line treatment includes:
- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by intramuscular injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for immediate self-administration); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow oxygen and intravenous fluids is also of primary importance;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection is a useful adjunctive treatment, given after adrenaline.
- Administering an intravenous corticosteroid such as hydrocortisone p. 583 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 222, inhaled ipratropium bromide p. 217, intravenous aminophylline p. 237, or intravenous magnesium sulfate p. 858 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately.

On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

Intramuscular adrenaline (epinephrine)

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

ª These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.

¹ Use suitable syringe for measuring small volume
² 300 micrograms (0.3 mL) if child is small or prepubertal

intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine p. 196 should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by slow intravenous injection repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a slow intravenous infusion stopping when a response has been obtained.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for cardiac resuscitation.

Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under Anaphylaxis; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.
Hereditary angioedema

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 255, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 255 and icatibant p. 255 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 95 and danazol p. 636 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

ANTIHISTAMINES

Acrivastine

INDICATIONS AND DOSE

Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria

BY MOUTH

- Child 12–17 years: 8 mg 3 times a day
- Adult: 8 mg 3 times a day

- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe) - elderly
- CAUTIONS Epididymitis
- INTERACTIONS - Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.
- SIDE-EFFECTS
  - Uncommon Antimuscarinic effects - gastro-intestinal disturbances - headache - psychomotor impairment
  - Rare Anaphylaxis - angioedema - angle-closure glaucoma (in adults) - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor - Frequency not known Blurred vision - drowsiness - dry mouth - urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment. Children and the elderly are more susceptible to side-effects.

- ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to triprolidine.
- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- BREASTFEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- RENAL IMPAIRMENT Avoid in severe impairment.
- PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); excess alcohol should be avoided.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

- Benadryl Allergy Relief (McNeil Products Ltd)
  Acrivastine 8 mg Benadryl Allergy Relief 8mg capsules
  12 capsule £2.91 OT price £2.91 | 24 capsule £4.95

Alimemazine tartrate (Trimepazine tartrate)

INDICATIONS AND DOSE

Urticaria | Pruritus

BY MOUTH

- Child 2–4 years: 2.5 mg 3–4 times a day
- Child 5–11 years: 5 mg 3–4 times a day
- Child 12–17 years: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- Adult: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- Elderly: 10 mg 1–2 times a day

- CONTRA-INDICATIONS Epilepsy - hepatic dysfunction - history of narrow angle glaucoma - hypothyroidism - many antihistamines should be avoided in Acute porphyrias p. 864 but alimemazine is thought to be safe - myasthenia gravis - parkinson’s disease - phaeochromocytoma - prostatic hypertrophy - renal dysfunction
- CAUTIONS Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) - elderly - exposure to sunlight should be avoided during treatment with high doses - pyloroduodenal obstruction - urinary retention - volume depleted patients who are more susceptible to orthostatic hypotension

- INTERACTIONS - Appendix 1 (antihistamines).
- SIDE-EFFECTS
  - Rare Anaphylaxis - angioedema - bronchospasm - hypersensitivity reactions
  - Frequency not known Acute dystonia - agitation - agranulocytosis - akathisia - akinesia - angle-closure glaucoma - anti-muscarinic effects - arrhythmias (may be predisposed by hypokalaemia and cardiac disease) - blurred vision - contact sensitisation - convulsions - drowsiness - dry mouth - dyskinesia - gastro-intestinal disturbances - headache - hyperprolactinamia - hypotension - insomnia - jaundice - leukopenia (on prolonged high dose) - nasal stuffiness - neuroleptic malignant syndrome - ocular changes - paller (in children) - paradoxical excitement - parkinsonism - photosensitivity - postural hypotension (in elderly) - postural hypotension (in volume depletion) - rashes - respiratory depression - rigidity - tardive dyskinesia (usually after prolonged high doses) - tremor - urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight. Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days.
of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Avoid in severe liver disease—increased risk of coma.

- **INTERACTIONS** Avoid in Acute porphyrias.

- **CAUTIONS** Avoid in severe liver disease.

### Bilastine

**INDICATIONS AND DOSE**
Symptomatic relief of allergic rhinoconjunctivitis and urticaria

**BY MOUTH**
- Child 12–17 years: 20 mg once daily
- Adult: 20 mg once daily

**CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe)

**CAUTIONS** Epilepsy

**INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**SIDE-EFFECTS**
- **Common or very common** Headache - malaise
- **Uncommon** Abdominal pain - anxiety - diarrhoea - dizziness - dyspnoea - gastritis - increased appetite - insomnia - oral herpes - prolongation of the QT interval - pyrexia - thirst - tinnitus - vertigo - weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**
Children and the elderly are more susceptible to side-effects. Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

- **PREGNANCY** Avoid—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING** Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**DIRECTIONS FOR ADMINISTRATION** Take tablet 1 hour before or 2 hours after food or fruit juice.

**PATIENT AND CARER ADVICE** Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided. Patients or carers should be given advice on how to administer bilastine tablets.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Fexofenadine hydrochloride**

**INDICATIONS AND DOSE**  
Symptomatic relief of seasonal allergic rhinitis

**BY MOUTH**  
- Child 6-11 years: 30 mg twice daily  
- Child 12-17 years: 120 mg once daily  
- Adult: 120 mg once daily

**Symptomatic relief of chronic idiopathic urticaria**

**BY MOUTH**  
- Child 12-17 years: 180 mg once daily  
- Adult: 180 mg once daily

**PHARMACOKINETICS**  
Fexofenadine is a metabolite of terfenadine.

- **CAUTIONS** Epilepsy
- **INTERACTIONS** → Appendix 1 (antihistamines).  
  Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

- **SIDE-EFFECTS**
  - **Uncommon** Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
  - **Rare** Anaphylaxis - angioedema - angle-closure glaucoma (in adults) - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - myalgia - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor
  - **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**  
Children and the elderly are more susceptible to side-effects.  
Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.  
If drowsiness occurs, it may diminish after a few days of treatment.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
Hydroxyzine hydrochloride

INDICATIONS AND DOSE
Pruritus
BY MOUTH
- Child 1-5 years: Initially 5–15 mg once daily, dose to be taken at night, increased if necessary to 50 mg daily in 3–4 divided doses
- Child 6-11 years: Initially 15–25 mg once daily, dose to be taken at night, increased if necessary to 50–100 mg daily in 3–4 divided doses
- Child 12-17 years: Initially 25 mg once daily, dose to be taken at night, increased if necessary to 100 mg daily in 3–4 divided doses
- Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day

Important safety information
HYDROXYZINE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTE (APRIL 2015)
Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and Torsade de Pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia.
To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:
- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
- Consider the risks of QT-interval prolongation and Torsade de Pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In adults, the maximum daily dose is 100 mg;
- In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- The lowest effective dose for the shortest period of time should be prescribed.

CONTRA-INDICATIONS
Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe)

CAUTIONS
Epilepsy - prostatic hypertrophy - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - susceptibility to QT interval prolongation - urination retention

INTERACTIONS • Appendix 1 (antihistamines).

SIDE-EFFECTS
> Rare Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor
> Frequency not known Antimuscarinic effects - blurring vision - drowsiness - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urination retention

SIDE-EFFECTS, FURTHER INFORMATION
Children and the elderly are more susceptible to side-effects.
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING
Manufacturer advises avoid. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT
Reduce daily dose by one-third. Avoid in severe liver disease—increased risk of coma.

RENAL IMPAIRMENT
Reduce daily dose by half.

PATIENT AND CARER ADVICE
Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Ketotifen

INDICATIONS AND DOSE
Allergic rhinitis
BY MOUTH
- Child 3-17 years: 1 mg twice daily
- Adult: 1 mg twice daily, increased if necessary to 2 mg twice daily, to be taken with food

Allergic rhinitis in readily sedated patients
BY MOUTH
- Adult: Initially 0.5–1 mg once daily, dose to be taken at night

CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe).

CAUTIONS Epilepsy - prostatic hypertrophy - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention

INTERACTIONS Appendix 1 (antihistamines).
Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

SIDE-EFFECTS
- Common or very common Excitation (in adults) - irritability - nervousness
- Uncommon Cystitis
- Rare Weight gain
- Very rare Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION
Children and the elderly are even more susceptible to side effects.
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT Avoid in severe liver disease—increased risk of coma.

PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet

Levocetirizine hydrochloride

INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever, urticaria
BY MOUTH
- Child 6-17 years: 5 mg once daily
- Adult: 5 mg once daily

PHARMACOKINETICS
Levocetirizine is an isomer of cetirizine.

CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe).

CAUTIONS Epilepsy

INTERACTIONS Appendix 1 (antihistamines).
Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

SIDE-EFFECTS
- Uncommon Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
- Rare Anaphylaxis - angioedema - angle-closure glaucoma (in adults) - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor
- Very rare Weight gain
- Frequency not known Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION
Children and the elderly are more susceptible to side-effects. Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

RENAL IMPAIRMENT
- In adults 5 mg on alternate days if eGFR 30–50 mL/minute/1.73 m². 5 mg every 3 days if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- In children Reduce dose frequency to alternate days if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Reduce dose frequency to every 3 days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
**Loratadine**

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria  
**BY MOUTH**  
- Child 2-11 years (body-weight up to 30 kg): 5 mg once daily  
- Child 2-11 years (body-weight 30 kg and above): 10 mg once daily  
- Child 12-17 years: 10 mg once daily  
- Adult: 10 mg once daily

- **CAUTIONS** Acute porphyria p. 864 • epilepsy
- **INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines used for topical action (including inhalation).
- **SIDE-EFFECTS**  
  - **Common** Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - Headache - psychomotor impairment - urinary retention  
  - **Rare** Anaphylaxis - angioedema - angle-closure glaucoma (in adults) • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • palpitation • photosensitivity reactions • rashes • sleep disturbances • tremor
- **Frequency not known** Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION
Children and elderly are more susceptible to side-effects. Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment.

Promethazine hydrochloride

INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus
BY MOUTH
> Child 2-4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
> Child 5-9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
> Child 10-17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily
> Adult: 20–25 mg 2–3 times a day

BY DEEP INTRAMUSCULAR INJECTION
> Adult: 25–50 mg (max. per dose 100 mg)

Emergency treatment of anaphylactic reactions
BY SLOW INTRAVENOUS INJECTION
> Adult: 25–50 mg, to be administered as a solution containing 2.5 mg/mL in water for injections; maximum 100 mg per course

Sedation (short-term use)
BY MOUTH
> Child 2-4 years: 15–20 mg
> Child 5-9 years: 20–25 mg
> Child 10-17 years: 25–50 mg
> Adult: 25–50 mg

BY DEEP INTRAMUSCULAR INJECTION
> Adult: 25–50 mg

Nausea | Vomiting | Vertigo | Labyrinthine disorders | Motion sickness
BY MOUTH
> Child 2-4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
> Child 5-9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
> Child 10-17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
> Adult: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

Important safety information
MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009)
OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- CONTRA-INDICATIONS
  Many antihistamines should be avoided in Acute porphyrias p. 864 but promethazine is thought to be safe.

- CAUTIONS
  GENERAL CAUTIONS
  Epilepsy | prostatic hypertrophy | pyloroduodenal obstruction | severe coronary artery disease | susceptibility to angle-closure glaucoma | urinary retention

SPECIFIC CAUTIONS
> With intravenous use avoid extravasation with intravenous injection

- INTERACTIONS
  > Appendix 1 (antihistamines).

- SIDE-EFFECTS
  GENERAL SIDE-EFFECTS
  > Rare Anaphylaxis | angioedema | angle-closure glaucoma | arrhythmias | blood disorders | bronchospasm | confusion | convulsions | depression | dizziness | extrapyramidal effects | hypersensitivity reactions | hypotension | liver dysfunction | palpitation | photosensitivity reactions | rashes | sleep disturbances | tremor
  > Frequency not known Antimuscarinic effects | blurred vision | drowsiness | dry mouth | gastro-intestinal disturbances | headache | psychomotor impairment | restlessness | urinary retention

Bee venom extract

INDICATIONS AND DOSE
Hypersensitivity to bee venom
BY SUBCUTANEOUS INJECTION
▶ Adult: (consult product literature)

Important safety information
MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009)
OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

▶ CAUTIONS Acute porphyrias p. 864 · asthma · bronchiectasis · bronchitis · epilepsy · prostatic hypertrophy · pyloroduodenal obstruction · Reye’s syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

▶ INTERACTIONS ▶ Appendix 1 (antihistamines).

▶ SIDE-EFFECTS

GENERAL SIDE-EFFECTS
▶ Rare Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor

▶ Frequency not known Antimuscarinic effects · blurred vision · drowsiness · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · restlessness · urinary retention

SPECIFIC SIDE-EFFECTS
▶ With intramuscular use injection pain
symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

- **PREGNANCY** Avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.
- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - Pharmalgen for bee and wasp venom allergy (February 2012)
  - NICE TA246

  Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:
  - a severe systemic reaction to bee or wasp venom;
  - a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

  Treatment with Pharmalgen® should be initiated and monitored in a specialist centre experienced in venom immunotherapy. www.nice.org.uk/TA246

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **BEE VENOM EXTRACT (Non-proprietary)**
  - Bee venom 1.2 microgram powder and solvent for solution for injection vials | 1 vial £80 no price available
  - Bee venom 12 microgram powder and solvent for solution for injection vials | 1 vial £80 no price available

  - Bee venom 120 nano gram powder and solvent for solution for injection vials | 1 vial no price available

Grass pollen extract

**INDICATIONS AND DOSE**

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature)

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

**BY MOUTH**

- Adult: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

- **DESENSITISING VACCINES**

  In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
  - Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
  - Hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).
- **SIDE-EFFECTS**

  **SIDE-EFFECTS, FURTHER INFORMATION**

  Consult product literature.

  **Hypersensitivity reactions** Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

  - **PREGNANCY** Should be avoided in pregnant women—consult product literature.

- **MONITORING REQUIREMENTS** The first dose of grass pollen extract should be (Grazax®) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer oral lyophilisates.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral Lyophilisate**

- Grazax (ALK-Abello Ltd)
  - Pollinex Grasses + Rye (Allergy Therapeutics (UK) Ltd)

**Injection**

- Pollinex Grasses + Rye suspension for injection treatment and extension course vials | 4 vial £450.00

Tree pollen extract

**INDICATIONS AND DOSE**

Treatment of seasonal allergic hay fever due to tree pollen in patients who have failed to respond to anti-allergy drugs

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature)

**MEDICINAL FORMS**

- **Oral Lyophilisate**
  - Grazax (ALK-Abello Ltd)
  - Pollinex Grasses + Rye suspension for injection treatment and extension course vials | 4 vial £450.00

**Important safety information**

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
Respiratory system

CONTRA-INDICATIONS
Consult product literature

CAUTIONS
Consult product literature

INTERACTIONS
Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION
Consult product literature.

Hypersensitivity reactions
Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

PREGNANCY
Avoid.

PRESCRIBING AND DISPENSING INFORMATION
Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hypo sensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Pharmalgen for bee and wasp venom allergy (February 2012) NICE TA246 Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with Pharmalgen® should be initiated and monitored in a specialist centre experienced in venom immunotherapy. www.nice.org.uk/TA246

2.1 Angioedema

Drugs used for Angioedema not listed below;
Adrenaline/epinephrine, p. 196
COMPLEMENT BLOCKERS

C1-esterase inhibitor

INDICATIONS AND DOSE

CINRYZE®
Acute attacks of hereditary angioedema (under expert supervision)
BY SLOW INTRAVENOUS INJECTION
Adult: 1000 units for 1 dose, repeated if necessary
Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
BY SLOW INTRAVENOUS INJECTION
Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure
Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)
BY SLOW INTRAVENOUS INJECTION
Adult: 1000 units every 3–4 days, interval between doses to be adjusted according to response

BERINERT®
Acute attacks of hereditary angioedema (under expert supervision)
BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: 20 units/kg
Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure

CAUTIONS
Vaccination against hepatitis A and hepatitis B may be required

SIDE-EFFECTS
Fever, headache, thrombosis (with high doses)

PREGNANCY
Manufacturer advises avoid unless essential.

PRESCRIBING AND DISPENSING INFORMATION
C1-esterase inhibitor is prepared from human plasma.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
Berinert P (CSL Behring UK Ltd)
Conestat alfa 2100 unit Ruconest 2.100 unit powder for solution for injection vials | 1 vial £750.00

SELECTIVE BRADYKININ B2 ANTAGONISTS

Icatibant

INDICATIONS AND DOSE
Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency
BY SUBCUTANEOUS INJECTION
Adult: 30 mg for 1 dose, then 30 mg after 6 hours if required, then 30 mg after 6 hours if required; maximum 3 doses per day

CAUTIONS
Ischaemic heart disease • stroke

SIDE-EFFECTS
Dizziness, erythema, headache, injection-site reactions, nausea, pruritus, pyrexia, rash

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid for 12 hours after administration.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
Firazyr (Shire Pharmaceuticals Ltd)
Icatibant (as Icatibant acetate) 10 mg per 1 ml Firazyr 30 mg/3 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £1,395.00

Conestat alfa

INDICATIONS AND DOSE
Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency
BY SLOW INTRAVENOUS INJECTION
Adult (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day
Adult (body-weight ≥ 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

MUCOLYTICS

Carbocisteine

INDICATIONS AND DOSE
Reduction of sputum viscosity
BY MOUTH
Adult: Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

CONTRA-INDICATIONS
Active peptic ulceration
3.1 Cystic fibrosis

Mucolytics for cystic fibrosis

Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Dornase alfa below is used to reduce sputum viscosity in patients with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g. cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Manitol, administered by inhalation, improves mucus clearance and is licensed for the treatment of cystic fibrosis as an add-on therapy to standard care.

Erdosteine

**INDICATIONS AND DOSE**

Symptomatic treatment of acute exacerbations of chronic bronchitis

**BY MOUTH**

- Adult: 300 mg twice daily for up to 10 days

- **CAUTIONS** History of peptic ulceration (may disrupt the gastric mucosal barrier)

- **SIDE-EFFECTS**
  - Rare Abdominal pain, diarrhoea, headache, nausea, rash, taste disturbance, urticaria, vomiting

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises max. 300 mg daily in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m²—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium (October 2007) has advised that erdosteine (Erdotin®) is not recommended for the symptomatic treatment of acute exacerbations of chronic bronchitis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - Erdotin (Galen Ltd)
  - Erdosteine 300 mg Erdotin 300mg capsules | 20 capsule [PEN] £4.25 DT price = £4.25

- **RENAH IMPAIRMENT** No information available.

- **BREAST FEEDING** No information available.

- **PREGNANCY** Manufacturer advises avoid in first trimester.

- **SIDE-EFFECTS**
  - Very rare Abdominal pain, diarrhoea, headache, nausea, rash, taste disturbance, urticaria, vomiting

- **DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

**INDICATIONS AND DOSE**

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

**BY INHALATION OF NEBULISED SOLUTION**

- Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

**Dose equivalence and conversion**

Dornase alfa 1000 units is equivalent to 1 mg

- **SIDE-EFFECTS**
  - Rare Chest pain, conjunctivitis, dyspepsia, dysphonia, dysphonia, laryngitis, pharyngitis, pyrexia, rash, rhinitis, urticaria

- **PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION** Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment. For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Nebuliser liquid**
  - Pulmozyme (Roche Products Ltd)
  - Dornase alfa 1 mg per 1 ml Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule [PEN] £496.43 DT price = £496.43
**Ivacaftor**

**INDICATIONS AND DOSE**

Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)

**BY MOUTH**
- Adult: 150 mg every 12 hours

**Dose adjustments due to interactions**
Reduce dose to 150 mg twice a week with concomitant use of itraconazole, ketoconazole, posaconazole, voriconazole, telithromycin, and clarithromycin. Reduce dose to 150 mg once daily with concomitant use of fluconazole and erythromycin.

- **CONTRA-INDICATIONS** Organ transplantation (no information available)
- **INTERACTIONS** → Appendix 1 (ivacaftor). Avoid grapefruit and Seville oranges.
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · diarrhoea · dizziness · ear discomfort · headache · nasal congestion · nasopharyngitis · oropharyngeal pain · pharyngolaryngeal pain · rash · rhinitis · tinnitus · upper respiratory tract infection
  - **Uncommon** Gynaecomastia · vestibular disorder
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.
- **RENAL IMPAIRMENT** Caution in severe impairment.
- **PRE-TREATMENT SCREENING** If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.
- **MONITORING REQUIREMENTS** Test liver function before treatment, every 3 months during the first year of treatment, then annually thereafter.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.
- **PRESCRIBING AND DISPENSING INFORMATION** Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ivacaftor tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**

**CAUTIONARY AND ADVISORY LABELS 5.25**
- Ivacaftor 150 mg Kalydeco 150mg tablets | 56 tablet | [PSM]
  - £14,000.00

---

**Mannitol**

**INDICATIONS AND DOSE**

Treatment of cystic fibrosis as an add-on therapy to standard care

**BY INHALATION OF POWDER**
- Adult: Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

- **CONTRA-INDICATIONS** Bronchial hyperresponsiveness to inhaled mannitol · impaired lung function (forced expiratory volume in 1 second < 30% of predicted) · non-CF bronchiectasis
- **CAUTIONS** Asthma · haemoptysis
- **INTERACTIONS** → Appendix 1 (mannitol).
- **SIDE-EFFECTS**
  - **Common or very common** Cough · haemoptysis · headache · pharyngolaryngeal pain · throat irritation · vomiting · wheezing
  - **Uncommon** Acne · arthralgia · bronchospasm · dizziness · dysphonia · dysphagia · ear pain · eructation · flatulence · gastro-oesophageal reflux disease · glossodynia · hyperventilation · influenza-like illness · malaise · nausea · oral candidiasis · pharyngitis · pruritis · pyrexia · rash · rhinorrhea · stomatitis · transient insomnia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid.
- **PRE-TREATMENT SCREENING** Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mannitol inhalation powder.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)** Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012) NICE TA266

Mannitol dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:
- who cannot use dornase alfa (rhDNase) because of ineffectiveness, intolerance or inadequate response to dornase alfa (rhDNase), and
- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), and
- for whom other osmotic agents are not considered appropriate. www.nice.org.uk/TA266

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium, has advised (November 2013) that mannitol (Bronchitol®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineffectiveness and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order
4 Cough and congestion

Aromatic inhalations, cough preparations and systemic nasal decongestants

Aromatic inhalations in adults

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. Inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. Eucalyptus with menthol p. 259 inhalation is used to relieve sinussitis affecting the maxillary antrum.

Cough preparations in adults

Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

Cough suppressants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 982 is available over the counter; it has few sympathomimetic effects.

Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate p. 360 should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine p. 259 are not generally recommended in children and should be avoided in children under 6 years.

MHRA/CHM advice (March 2008 and February 2009)

Over-the-counter cough and cold medicines for children

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- Brompheniramine, chlorphenamine maleate, diphenhydramine, doxylamine, promethazine, or tripolidine (antihistamines);
- Dextromethorphan or pholcodine (cough suppressants);
- Guaifenesin or ipecacuanha (expectorants);
- Phenylephrine hydrochloride, pseudoephedrine hydrochloride, ephedrine hydrochloride, oxymetazoline, or xylometazoline hydrochloride (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

Drugs used for cough and congestion not listed below; Codeine phosphate, p. 360 · Methadone hydrochloride, p. 436 · Morphine hydrochloride, p. 367

Citric acid

(Formulated as Simple Linctus)

INDICATIONS AND DOSE

Cough

BY MOUTH

- Adult: 5 mL 3–4 times a day, this dose is for Simple Linctus, BP (2.5%)
Cough and congestion

Pholcodine

INDICATIONS AND DOSE
Dry cough

BY MOUTH USING LINCTUS

> Child 6-11 years: 2–5 mg 3–4 times a day
> Child 12-17 years: 5–10 mg 3–4 times a day
> Adult: 5–10 mg 3–4 times a day

MOUTH USING LINCTUS

Important safety information

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009)

OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant). Over-the-counter cough and cold medicines should be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

CONTRA-INDICATIONS Bronchiectasis - bronchiolitis (in children) - chronic bronchitis - chronic obstructive pulmonary disease (in adults) - patients at risk of respiratory failure

CAUTIONS Asthma - chronic cough - persistent cough - productive cough

INTERACTIONS Appendix 1 (pholcodine).

SIDE-EFFECTS Confusion - constipation - dizziness - drowsiness - excitation - nausea - rash - sputum retention - vomiting

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk – no information available.

HEPATIC IMPAIRMENT Avoid in hepatic impairment.

RENAI IMPAIRMENT Use with caution in renal impairment. Avoid in severe renal impairment.

PRESCRIBING AND DISPENSING INFORMATION Pholcodine is not generally recommended for children. Flavours of oral liquid formulations may include anise. When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 5 mg/5 ml in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 ml in a suitable flavoured vehicle, containing citric acid monohydrate 2%

RESINS

Benzoin tincture

(Friars’ Balsam)

INDICATIONS AND DOSE

Aromatic inhalation for relief of nasal congestion

BY INHALATION

> Child: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary
> Adult: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary

SIDE-EFFECTS Allergic contact dermatitis

PRESCRIBING AND DISPENSING INFORMATION Tincture, balsamic acids approx. 4.5%. When prepared extemporaneously, the BP states Benzoin Tincture, Compound, BP consists of balsamic acids approx. 4.5%. Not recommended (applied as a rub or to pillows) for infants under 3 months.
5 Idiopathic pulmonary fibrosis

ANTIFIBROTICS

Pirfenidone

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

**INDICATIONS AND DOSE**

- Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)
  - **BY MOUTH**
    - Adult: Initially 267 mg three times a day for 7 days, then increased to 534 mg three times a day for 7 days, then increased to 801 mg 3 times a day
  - **Dose adjustments due to interactions**
    - Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily)
    - Caution with concomitant use of drugs known to cause photosensitivity—phototoxic or photoinflammatory reactions, dosage adjustments may be required (consult product literature).

- **CONTRA-INDICATIONS** Cigarette smoking

- **CAUTIONS**
  - **CAUTION, FURTHER INFORMATION** Photosensitivity
    - Avoid exposure to direct sunlight—phototoxic or photoinflammatory reactions, dosage adjustment or treatment interruption may be required (consult product literature).
  - **Treatment interruption**
    - If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

- **INTERACTIONS** Appendix 1 (pirfenidone).

- **SIDE-EFFECTS**
  - Rare: Raised bilirubin in combination with raised hepatic transaminases

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **PREGNANCY** Common or very common
- **SIDE-EFFECTS** Interactions
- **PREGNANCY** Common or very common
- **SIDE-EFFECTS** Interactions

6 Respiratory depression, respiratory distress syndrome and apnoea

**Respiratory stimulants**

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when
ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

**RESPIRATORY STIMULANTS**

**Doxapram hydrochloride**

**INDICATIONS AND DOSE**

**Postoperative respiratory depression**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

**Acute respiratory failure**

**BY INTRAVENOUS INFUSION**

- Adult: 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

**CONTRA-INDICATIONS**

- Cerebral oedema
- cerebrovascular accident
- coronary artery disease
- epilepsy and other convulsive disorders
- hyperthyroidism
- physical obstruction of respiratory tract
- severe hypertension
- status asthmaticus

**CAUTIONS**

- Give with beta₂ agonist in bronchoconstriction
- give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing)
- hypertension
- impaired cardiac reserve
- phaeochromocytoma

**INTERACTIONS**

- See Appendix 1 (doxapram).

**SIDE-EFFECTS**

- Arrhythmias
- bradycardia
- bronchospasm
- chest pain
- confusion
- convulsions
- cough
- dizziness

**PREGNANCY**

- No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.

**HEPATIC IMPAIRMENT**

- Use with caution.

**MONITORING REQUIREMENTS**

- Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Doxapram hydrochloride 20 mg per 1 ml**
- **Doxapram hydrochloride 100 mg/5 ml**
  - solution for injection ampoules | 5 ampoule (PO) £30.00–£110.00

**Infusion**

- **Doxapram hydrochloride 2 mg per 1 ml**
- **Doxapram hydrochloride 1 g/500 ml**
  - infusion bags | 1 bag (PO) no price available
Chapter 4
Nervous system

1 Dementia

Dementia
Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer’s disease, specifically for mild to moderate disease. Rivastigmine p. 264 is also licensed for mild to moderate dementia associated with Parkinson’s disease. The evidence to support the use of these drugs relates to their cognitive enhancement.

Treatment with drugs for dementia should be initiated and supervised only by a specialist experienced in the management of dementia.

Benefit is assessed by repeating the cognitive assessment at around 3 months. Such assessment cannot demonstrate how the disease may have progressed in the absence of treatment but it can give a good guide to response. Up to half the patients given these drugs will show a slower rate of cognitive decline. Drugs for dementia should be discontinued in those thought not to be responding. Many specialists repeat the cognitive assessment 4 to 6 weeks after discontinuation to assess deterioration; if significant deterioration occurs during this short period, consideration should be given to restarting therapy.

ANTICHLINORESTASES

Donepezil hydrochloride

- **DRUG ACTION** Donepezil is a reversible inhibitor of acetylcholinesterase.

**INDICATIONS AND DOSE**
Mild to moderate dementia in Alzheimer’s disease

BY MOUTH
- Adult: Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime

- **CAUTIONS** Asthma · chronic obstructive pulmonary disease · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers

- **INTERACTIONS** → Appendix 1 (parasympathomimetics). Caution with concomitant antipsychotic treatment—increased risk of neuroleptic malignant syndrome.

- **SIDE-EFFECTS**
  - **Common or very common** Abnormal dreams · aggression · agitation · anorexia · diarrhoea · dizziness · fatigue · hallucinations · headache · insomnia · muscle cramps · nausea · pruritus · rash · syncope · urinary incontinence · vomiting
  - **Uncommon** Bradycardia · duodenal ulcers · gastric ulcers · gastro-intestinal haemorrhage · seizures
  - **Rare** AV block · extrapyramidal symptoms · hepatitis · potential for bladder outflow obstruction · sino-atrial block
  - **Very rare** Neuroleptic malignant syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**
Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. No information available for severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer donepezil hydrochloride orodispersible tablets.

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
- Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease (March 2011) NICE TA217

These drugs can be used for the treatment of mild to moderate Alzheimer’s disease. Treatment should only be prescribed under the following conditions:

- Alzheimer’s disease must be diagnosed and treatment initiated by a specialist; treatment can be continued by general practitioners under a shared-care protocol;
- the carer’s view of the condition should be sought before and during treatment;
Dementia 263

Galantamine

**DRUG ACTION** Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

**INDICATIONS AND DOSE**

**Mild to moderate dementia in Alzheimer’s disease**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for 4 weeks; maintenance 8–12 mg twice daily

**Mild to moderate dementia in Alzheimer’s disease**

**BY MOUTH USING MODIFIED-RELEASE CAPSULES**

- Adult: Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for 4 weeks; maintenance 16–24 mg daily

**CAUTIONS** Asthma - avoid in gastro-intestinal obstruction • avoid in urinary retention - avoid whilst recovering from bladder surgery - avoid whilst recovering from gastro-intestinal surgery - cardiac disease - chronic obstructive pulmonary disease - congestive heart failure - electrolyte disturbances - history of seizures - pulmonary infection - sick sinus syndrome - supraventricular conduction abnormalities - susceptibility to peptic ulcers - unstable angina

**INTERACTIONS** → Appendix 1 (parasympathomimetics).

**SIDE-EFFECTS**

- Common or very common Abdominal pain • anorexia • bradycardia • depression • diarrhoea • dizziness • drowsiness • dyspepsia • hallucination • headache • hypertension • malaise • muscle spasm • nausea • sweating • syncpe • tremor • vomiting • weight loss

- Uncommon Arrhythmias • blunted vision • dehydration • first-degree AV block • flushing • hypotension • muscular weakness • palpitation • paraesthesia • seizures • taste disturbance • tinnitus

- Rare Exacerbation of Parkinson’s disease • hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION** Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

**PREGNANCY** Use with caution.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** For immediate-release preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment. For modified-release preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; max. 16 mg daily; avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid if eGFR less than 9 ml/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease (March 2011) NICE TA217

See Donepezil, p. 262. www.nice.org.uk/TA217

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
  - Donepezil hydrochloride 5 mg Donepezil 5mg tablets | 28 tablet [Pod] £59.85 DT price = £1.31
  - Donepezil hydrochloride 10 mg Donepezil 10mg tablets | 28 tablet [Pod] £83.89 DT price = £1.65
  - Aricept (Eisai Ltd)
    - Donepezil hydrochloride 5 mg Aricept 5mg tablets | 28 tablet [Pod] £59.85 DT price = £1.31
    - Donepezil hydrochloride 10 mg Aricept 10mg tablets | 28 tablet [Pod] £83.89 DT price = £1.65
- **Orodispensible tablet**
  - Donepezil hydrochloride 5 mg Donepezil 5mg orodispersible tablets | 28 tablet [Pod] £59.85
  - Donepezil hydrochloride 5 mg Donepezil 5mg orodispersible tablets sugar free (sugar-free) | 28 tablet [Pod] £5.35–£7.99 DT price = £6.75
  - Donepezil hydrochloride 10 mg Donepezil 10mg orodispersible tablets sugar free (sugar-free) | 28 tablet [Pod] £8.16–£8.99 DT price = £8.50
  - Donepezil 10mg orodispersible tablets | 28 tablet [Pod] £83.89
  - Aricept Evess (Eisai Ltd)
    - Donepezil hydrochloride 5 mg Aricept Evess 5mg orodispersible tablets (sugar-free) | 28 tablet [Pod] £59.85 DT price = £6.75
    - Donepezil hydrochloride 10 mg Aricept Evess 10mg orodispersible tablets (sugar-free) | 28 tablet [Pod] £83.89 DT price = £8.50
- **Oral solution**
  - Donepezil hydrochloride 1 mg per 1 ml Donepezil 1mg/ml oral solution sugar free (sugar-free) | 150 ml [Pod] £37.50 DT price = £37.50

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **GALANTAMINE (Non-proprietary)**
      - Galantamine (as Galantamine hydrobromide) 8 mg Galantamine 8mg tablets | 56 tablet [Pod] £95.25–£94.90 DT price = £61.09
      - Galantamine (as Galantamine hydrobromide) 12 mg Galantamine 12mg tablets | 56 tablet [Pod] £71.25–£79.80 DT price = £74.10
      - Reminyl (Shire Pharmaceuticals Ltd)
        - Galantamine (as Galantamine hydrobromide) 8 mg Reminyl 8mg tablets | 56 tablet [Pod] £68.32 DT price = £61.09
        - Galantamine (as Galantamine hydrobromide) 12 mg Reminyl 12mg tablets | 56 tablet [Pod] £80.40 DT price = £74.10
  - **Modified-release capsule**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **GALANTAMINE (Non-proprietary)**
      - Galantamine (as Galantamine hydrobromide) 8 mg Galantamine 8mg capsule | 28 capsule [Pod] £51.88 DT price = £51.88
      - Galantamine (as Galantamine hydrobromide) 16 mg Galantamine 16mg capsules | 28 capsule [Pod] £35.49 DT price = £35.49
      - Galantamine (as Galantamine hydrobromide) 24 mg Galantamine 24mg capsules | 28 capsule [Pod] £79.80 DT price = £79.80
      - Brands may include: Acicarm XL; Constil XL; Elminco; Galantex XL; Galia XL; Gatalin XL; Gazylan XL; Lotprosin XL; Luventa XL
  - **Oral solution**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **GALANTAMINE (Non-proprietary)**
      - Galantamine (as Galantamine hydrobromide) 4 mg per 1 ml Galantamine 20mg/5ml oral solution sugar free (sugar-free) | 100 ml [Pod] £43.70
      - Reminyl (Shire Pharmaceuticals Ltd)
        - Galantamine (as Galantamine hydrobromide) 4 mg per 1 ml Reminyl 4mg/ml oral solution (sugar-free) | 100 ml [Pod] £120.00
Rivastigmine

**DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterase.

**INDICATIONS AND DOSE**

**Mild to moderate dementia in Alzheimer’s disease**

**BY MOUTH**
- Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, to a maximum of 4.5 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, titrate from 1.5 mg twice daily.

**BY TRANSDERMAL APPLICATION USING PATCHES**
- Adult: Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated, up to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increased to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, titrate from 4.6 mg/24 hours patch.

**Mild to moderate dementia in Parkinson’s disease**

**BY MOUTH**
- Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, to a maximum of 4.5 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, titrate from 1.5 mg twice daily.

**Dose equivalence and conversion**

When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose.

**CAUTIONS**

**INTERACTIONS** → Appendix 1 (parasympathomimetics).

**SIDE-EFFECTS**

- **Uncommon** Atrial fibrillation - AV block - depression - syncope.

- **Rare** Angina - duodenal ulceration - gastric ulceration - rash - seizures.

- **Very rare** Gastro-intestinal haemorrhage - hallucinations - hypertension - pancreatitis - tachycardia.

- **Frequency not known** Aggression - dehydration - hepatitis - restlessness - sick sinus syndrome - skin hypersensitivity reactions.

**SIDE-EFFECTS, FURTHER INFORMATION**

Transdermal administration less likely to cause gastro-intestinal disturbance.

Treatment should be interrupted if gastro-intestinal side-effects occur and withheld until their resolution—retitrate dose if necessary. Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- **HEPATIC IMPAIRMENT** Titrate according to individual tolerability in mild to moderate impairment. Use with caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Titrate according to individual tolerability.

**MONITORING REQUIREMENTS** Monitor body-weight.

**DIRECTIONS FOR ADMINISTRATION**

- With transdermal use, apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days).

**PATIENT AND CARER ADVICE**

**EXELON® TRANSDERMAL PATCHES.** Advise patients and carers of patch administration instructions, particularly to remove the previous day’s patch before applying the new patch—consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2007) that Exelon® patches should be restricted for use in patients with moderately severe Alzheimer’s disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 21, 25**

- **RIVASTIGMINE (Non-proprietary)**

  - Rivastigmine (as Rivastigmine hydrogen tartrate) 1.5 mg Rivastigmine 1.5 mg capsules 28 capsule £33.25 DT price = £3.25 | 56 capsule £66.51

NMDA RECEPTOR ANTAGONISTS

Memantine hydrochloride

▶ DRUG ACTION Memantine is a glutamate receptor antagonist.

INDICATIONS AND DOSE

Moderate to severe dementia in Alzheimer’s disease

BY MOUTH

▶ Adult: Initially 5 mg once daily, increased in steps of 5 mg at weekly intervals; maximum 20 mg per day

▶ CAUTIONS History of convulsions

▶ INTERACTIONS → Appendix 1 (memantine).

SIDE-EFFECTS

▶ Common or very common Constipation, dizziness, drowsiness, dyspnoea, headache, hypertension

▶ Uncommon Abnormal gait, confusion, fatigue, hallucinations, heart failure, thrombosis, vomiting

▶ Very rare Seizures

▶ Frequency not known Depression, pancreatitis, psychosis, suicidal ideation

▶ HEPATIC IMPAIRMENT Avoid in severe impairment—no information available.

▶ RENAL IMPAIRMENT Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m², if well tolerated after at least 7 days can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m². Avoid if eGFR less than 5 mL/minute/1.73 m².

▶ DIRECTIONS FOR ADMINISTRATION Oral solution should be dosed onto a spoon or into a glass of water.

CARBAMATES

Meprobamate

INDICATIONS AND DOSE

Short-term use in anxiety—not recommended

BY MOUTH

▶ Adult: 400 mg 3–4 times a day

▶ Elderly: Up to 200 mg 3–4 times a day

Important safety information

The European Medicines Agency has recommended (January 2012) the suspension of all marketing authorisations for meprobamate because the risks, particularly of serious CNS side-effects, outweigh the benefits.

▶ CONTRA-INDICATIONS Acute porphyrias p. 864 - acute pulmonary insufficiency - respiratory depression

▶ CAUTIONS Abrupt withdrawal (may precipitate convulsions) - avoid prolonged use - debilitated elderly - epilepsy (may induce seizures) - history of alcohol abuse - history of drug abuse - marked personality disorder - muscle weakness - respiratory disease

▶ INTERACTIONS → Appendix 1 (anxiolytics and hypnotics).

SIDE-EFFECTS

▶ Common or very common Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression

▶ Uncommon Changes in libido - dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - headache - hypotension - incontinence - salivation changes -
slurred speech • tremor • urinary retention • vertigo • visual disturbances

▶ Rare Agranulocytosis • apnoea • blood disorders • jaundice • rashes • respiratory depression • skin reactions

▶ Frequency not known CNS effects • paradoxical excitement • paraesthesia • weakness

ʼ PREGNANCY  Avoid if possible.

ʼ BREAST FEEDING  Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.

ʼ HEPATIC IMPAIRMENT  Can precipitate coma.

ʼ RENAL IMPAIRMENT  Increased cerebral sensitivity. Start with small doses in severe impairment.

ʼ PATIENT AND CARER ADVICE  Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

ʼ LESS SUITABLE FOR PRESCRIBING  Meprobamate is less suitable for prescribing.

ʼ MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

ʼ MEPROBAMATE (Non-proprietary)
Meprobamate 400 mg Meprobamate 400 mg tablets | 84 tablet (£197.63–£200.54 DT price + £200.54 Schedule 3 (CD No Register)

HYPNOTICS AND SEDATIVES (BENZODIAZEPINE)

Benzodiazepines

ʼ CONTRA-INDICATIONS  Acute pulmonary insufficiency • marked neuromuscular respiratory weakness • sleep apnoea syndrome • unstable myocardial gravis

ʼ CAUTIONS  Avoid prolonged use (and abrupt withdrawal thereafter) • debilitated patients (reduce dose) • elderly (reduce dose) • history of alcohol dependence or abuse • history of drug dependence or abuse • myasthenia gravis • respiratory disease

ʼ CAUTIONS, FURTHER INFORMATION  Paradoxical effects  A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

ʼ INTERACTIONS  → Appendix 1 (anxiolytics and hypnotics).

ʼ SIDE-EFFECTS

Overdose  Benzodiazepines taken alone cause drowsiness, ataxia, dysarthritis, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1123.

ʼ PREGNANCY  Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

ʼ RENAL IMPAIRMENT  Increased cerebral sensitivity to benzodiazepines.

ʼ PATIENT AND CARER ADVICE  Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see Drugs and driving under Guidance on prescribing p. 1.

Alprazolam

INDICATIONS AND DOSE

Short-term use in anxiety

BY MOUTH

ʼ Adult: 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose

ʼ Elderly: 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily

ʼ CONTRA-INDICATIONS  Chronic psychosis • hyperkinesis • not for use alone to treat depression (or anxiety associated with depression) • obsessional states • phobic states • respiratory depression

ʼ CAUTIONS  Muscle weakness • organic brain changes • personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

ʼ SIDE-EFFECTS

▶ Common or very common  Amnesia • ataxia (especially in the elderly) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression

▶ Uncommon  Changes in libido • dizziness • dystarthritis • gastro-intestinal disturbances • gynaecomastia • headache • hypotension • incontinence • salivation changes • slurred speech • tremor • urinary retention • vertigo • visual disturbances

ʼ Rare  Agranulocytosis • apnoea • blood disorders • jaundice • respiratory depression • skin reactions

ʼ BREAST FEEDING  Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

ʼ HEPATIC IMPAIRMENT  Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Start with smaller initial doses or reduce dose. Avoid in severe impairment.

ʼ RENAL IMPAIRMENT  Start with small doses in severe impairment.

ʼ PATIENT AND CARER ADVICE  May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

ʼ NATIONAL FUNDING/ACCESS DECISIONS  NHS restrictions  Alprazolam tablets are not prescribable under the NHS.

ʼ MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

ʼ XANAX (Pfizer Ltd)
Xanax 250 microgram Xanax 250 microgram tablets | 60 tablet (£3.18 Schedule 4 (CD Benz))

Xanax 500 microgram Xanax 500 microgram tablets | 60 tablet (£6.09 Schedule 4 (CD Benz))
Chlordiazepoxide hydrochloride

INDICATIONS AND DOSE
Short-term use in anxiety
BY MOUTH
- Adult: 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses

Treatment of alcohol withdrawal in moderate dependence
BY MOUTH
- Adult: 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens

Treatment of alcohol withdrawal in severe dependence
BY MOUTH
- Adult: 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

CONTRA-INDICATIONS
- Chronic psychosis, hyperkinesia
- Not for use alone to treat depression (or anxiety associated with depression), obsessional states, phobic states, respiratory depression

CAUTIONS
- Muscle weakness, organic brain changes
- Personality disorder (within the fearful group—dependent, avoidant, obsessive–compulsive) may increase risk of dependence

SIDE-EFFECTS
- Common or very common
  - Amnesia; ataxia (especially in the elderly) - confusion (especially in the elderly)
  - Drowsiness next day
  - Lightheadedness next day
  - Muscle weakness, paradoxic increase in aggression
- Uncommon
  - Changes in libido - dizziness - dysarthria
  - Gastro-intestinal disturbances - gynaecomastia - headache
  - Hypotension - incontinence - salivation changes - slurred speech - tremor - urinary retention - vertigo - visual disturbances
- Rare
  - Apnoea - blood disorders - jaundice - respiratory depression - skin reactions

BREAST FEEDING
- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

HEPATIC IMPAIRMENT
- Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Start with smaller initial doses or reduce dose. Avoid in severe impairment.

RENAL IMPAIRMENT
- Start with small doses in severe impairment.

PATIENT AND CAREGIVER ADVICE
- May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; chlordiazepoxide increases the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

NATIONAL FUNDING/ACCESS DECISIONS
- NHS restrictions. Librium® is not prescribable under the NHS.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
- CAUTIONARY AND ADVISORY LABELS 2
- Chlordiazepoxide hydrochloride (Non-proprietary)
  - Chlordiazepoxide (as Chlordiazepoxide hydrochloride)
  - 10 mg Chlordiazepoxide 10mg tablets | 100 tablet | £49.50 DT

Capsule
- CAUTIONARY AND ADVISORY LABELS 2
- Chlordiazepoxide hydrochloride (Non-proprietary)
  - Chlordiazepoxide hydrochloride 5 mg
    - Chlordiazepoxide 5mg capsules | 28 capsule | £4.60 Schedule 4 (CD Benz)
    - 100 capsule | £10.96 DT price + £9.53 Schedule 4 (CD Benz)
  - Chlordiazepoxide hydrochloride 10 mg
    - Chlordiazepoxide 10mg capsules | 28 capsule | £5.15 Schedule 4 (CD Benz)
    - 100 capsule | £18.00 DT price + £16.08 Schedule 4 (CD Benz)
- Librium (Meda Pharmaceuticals Ltd)
  - Chlordiazepoxide hydrochloride 5 mg
    - Librium 5mg capsules | 100 capsule | £5.38 DT price + £9.53 Schedule 4 (CD Benz)
  - Chlordiazepoxide hydrochloride 10 mg
    - Librium 10mg capsules | 100 capsule | £7.46 DT price + £16.08 Schedule 4 (CD Benz)

Diazepam

INDICATIONS AND DOSE
Muscle spasm of varied aetiology
BY MOUTH
- Adult: 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions

Acute muscle spasm
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION
- Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

Tetanus
BY INTRAVENOUS INJECTION
- Child: 100–300 micrograms/kg every 1–4 hours
- Adult: 100–300 micrograms/kg every 1–4 hours

BY INTRAVENOUS INFUSION OR BY NASODUODENAL TUBE
- Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
- Adult: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm
BY MOUTH
- Child 1-11 months: Initially 250 micrograms/kg twice daily
- Child 1-4 years: Initially 2.5 mg twice daily
- Child 5-11 years: Initially 5 mg twice daily
- Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

Anxiety
BY MOUTH
- Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

Insomnia associated with anxiety
BY MOUTH
- Adult: 5–15 mg daily, to be taken at bedtime

Severe acute anxiety / Control of acute panic attacks / Acute alcohol withdrawal
INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION
- Adult: 10 mg, then (by intramuscular injection or by intravenous injection) 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

continued →
Acute anxiety and agitation

BY RECTUM
- Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

Acute drug-induced dystonic reactions

BY INTRAVENOUS INJECTION
- Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

Premedication

BY MOUTH
- Adult: 5–10 mg, to be given 1–2 hours before procedure, for depleted patients, use elderly dose
- Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

BY INTRAVENOUS INJECTION
- Adult: 100–200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

Sedation in dental procedures carried out in hospital

BY MOUTH
- Adult: Up to 20 mg, to be given 1–2 hours before procedure

Conscious sedation for procedures, and in conjunction with local anaesthesia

BY MOUTH
- Adult: 5–10 mg, to be given 1–2 hours before procedure, for depleted patients, use elderly dose
- Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

Sedative cover for minor surgical and medical procedures

BY INTRAVENOUS INJECTION
- Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

Status epilepticus | Febrile convulsions | Convulsions due to poisoning

BY INTRAVENOUS INJECTION
- Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.
- Child 1 month-1 year: 5 mg, then 5 mg after 10 minutes if required
- Child 2-11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
- Child 12-17 years: 10–20 mg, then 10–20 mg after 10 minutes if required
- Adult: 10–20 mg, then 10–20 mg after 10 minutes if required
- Elderly: 10 mg, then 10 mg after 10–15 minutes if required

BY RECTUM
- Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.
- Child 1 month-1 year: 5 mg, then 5 mg after 10 minutes if required
- Child 2-11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
- Child 12-17 years: 10 micrograms/kg, repeated if necessary, to be given over 3–5 minutes
- Child 12-17 years: 5–10 mg, repeated if necessary, to be given over 3–5 minutes

Dyspnoea associated with anxiety in palliative care

BY MOUTH
- Adult: 5–10 mg daily

Pain of muscle spasm in palliative care

BY MOUTH
- Adult: 5–10 mg daily

**UNLICENSED USE**

**CONTRA-INDICATIONS**
- Avoid injections containing benzyl alcohol in neonates.
- Chronic psychosis (in adults).
- CNS depression.
- Compromised airway.
- Hypokinesia.
- Not for use alone to treat depression (or anxiety associated with depression).
- (in adults).
- Obsessive–compulsive.

**CAUTIONS**
- General caution.
- Muscle weakness.
- Organic brain changes.
- Parenteral administration (close observation required until full recovery from sedation).
- Personality disorder.
- (within the fearful group—dependent, avoidant, obsessive–compulsive).

**SPECIFIC CAUTIONS**
- With intravenous use.
- High risk of venous thrombophlebitis.
- With intravenous use (reduced by using an emulsion formulation).

**CAUTIONS, FURTHER INFORMATION**
- Special precautions for intravenous injection.
- When given intravenously for reversing respiratory depression with mechanical ventilation must be immediately available.

**SIDE-EFFECTS**
- General side-effects.
- Common or very common.
- Amnesia.
- Ataxia (in children).
- Ataxia (especially in the elderly).
- Confusion (in children).
- Confusion (especially in the elderly).
- Dependence.
- Drowsiness the next day.
- Lightheadedness.
- Muscle weakness.
- Paradoxical increase in aggression.
- Uncommon.
- Changes in libido.
- Dizziness.
- Dysarthria.
- Gastro-intestinal disturbances.
- Gynaecomastia.
- Headache.
- Hypotension.
- Incontinence.
- Salivation changes.
- Slurred speech.
- Tremor.
- Urinary retention.
- Vertigo.
- Visual disturbances.
- Rare.
- Apnoea.
- Blood disorders.
- Changes in libido.
- Headache.
- Hypotension.
- Jaundice.
- Respiratory depression.
- Skin reactions.
- Urinary retention.
- Vertigo.

**FREQUENCY NOT KNOWN**
- Delusions.
- Excitement.
- Hallucinations.
- Hypotonia.
- Irritability.
- Marked respiratory depression.
- Particularly high dose.
- Facilities for its treatment are essential.
- Psychosis.
- Restlessness.

**SPECIFIC SIDE-EFFECTS**
- With intravenous use.
- Pain.
- Thrombophlebitis.
- Venous thrombosis.

**PREGNANCY**
- Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any...
change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

**Epilepsy and Pregnancy Register** All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1246).

- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use **Diazepam** is adsorbed by plastics of infusion bags and giving sets.
- With intravenous use **Emulsion formulation preferred for intravenous injection.**
- With intravenous use in children For continuous intravenous infusion of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For continuous intravenous infusion of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For intravenous infusion (solution) **Diazepam, Wockhardt,** give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL.
- With intravenous use in adults For intravenous infusion (emulsion) **Diazemuls**, give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.
- With intramuscular use or intravenous use in adults Solution for injection should not be diluted, except for intravenous infusion.
- With intramuscular use in adults Only use intramuscular route when oral and intravenous routes not possible.

- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

**Serotonergic Medications**

**INDICATIONS AND DOSE**

**Anxiety (short-term use)**

**By mouth**

- Adult: 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 - epilepsy
- **CAUTIONS** Does not alleviate symptoms of benzodiazepine withdrawal

**CAUTIONS, FURTHER INFORMATION**

A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone.

**INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).

**SIDE-EFFECTS**

- Common or very common Dizziness - excitement - headache - nausea - nervousness
- Rare Chest pain - confusion - drowsiness - dry mouth - fatigue - palpitation - seizures - sweating - tachycardia
- **PREGNANCY** Avoid.

**Breastfeeding** Avoid.
Nervous system

(Dexamphetamine sulfate)

CNS STIMULANTS (AMFETAMINE ISOMERS)

lisdexamfetamine mesilate p. (dexamfetamine sulfate below and amfetamines

Central nervous system stimulants include the

Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

Central nervous system stimulants include the amfetamines (dexamfetamine sulfate below and lisdexamfetamine mesilate p. 271) and related drugs (e.g. methylphenidate hydrochloride p. 273). They have very few indications and in particular, should not be used to treat depression, obesity, senility, debility, or for relief of fatigue. CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependance; and preferences of the patient and carers. Methylphenidate hydrochloride and atomoxetine are used for the management of ADHD; dexamfetamine sulfate and lisdexamfetamine mesilate are alternative in children who do not respond to these drugs.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

CNS STIMULANTS (AMFETAMINE ISOMERS)

Dexamfetamine sulfate
(Desmethylamphetamine sulfate)

INDICATIONS AND DOSE

Narcolepsy
BY MOUTH
Adult: Initially 10 mg daily in divided doses, increased in steps of 10 mg every 1 week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

Elderly: Initially 5 mg daily in divided doses, increased in steps of 5 mg every 1 week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

Refactory attention deficit hyperactivity disorder (initiated under specialist supervision)

BY MOUTH
Child 6–17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg daily if required, dose to be increased at weekly intervals, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)

Adult: Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

UNLICENSED USE Not licensed for use in adults for refractory attention deficit hyperactivity disorder.

CONTRA-INDICATIONS Advanced arteriosclerosis (in adults) - agitated states - cardiovascular disease - history of alcohol abuse - history of drug abuse - hyperexcitability - hyperthyroidism - moderate hypertension - severe hypertension - structural cardiac abnormalities

CAUTIONS Anorexia - bipolar disorder - history of epilepsy (discontinue if seizures occur) - mild hypertension - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

CAUTIONS, FURTHER INFORMATION

Tics and Tourette syndrome Discontinue use if tics occur.

Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

INTERACTIONS Appendix 1 (sympathomimetics).

SIDE-EFFECTS

Very rare Angle-closure glaucoma

Frequency not known Choreoathetoid movements (in predisposed individuals) - dyskinesia (in predisposed individuals) - increased appetite - tics (in predisposed individuals)

Overdose Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning, p. 1123.

PREGNANCY Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).

BREAST FEEDING Significant amount in milk—avoid.

RENAI IMPAIRMENT Use with caution.
Lisdexamfetamine mesilate

**DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

**INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist) by mouth

- **Child 6-17 years:** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
- **Adult:** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

**UNLICENSED USE**

Not licensed for use in adults for attention deficit hyperactivity disorder.

**CONTRA-INDICATIONS** Advanced arteriosclerosis - agitated states - hypereexcitability - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

**CAUTIONS** Anorexia - bipolar disorder - history of alcohol abuse - history of cardiac abnormalities - history of cardiovascular disease - history of drug abuse - may lower seizure threshold (discontinue if seizures occur) - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

**TREATMENT CESSATION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use in children Tablets can be halved.

**PRESCRIBING AND DISPENSING INFORMATION**

Data on safety and efficacy of long-term use not complete.

**PATIENT AND CARER ADVICE**

**DRUGS AND DRIVING** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

For information on 2012 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see *Drugs and driving* under Guidance on prescribing p. 1.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Methylenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98

Dexamfetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. [www.nice.org.uk/TA98](http://www.nice.org.uk/TA98)

**MEDICINAL FORMS**

There can be variations in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, modified-release capsule

- **Tablet**
  - DEXAMFETAMINE SULFATE (Non-proprietary)
  - Dexamfetamine sulfate 5 mg Dexamfetamine 5mg tablets | 28 tablet [P] £24.75 DT price £24.75 Schedule 2 (CD)

- **Oral solution**
  - DEXAMFETAMINE SULFATE (Non-proprietary)
  - Dexamfetamine sulfate 1 mg per 1 ml Dexamfetamine 5mg/5ml oral solution sugar free (sugar-free) | 500 ml [P] £109.04 DT price £109.04 Schedule 2 (CD)

**SIDE-EFFECTS**

- Common or very common Abdominal cramps - aggression - decreased appetite - diarrhoea - dizziness - dry mouth - dysphoria - growth restriction in children - headache - lable mood - malaise - mydriasis - nausea - pyrexia - sleep disturbances - tics - vomiting - weight loss

- Very rare Angle-closure glaucoma

- Frequency not known Cardiomyopathy - choreoathetoid movements (in predisposed individuals) - dyskinesia (in predisposed individuals) - euphoria - seizures - Tourette syndrome (in predisposed individuals)

**OVERDOSE**

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—present in human milk.

**RENAL IMPAIRMENT**

Max. dose 50 mg daily in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor for aggressive behaviour or hostility during initial treatment.
- Monitor growth in children.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

**PATIENT AND CARER ADVICE**

Patients and carers should be counselled on the administration of capsules.

**DRUGS AND DRIVING**

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and driving under Guidance on prescribing p. 1.

CNS STIMULANTS (NORADRENALINE REUPTAKE INHIBITORS)

Atomoxetine

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

BY MOUTH

● Child 6-17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

● Child 6-17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day

● Adult (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day

● Adult (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80–100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

● UNLICENSED USE

○ In children Doses above 100 mg daily not licensed.

○ In adults Dose maximum of 120 mg not licensed.

Atomoxetine doses in BNF may differ from those in product literature.

● CONTRA-INDICATIONS Phaeochromocytoma - severe cardiovascular disease - severe cerebrovascular disease

● CAUTIONS QT-interval prolongation - aggressive behaviour - cardiovascular disease - cerebrovascular disease - emotional lability - history of seizures - hostility - hypertension - mania - psychosis - structural cardiac abnormalities - susceptibility to angle-closure glaucoma - tachycardia

● INTERACTIONS → Appendix 1 (atomoxetine). Avoid concomitant use of drugs that prolong QT interval.

● SIDE-EFFECTS

○ Common or very common Abdominal pain - anorexia - anxiety - constipation - depression - dermatitis - dizziness - drowsiness - dry mouth - dyspepsia - flatulence - flushing - headache - chills - increased blood pressure - irritability - lethargy - malaise - mydriasis - nausea - palpitation - paraesthesia - prostatitis - rash - sexual dysfunction - sleep disturbances - sweating - tachycardia - taste disturbances - tremor - urinary dysfunction - vomiting

○ Uncommon Aggression - cold extremities - emotional lability - hostility - hypoaesthesia - menstrual disturbances - muscle spasms - pruritus - psychosis - QT-interval prolongation - suicidal ideation - syncope - tics

○ Rare Raynaud’s phenomenon - seizures

○ Very rare Angle-closure glaucoma - hepatic disorders

● PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

● BREAST FEEDING Avoid-present in milk in animal studies.

● HEPATIC IMPAIRMENT Halve dose in moderate impairment. Quarter dose in severe impairment.

● MONITORING REQUIREMENTS

○ Monitor for appearance or worsening of anxiety, depression or tics.

○ Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd

Suicidal ideation Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression. Hepatic impairment Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

● NATIONAL FUNDING/ACCESS DECISIONS

Attention deficit hyperactivity disorder

### Methylphenidate hydrochloride

#### CNS STIMULANTS (SYMPATHOMIMETICS, CENTRALLY ACTING)

**INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder (initiated under specialist supervision)**

**BY MOUTH**
- **Child 6-17 years:** Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation; maximum 90 mg per day.
- **Adult:** Initially 5 mg 2–3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2–3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation.

**Narcolepsy**

**BY MOUTH**
- **Adult:** 10–60 mg daily in divided doses; usual dose 20–30 mg daily in divided doses, dose to be taken before meals.

**CONCERTA**

**Attention deficit hyperactivity disorder**

**BY MOUTH**
- **Child 6-17 years:** Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day.

**Dose equivalence and conversion**

Total daily dose of 15 mg of standard-release formulation is considered equivalent to **Concerta** XL 18 mg once daily.

**MEDIKINET**

**Attention deficit hyperactivity disorder**

**BY MOUTH**
- **Child 6-17 years:** Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day.
- **Adult:** Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day.

**EQUASYM**

**Attention deficit hyperactivity disorder**

**BY MOUTH**
- **Child 6-17 years:** Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day.
- **Adult:** Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; maximum 100 mg per day.

**UNLICENSED USE**

Not licensed for use in children under 6 years; doses over 60 mg daily not licensed; doses of **Concerta** XL over 54 mg daily not licensed. Not licensed for use in narcolepsy. Not licensed for use in adults for attention deficit hyperactivity disorder.

**CONTRA-INDICATIONS**

- Anorexia nervosa · arrhythmias · cardiomyopathy · cardiovascular disease · cerebrovascular disorders · heart failure · hyperthyroidism · phaeochromocytoma · psychosis · severe depression · severe hypertension · structural cardiac abnormalities · suicidal ideation · uncontrolled bipolar disorder · vasculitis

**CAUTIONS**

- Agitation · alcohol dependence · anxiety · drug dependence · epilepsy (discontinue if increased seizure frequency) · family history of Tourette syndrome · susceptibility to angle-closure glaucoma · tics

**CONCERTA**

**Dysphagia (dose form not appropriate) · restricted gastro-intestinal lumen (dose form not appropriate)**

**INTERACTIONS**

Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · aggression · alopecia · anorexia · arrhythmias · arthralgia · asthenia · changes in blood pressure · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · fever · growth restriction · headache · insomnia · irritability · movement disorders · nasopharyngitis · nausea · nervousness · palpitation · pruritus · rash · reduced weight gain · tachycardia · tics · vomiting

- **Uncommon** Abnormal dreams · confusion · constipation · dysphagia · epistaxis · haematuria · muscle cramps · suicidal ideation · urinary frequency

- **Rare** Angina · sweating · visual disturbances

- **Very rare** Angle-closure glaucoma · blood disorders · cerebral arteritis · dependence · erythema multiforme · exfoliative dermatitis · hepatic dysfunction · leucopenia · myocardial infarction · neurologic malignant syndrome · psychosis · seizures · thrombocytopenia · tolerance · Tourette syndrome

- **Frequency not known** Bradycardia · convulsions · supraventricular tachycardia

**PREGNANCY**

Limited experience—avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

Limited information available—avoid.

**MONITORING REQUIREMENTS**

- Monitor for psychiatric disorders.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).
2.3 Bipolar disorder and mania

**Drugs used for mania and hypomania**

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse. An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

**Benzodiazepines**

Use of benzodiazepines (such as lorazepam p. 412) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

**Antipsychotic drugs**

Antipsychotic drugs (normally olanzapine p. 315, quetiapine p. 318, or risperidone p. 319) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine p. 315 can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine p. 315 therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 276, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.
Carbamazepine

Carbamazepine p. 387 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine p. 387 should not normally be increased if an acute episode of mania occurs.

Valproate

Valproate p. 387 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine p. 387 should not normally be increased if an acute episode of mania occurs.

Lithium

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine p. 315 or valproate (given alone or as an adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

Valproate

Valproic acid (as the semisodium salt) and sodium valproate p. 403 are used for the treatment of manic episodes associated with bipolar disorder. Valproate (valproic acid below and sodium valproate) is also used for the prophylaxis of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential.

Migraine prophylaxis

BY MOUTH

Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

CONVULEX®

Epilepsy

BY MOUTH

Child: Total daily dose to be given in 2–4 divided doses (consult product literature)

Adult: Total daily dose to be given in 2–4 divided doses (consult product literature)

Dose equivalence and conversion

Sodium valproate also contains sodium valproate, but nevertheless care is needed if switching or making changes.

Unlicensed use

Not licensed for migraine prophylaxis.

Contra-indications

Acute porphyrias p. 864 • family history of severe hepatic dysfunction

Caution

Systemic lupus erythematosus

Caution, further information

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Interactions

Appendix 1 (valproic acid).

Side-effects

Common or very common Diarrhoea • gastric irritation • hyperammonaemia • nausea • thrombocytopenia • transient hair loss (growth may be curly) • weight gain

Uncommon Aggression • ataxia • behavioural disturbances • hyperactivity • increased alertness • tremor • vasculitis

Rare Anaemia • blood disorders • confusion • drowsiness • hallucinations • hearing loss • hepatic dysfunction • lethargy • leucopenia • pancytopenia • rash • stupor

Very rare Acne • coma • dementia • encephalopathy • enuresis • extrapyramidal symptoms • Fanconi’s syndrome • gynaecomastia • hirsutism • hyponatraemia • increase in bleeding time • pancreatitis • peripheral oedema • reduced bone mineral density • Stevens-Johnson syndrome • suicidal ideation • toxic epidermal necrolysis

Frequency not known Drug rash with eosinophilia and systemic symptoms (DRESS) syndrome • hypersensitivity reactions • male infertility • menstrual disturbances • syndrome of inappropriate secretion of antidiuretic hormone

Side-effects, further information

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Conception and contraception

Valproate is associated with teratogenic risks and should not be used in women of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for women of child-bearing age.
Effective contraception advised in women of child-bearing potential.

- **Pregnancy** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. Neonatal bleeding (related to hypofibrinohaemia) and neonatal hepatotoxicity also reported. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **Breastfeeding** Amount too small to be harmful.

- **Hepatic Impairment** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

- **Renal Impairment** Reduce dose.

### Monitoring Requirements

- **Monitor closely if dose greater than 10 mg/kg daily.**
- **Monitor liver function before therapy and during first 6 months especially in patients most at risk.**
- **Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.**

### Effect on Laboratory Tests

- **False-positive urine tests for ketones.**

### Treatment Cessation

If treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

### Prescribing and Dispensing Information

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.

### Patient and Carer Advice

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop. Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop. Counselling advised on pregnancy.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension gastro-resistant tablet

- **Depakote (Sanofi)**
  - Valproic acid (as Valproate semisodium) 250 mg Depakote 250mg gastro-resistant tablets | 90 tablet [P] £14.60 DT price = £14.40
  - Valproic acid (as Valproate semisodium) 500 mg Depakote 500mg gastro-resistant tablets | 90 tablet [P] £29.15 DT price = £29.15

Gastro-resistant capsule

- **Convulex** (Pfizer Ltd)
  - Valproic acid 150 mg Convulex 150mg gastro-resistant capsules | 100 capsule [P] £0.60
  - Valproic acid 300 mg Convulex 300mg gastro-resistant capsules | 100 capsule [P] £1.20
  - Valproic acid 500 mg Convulex 500mg gastro-resistant capsules | 100 capsule [P] £1.20

### LITHIUM SALTS

#### Lithium salts

- **Contra-Indications** Addison’s disease - cardiac insufficiency - dehydration - family history of Brugada syndrome - low sodium diets - personal history of Brugada syndrome - rhythm disorder - untreated hypothyroidism

- **Caution** Avoid abrupt withdrawal - cardiac disease - concurrent ECT (may lower seizure threshold) - diuretic treatment (risk of toxicity) - elderly (reduce dose) - epilepsy (may lower seizure threshold) - myasthenia gravis - psoriasis (risk of exacerbation) - QT interval prolongation - review dose as necessary in diarrhoea - review dose as necessary in intercurrent infection (especially if sweating profusely) - review dose as necessary in vomiting - surgery

- **Caution, Further Information**

**Long-term use** Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).
The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

- **INTERACTIONS** → Appendix 1 (lithium).
  - Caution with concomitant use of drugs and any therapy that may lower seizure threshold.
  - Caution with concomitant use of drugs that prolong the QT interval.
  - Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided.

- **SIDE-EFFECTS**
  - Very rare: Nystagmus
  - Frequency not known: Acneiform eruptions, alopecia, anorexia, arthralgia, AV block, benign intracranial hypertension, bradycardia, cardiomyopathy, cognitive impairment, dry mouth, dysgeusia, ECG changes, electrolyte imbalance, encephalopathy, euthyroid goitre, extrapyramidal side-effects, fine tremor, gastritis, gastro-intestinal disturbances, hallucinations, hyperparathyroidism, hypersalivation, hypothyroidism, hypothyroidism, kidney changes, leucocytosis, malaise, memory loss, myalgia, myasthenia gravis, nephrogenic diabetes insipidus, nephrotic syndrome, oedema, other skin disorders, parathyroid adenoma, peripheral neuropathy, polydipsia, polyuria, psychosis, vertigo.
  - QT interval prolongation, Raynaud’s phenomena, renal impairment, sexual dysfunction, sinus node dysfunction, speech disorder, thyroid changes, vertigo, weight changes.

**Overdose**

- Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessess, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdose (serum-lithium concentration above 2 mmol/litre) seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1123.

- **CONCEPTION AND CONTRACTION**
  - Manufacturer advises effective contraception during treatment for women of child-bearing potential.

- **PREGNANCY**
  - Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).
  - Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).
  - Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREAST FEEDING**
  - Present in milk and risk of toxicity in infant—avoid.

- **RENAL IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.
  - In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

- **MONITORING REQUIREMENTS**
  - Serum concentrations: Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
  - Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).

- A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.
  - Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.

- **Renal function should be monitored at baseline and every 6 months thereafter** (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).

- Assess cardiac and thyroid function before initiating, and thereafter every 6 months on stabilised regimens.

- **TREATMENT CESSATION**
  - While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE**

  - **Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving, operating machinery).

  - Lithium treatment packs
    - A lithium treatment pack should be given to patients on initiation of treatment with lithium.
    - The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M: 0845 610 1112 nhsforms@mm.m.org.uk

  - Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance).
  - Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

### Lithium carbonate

#### INDICATIONS AND DOSE

- **Treatment and prophylaxis of mania** | **Treatment and prophylaxis of bipolar disorder** | **Treatment and prophylaxis of recurrent depression** | **Treatment and prophylaxis of aggressive or self-harming behaviour**

**B Y M O U T H**

- Adult: Dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**CAMCOLIT™ TABLET**

- **Treatment of mania** | **Treatment of bipolar disorder** | **Treatment of recurrent depression** | **Treatment of aggressive or self-harming behaviour**

**BY MOUTH**

- Adult: Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then
every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Elderly: Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**LISKONUM®**

**Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour**

**BY MOUTH**

- Adult: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Elderly: Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour**

**CAMCOLIT® MODIFIED-RELEASE TABLET**

**Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of aggressive or self-harming behaviour**

**BY MOUTH**

- Adult: Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Elderly: Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania | Prophylaxis of bipolar disorder | Prophylaxis of recurrent depression | Prophylaxis of aggressive or self-harming behaviour**

**BY MOUTH**

- Adult: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**PRIADEL® TABLETS**

**Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour**

**BY MOUTH**

- Adult (body-weight up to 49 kg): Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Adult (body-weight 50 kg and above): Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Preparations vary widely in bioavailability:** changing the preparation requires the same precautions as initiation of treatment.
Lithium citrate

INDICATIONS AND DOSE
Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH
- Adult: Dosed adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Adult (body-weight up to 49 kg): Initially 509 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly (body-weight above 50 kg): Initially 1018–3054 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

LI-LIQUID™

Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH
- Adult (body-weight up to 49 kg): Initially 520 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Adult (body-weight 50 kg and above): Initially 1040–3120 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly (body-weight above 50 kg): Initially 1040 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly (body-weight above 50 kg): Initially 520 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Antidepressant drugs

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep...
disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression (typically of at least 2 years duration)). Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice
The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification. There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, elective conversion treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 288 has shown to be safe. Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiovascular effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists. Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

St John’s wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

Management
Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond). Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hyponatraemia and Antidepressant Therapy Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal Behaviour and Antidepressant Therapy The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to life-threatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 291. Other second-line choices include lofepramine p. 297, moclobemide p. 283, and reboxetine p. 284. Other tricyclic antidepressants and venlafaxine p. 289 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 312 [unlicensed], olanzapine p. 315 [unlicensed], quetiapine p. 318, or risperidone p. 319 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Anxiety disorders and obsessive-compulsive disorder Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 269. For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with generalised anxiety disorder, a form of chronic anxiety, should be offered...
psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 285, paroxetine p. 287, or sertraline p. 288 [unlicensed], can be used. Duloxetine p. 288 and venlafaxine p. 289 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder, if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 400 can be considered.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine hydrochloride p. 294 or imipramine hydrochloride p. 296 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride p. 294 can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 283 is licensed for the treatment of social anxiety disorder.

**Tricyclic and related antidepressant drugs**

**Choice**

Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride p. 294 is more selective for serotoninergic transmission, and imipramine hydrochloride p. 296 is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with **sedative** properties include amitriptyline hydrochloride p. 292, clomipramine hydrochloride p. 294, doxepin hydrochloride p. 295, doxepin p. 296, mianserin hydrochloride p. 290, trazodone hydrochloride p. 291, and trimipramine p. 299. Those with **less sedative** properties include imipramine hydrochloride p. 296, lofepramine p. 297, and nortriptyline p. 298.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdosage, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and doxepin hydrochloride are effective but they are particularly dangerous in overdosage and are not recommended for the treatment of depression; doxepin hydrochloride should be initiated by a specialist.

**Dosage**

About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly. In most patients the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of panic and other anxiety disorders. Some tricyclic antidepressants may also have a role in some forms of neuralgia and in nocturnal enuresis in children.

**Children and adolescents**

Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

**Monoamine-oxidase inhibitors**

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine p. 283 has a greater stimulant action than phenelzine p. 283 or isocarboxazid p. 282 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Moclobemide p. 283 should be reserved as a second line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

**Other antidepressant drugs**

The thioxanthene flupentixol p. 305 (Fluanxol®) has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses.

**Drugs used for Depression not listed below; Flupentixol, p. 305 · Lithium carbonate, p. 277 · Lithium citrate, p. 279 · Quetiapine, p. 318

**MELATONIN RECEPTOR AGONISTS**

**Agomelatine**

**DRUG ACTION** A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

**INDICATIONS AND DOSE**

**Major depression**

**BY MOUTH**

Adult: 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

**Dose adjustments due to interactions**

Caution—dose adjustment may be necessary if smoking started or stopped during treatment.

**CONTRA-INDICATIONS** Dementia · patients over 75 years of age

**CAUTIONS** Bipolar disorder · diabetes · excessive alcohol consumption · hypomania · mania · non-alcoholic fatty liver disease · obesity

**INTERACTIONS** → Appendix 1 (agomelatine).

Caution with concomitant use of drugs associated with hepatic injury.

**SIDE-EFFECTS**

- Common or very common Abdominal pain · agitation · anxiety · back pain · constipation · diarrhoea · dizziness · drowsiness · fatigue · headache · increased serum transaminases · nausea · sleep disturbances · sweating · vomiting

- Uncommon Blurred vision · eczema · paraesthesia · restless legs syndrome · tinnitus

- Rare Hepatic failure · hepatic injury · hepatitis · rash · weight changes

- Frequency not known Pruritus · suicidal behaviour
SIDE-EFFECTS, FURTHER INFORMATION

Suicidal behaviour The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Avoid. Do not start if serum transaminases exceed 3 times the upper limit of reference range.

RENAL IMPAIRMENT Caution in moderate to severe impairment.

MONITORING REQUIREMENTS Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.

PATIENT AND CARER ADVICE Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or purpura develop. Patients should be given a booklet with more information on the risk of hepatic side-effects.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

» Valdoxan (Servier Laboratories Ltd)

Agomelatine 25 mg Valdoxan 25mg tablets | 28 tablet (POS) £30.00
DT price = £30.00

MONOAMINE-OXIDASE A AND B INHIBITORS (IRREVERSIBLE)

Monoamine-oxidase inhibitors

DRUG ACTION MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.

CONTRA-INDICATIONS Cerebrovascular disease, not indicated in manic phase, phaeochromocytoma

CAUTIONS Acute porphyria, avoid in agitated patients, blood disorders, cardiovascular disease, concurrent electroconvulsive therapy, diabetes mellitus, elderly (great caution), epilepsy, severe hypertensive reactions to certain drugs and foods, surgery

INTERACTIONS » Appendix 1 (MAOIs).

The metabolism of some amine drugs such as indirect-acting sympathomimetics (present in many cough and decongestant preparations) is inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Some psychiatrists use selected tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone.

SIDE-EFFECTS

» Common or very common Dizziness, postural hypotension (especially in elderly)

» Uncommon Agitation, arrhythmias, blurred vision, confusion, constipation, convulsions, difficulty in micturition, drowsiness, dry mouth, elevated liver enzymes, euphoria, fatigue, gastrointestinal disturbances, hallucinations, headache, hyperreflexia, insomnia, leucopenia, myoclonic movement, nervousness, nyctagmus, oedema, psychotic episodes with hypomanic behaviour, purpura, rashes, sexual disturbances, suicidal behaviour, sweating, tremors, weakness, weight gain with inappropriate appetite

» Rare Fatal progressive hepatocellular necrosis

» Frequency not known Jaundice, hypoglycaemia, paraesthesia, peripheral neuritis, peripheral neuropathy (may be due to pyridoxine deficiency)

SIDE-EFFECTS, FURTHER INFORMATION

Risk of postural hypotension and hypertensive responses Discontinue use if palpitations or frequent headaches occur.

PREGNANCY Increased risk of neonatal malformations—manufacturer advises avoid unless there are compelling reasons.

HEPATIC IMPAIRMENT MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment.

MONITORING REQUIREMENTS Monitor blood pressure (risk of postural hypotension and hypertensive responses).

TREATMENT CESSATION If possible avoid abrupt withdrawal. MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving). Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or off; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Isocarboxazid

INDICATIONS AND DOSE

Depressive illness

BY MOUTH

» Adult: Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks up to 60 mg daily for 4–6 weeks, dose to be increased under
close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg may be required
  ▶ Elderly: 5–10 mg daily

● **BREAST FEEDING** Avoid.
● **HEPATIC IMPAIRMENT** Avoid in hepatic impairment.
● **RENAL IMPAIRMENT** Use with caution.
● **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

● **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  Tablet
  CAUTIONARY AND ADVISORY LABELS 3, 10
  ▶ ISO CARBOXAZID (Non-proprietary)
  Iso carboxazid 10 mg Iso carboxazid 10mg tablets | 56 tablet [P] £13.95

---

### Phenelzine

**INDICATIONS AND DOSE**

**Depressive illness**

**BY MOUTH**

- Adult: Initially 15 mg 3 times a day, response is usually seen within first week; dose may be increased if necessary after 2 weeks if response is not evident, increased if necessary to 15 mg 4 times a day, doses up to 30 mg three times a day may be used in hospital patients, then reduced to 15 mg once daily on alternate days, response may not become apparent for up to 4 weeks, once satisfactory response has been achieved, reduce dose gradually to lowest suitable maintenance dose (15 mg on alternate days may be adequate)

- Elderly: 10 mg 3 times a day

- Very rare: Seizures

- Common or very common: Confusion, extreme restlessness (with the traditional (irreversible) MAOIs, but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped.

- SIDE-EFFECTS
  - Rare: Galactorrhoea - hyponatraemia - raised liver enzymes
  - Frequency not known: Agitation - confusional states - dizziness - dry mouth - gastrointestinal disorders - headache - oedema - paraesthesia - restlessness - skin reactions - sleep disturbances - visual disturbances

---

### Tranzylcypromine

**INDICATIONS AND DOSE**

**Depressive illness**

**BY MOUTH**

- Adult: Initially 10 mg twice daily, dose to be taken at a time no later than 3 p.m., dose may be increased if necessary after 1 week, increased if necessary to 10 mg daily, dose to be taken in the morning and 20 mg daily, dose to be taken in the afternoon, doses above 30 mg daily, under close supervision only; maintenance 10 mg daily

- Elderly: 5–10 mg daily

- Very rare: Seizures

- Common or very common: Confusion, extreme restlessness (with the traditional (irreversible) MAOIs, but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped.

- SIDE-EFFECTS
  - Rare: Galactorrhoea - hyponatraemia - raised liver enzymes
  - Frequency not known: Agitation - confusional states - dizziness - dry mouth - gastrointestinal disorders - headache - oedema - paraesthesia - restlessness - skin reactions - sleep disturbances - visual disturbances

---

### Moclobemide

**DRUG ACTION** Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

**INDICATIONS AND DOSE**

**Depressive illness**

**BY MOUTH**

- Adult: Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food

- Social anxiety disorder

**BY MOUTH**

- Adult: Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy

- **CONTRA-INDICATIONS** Acute confusional states • phaeochromocytoma

- **CAUTIONS** Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks) • may provoke manic episodes in bipolar disorders • thyrotoxicosis

- **INTERACTIONS** → Appendix 1 (moclobemide).

- The risk of drug interactions is claimed to be less than with the traditional (irreversible) MAOIs, but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped.

- SIDE-EFFECTS
  - Rare: Galactorrhoea - hyponatraemia - raised liver enzymes
  - Frequency not known: Agitation - confusional states - dizziness - dry mouth - gastrointestinal disorders - headache - oedema - paraesthesia - restlessness - skin reactions - sleep disturbances - visual disturbances
SELECTIVE SEROTONIN RE- UPTAKE INHIBITORS

Reboxetine

**DRUG ACTION** Reboxetine is a selective inhibitor of noradrenaline re-uptake.

**INDICATIONS AND DOSE**

**BY MOUTH**

- **Adult**:
  - 4 mg twice daily, then increased if necessary to 10 mg/24 hours after 3–4 weeks in divided doses; maximum 12 mg per day

**CAUTIONS**
- Bipolar disorder
- History of cardiovascular disease
- History of epilepsy
- Postural hypotension
- Susceptibility to angle-closure glaucoma
- Urinary retention

**INTERACTIONS** → Appendix 1 (reboxetine).

**SIDE-EFFECTS**

- **Common or very common**
  - Anorexia, chills, constipation, dizziness, dry mouth, headache, impaired visual accommodation, impotence, insomnia, lowering of plasma-potassium concentration on prolonged administration in the elderly, nausea, palpitation, postural hypotension, sweating, tachycardia, urinary retention, vasodilatation
- **Very rare**
  - Angle-closure glaucoma

Raynaud’s syndrome, suicidal behaviour, testicular pain, vomiting

**PREGNANCY** Use only if potential benefit outweighs risk—limited information available.

**BREAST FEEDING** Small amount present in milk—use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Initial dose 2 mg twice daily, increased according to tolerance.

**RENAI IMPAIRMENT** Initial dose 2 mg twice daily, increased according to tolerance.

**TREATMENT CESSATION** Caution—avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE** Counselling advised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Reboxetine (as Reboxetine mesilate) 4 mg | Edronax 4mg tablets |
| 60 tablet PT | £18.91 DT price = £18.91 |

**NORADRENALINE RE- UPTAKE INHIBITORS**

- **Drug action** Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
- **Contra-indications** Poorly controlled epilepsy—SSRIs should not be used if the patient enters a manic phase.
- **Caution** Cardiac disease—concurrent electroconvulsive therapy—diabetes mellitus—epilepsy (discontinue if convulsions develop)—history of bleeding disorders (especially gastro-intestinal bleeding)—history of mania—susceptibility to angle-closure glaucoma
- **Interactions** → Appendix 1 (antidepressants, SSRI).
  - Caution with other drugs that increase the risk of bleeding.
  - **Side-effects**
    - **Common or very common**
      - Abdominal pain (dose-related)—constipation (dose-related)—diarrhoea (dose-related)—dyspepsia (dose-related)—gastro-intestinal effects (dose-related)—nausea (dose-related)—vomiting (dose-related)
    - **Uncommon**
      - Serotonin syndrome
    - **Very rare**
      - Angle-closure glaucoma
    - **Frequency not known**

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypersensitivity reactions** If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.

**Overdose** Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.
For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1123.

- **PREGNANCY** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

- **TREATMENT CESSATION** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PATIENT AND CARER ADVICE** May also impair performance of skilled tasks (e.g. driving, operating machinery).

### Citalopram

**INDICATIONS AND DOSE**

**Depressive illness**

BY MOUTH USING TABLETS
- Adult: 20 mg once daily, increased in steps of 20 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 40 mg per day
- Elderly: 10–20 mg once daily; maximum 20 mg per day

BY MOUTH USING ORAL DROPS
- Adult: 16 mg once daily, increased in steps of 16 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 32 mg per day
- Elderly: 8–16 mg daily; maximum 16 mg per day

**Panic disorder**

BY MOUTH USING TABLETS
- Adult: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; usual dose 20–30 mg daily; maximum 40 mg per day
- Elderly: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; maximum 20 mg per day

BY MOUTH USING ORAL DROPS
- Adult: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; usual dose 16–24 mg daily; maximum 32 mg per day
- Elderly: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; maximum 16 mg per day

**Dose equivalence and conversion**

4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

- **CONTRA-INDICATIONS** QT-interval prolongation
- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS** abnormal dreams, aggressiveness, amnesia, bradycardia, confusion, coughing, euphoria, haemorrhage, hepatitis, hypokalaemia, impaired concentration, increased salivation, malaise, micturition disorders, migraine, mydriasis, oedema, palpitation, paradoxical increased anxiety during initial treatment of panic disorder (reduce dose); paraesthesia; polyuria; postural hypotension; pruritus; QT-interval prolongation; rhinitis; tachycardia; tinnitus; taste disturbance; yawning
- **BREAST FEEDING** Present in milk—use with caution.
- **HEPATIC IMPAIRMENT** Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.
- **RENAL IMPAIRMENT** No information available for eGFR less than 20 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.

**PATIENT AND CARER ADVICE** Patients should be advised of the effects of citalopram on driving. Counselling on administration of oral drops is advised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **CITALOPRAM (Non-proprietary)**
  - Citalopram (as Citalopram hydrobromide) 10 mg Citalopram 10mg tablets | 28 tablet (P99) £8.90 DT price = £1.05

---

**Escitalopram**

**DRUG ACTION** Escitalopram is the active enantiomer of citalopram.

**INDICATIONS AND DOSE**

Depressive illness | Generalised anxiety disorder | Obsessive-compulsive disorder

BY MOUTH
- Adult: 10 mg once daily; increased if necessary up to 20 mg daily
- Elderly: Initially 5 mg once daily; maximum 10 mg per day

**Panic disorder**

BY MOUTH
- Adult: Initially 5 mg once daily for 7 days, then increased to 10 mg daily; maximum 20 mg per day
- Elderly: Initially 2.5 mg once daily; maximum 10 mg per day
Fluoxetine

INDICATIONS AND DOSE

Major depression

BY MOUTH

- Adult: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
- Elderly: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; usual maximum dose is 40 mg but doses up to 60 mg can be used

Bulimia nervosa

BY MOUTH

- Adult: 60 mg daily, daily dose may be administered as a single or divided dose
- Elderly: Up to 40 mg daily, daily dose may be administered as a single or divided dose; usual maximum dose is 40 mg but doses up to 60 mg can be used

Obsessive compulsive disorder

BY MOUTH

- Adult: 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks; maximum 60 mg per day
- Elderly: 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg but doses up to 60 mg can be used

PHARMACOKINETICS

Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

- SIDE-EFFECTS
  - Abnormal dreams, fatigue, paraesthesia, pyrexia, restlessness, sinusitis, yawning
  - Alopoeia, bruxism, confusion, epistaxis, menstrual disturbances, mydriasis, oedema, pruritus, syncope, tachycardia, taste disturbance, tinnitus
  - Aggression, bradycardia, depersonalisation
  - Paradoxical increased anxiety during initial treatment of panic disorder (reduce dose), postural hypotension, QT interval prolongation, thrombocytopenia

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

  Tablet
  - ESCITALOPRAM (Non-proprietary)

  - Escitalopram (as Escitalopram oxalate) 10 mg: Escitalopram 10mg tablets | 28 tablet [PCE] £1.53–£14.16 DT price = £1.53
  - Escitalopram (as Escitalopram oxalate) 20 mg: Escitalopram 20mg tablets | 28 tablet [PCE] £2.07–£23.94 DT price = £2.07
  - Cipralex (Lundbeck Ltd)
  - Escitalopram (as Escitalopram oxalate) 5 mg: Cipralex 5mg tablets | 28 tablet [PCE] £0.97 DT price = £1.26
  - Escitalopram (as Escitalopram oxalate) 10 mg: Cipralex 10mg tablets | 28 tablet [PCE] £14.91 DT price = £1.53
  - Escitalopram (as Escitalopram oxalate) 20 mg: Cipralex 20mg tablets | 28 tablet [PCE] £25.20 DT price = £2.07
  - Oral drops
  - Cipralex (Lundbeck Ltd)
  - Escitalopram (as Escitalopram oxalate) 20 mg per 1 ml: Cipralex 20mg/ml oral drops (sugar-free) | 15 ml [PCE] £20.16

  Dispersible tablet
  - CAUTIONARY AND ADVISORY LABELS 10
  - Olena (AMCo)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg: Olena 20mg dispersible tablets (sugar-free) | 28 tablet [PCE] £3.44 DT price = £3.44

  Capsule
  - FLUOXETINE (Non-proprietary)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg: Fluoxetine 20mg capsules | 30 capsule [PCE] £23.75 DT price = £1.16
  - Fluoxetine (as Fluoxetine hydrochloride) 60 mg: Fluoxetine 60mg capsules | 30 capsule [PCE] £144.00 DT price = £26.17
  - Prozac (Eli Lilly and Company Ltd)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg: Prozac 20mg capsules | 30 capsule [PCE] £1.50 DT price = £1.16
  - Brands may include Oxaclin

  Oral solution
  - FLUOXETINE (Non-proprietary)
  - Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml: Fluoxetine 20mg/5ml oral solution | 70 ml [PCE] £12.75 DT price = £3.69
  - Fluoxetine 20mg/5ml oral solution sugar free (sugar-free) | 70 ml [PCE] £5.70
**Fluvoxamine maleate**

**INDICATIONS AND DOSE**

**Depressive illness**

**BY MOUTH**

- Adult: Initially 50–100 mg daily, dose to be increased gradually, then increased if necessary up to 300 mg daily, doses over 150 mg daily are given in divided doses; maintenance 100 mg daily

**Obsessive-compulsive disorder**

**BY MOUTH**

- Adult: Initially 50 mg daily, dose to be taken in the evening, dose is increased gradually if necessary after several weeks, doses over 150 mg daily are given in divided doses, then increased if necessary up to 300 mg daily; maintenance 100–300 mg daily, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

**SIDE-EFFECTS**

- Common or very common: Malaise, palpitation, tachycardia
- Uncommon: Ataxia, confusion, postural hypotension
- Rare: Abnormal liver function, usually asymptomatic (discontinue treatment)
- Frequency not known: Neuroleptic malignant syndrome–like event, paraesthesia, taste disturbance

**BREAST FEEDING**

Present in milk—avoid.

**HEPATIC IMPAIRMENT**

Start with low dose.

**RENAL IMPAIRMENT**

Start with low dose.

**PATIENT AND CARER ADVICE**

Patients should be counselled about the effects on driving.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**FLUVOXAMINE MALEATE (Non-proprietary)**

Fluvoxamine maleate 50 mg, Fluvoxamine 50 mg tablets | 60 tablet | £18.95 DT price = £17.03

Fluvoxamine maleate 100 mg, Fluvoxamine 100 mg tablets | 30 tablet | £18.90 DT price = £17.03

Faverin (BGP Products Ltd)

Fluvoxamine maleate 50 mg, Faverin 50 mg tablets | 60 tablet | £17.10 DT price = £17.03

Fluvoxamine maleate 100 mg, Faverin 100 mg tablets | 30 tablet | £17.10 DT price = £17.03

**Obsessive-compulsive disorder**

**BY MOUTH**

- Adult: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- Elderly: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

**Panic disorder**

**BY MOUTH**

- Adult: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- Elderly: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

**CAUTIONS**

Achromydria - high gastric pH

**CAUTIONS, FURTHER INFORMATION**

Achromydria or high gastric pH Causes reduced absorption of the oral suspension.

**SIDE-EFFECTS**

- Common or very common: Abnormal dreams, raised cholesterol, yawning
- Uncommon: Arrhythmias, confusion, urinary incontinence
- Rare: Depersonalisation, neuroleptic malignant syndrome–like event, panic attacks, paradoxical increased anxiety during initial treatment of panic disorder (reduce dose); restless legs syndrome
- Very rare: Acute glaucoma, hepatic disorders, hepatitis, peripheral oedema, priapism
- Frequency not known: Extrapyramidal reactions, orofacial dystonias, tinnitus, withdrawal reactions

**PREGNANCY**

Increased risk of congenital malformations, especially if used in the first trimester.

**BREAST FEEDING**

Present in milk but amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Reduce dose.

**RENAL IMPAIRMENT**

Reduce dose if eGFR less than 30 mL/minute/1.73 m².

**TREATMENT CESSATION**

Associated with a higher risk of withdrawal reactions.

**PATIENT AND CARER ADVICE**

Patients should be counselled about the effect on driving.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

**PAROXETINE (Non-proprietary)**

Paroxetine (as Paroxetine hydrochloride) 10 mg, Paroxetine 10 mg tablets | 28 tablet | £14.21–£18.12 DT price = £17.47

Paroxetine (as Paroxetine hydrochloride) 20 mg, Paroxetine 20 mg tablets | 30 tablet | £3.29 DT price = £2.29

Paroxetine (as Paroxetine hydrochloride) 30 mg, Paroxetine 30 mg tablets | 30 tablet | £3.36 DT price = £1.95

Seroxat (GlaxoSmitheKline UK Ltd)

Paroxetine (as Paroxetine hydrochloride) 10 mg, Seroxat 10 mg tablets | 28 tablet | £14.21 DT price = £17.47

Paroxetine (as Paroxetine hydrochloride) 20 mg, Seroxat 20 mg tablets | 30 tablet | £15.23 DT price = £2.29

Paroxetine (as Paroxetine hydrochloride) 30 mg, Seroxat 30 mg tablets | 30 tablet | £26.74 DT price = £1.95
Sertraline

**INDICATIONS AND DOSE**

**Depressive illness**
- **Adult:** Initially 50 mg daily, then increased in steps of 50 mg at least every 1 week if required; maintenance 50 mg daily; maximum 200 mg per day

**Obsessive-compulsive disorder**
- **Adult:** Initially 50 mg daily, then increased in steps of 50 mg at least every 1 week if required; maximum 200 mg per day

**Panic disorder | Post-traumatic stress disorder | Social anxiety disorder**
- **Adult:** Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at least every 1 week if required, increase only if response is partial and if drug is tolerated; maximum 200 mg per day

**SIDE-EFFECTS**
- Aggression • amnesia • bronchospasm • hepatitis • hypercholesterolaemia • hyperprolactinaemia • hypertension • hypoglycaemia • hypothyroidism • jaundice • leucopenia • liver failure • menstrual irregularities • palpitation • pancreatitis • paraesthesia • postural hypotension • stomatitis • tachycardia • tinnitus • urinary incontinence

**BREAST FEEDING**
- Not known to be harmful but consider discontinuing breast-feeding.

**HEPATIC IMPAIRMENT**
- Reduce dose or increase dose interval in mild or moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
- Use with caution.

**PATIENT AND CARER ADVICE**
- Patients should be counselled on the effects on driving.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **SERTRALINE (Non-proprietary)**
  - Sertraline (as Sertraline hydrochloride) 50 mg | 28 tablet [†] £19.25 DT price = £1.46
  - Sertraline (as Sertraline hydrochloride) 100 mg | 28 tablet [†] £25.09 DT price = £1.66
- **Lustral** (Pfizer Ltd)
  - Sertraline (as Sertraline hydrochloride) 50 mg | 28 tablet [‡] £17.82 DT price = £1.46
  - Sertraline (as Sertraline hydrochloride) 100 mg | 28 tablet [‡] £29.16 DT price = £1.66

**SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS**

**Duloxetine**
- **DRUG ACTION**
  - Inhibits the re-uptake of serotonin and noradrenaline.

**INDICATIONS AND DOSE**

**Major depressive disorder**
- **BY MOUTH**
  - **Adult:** 60 mg once daily

**Generalised anxiety disorder**
- **BY MOUTH**
  - **Adult:** Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

**Diabetic neuropathy**
- **BY MOUTH**
  - **Adult:** 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

**Moderate to severe stress urinary incontinence**
- **BY MOUTH**
  - **Adult (female):** 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

**CAUTIONS**
- Bleeding disorders • cardiac disease • elderly • history of mania • history of seizures • hypertension (avoid if uncontrolled) • raised intra-ocular pressure • susceptibility to angle-closure glaucoma

**INTERACTIONS**
- Appendix 1 (duloxetine). Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**
- Common or very common Abdominal pain • abnormal dreams • anorexia • anxiety • constipation • decreased appetite • diarrhoea • dizziness • drowsiness • dry mouth • dyspepsia • fatigue • flatulence • headache • hot flush • insomnia • nausea • nervousness • palpitation • paraesthesia • pruritis • sexual dysfunction • sweating • tremor • visual disturbances • vomiting • weakness • weight changes

- Uncommon Bruisism • cold extremities • dysphagia • gastritis • halitosis • hepatitis • hypertension • hypothyroidism • impaired attention • impaired temperature regulation • movement disorders • muscle twitching • musculoskeletal pain • photosensitivity • postural hypotension • raised cholesterol • stomatitis • syncope • tachycardia • taste disturbance • thirst • urinary disturbances • vertigo

- Rare Mania

- Very rare Angle-closure glaucoma

- Frequency not known Anaphylaxis • angioedema • chest pain • hallucinations • hypersensitivity reactions • hyponatraemia • rash • seizures • Stevens-Johnson syndrome • suicidal behaviour • supraventricular arrhythmia • urticaria

**PREGNANCY**
- Toxicity in animal studies—avoid in patients with stress urinary incontinence; in other conditions use only if potential benefit outweighs risk. Risk of neonatal withdrawal symptoms if used near term.

**BREAST FEEDING**
- Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**
- Manufacturer advises avoid.

**RENAL IMPAIRMENT**
- Avoid if eGFR less than 30 mL/minute/1.73 m².

**TREATMENT CESSATION**
- Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.

---

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 5, 21**

- **Seroxat** (GlaxoSmithKline UK Ltd) Paroxetine (as Paroxetine hydrochloride) 2 mg per 1 ml Seroxat 20mg/10ml liquid (sugar-free) | 150 ml [†] £9.12 DT price = £9.12
Venlafaxine

**INDICATIONS AND DOSE**

**Major depression**

- **By mouth using immediate-release medicines**
  - Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day
- **By mouth using modified-release medicines**
  - Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

**Generalised anxiety disorder**

- **By mouth using modified-release medicines**
  - Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

**Social anxiety disorder**

- **By mouth using modified-release medicines**
  - Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

**CONTRA-INDICATIONS**

Conditions associated with high risk of cardiac arrhythmia - uncontrolled hypertension

**CAUTIONS**

Diabetes - heart disease (monitor blood pressure) - history of bleeding disorders - history of epilepsy - history or family history of mania - susceptibility to angle-closure glaucoma

**INTERACTIONS**

Appendix 1 (venlafaxine). Comitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- **Common or very common**
  - Abnormal dreams - anorexia - anxiety - anxiety (on withdrawal) - asthenia - changes in serum cholesterol - chills - confusion - constipation - difficulty with micturition - dizziness - dizziness (on withdrawal) - drowsiness - dry mouth - gastro-intestinal disturbances (on withdrawal) - headache - headache (on withdrawal) - hypertension - hypotension - insomniam - menstrual disturbances - mydriasis - nausea - nervousness - palpitation - paraesthesia (on withdrawal) - sensory disturbances - sexual dysfunction - sleep disturbances (on withdrawal) - sweating - sweating (on withdrawal) - tremor - tremor (on withdrawal) - vasodilatation - visual disturbances - vomiting - weight changes - yawning
- **Uncommon**
- **Rare**
  - Akathisia - extrapyramidal symptoms - hypomania - mania - seizures - urinary incontinence
- **Very rare**
  - Angle-closure glaucoma
- **Frequency not known**

**PREGNANCY**

Avoid unless potential benefit outweighs risk—toxicity in animal studies. Risk of withdrawal effects in neonate.

**BREAST FEEDING**

Present in milk—avoid.

**HEPATIC IMPAIRMENT**

Consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment.

**RENAL IMPAIRMENT**

Use with caution. Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m².

**TREATMENT CESSATION**

Associated with a higher risk of withdrawal effects compared with other antidepressants. Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

**PATIENT AND CARER ADVICE**

May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 3**

- **VENLAFAXINE (Non-proprietary)**
  - Venlafaxine (as Venlafaxine hydrochloride) 37.5 mg
  - Venlafaxine 37.5 mg tablets | 56 tablet (POD) £20.00 DT price = £2.37
  - Venlafaxine (as Venlafaxine hydrochloride) 75 mg
  - Venlafaxine 75 mg tablets | 56 tablet (POD) £30.00 DT price = £2.66
  - Brands may include ViePax

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 3, 21, 25**

- Sunvenix XL (Sun Pharmaceuticals UK Ltd)
  - Venlafaxine (as Venlafaxine hydrochloride) 75 mg
  - Sunvenix XL 75 mg tablets | 30 tablet (POD) £11.14 DT price = £1.12
  - Venlafaxine (as Venlafaxine hydrochloride) 150 mg
  - Sunvenix XL 150 mg tablets | 30 tablet (POD) £18.64 DT price = £1.87

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta®) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.

**CONTRA-INDICATIONS**

Conditions associated with high risk of cardiac arrhythmia - uncontrolled hypertension

**CAUTIONS**

Diabetes - heart disease (monitor blood pressure) - history of bleeding disorders - history of epilepsy - history or family history of mania - susceptibility to angle-closure glaucoma

**INTERACTIONS**

Appendix 1 (venlafaxine). Comitant use of drugs that increase risk of bleeding.
Mianserin hydrochloride

INDICATIONS AND DOSE
Depressive illness (particularly where sedation is required)

- Adult: Initially 30–40 mg daily in divided doses, alternately initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg
- Elderly: Initially 30 mg daily in divided doses, alternately initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

CONTRA-INDICATIONS
Acute porphyrias p. 864.
arrhythmias - during the manic phase of bipolar disorder.
heart block - immediate recovery period after myocardial infarction
CAUTIONS
Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

CAUTIONS, FURTHER INFORMATION
Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS
Antidepressants, tricyclic (related).

SIDE-EFFECTS
Common or very common: Agitation - anxiety - arrhythmia - blurred vision - confusion - dizziness - dry mouth - ECG changes, heart block - irritability - paraesthesia - postural hypotension - sleep disturbances - sudden death of patients with cardiac disease - tachycardia
Rare: Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor - urinary retention
Very rare: Constipation - neuroleptic malignant syndrome - precipitation of angle-closure glaucoma
Frequency not known: Alopecia - anorexia - arthralgia - arthritis - blood dyscrasias - breast enlargement - changes in blood sugar - chills (on withdrawal) - convulsions - delusions - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - hepatic reactions - hypomania - hypotension - increased appetite - influenza-like symptoms (on withdrawal) - Insomnia (on withdrawal) - jaundice - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - oedema - photosensitivity - pruritus - rash - sexual dysfunction - suicidal behaviour - sweating - sweating (on withdrawal) - taste disturbance - tinnitus - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

OVERDOSE
Emergency treatment of poisoning
The tricyclic-related antidepressant drugs may be associated with a lower risk of cardio toxicity in overdosage.
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.
Pregnancy
Avoid.
Breast Feeding
The amount secreted into breast milk is too small to be harmful.

Hepatic impairment
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

Renal impairment
Caution in renal impairment.

Monitoring requirements
A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop.

Treatment cessation
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

Prescribing and dispensing information
Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

Patient and carer advice
Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
Mirtazapine

**DRUG ACTION** Mirtazapine is a presynaptic alpha₂-adrenoceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

**INDICATIONS AND DOSE**

**Major depression**

**BY MOUTH**

- **Adult:** Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily; increased if necessary up to 45 mg daily in 2 divided doses.

**CAUTIONS** Cardiac disorders - diabetes mellitus - elderly - history of bipolar depression - history of seizures - history of urinary retention - hypotension - psychoses (may aggravate psychotic symptoms) - susceptibility to angle-closure glaucoma

**INTERACTIONS** Appendix 1 (mirtazapine).

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams - agitation (on withdrawal) - anxiety - anxiety (on withdrawal) - arthralgia - confusion - dizziness - dizziness (on withdrawal) - drowsiness - dry mouth - fatigue - headache (on withdrawal) - increased appetite - insomnia - myalgia - nausea (on withdrawal) - oedema - postural hypotension - tremor - vomiting (on withdrawal) - weight gain

- **Uncommon** Hallucinations - mania - movement disorders - syncope

- **Rare** Aggression - myoclonus - pancreatitis

- **Frequency not known** Angle-closure glaucoma - blood disorders - convulsions - dysarthria - hypersalivation - hyponatraemia - inappropriate secretion of antidiuretic hormone - sedation during initial treatment - Stevens-Johnson syndrome - suicidal behaviour - toxic epidermal necrolysis

**PREGNANCY** Use with caution—limited experience; monitor neonate for withdrawal effects.

**BREAST FEEDING** Present in milk; use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Use with caution. Discontinue if jaundice occurs.

**RENAL IMPAIRMENT** Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m²; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m².

**TREATMENT CESSATION** Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

**DIRECTIONS FOR ADMINISTRATION** Orosuspensory tablet (Zispin SolTab) should be placed on the tongue, allowed to disperse and swallowed.

**PATIENT AND CARER ADVICE** Counselling on administration of orosuspensory tablet advised.

Blood Disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected.
CAUTIONS, FURTHER INFORMATION
Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS
Antidepressants, tricyclic (related).

SIDE-EFFECTS
- Rare
  - Extrapyramidal symptoms - paralytic ileus
- Very rare
  - precipitation of angle-closure glaucoma
- Frequency not known
  - agitation - alopecia - anorexia - anxiety - arrhythmia - arthralgia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - drowsiness - dry mouth - dysarthria - dyspepsia - dyspnoea - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypersalivation - hypertension - hypomania - hypopatraemia - increased appetite - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - palpitation - paranaesthesia - photosensitivity - postural hypotension - priapism (discontinue immediately) - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - tremor - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

OVERDOSE
Emergency treatment of poisoning. The tricyclic-related antidepressant drugs may be associated with a lower risk of cardio toxicity in overdosage. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

PREGNANCY
Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.

BREAST FEEDING
The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

RENAL IMPAIRMENT
Use with caution in severe impairment.

TREATMENT CESSATION
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION
Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

PATIENT AND CARER ADVICE
Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

TRICYCLIC ANTIDEPRESSANTS
Amitriptyline hydrochloride

INDICATIONS AND DOSE
Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)

BY MOUTH
- Adult: Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 50 mg per day.

Depressive illness (but not recommended)

BY MOUTH
- Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually
- Elderly: Initially 30–75 mg daily in divided doses, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually

Neuropathic pain

BY MOUTH
- Adult: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

Migraine prophylaxis

BY MOUTH
- Adult: Initially 10 mg once daily, then increased if necessary to 50–75 mg once daily (max. per dose 150 mg), dose to be taken at night

UNLICENSED USE
licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 - arrhythmias - during manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** Appendix 1 (Antidepressants, tricyclic).

- **SIDE-EFFECTS**

  - **Common or very common** Abdominal pain - fatigue - hypertension - mydriasis - oedema - palpitation - restlessness - stomatitis

  - **Rare** Dysthria - extrapyramidal symptoms - paralytic ileus - tremor

  - **Very rare** Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

  - **Frequency not known** Agitation - alopecia - anorexia - anxiety - arthrythmia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - drowsiness - dry mouth - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hypotenraemia - increased appetite - increased intra-ocular pressure - influenza-like symptoms (on withdrawal) - Insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

- **Overdose** Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdose may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 1123.

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. Risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

- **AMITRIPTYLINE HYDROCHLORIDE (Non-proprietary)**
  - Amitriptyline hydrochloride 10 mg Amitriptyline 10mg tablets | 28 tablet (£0.12 DT price = £1.05
  - Amitriptyline hydrochloride 25 mg Amitriptyline 25mg tablets | 28 tablet (£0.10 DT price = £1.10
  - Amitriptyline hydrochloride 50 mg Amitriptyline 50mg tablets | 28 tablet (£0.19 DT price = £1.19

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 2**

- **AMITRIPTYLINE HYDROCHLORIDE (Non-proprietary)**
  - Amitriptyline hydrochloride 10mg/5ml oral solution sugar free (sugar-free) | 150 ml (£30 £22.60-£26.00
  - Amitriptyline hydrochloride 5mg/1ml oral solution sugar free (sugar-free) | 150 ml (£30 £18.00 DT price = £18.00
  - Amitriptyline hydrochloride 10mg/5ml oral solution sugar free (sugar-free) | 150 ml (£30 £19.20 DT price = £19.20

**Amitriptyline with perphenazine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, amitriptyline hydrochloride p. 292, perphenazine p. 308.

**INDICATIONS AND DOSE**

**Depression with anxiety**

**BY MOUTH**

- Adult: 1 tablet 3 times a day, an additional tablet may be taken at bedtime when required

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

- **Triptafen (AMCo)**
  - Amitriptyline hydrochloride 25 mg, Perphenazine 2 mg Triptafen tablets | 100 tablet (£33.13
Clomipramine hydrochloride

INDICATIONS AND DOSE

Depressive illness
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
**Adult:** Initially 10 mg daily, then increased if necessary to 30–150 mg daily in divided doses, dose to be increased gradually, alternatively increased if necessary to 30–150 mg once daily, dose to be taken at bedtime; maximum 250 mg per day
**Elderly:** Initially 10 mg daily, then increased to 30–75 mg daily, dose to be increased carefully over approximately 10 days

Phobic and obsessional states
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
**Adult:** Initially 25 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day
**Elderly:** Initially 10 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
**Adult:** Initially 10 mg daily, dose to be gradually increased until satisfactory response; increased if necessary to 10–75 mg daily

ANAFRANIL SR®
Depressive illness
BY MOUTH
**Adult:** Initially 10 mg once daily, then increased if necessary to 30–150 mg once daily, to be taken at bedtime, doses to be titrated using clomipramine capsules, dose to be increased gradually; maximum 250 mg per day
**Elderly:** Initially 10 mg once daily, then increased to 30–75 mg once daily, dose to be increased carefully over approximately 10 days, doses to be titrated using clomipramine capsules

Phobic and obsessional states
BY MOUTH
**Adult:** Initially 25 mg once daily, then increased to 100–150 mg once daily, dose to be increased gradually over 2 weeks, doses to be titrated using clomipramine capsules; maximum 250 mg per day
**Elderly:** Initially 10 mg once daily, then increased to 100–150 mg once daily, dose to be increased gradually over 2 weeks, doses to be titrated using clomipramine capsules; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy
BY MOUTH
**Adult:** Initially 10 mg once daily, dose to be gradually increased until satisfactory response; usual dose 10–75 mg once daily, doses to be titrated using clomipramine capsules

- **CONTRA-INDICATIONS** Acute porphyrias p. 864; arrhythmias during the manic phase of bipolar disorder; heart block; immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease, chronic constipation, diabetes, epilepsy, history of bipolar disorder, history of psychosis, hyperthyroidism (risk of arrhythmias), increased intra-ocular pressure, patients with a significant risk of suicide, phaeochromocytoma (risk of arrhythmias), prostatic hypertrophy, susceptibility to angle-closure glaucoma, urinary retention

- **INTERACTIONS** Appendix 1 (antidepressants, tricyclic.

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain, agitation, alopecia, anxiety, arthralgia, blurred vision, breast enlargement, changes in blood sugar, chills (on withdrawal), confusion, constipation, convulsions, delusions, dizziness, dry mouth, ECG changes, galactorrhoea, gynaecomastia, haematological reactions, hallucinations, headache (on withdrawal), heart block, hepatic reactions, hypomana, hypotension, increased appetite, influenza-like symptoms (on withdrawal), insomnia (on withdrawal), irritability, mania, movement disorders (on withdrawal), myalgia (on withdrawal), nausea, nausea (on withdrawal), paraesthesia, photosensitivity, postural hypotension, pruritus, rash, sexual dysfunction, sleep disturbances, sudden death of patients with cardiac disease, suicidal behaviour, sweating, sweating (on withdrawal), tachycardia, taste disturbance, tinnitus, urinary retention, urticaria, vivid dreams (on withdrawal), vomiting, weight gain, weight loss

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- **PREGNANCY** Neonatal withdrawal symptoms reported if used during third trimester.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be
Dosulepin hydrochloride (Dothiepin hydrochloride)

**INDICATIONS AND DOSE**

Depressive illness (particularly where sedation is required) (initiated by a specialist)

*BY MOUTH*

- **Adult:** Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use).
- **Elderly:** Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use).

**CONTRA-INDICATIONS**

Acute porphyrias p. 864 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

**CAUTIONS**

Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

**INTERACTIONS**

Appendix 1 (antidepressants, tricyclic).

**SIDE-EFFECTS**

- Rare: Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor.
- Very rare: Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma.

**FREQUENCY NOT KNOWN**

Agitation - alopecia - anorexia - anxiety - arrhythmias - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - dry mouth - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomana - hypotension - increased appetite - increased intraocular pressure - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss.

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**OVERDOSE**

Overdosage with dosulepin is associated with a relatively high rate of fatality. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- **PREGNANCY**

Use only if potential benefit outweighs risk.

- **BREAST FEEDING**

The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT**

Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

- **TREATMENT CESSATION**

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION**

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose. A maximum prescription equivalent to 2 weeks’ supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.

- **PATIENT AND CARER ADVICE**

Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING**

Dosulepin hydrochloride is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.
Tablet

**CAUTIONARY AND ADVISORY LABELS 2**
- **DOSULEPIN HYDROCHLORIDE** (Non-proprietary)
  - Dosulepin hydrochloride 75 mg: Dosulepin 75mg tablets | 28 tablet (BNF) £2.15 DT price + £1.80
- Prothiaden (Teofarma)
  - Dosulepin hydrochloride 75 mg: Prothiaden 75mg tablets | 28 tablet (BNF) £2.97 DT price + £1.80

Capsule

**CAUTIONARY AND ADVISORY LABELS 2**
- **DOSULEPIN HYDROCHLORIDE** (Non-proprietary)
  - Dosulepin hydrochloride 25 mg: Dosulepin 25mg capsules | 28 capsule (BNF) £1.86 DT price + £1.86
- Prothiaden (Teofarma)
  - Dosulepin hydrochloride 25 mg: Prothiaden 25mg capsules | 28 capsule (BNF) £1.70 DT price + £1.86

**Doxepin**

**INDICATIONS AND DOSE**

**Depressive illness (particularly where sedation is required)**

**BY MOUTH**
- **Adult:** Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to be taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses
- **Elderly:** Start with lower doses and adjust according to response

**CONTRA-INDICATIONS**
- Acute porphyrias p. 864.
- arrhythmias - during manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction (in adults)
- **CAUTIONS**
  - Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase.

**Elderly** Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

**INTERACTIONS** → Appendix 1 (antidepressants, tricyclic).

**SIDE-EFFECTS**
- Common or very common: Agitation - anxiety - confusion - dizziness - drowsiness - irritability - paraesthesia - sleep disturbances
- Rare: Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor
- Very rare: Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma
- Frequency not known: Abdominal pain - alopecia - anorexia - arthralgia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) (in adults) - constipation - convulsions - delusions - diarrhoea - dry mouth - ECG changes (in adults) - flushing - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hypotension - increased appetite - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - oedema - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - stomatitis - sudden death of patients with cardiac disease
- suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**Overdose**

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

**PREGNANCY**

Use with caution—limited information available.

**BREAST FEEDING**

The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.

**HEPATIC IMPAIRMENT**

Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

Use with caution.

**TREATMENT CESSATION**

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION**

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

**PATIENT AND CARER ADVICE**

Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Capsule

**CAUTIONARY AND ADVISORY LABELS 2**
- **DOXEPIN** (Non-proprietary)
  - Doxepin (as Doxepin hydrochloride) 25 mg: Doxepin 25mg capsules | 28 capsule (BNF) £48.00 DT price + £48.00
  - Doxepin (as Doxepin hydrochloride) 50 mg: Doxepin 50mg capsules | 28 capsule (BNF) £84.00 DT price + £84.00

**Imipramine hydrochloride**

**INDICATIONS AND DOSE**

**Depressive illness**

**BY MOUTH**
- **Adult:** Initially up to 75 mg daily in divided doses, then increased to 150–200 mg daily, up to 150 mg may be given as a single dose at bedtime, dose to be increased gradually
- **Elderly:** Initially 10 mg daily, increased to 30–50 mg daily, dose to be increased gradually
Depressive illness in hospital patients

**BY MOUTH**
- Adult: Initially up to 75 mg daily in divided doses, dose to be increased gradually, increased to up to 300 mg daily in divided doses

**Nocturnal enuresis**
- Child 6-7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Child 8-10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Child 11-17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

**SIDE-EFFECTS**
- Common or very common: Fatigue, flushing, headache, palpitation, restlessness
- Rare: Extrapyramidal symptoms, paralytic ileus
- Very rare: Abdominal pain, aggression, allergic alveolitis, cardiac decompensation, diarrhoea, dry mouth, dysarthria, ECG changes, galactorrhoea, gynaecomastia, haematological reactions, hallucinations, headache (on withdrawal), heart block, hepatic reactions, hypomania, hyponatraemia, increased appetite, influenza-like symptoms (on withdrawal), insomnia (on withdrawal), irritability, mania, movement disorders (on withdrawal), myalgia (on withdrawal), nausea, nausea (on withdrawal), paraesthesia, photosensitivity, postural hypotension, pruritus, rash, sexual dysfunction, sleep disturbances, sudden death of patients with cardiac disease, suicidal behaviour, sweating, sweating (on withdrawal), tachycardia, taste disturbance, tinnitus, tremor, urinary retention, urticaria, vivid dreams (on withdrawal), vomiting, weight gain, weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**
- In adults The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.
- **Overdose** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.
- **PREGNANCY** Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal symptoms reported in neonates when used in the third trimester.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 4 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic antidepressants should be withdrawn slowly.
- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.
- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced. Medicines for Children leaflet: Imipramine www.medicinesforchildren.org.uk/imipramine

**Lofepramine**

**INDICATIONS AND DOSE**

**Depressive illness**
- **BY MOUTH**
  - Adult: 140–210 mg daily in divided doses
  - Elderly: May respond to lower doses
- **CONTRA-INDICATIONS** Acute porphyrias p. 864 – arrhythmias – during the manic phase of bipolar disorder –...
heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

**PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **MEDITICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**SIDE-EFFECTS**

- **Common or very common** Agitation - anxiety - confusion - dizziness - irritability - paraesthesia - postural hypotension - sleep disturbances
- **Rare** Extrapyramidal symptoms - paralytic ileus
- **Very rare** Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Frequency not known** Alopecia - anorexia - arrhythmias - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - constipation - convulsions - delusions - dizziness - dryness - dry mouth - drowsiness - dryness of mouth - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache - head block - hepatic reactions - hypomania - hypotension - increased appetite - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - oedema - photosensitivity - pruritus - rash - sexual dysfunction - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - tremor - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are taken initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**OVERDOSE** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

**PREGNANCY** Neonatal withdrawal symptoms and respiratory depression reported if used during third trimester.

**BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

**HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

**RENAL IMPAIRMENT** Avoid in severe impairment.

**REFERENCES**

- **INDICATIONS AND DOSE**

**INDICATIONS AND DOSE**

**Depression**

**BY MOUTH**

- **Adult**: To be initiated at a low dose, then increased if necessary to 75–100 mg daily in divided doses, alternatively increased if necessary to 75–100 mg once daily; maximum 150 mg per day
- **Elderly**: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses

**Neuropathic pain**

**BY MOUTH**

- **Adult**: Initially 10 mg once daily, to be taken at night, increased if necessary to 75 mg daily, dose to be increased gradually; higher doses to be given under specialist supervision

**UNLICENSED USE** Not licensed for use in neuropathic pain.

**CONTRA-INDICATIONS**

- **Acute porphyrias p. 864** - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

**CAUTIONS**

- **Cardiovascular disease** - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
Tramipramine

**INDICATIONS AND DOSE**

Depressive illness (particularly where sedation required)

**BY MOUTH**
- Adult: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–300 mg daily
- Elderly: Initially 10–25 mg 3 times a day, maintenance 75–150 mg daily

**CONTRA-INDICATIONS**
Acute porphyrias p. 864 · arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

**CAUTIONS**
Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

**CAUTIONS, FURTHER INFORMATION**
Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

**INTERACTIONS**
Appendix 1 (antidepressants, tricyclic).

**SIDE-EFFECTS**
- Rare Paralytic ileus
- Very rare Neuroleptic malignant syndrome · precipitation of angle-closure glaucoma
- Frequency not known Abdominal pain · agitation · alopcaia · anorexia · anxiety · arrhythmia · blurred vision · breast enlargement · changes in blood sugar · chills (on withdrawal) · confusion · constipation · convulsions · delusions · diarrhoea · dizziness · dry mouth · dysarthria · ECG changes · flushing · galactorrhoea · gynaecomastia · haematological reactions · hallucinations · headache (on withdrawal) · heart block · hepatic reactions · hypomania · hypotenraemia · increased appetite · influenza-like symptoms (on withdrawal) · insomnia (on withdrawal) · irritability · mania · movement disorders (on withdrawal) · myalgia (on withdrawal) · nausea · nausea (on withdrawal) · oedema · parasthesia · photosensitivity · postural hypotension · pruritis · rash · sexual dysfunction · sleep disturbances · stomatitis · sudden death of patients with cardiac disease · suicidal behaviour · sweating · sweating (on withdrawal) · tachycardia · taste disturbance · tinnitus · tremor · urinary retention · urticaria · vivid dreams (on withdrawal) · vomiting · weight gain · weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**OVERDOSE**
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

**PREGNANCY**
Use only if potential benefit outweighs risk.

**BREAST FEEDING**
The amount secreted into breast milk is too small to be harmful.

**HEPATIC IMPAIRMENT**
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

**MONITORING REQUIREMENTS**
Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.

**TREATMENT CESSION**
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION**
Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

**PATIENT AND CARER ADVICE**
Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

**2.6 Psychoses and schizophrenia**

### Psychoses and related disorders

**Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit**

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore unlicensed

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.
- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and
reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.

- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important: When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

Antipsychotic drugs

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquillisers’. In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D2 receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

- **Group 1**: chlorpromazine hydrochloride p. 304, levomepromazine p. 345, and promazine hydrochloride p. 320, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2**: pericyazine p. 308 and pipotiazine palmitate, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3**: fluphenazine decanoate p. 306, perphenazine p. 308, prochlorperazine p. 309, and trifluoperazine p. 310, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Butyrophenones (benperidol p. 300 and haloperidol p. 306) resemble the group 3 phenothiazines in their clinical properties. Thioxanthenes (flupentixol p. 305 and zuclopenthixol p. 311) have moderate sedative, antimuscarinic effects, and extrapyramidal effects. Diphenylbutylpiperidines (pimozide p. 306) and the substituted benzamides (sulpiride p. 310) have reduced sedative, antimuscarinic, and extrapyramidal effects.

Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient’s weight, comorbidity, and concomitant medication.
- Treatment should be reviewed regularly.

Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- **parkinsonian symptoms** (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- **dystonia** (abnormal face and body movements) and **dyskinesia**, which occur more commonly in children or young adults after large initial doses and may resemble an exacerbation of the condition being treated;
- **akathisia** (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- **tardive dyskinesia** (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

**Tardive dyskinesia** is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermiform movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly
frequently, especially in the elderly, and treatment must be carefully and regularly reviewed. Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea. Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha-1-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered. Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred. Hyperglycaemia and sometimes diabetes can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain. Hypotension and interference with temperature regulation Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients. Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used. Blood dyscrasias Perform blood counts if unexplained infection or fever develops.

Choice There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 313), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms. Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia. Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 312, clozapine p. 313, olanzapine p. 315, and quetiapine p. 318 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 312 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway. Aripiprazole p. 312 has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride p. 312, clozapine p. 313, fluphenazine p. 305, fluphenazine decanoate p. 306, olanzapine p. 315, perphenazine p. 308, prochlorperazine p. 309, risperidone p. 319, and sulpiride p. 310. Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate p. 306 and haloperidol p. 306 are lowest risk. Olanzapine p. 312 and aripiprazole p. 312 have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulpiride p. 310, and trifluoperazine p. 310 are least likely to cause weight gain. The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole p. 312 and quetiapine p. 318. Olanzapine p. 315 may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine p. 313, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility. Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death. Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

Monitoring Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter. Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly. Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.
Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

Other uses
Some antipsychotic drugs can be used for the treatment of nausea and vomiting, chorea, and motor tics. Chlorpromazine hydrochloride p. 304 and haloperidol p. 306 can be used for intractable hiccups. Benperidol p. 300 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

Equivalent doses of oral antipsychotics
These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

Dosage
After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

Antipsychotic depot injections
Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 319 and olanzapine enbomate p. 316.

Choice
There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 311 may be suitable for the treatment of agitated or aggressive patients whereas flupentixol decanoate p. 305 can cause over-excitement in such patients. Zuclopenthixol decanoate may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

Equivalent doses of depot antipsychotics

<table>
<thead>
<tr>
<th>Antipsychotic drug/interval</th>
<th>Dosage (mg)</th>

</tbody>
</table>

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

Dosage
Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient’s response.

ANTIPSYCHOTICS (FIRST-GENERATION)

Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias - cardiovascular disease - conditions predisposing to seizures - depression - epilepsy - history of jaundice - myasthenia gravis - Parkinson’s disease (may be exacerbated) - photosensitisation (may occur with higher dosages) - prostatic hypertrophy - severe respiratory disease - susceptibility to angle-closure glaucoma

- **CAUTIONS, FURTHER INFORMATION**
  - **Cardiovascular disease** An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

- **INTERACTIONS** ▶ Appendix 1 (antipsychotics).
  - Increased risk of toxicity with myelosuppressive drugs.

- **SIDE-EFFECTS** ▶ Rare Neuroleptic malignant syndrome—discontinue (potentially fatal)
  - Very rare Precipitation of angle-closure glaucoma

- **Overdose** Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning, p. 1123.
Nervous system
Chlorpromazine hydrochloride

Pregnancy
Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

Breastfeeding
There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

Monitoring requirements
- It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.

Patient and carer advice
Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced. As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Chlorpromazine hydrochloride

Indications and dose
Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

By mouth
- Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses, take a third to half adult dose in the elderly and debilitated patients

By rectum
- Adult: 100 mg every 6–8 hours, dose expressed as chlorpromazine base

Intractable hiccup

By mouth
- Adult: 25–50 mg 3–4 times a day

Relief of acute symptoms of psychoses (under expert supervision)

By deep intramuscular injection
- Adult: 25–50 mg every 6–8 hours

Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

By mouth
- Child 1-5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- Child 12–17 years: 10–25 mg every 4–6 hours
- Adult: 30–25 mg every 4–6 hours

By rectum
- Adult: 100 mg every 6–8 hours

Dose adjustments due to interactions
Dose adjustment may be necessary if smoking started or stopped during treatment.

Dose equivalence and conversion
For each therapeutic effect 100 mg chlorpromazine base given rectally as a suppository = 20–25 mg chlorpromazine hydrochloride by intramuscular injection = 40–50 mg of chlorpromazine base or hydrochloride given by mouth.

Unlicensed use
Rectal route is not licensed.

Contra-indications
CNS depression · comatose states · hypothyroidism · phaeochromocytoma

Caution
Diabetes

Side-effects
Side-effects, further information
Acute dystonic reactions Phenothiazines can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

Hepatic impairment Can precipitate coma; phenothiazines are hepatotoxic.

Renal impairment Start with small doses in severe renal impairment because of increased cerebral sensitivity.

Monitoring requirements
- With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.
- Handling and storage Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, capsule

Tablet
Cautionary and advisory labels 2, 11

Chlorpromazine hydrochloride (Non-proprietary)
Chlorpromazine hydrochloride 25 mg Chlorpromazine 25 mg tablets | 28 tablet | £6.45 DT price = £2.31
Chlorpromazine hydrochloride 50 mg Chlorpromazine 50 mg tablets | 28 tablet | £6.00 DT price = £2.24
Chlorpromazine hydrochloride 100 mg Chlorpromazine 100 mg tablets | 28 tablet | £6.25 DT price = £2.39

Oral solution
Cautionary and advisory labels 2, 11

Chlorpromazine hydrochloride (Non-proprietary)
Chlorpromazine hydrochloride 5 mg per 1 ml Chlorpromazine 25 mg/5 ml syrup | 150 ml | £2.35 DT price = £2.35
Chlorpromazine 25 mg/5 ml oral solution sugar free (sugar-free) | 150 ml | £2.35
Chlorpromazine 25 mg/5 ml oral solution | 150 ml | £2.35 DT price = £2.35
Chlorpromazine hydrochloride 20 mg per 1 ml Chlorpromazine 100 mg/5 ml oral solution | 150 ml | £5.50 DT price = £5.50
Flupentixol (Flupenthixol)

INDICATIONS AND DOSE
Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychotic motor hyperactivity

BY MOUTH
- Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
- Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive Illness
- Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
- Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

CONTRA-INDICATIONS
- Circulatory collapse
- CNS depression
- Comatose states
- Excitable patients
- Overactive patients
- Phaeochromocytoma

CAUTIONS
- Acute porphyrias
- Cardiovascular disease
- Nephrotic syndrome
- Diabetes mellitus
- Severe renal impairment because of increased cerebral sensitivity
- Prolongation of QT interval

INTERACTIONS
- Avoid concomitant administration of drugs that prolong QT interval.

SIDE-EFFECTS
- Asthenia
- Dysphoria
- Hypersalivation
- Myalgia
- Sudden death
- Torsade de Pointes

SIDE-EFFECTS, FURTHER INFORMATION
- Less sedating but extrapyramidal symptoms frequent.
- Avoid concomitant administration of drugs that prolong QT interval.

PREGNANCY
- Avoid unless potential benefit outweighs risk.

BREAST FEEDING
- Present in breast milk—avoid.

HEPATIC IMPAIRMENT
- Can precipitate coma.

RENAL IMPAIRMENT
- Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity.
- Manufacturer advises caution in renal failure.

PATIENT AND CARER ADVICE
- Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Solution for injection
  - Largactil
    - Chlorpromazine hydrochloride 25 mg per 1 ml
    - 50 mg/ml solution for injection ampoules | 10 ampoule £7.51

Flupentixol decanoate (Flupenthixol Decanoate)

INDICATIONS AND DOSE
Maintenance in schizophrenia and other psychoses

BY DEEP INTRAMUSCULAR INJECTION
- Adult: Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20–40 mg every 2–4 weeks, adjusted according to response, usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; maximum 400 mg per week
- Elderly: Dose is initially quarter to half adult dose

CONTRA-INDICATIONS
- Children
- CNS depression
- Comatose states
- Excitable patients
- Overactive patients
- Phaeochromocytoma

CAUTIONS
- An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear—avoid in Acute porphyrias
- Diabetes mellitus
- Increased cerebral sensitivity
- Torsade de Pointes

SIDE-EFFECTS
- Erythema
- Hyperglycaemia
- Mood elevating effect
- Nodules
- Pain at injection site

SIDE-EFFECTS, FURTHER INFORMATION
- Less sedating but extrapyramidal symptoms frequent.

HEPATIC IMPAIRMENT
- Can precipitate coma.

RENAL IMPAIRMENT
- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS
- Treatment requires careful monitoring for optimum effect.

DIRECTIONS FOR ADMINISTRATION
- In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Depixol (Flupentixol decanoate) (Lundbeck Ltd)
  - Flupentixol decanoate 20 mg per 1 ml
    - Depixol 40 mg/2 ml solution for injection ampoules | 10 ampoule £25.39
    - Depixol 80 mg/1 ml solution for injection ampoules | 10 ampoule £15.17
  - Flupentixol decanoate 100 mg per 1 ml
    - Depixol Conc 100 mg/1 ml solution for injection ampoules | 10 ampoule £62.51

- Psytixol
  - Flupentixol decanoate 20 mg per 1 ml
    - Psytixol 40 mg/2 ml solution for injection ampoules | 10 ampoule £25.38
  - Flupentixol decanoate 100 mg per 1 ml
    - Psytixol 50 mg/0.5 ml solution for injection ampoules | 10 ampoule £53.12
Fluphenazine decanoate

**INDICATIONS AND DOSE**

Maintenance in schizophrenia and other psychoses

*BY DEEP INTRAMUSCULAR INJECTION*

- Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
- Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response

**Dose adjustments due to interactions**

Dose adjustment may be necessary if smoking started or stopped during treatment.

- CONTRA-INDICATIONS: Children - CNS depression - comatose states - marked cerebral atherosclerosis - phaeochromocytoma
- CAUTIONS: QT-interval prolongation - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- INTERACTIONS: Avoid concomitant drugs that prolong QT interval.
- SIDE-EFFECTS: Erythema - inappropriate antidiuretic hormone secretion - nodules - oedema - pain at injection site - swelling - systemic lupus erythematosus
- SIDE-EFFECTS, FURTHER INFORMATION

Less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent. Extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed.

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- HEPATIC IMPAIRMENT: Avoid in hepatic failure. Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT: Manufacturer advises caution. Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Avoid in renal failure.
- MONITORING REQUIREMENTS: Treatment requires careful monitoring for optimum effect.
- DIRECTIONS FOR ADMINISTRATION: In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Excipients: May contain Sesame oil
- **Fluphenazine decanoate 25 mg per 1 ml** Modecate (Sanofi) 5 ampoule (£) £22.22
- **Fluphenazine decanoate 100 mg per 1 ml** Modecate Concentrate 100mg/1ml solution for injection ampoules 1 5 ampoule (£) £43.73
- **Fluphenazine decanoate 50mg/0.5ml solution for injection ampoules** 5 ampoule (£) £8.51

Flupentixol decanoate

**INDICATIONS AND DOSE**

Schizophrenia | Psychoses | Mania and hypomania | Organic brain damage (depending on symptoms)

*BY MOUTH*

- Adult: Initially 2–20 mg once daily, alternatively initially 2–20 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; for debilitated patients, use elderly dose; maximum 20 mg per day
- Elderly: Initially 1–10 mg once daily, alternatively initially 1–10 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; maximum 20 mg per day

*BY INTRAMUSCULAR INJECTION*

- Adult: Initially 2–5 mg, repeated if necessary, repeated dose given according to response and tolerability, for debilitated patients, use elderly dose; maximum 12 mg per day
- Elderly: Initially 1–2.5 mg, repeated if necessary, repeated dose given according to response and tolerability; maximum 12 mg per day

Agitation and restlessness in the elderly

*BY MOUTH*

- Elderly: Initially 0.75–1.5 mg 2–3 times a day, adjusted according to response

Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in the mentally retarded and in patients with organic brain damage (depending on symptoms) | Gilles de la Tourette syndrome | Severe tics | Intractable hiccup | Adjunct to short-term management of moderate to severe psychomotor agitation, excitement and, violent or dangerously impulsive behaviour

*BY MOUTH*

- Adult: Initially 1.5–3 mg 2–3 times a day, alternatively initially 3–5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose, for debilitated patients, use elderly dose
- Elderly: Initially 0.75–1.5 mg 2–3 times a day, alternatively initially 1.5–2.5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose

Nausea and vomiting

*BY INTRAMUSCULAR INJECTION*

- Adult: 1–2 mg

Nausea and vomiting in palliative care

*BY MOUTH*

- Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses
Haloperidol decanoate

INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses

BY DEEP INTRAMUSCULAR INJECTION

- Adult: Initially 50 mg every 4 weeks, increased in steps of 50 mg if required, increased if necessary to 300 mg every 4 weeks. Higher doses may be needed in some patients, dose to be administered into gluteal muscle, if 2-weekly administration preferred, doses should be halved.
- Elderly: Initially 12.5–25 mg every 4 weeks, if 2-weekly administration preferred, doses should be halved.

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

Important safety information

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

CONTRA-INDICATIONS

Bradycardia - CNS depression - comatose states - lesions of the basal ganglia - Parkinson’s disease - phaeochromocytoma - QT-interval prolongation

CAUTIONS

Arteriosclerosis - hypocalcaemia - hypokalaemia - hypomagnesaemia - metabolic disturbances - subarachnoid haemorrhage - thyrotoxicosis

INTERACTIONS

Avoid concomitant administration of drugs that prolong QT interval.

SIDE-EFFECTS

Common or very common - Depression - weight loss - Uncommon - Dysphoria - oedema - Rare - Bronchospasm - hypoglycaemia - inappropriate antidiuretic hormone secretion - photosensitivity reactions - pigmentation

Frequency not known - Hypertension - Stevens-Johnson syndrome - sweating - toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Less sedating and fewer antimuscarinic or hypotensive symptoms.

PREGNANCY

Avoid unless benefits outweigh risks.

HEPATIC IMPAIRMENT

Can precipitate coma.

RENAIS IMPAIRMENT

Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS

Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet

CAUTIONARY AND ADVISORY LABELS

HALOPERIDOL (Non-proprietary)

Haloperidol 500 microgram Haloperidol 500microgram tablets 28 tablet $1.01–$1.10

Haloperidol 1.5 mg Haloperidol 1.5mg tablets 28 tablet $3.00 DT price = $2.50

Haloperidol 5 mg Haloperidol 5mg tablets 28 tablet $7.25 DT price = $3.30

Haloperidol 10 mg Haloperidol 10mg tablets 28 tablet $12.99 DT price = $12.26

Haloperidol 20 mg Haloperidol 20mg tablets 28 tablet $21.63–$22.00 DT price = $21.75

Capsule

CAUTIONARY AND ADVISORY LABELS

HALOPERIDOL (Non-proprietary)

Haloperidol 1 mg per 1 ml Haloperidol 5mg/5ml oral solution sugar-free (sugar-free) 100 ml $35.99 DT price = $26.81 (sugar-free) 500 ml $32.05

Haloperidol 2 mg per 1 ml Haloperidol 10mg/5ml oral solution sugar-free (sugar-free) 100 ml $46.75 DT price = $7.10 (sugar-free) 500 ml $35.50

Haloperidol 2 mg per 1 ml Haloperidol 2mg/ml oral solution (sugar-free) 100 ml $46.75 DT price = $7.10

Solution for injection

HALOPERIDOL (Non-proprietary)

Haloperidol 5 mg per 1 ml Haloperidol 5mg/1ml solution for injection ampoules 10 ampoule $8.65 DT price = $8.65

Important safety information

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

CONTRA-INDICATIONS

Bradycardia - children - CNS depression - comatose states - lesions of the basal ganglia - Parkinson’s disease - phaeochromocytoma - QT-interval prolongation

CAUTIONS

Arteriosclerosis - hypocalcaemia - hypokalaemia - hypomagnesaemia - metabolic disturbances - subarachnoid haemorrhage - thyrotoxicosis - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

INTERACTIONS

Avoid concomitant administration of drugs that prolong QT interval.

SIDE-EFFECTS

Common or very common - Depression - weight loss - Uncommon - Dysphoria - oedema - Rare - Bronchospasm - hypoglycaemia - inappropriate antidiuretic hormone secretion - photosensitivity reactions - pigmentation

Frequency not known - Erythema - hypertension - nodules - pain may occur at injection site - Stevens-Johnson syndrome - sweating - swelling - toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Less sedating and fewer antimuscarinic or hypotensive symptoms.

HEPATIC IMPAIRMENT

Can precipitate coma.

RENAIS IMPAIRMENT

Start with small doses in severe renal impairment because of increased cerebral sensitivity.
Pericyazine
(Periciazine)

**INDICATIONS AND DOSE**

Schizophrenia | Psychoses
---|---
**BY MOUTH**
- Adult: Initially 75 mg daily in divided doses, then increased in steps of 25 mg every 1 week, adjusted according to response; maximum 300 mg per day
- Elderly: Initially 15–30 mg daily in divided doses, then increased in steps of 25 mg every 1 week, adjusted according to response; maximum 300 mg per day

Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour

**CONTRA-INDICATIONS**
- CNS depression
- Comatose states
- Phaeochromocytoma

**SIDE-EFFECTS**
- Common or very common: Hypotension (when treatment initiated)
- Frequency not known: Respiratory depression

**SIDE-EFFECTS, FURTHER INFORMATION**
- More sedating.
- Hepatic impairment: Can precipitate coma; phenothiazines are hepatotoxic.
- Renal impairment: Avoid in renal impairment.

**PERICYAZINE (Non-proprietary)**
- **Pericyazine 2.5 mg** Pericyazine 2.5mg tablets | 84 tablet [PDr]
  - £16.93 | 100 tablet [PDr] no price available

Perphenazine

**INDICATIONS AND DOSE**

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of anxiety | Severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour | Severe nausea and vomiting unresponsive to other anti-emetics

**BY MOUTH**
- Adult: Initially 4 mg 3 times a day, adjusted according to response; maximum 24 mg per day
- Elderly: Initially 1–2 mg 3 times a day; maximum 12 mg per day

**PERICYAZINE (Non-proprietary)**
- **Pericyazine 10mg** Pericyazine 10mg tablets | 84 tablet [PDr]
  - £43.75 | 100 tablet [PDr] no price available

**Oral solution**
- **Pericyazine 2 mg per 1 ml** Pericyazine 10mg/5ml oral solution | 100 ml [PDr]
  - £46.00–£46.01 DT price = £46.01

**CONTRA-INDICATIONS**
- Agitation in the elderly
- CNS depression
- Comatose states
- Phaeochromocytoma
- Restlessness in the elderly

**CAUTIONS**
- With oral use: hypothyroidism

**SIDE-EFFECTS**
- Rare: Systemic lupus erythematosus
- Frequency not known: Dystonic reactions

**SIDE-EFFECTS, FURTHER INFORMATION**
- Less sedating.
- Acute dystonic reactions: Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- Hepatic impairment: Can precipitate coma; phenothiazines are hepatotoxic.
- Renal impairment: Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**PERICYAZINE (Non-proprietary)**
- **Pericyazine 10 mg** Pericyazine 10mg tablets | 84 tablet [PDr]
  - £43.75 | 100 tablet [PDr] no price available

**Oral solution**
- **Pericyazine 2 mg per 1 ml** Pericyazine 10mg/5ml oral solution | 100 ml [PDr]
  - £46.00–£46.01 DT price = £46.01

Perphenazine

**INDICATIONS AND DOSE**

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of anxiety | Severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour | Severe nausea and vomiting unresponsive to other anti-emetics

**BY MOUTH**

Psychoses and schizophrenia 309

Prochlorperazine

INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania

BY MOUTH

- Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily
- Adult: 12.5–25 mg 2–3 times a day

Short-term adjunctive management of severe anxiety

BY MOUTH

- Adult: 15–20 mg daily in divided doses; maximum 40 mg per day

Nausea and vomiting, acute attack

BY MOUTH

- Adult: Initially 20 mg, then 10 mg after 2 hours
- BY DEEP INTRAMUSCULAR INJECTION
- Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Nausea and vomiting, prevention

BY MOUTH

- Adult: 5–10 mg 2–3 times a day
- BY DEEP INTRAMUSCULAR INJECTION
- Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Prevention and treatment of nausea

BY MOUTH

- Child 1-11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
- Child 12-17 years: 5–10 mg up to 3 times a day if required
- BY DEEP INTRAMUSCULAR INJECTION
- Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
- Child 5–11 years: 5–6.25 mg up to 3 times a day if required
- Child 12-17 years: 12.5 mg up to 3 times a day if required

Labyrinthine disorders

INITIALLY BY MOUTH

- Adult: 5 mg 3 times a day, (by mouth) increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks

Nausea and vomiting in previously diagnosed migraine

BY MOUTH USING BUCCAL TABLET

- Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
- Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

SIDE-EFFECTS

- Rare Hypotension
- Frequency not known Glycosuria; serious arrhythmias

SIDE-EFFECTS, FURTHER INFORMATION

- Less sedating.
- Acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- Can precipitate coma.
- Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

CAUTIONS

- Elderly (in adults). Hypotension (more likely after intramuscular injection).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**INDICATIONS AND DOSE**

Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

**INDICATIONS AND DOSE**

Schizophrenia with predominantly negative symptoms

- **BY MOUTH**
  - Adult: 200–400 mg twice daily; maximum 800 mg per day
  - Elderly: Lower initial dose to be given, increased gradually according to response

Schizophrenia with mainly positive symptoms

- **BY MOUTH**
  - Adult: 200–400 mg twice daily; maximum 2.4 g per day
  - Elderly: Lower initial dose to be given, increased gradually according to response

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) · agitated patients (even low doses may aggravate symptoms) · excited patients (even low doses may aggravate symptoms)
- **SIDE-EFFECTS** Hepatitis
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include lemon and aniseed.

**MEDICINAL FORMS**

**Trifluoperazine**

**INDICATIONS AND DOSE**

Schizophrenia and other psychoses | Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

**INDICATIONS AND DOSE**

**BY MOUTH**

- Adult: Initially 5 mg twice daily for 1 week, then increased in steps of 5 mg daily, dose then to be increased at intervals of 3 days, according to response
- Elderly: Initially up to 2.5 mg twice daily for 1 week, then increased in steps of 5 mg daily, dose then to be increased at intervals of 3 days, according to response

**Short-term adjunctive management of severe anxiety**

**BY MOUTH**

- Adult: 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
- Elderly: Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

**Severe nausea and vomiting**

**BY MOUTH**

- Adult: 2–4 mg daily in divided doses; maximum 6 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **SIDE-EFFECTS** Anorexia · dystonic reactions · muscle weakness
- **SIDE-EFFECTS, FURTHER INFORMATION** Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily. Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**Zuclopenthixol**

**INDICATIONS AND DOSE**

**Schizophrenia and other psychoses**

**BY MOUTH**

- Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose.

- Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg).

**RENA L IMPAIRMENT**

- Consider serum-level monitoring in patients with hepatic impairment.

**HEPATIC IMPAIRMENT**

- Halve dose. Can precipitate coma.

**SIDE-EFFECTS**

- Urinary frequency
- Urinary incontinence
- Weight loss (less common than weight gain)
- Apathetic states
- Increased cerebral sensitivity.

**CONTRA-INDICATIONS**

- Apathetic states • CNS depression • comatose states • phaeochromocytoma • withdrawn states

**CAUTIONS**

- Avoid in Acute porphyrias p. 864

**MEDICAL FORMS**

- There can be a variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Clopixol Acuphase (Lundbeck Ltd) Zuclopenthixol acetate 50 mg per 1 ml Clopixol Acuphase 50mg/1ml solution for injection ampoules 5 ampoule DT price = £24.21

**Zuclopenthixol decanoate**

**INDICATIONS AND DOSE**

**Maintenance in schizophrenia and paranoid psychoses**

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Test dose 100 mg, dose to be administered into the upper outer buttock or lateral thigh, followed by 200–500 mg after at least 7 days, then 200–500 mg every 1–4 weeks, adjusted according to response, higher doses of more than 500mg can be used; do not exceed 600 mg weekly.

- Elderly: A quarter to half usual starting dose to be used when transferring from oral to depot therapy. the dose by mouth should be reduced gradually.

**SIDE-EFFECTS**

- Erythema • nodules • pain at injection site • swelling

**CONTRA-INDICATIONS**

- Children • CNS depression • comatose states • phaeochromocytoma

**CAUTIONS**

- Avoid in Acute porphyrias p. 864

**MEDICAL FORMS**

- There can be a variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Clopixol Acuphase (Lundbeck Ltd) Zuclopenthixol decanoate 400 mg/4 ml solution for injection vials 10 vials DT price = £16.13

**Zuclopenthixol acetate**

**INDICATIONS AND DOSE**

**Short-term management of acute psychosis | Short-term management of exacerbation of chronic psychosis**

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 50–150 mg, then 50–150 mg after 2–3 days, repeated if necessary maximum duration of treatment 2 weeks, to be administered into the gluteal muscle or lateral thigh, 1 additional dose may be needed 1–2 days after the first injection, maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections, if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate.

- Elderly: 50–100 mg, then 50–100 mg after 2–3 days, repeated if necessary maximum duration of treatment 2 weeks, to be administered into the gluteal muscle or lateral thigh, 1 additional dose may be needed 1–2 days after the first injection, maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections, if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate.

**CONTRA-INDICATIONS**

- Children • CNS depression • comatose states • phaeochromocytoma

**CAUTIONS**

- Avoid in Acute porphyrias p. 864 • QT interval prolongation • when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

**INTERACTIONS**

- Avoid concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

- Erythema • nodules • pain at injection site • swelling

**SIDE-EFFECTS, FURTHER INFORMATION**

- If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

**HEPATIC IMPAIRMENT**

- Can precipitate coma.

**RENA L IMPAIRMENT**

- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS**

- Treatment requires careful monitoring for optimum effect.

**DIRECTIONS FOR ADMINISTRATION**

- In general not more than 2–3 mL of oily injection should be administered at
any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - **Clozapine (Zuclopenthixol decanoate)** (Lundbeck Ltd)
    - Zuclopenthixol decanoate 200 mg per 1 ml (Clozapine 200mg/1ml solution for injection ampoules | 10 ampoule $\text{P} \text{Pami } €31.51$ DT price = €31.51
    - Zuclopenthixol decanoate 500 mg per 1 ml (Clozapin Conc 500mg/1ml solution for injection ampoules | 5 ampoule $\text{P} \text{Pami } €37.18$ DT price = €37.18

- **ANTIPSYCHOTICS (SECOND-GENERATION)**

  - **Amisulpride**
    - **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₂ and D₃ receptors.
    - **INDICATIONS AND DOSE**
      - **Acute psychotic episode in schizophrenia**
        - **BY MOUTH**
          - Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day
      - **Schizophrenia with predominantly negative symptoms**
        - **BY MOUTH**
          - Adult: 50–300 mg daily
    - **CONTRA-INDICATIONS** CNS depression • comatose states • phaeochromocytoma • pre-pubertal children • prolactin-dependent tumours
    - **SIDE-EFFECTS**
      - Common or very common Anxiety
      - Uncommon Bradycardia
    - **PREGNANCY** Avoid.
    - **BREAST FEEDING** Avoid—no information available.
    - **RENAL IMPAIRMENT** Halve dose if eGFR 30–60 mL/minute/1.73 m². Use one-third dose if eGFR 10–30 mL/minute/1.73 m². No information available if eGFR less than 10 mL/minute/1.73 m².
    - **MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
    - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include caramel.
    - **MEDICINAL FORMS**
      - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

  **Tablet**
  - $\text{CAYIONARY AND ADVISORY LABELS 2}$
    - **Amisulpride 50 mg** Amisulpride 50mg tablets | 60 tablet $\text{P} \text{Pami } €27.00$ DT price = €3.45
    - **Amisulpride 100 mg** Amisulpride 100mg tablets | 60 tablet $\text{P} \text{Pami } €51.27$ DT price = €5.79
    - **Amisulpride 200 mg** Amisulpride 200mg tablets | 60 tablet $\text{P} \text{Pami } €66.00$ DT price = €9.66
    - **Amisulpride 400 mg** Amisulpride 400mg tablets | 60 tablet $\text{P} \text{Pami } €113.20$ DT price = €15.83
    - **Solian** (Sanofi)
      - **Amisulpride 50 mg** Solian 50 tablets | 60 tablet $\text{P} \text{Pami } €22.76$ DT price = €3.45

- **Histamine H₁ receptor antagonist with weak D₂ receptor antagonism.**
  - **Aripiprazole**
    - **DRUG ACTION** Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT₁A partial agonism and 5-HT₂A receptor antagonism.
    - **INDICATIONS AND DOSE**
      - **Maintenance in schizophrenia in patients stabilised with oral aripiprazole**
        - **INITIALLY BY INTRAMUSCULAR INJECTION**
          - **Adult:** 400 mg every 1 month, to be injected into the gluteal muscle, minimum of 26 days between injections, for dose adjustment due to side effects or concomitant use of interacting drugs, consult product literature and (by mouth) 10–20 mg daily continued for 14 consecutive days after the first injection, for missed depot doses consult product literature
      - **Schizophrenia**
        - **INITIALLY BY MOUTH**
          - **Adult:** 10–15 mg once daily; (by mouth) usual dose 15 mg once daily (max, per dose 30 mg once daily), for dose adjustments due to concomitant use of interacting drugs—consult product literature
      - **Treatment and recurrence prevention of mania**
        - **BY MOUTH**
          - **Adult:** 15 mg once daily, increased if necessary up to 30 mg once daily, for dose adjustments due to concomitant use of interacting drugs—consult product literature
      - **Control of agitation and disturbed behaviour in schizophrenia**
        - **BY INTRAMUSCULAR INJECTION**
          - **Adult:** Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg, for dose adjustments due to concomitant use of interacting drugs—consult product literature

  **Important safety information**
  - When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an acute episode (solution for injection containing aripiprazole 7.5 mg/mL) should not be confused with depot preparations (aripiprazole 400 mg vial with solvent), which are usually used in the community or clinics for maintenance treatment.
    - **CONTRA-INDICATIONS**
      - **GENERAL CONTRA-INDICATIONS:**
        - CNS depression • comatose state • phaeochromocytoma
**SPECIFIC CONTRA-INDICATIONS:**
- With intramuscular use do not use in children

**CAUTIONS**

**GENERAL CAUTIONS:**
Cerebrovascular disease - elderly (reduce initial dose)

**SPECIFIC CAUTIONS:**
- With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Anxiety, hypersalivation, malaise
- Uncommon Depression, dry mouth
- Frequency not known Alopecia, anorexia, bradycardia, hepatitis, hyponatraemia, infection, laryngospasm, myalgia, oedema, oopharyngeal spasm, pancreatitis, pathological gambling, respiratory disorders, rhabdomyolysis, suicidal ideation, sweating, urinary disorders

**SPECIFIC SIDE-EFFECTS**
- With intramuscular use erythema, nodules, pain at injection site, swelling

**SIDE-EFFECTS, FURTHER INFORMATION**
- With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose of the depot injection, therefore it may be a month or longer before side-effects subside.
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment (oral treatment preferred to intramuscular administration).

**MONITORING REQUIREMENTS** Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- With intramuscular use Treatment requires careful monitoring for optimum effect.

**DIRECTIONS FOR ADMINISTRATION**
- With oral use Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

**PATIENT AND CARER ADVICE**
- With oral use Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Solution for injection**

| INDIQUEMENT AND ADVISORY LABELS 2 | ARIPIPRAZOLE (Non-proprietary) | Aripiprazole 7.5 mg per 1 ml | Aripiprazole 7.5 mg per 1 ml | 1 vial | POM | £3.43 |
| - | Aripiprazole 400 mg | Aripiprazole 400 mg powder and solvent for suspension for injection | 1 vial | POM | £320.41 |
Psychosis in Parkinson’s disease

BY MOUTH

- Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime, increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

- CONTRA-INDICATIONS Alcoholic and toxic psychoses - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neutropenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy

- CAUTIONS Age over 60 years - prostatic hypertrophy - susceptibility to angle-closure glaucoma - taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- Perform physical examination and take full medical history before starting

- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk

- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy

- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist

- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

Intestinal obstruction Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

- INTERACTIONS Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

- SIDE-EFFECTS

  - Common or very common Anorexia - constipation - hypersalivation - malaise - speech disorders - urinary incontinence

  - Uncommon Agranulocytosis

  - Rare Circulatory collapse - dysphagia - hepatitis - myocarditis - pancreatitis - pericarditis - pneumonia - pulmonary aspiration

  - Very rare Cardiomyopathy - hypercholesterolaemia - hypertriglyceridaemia - interstitial nephritis - intestinal obstruction (including fatal cases) - myocardial infarction - obsessive compulsive disorder - paroxysmal gland enlargement - respiratory depression

  - Frequency not known Hepatic disorders - hepatic failure - muscle disorders - renal failure

SIDE-EFFECTS, FURTHER INFORMATION

Hypersalivation Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

- PREGNANCY Use with caution.

- BREAST FEEDING Avoid.

- RENAL IMPAIRMENT Avoid in severe impairment.

- MONITORING REQUIREMENTS

  - Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.

  - Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).

  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

  - Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

- TREATMENT CESSION On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

- DIRECTIONS FOR ADMINISTRATION Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer clozapine oral suspension.

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Lurasidone hydrochloride

**DRUG ACTION** Lurasidone is a dopamine D₂, 5-HT₆, alpha₂A- and alpha₁C-receptor antagonist, and is a partial agonist at 5-HT₁A receptors.

**INDICATIONS AND DOSE**

**Schizophrenia**

- **BY MOUTH**
  - Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily
  - Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)
  - **BY MOUTH**
  - Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)

**CAUTIONS** High doses in elderly - susceptibility to QT-interval prolongation

**INTERACTIONS** Contra-indicated with concomitant use of potent CYP3A4 inhibitors. Contra-indicated with concomitant use of potent CYP3A4 inducers. Caution with concomitant use of drugs that prolong the QT interval.

**SIDE-EFFECTS**

- **Common or very common** Anxiety - musculoskeletal stiffness
- **Uncommon** Catatonia - decreased appetite - dysarthria - dysuria - hot flush - myalgia - nightmares
- **Frequency not known** Angina - AV block - bradycardia - dysphagia - panic attacks - pruritus - suicidal behaviour - vertigo
- **PREGNANCY** Use only if potential benefit outweighs risks—limited information available.
- **HEPATIC IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment. Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.
- **RENAL IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m². Manufacturer advises use only if potential benefit outweighs risks if eGFR less than 15 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 2, 21, 25
  - **Luca®** (Sunovion Pharmaceuticals Europe Ltd)
  - **Lurasidone (as Lurasidone hydrochloride) 18.5 mg** Luca® 18.5mg tablets | 28 tablet [POD] £90.72
  - **Lurasidone (as Lurasidone hydrochloride) 37 mg** Luca® 37mg tablets | 28 tablet [POD] £90.72

**Contra-indications**

- With intramuscular use acute myocardial infarction - bradycardia - recent heart surgery - severe hypotension - sick sinus syndrome - unstable angina
- **CAUTIONS** Bone-marrow depression - diabetes mellitus (risk of exacerbation or ketoadiposis) - hypereosinophilic disorders - low leucocyte count - low neutrophil count - myeloproliferative disease - paralytic ileus

**Cautions, further information**

CNS and respiratory depression Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also

Lurasidone (as Lurasidone hydrochloride) 74 mg Latuda 74mg tablets | 28 tablet [POD] £90.72

Olanzapine

**DRUG ACTION** Olanzapine is a dopamine D₂, D₃, D₄, 5-HT₆, histamine-1-, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia | Combination therapy for mania**

- **BY MOUTH**
  - Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day
  - **Preventing recurrence in bipolar disorder**
  - Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day
  - **Monotherapy for mania**
  - Adult: 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase;
  - **Control of agitation and disturbed behaviour in schizophrenia or mania**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
    - Elderly: Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

**Dose adjustments due to interactions**

Dose adjustment may be necessary if smoking started or stopped during treatment.
receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
  - Common or very common Arthralgia - hypercholesterolaemia - hypertriglyceridaemia - increased appetite - malaise - oedema
  - Uncommon Alopecia - amnesia - bradycardia - epistaxis
  - Rare Hepatitis - pancreatitis - rhabdomyolysis

- **SPECIFIC SIDE-EFFECTS**
  - With intramuscular use hypoventilation - sinus pause

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Consider initial dose of 5 mg daily.

- **RENAL IMPAIRMENT** Consider initial dose of 5 mg daily.

- **MONITORING REQUIREMENTS**
  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month’s treatment, then every 4–6 months.

- **DIRECTIONS FOR ADMINISTRATION**
  - Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With intramuscular use When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Table

**CAUTIONARY AND ADVISORY LABELS 2**

- **Olanzapine (Non-proprietary)**
  - Olanzapine 2.5 mg Olanzapine 2.5mg tablets | 28 tablet £2.85 DT price = £1.02
  - Olanzapine 5 mg Olanzapine 5mg tablets | 28 tablet £43.70 DT price = £1.17
  - Olanzapine 7.5 mg Olanzapine 7.5mg tablets | 28 tablet £65.55 DT price = £1.19 | 56 tablet £131.10
  - Olanzapine 10 mg Olanzapine 10mg tablets | 28 tablet £87.40 DT price = £1.59
  - Olanzapine 15 mg Olanzapine 15mg tablets | 28 tablet £119.18 DT price = £1.67
  - Olanzapine 20 mg Olanzapine 20mg tablets | 28 tablet £158.90 DT price = £1.96
  - Zyprexa (Eli Lilly and Company Ltd)
    - Olanzapine 2.5 mg Zyprexa 2.5mg tablets | 28 tablet £21.85 DT price = £1.02
    - Olanzapine 5 mg Zyprexa 5mg tablets | 28 tablet £43.70 DT price = £1.17
    - Olanzapine 7.5 mg Zyprexa 7.5mg tablets | 56 tablet £131.10
    - Olanzapine 10 mg Zyprexa 10mg tablets | 28 tablet £87.40 DT price = £1.59
    - Olanzapine 15 mg Zyprexa 15mg tablets | 28 tablet £119.18 DT price = £1.67
    - Olanzapine 20 mg Zyprexa 20mg tablets | 28 tablet £158.90 DT price = £1.96

### Oral lyophilisate

- **Zyprexa Velotabs (Eli Lilly and Company Ltd)**
  - Olanzapine 2.5 mg Zyprexa 5mg Velotabs (sugar-free) | 28 tablet £48.07 DT price = £48.07
  - Olanzapine 5 mg Zyprexa 10mg Velotabs (sugar-free) | 28 tablet £87.40 DT price = £87.40
  - Olanzapine 15 mg Zyprexa 15mg Velotabs (sugar-free) | 28 tablet £131.10 DT price = £131.10
  - Olanzapine 20 mg Zyprexa 20mg Velotabs (sugar-free) | 28 tablet £174.79 DT price = £174.79

### Olanzapine embonate

(Olanzapine pamoate)

**INDICATIONS AND DOSE**

- Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult 18-75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required
- Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult 18-75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required
- Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

### Brands may include Zalasta;

- **Orodispersible tablet**

- **CAUTIONARY AND ADVISORY LABELS 2**

- **EXCEPTIONS:** May contain Aspartame

- **OLANZAPINE (Non-proprietary)**
  - Olanzapine 5 mg Olanzapine 5mg orodispersible tablets sugar free (sugar-free) | 28 tablet p<sub>DT</sub> £40.86 DT price = £2.67
  - Olanzapine 5mg orodispersible tablets | 28 tablet p<sub>DT</sub> £1.19–£4.99 DT price = £2.46
  - Olanzapine 10 mg Olanzapine 10mg orodispersible tablets | 28 tablet p<sub>DT</sub> £1.65–£5.99 DT price = £3.10
  - Olanzapine 10mg orodispersible tablets sugar free (sugar-free) | 28 tablet p<sub>DT</sub> £74.29 DT price = £3.67
  - Olanzapine 15 mg Olanzapine 15mg orodispersible tablets sugar free (sugar-free) | 28 tablet p<sub>DT</sub> £111.44 DT price = £4.64
  - Olanzapine 15mg orodispersible tablets | 28 tablet p<sub>DT</sub> £2.25–£6.99 DT price = £3.83
  - Olanzapine 20 mg Olanzapine 20mg orodispersible tablets sugar free (sugar-free) | 28 tablet p<sub>DT</sub> £148.57 DT price = £6.43
  - Olanzapine 20mg orodispersible tablets | 28 tablet p<sub>DT</sub> £1.01–£7.99 DT price = £4.67

- **Brands may include Arkolamyl; Zalasta**
Dose adjustments due to interactions
Dose adjustment may be necessary if smoking started or stopped during treatment.

Important safety information
When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

● CONTRA-INDICATIONS
  Children

● CAUTIONS
  Bone-marrow depression • diabetes mellitus (risk of exacerbation or ketoacidosis) • hypereosinophilic disorders • low leucocyte count • low neutrophil count • myeloproliferative disease • paralytic ileus • when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

● SIDE-EFFECTS
  Common or very common
  Arthralgia • hypercholesterolaemia • hypertriglyceridaemia • increased appetite • malaise • oedema
  Uncommon
  Alopecia • anemia • bradycardia • epistaxis
  Rare
  Hepatitis • pancreatitis • rhabdomyolysis
  Frequency not known
  Erythema • nodules • pain at injection site • swelling

SIDE-EFFECTS, FURTHER INFORMATION
If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

Overdose
Post-injection reactions have been reported leading to signs and symptoms of overdose.

Pregnancy
Use only if potential benefit outweighs risk.

Breast feeding
Avoid—present in milk.

Hepatic impairment
Initially 150 mg every 4 weeks; increase with caution in moderate impairment.

Renal impairment
Initially 150 mg every 4 weeks.

Monitoring requirements
Observe patient for at least 3 hours after injection.

Treatment requires careful monitoring for optimum effect.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month’s treatment, then every 4–6 months.

DIRECTIONS FOR ADMINISTRATION
Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection
- Zypadhera (El Lilly and Company Ltd)
  Olanzapine (as Olanzapine embonate monohydrate)
  210 mg Zypadhera 210mg powder and solvent for suspension for injection vials [1 vial (P30) £14.22 (Hospital only)]
  Olanzapine (as Olanzapine embonate monohydrate)
  300 mg Zypadhera 300mg powder and solvent for suspension for injection vials [1 vial (P30) £22.64 (Hospital only)]
  Olanzapine (as Olanzapine embonate monohydrate)
  405 mg Zypadhera 405mg powder and solvent for suspension for injection vials [1 vial (P30) £28.52 (Hospital only)]

Paliperidine

- Drug action
  Paliperidine is a metabolite of risperidone.

Indications and dose
Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

By deep intramuscular injection
- Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle, for missed doses see product literature

Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder

By mouth
- Adult: 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily

Contra-indications
- With intramuscular use
- Children

Cautions

General cautions
Cataract surgery (risk of intraoperative floppy iris syndrome) • elderly patients with dementia • elderly patients with risk factors for stroke • predisposition to gastro-intestinal obstruction • prolactin-dependent tumours

Specific cautions
- With intramuscular use
- When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

Side-effects

General side-effects
Common or very common
  Anxiety • appetite changes • arthralgia • depression • epistaxis • hypertension • infection • malaise • myalgia • oedema • respiratory disorders • sleep disorders • toothache • urinary disorders

Uncommon
  Alopecia • elevated plasma-cholesterol concentrations • elevated plasma-triglyceride concentrations • hypoaesthesia • parasthesia • taste disturbances • tinnitus • visual disorders

Rare
  Inappropriate antidiuretic hormone secretion • intestinal obstruction • intra-operative floppy iris syndrome • pancreatitis • pulmonary embolism • rhabdomyolysis

Specific side-effects
- With intramuscular use
  Erythema • nodules • pain at injection site • swelling

Side-effects, further information
- With intramuscular use
  If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

Pregnancy
Use only if potential benefit outweighs risk— toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually.

Breast feeding
Avoid—present in milk.

Hepatic impairment
Caution in severe impairment—no information available.

Renal impairment
- With oral use
  Initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m² (max. 6 mg once daily).
Quetiapine

**DRUG ACTION** Quetiapine is a dopamine D<sub>2</sub>, dopamine D<sub>3</sub>, 5-HT<sub>2A</sub>, alpha<sub>1</sub>-adrenoceptor, and histamine<sub>1</sub> receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 25 mg twice daily for days 1, then 50 mg twice daily for days 2, then 100 mg twice daily for days 3, then 150 mg twice daily for days 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 300 mg once daily for days 1, then 600 mg once daily for days 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day

- Elderly: Initially 50 mg once daily, adjusted according to response. Adjusted in steps of 50 mg daily

**Treatment of mania in bipolar disorder**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 50 mg twice daily for days 1, then 100 mg twice daily for days 2, then 150 mg twice daily for days 3, then 200 mg twice daily for days 4, then, adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 300 mg once daily for days 1, then 600 mg once daily for days 2, then, adjusted according to response, usual dose 400–800 mg once daily

- Elderly: Initially 50 mg once daily, adjusted according to response. Adjusted in steps of 50 mg daily

**Treatment of depression in bipolar disorder**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 50 mg once daily for days 1, dose to be taken at bedtime, then 100 mg once daily for days 2, then 200 mg once daily for days 3, then 300 mg once daily for days 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 50 mg once daily for days 1, dose to be taken at bedtime, then 100 mg once daily for days 2, then 200 mg once daily for days 3, then 300 mg once daily for days 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

**Prevention of mania and depression in bipolar disorder**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

**Adjuvant treatment of major depression**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily

- Elderly: Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then, adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

**Dose equivalence and conversion**

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

**CAUTIONS** Cerebrovascular disease - elderly - patients at risk of aspiration pneumonia - treatment of depression in patients under 25 years (increased risk of suicide)

**SIDE-EFFECTS**

- **Common or very common** Asthenia - dysarthria - dysphonia - elevated plasma-cholesterol concentrations - elevated plasma-triglyceride concentrations - increased appetite - irritability - peripheral oedema - sleep disorders

- **Uncommon** Hypoatraemia - hypothyroidism - restless legs syndrome - rhinitis

- **Rare** Hepatitis - pancreatitis
Psychoses and schizophrenia

Risperidone

**DRUG ACTION** Risperidone is a dopamine D₂, 5-HT₆, alpha₁,adrenoceptor, and histamine-1 receptor antagonist.

**INDICATIONS AND DOSE**

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily.

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg at least every 4 weeks.

**(max. per dose 50 mg every 2 weeks), during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection**

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily.

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg at least every 4 weeks (max. per dose 50 mg every 2 weeks), during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection.

Acute and chronic psychoses

**BY MOUTH**

- Adult: 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day.

**BY MOUTH**

- Elderly: Initially 50 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily.

**Mania**

**BY MOUTH**

- Adult: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1–6 mg daily.

**BY MOUTH**

- Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily.

Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer’s dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others.

**BY MOUTH**

- Adult: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily).

**CONTRA-INDICATIONS**

- With intramuscular use children.

**CAUTIONS**

**GENERAL CAUTION**

Avoid in Acute porphyrias p. 864 · cataract surgery (risk of intra-operative floppy iris syndrome) · dehydration · dementia with Lewy bodies · prolactin-dependent tumours.

**SPECIFIC CAUTIONS**

- With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Anxiety · appetite changes · arthralgia · depression · epistaxis · hypertension · infection · malaise · myalgia · oedema · respiratory disorders · sleep disorders · toothache · urinary disorders.

- **Uncommon** Alopaeia · elevated plasma-cholesterol concentrations · elevated plasma-tryglucerylceride concentrations · hypoesthesia · parasthesia · taste disturbances · tinnitus · visual disorders.

- **Rare** Inappropriate antidiuretic hormone secretion · intestinal obstruction · intra-operative floppy iris syndrome · pancreatitis · pulmonary embolism · rhabdomyolysis.
SPECIFIC SIDE-EFFECTS
- With intramuscular use erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS, FURTHER INFORMATION
- With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Use only if potential benefit outweighs risk—small amount present in milk.
- HEPATIC IMPAIRMENT
- With intramuscular use If an oral dose of at least 2 mg daily is tolerated, 25 mg as a depot injection can be given every 2 weeks.
- With oral use Initial and subsequent oral doses should be halved.
- RENAL IMPAIRMENT Initial and subsequent oral doses should be halved.
- MONITORING REQUIREMENTS
- With intramuscular use Treatment requires careful monitoring for optimum effect.
- DIRECTIONS FOR ADMINISTRATION
- With oral use Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.
- With intramuscular use Correct injection technique (including the use of x-ray technique) and rotation of injection sites are essential.
- PATIENT AND CARER ADVICE
- With oral use Patients or carers should be given advice on how to administer risperidone orodispersible tablets. Patients or carers should be given advice on how to administer risperidone oral liquid; counselling on use of dose syringe advised.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Drugs used for Dystonias and other involuntary movements not listed below: Chlorpromazine, Clozapine, Haloperidol

**ANTIPSYCHOTICS (FIRST-GENERATION)**

Promazine hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

**INDICATIONS AND DOSE**

Short-term adjunctive management of psychomotor agitation

**BY MOUTH**

- Adult: 100–200 mg 4 times a day
Dystonias and other involuntary movements

Agitation and restlessness in elderly
BY MOUTH
» Elderly: 25–50 mg 4 times a day

- CONTRA-INDICATIONS  CNS depression · comatose states · phaeochromocytoma
- CAUTIONS Cerebral arteriosclerosis
- SIDE-EFFECTS Haemolytic anaemia
- HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- LESS SUITABLE FOR PRESCRIBING Promazine hydrochloride is less suitable for prescribing.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

CNS STIMULANTS

Piracetam

INDICATIONS AND DOSE
Adjunctive treatment of cortical myoclonus
BY MOUTH
» Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

- CONTRA-INDICATIONS Cerebral haemorrhage · Huntington’s chorea
- CAUTIONS Gastric ulcer · history of haemorrhagic stroke · increased risk of bleeding · major surgery · underlying disorders of haemostasis
- INTERACTIONS Caution with concomitant drugs that increase bleeding.
- SIDE-EFFECTS
  » Common or very common Hyperkinesia · nervousness · weight gain
  » Uncommon Abdominal pain · anxiety · asthenia · ataxia · confusion · depression · dermatitis · diarrhea · drowsiness · haemorrhagic disorder · hallucination · headache · insomnia · nausea · pruritus · urticaria · vertigo · vomiting
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Adjust dose if both hepatic and renal impairment.
- RENAL IMPAIRMENT Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².
- TREATMENT CESSATION Avoid abrupt withdrawal.
- PRESCRIBING AND DISPENSING INFORMATION Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.
- DIRECTIONS FOR ADMINISTRATION Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

INDICATIONS AND DOSE
Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions
BY MOUTH
» Adult: Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day
» Elderly: Lower initial dose may be necessary

Moderate to severe tardive dyskinesia
BY MOUTH
» Adult: Initially 12.5 mg daily, dose to be gradually increased according to response

- CONTRA-INDICATIONS Depression · parkinsonism · phaeochromocytoma · prolactin-dependent tumours
- CAUTIONS Susceptibility to QT-interval prolongation
- INTERACTIONS Appendix 1 (tetrabenazine).
Caution with concomitant use of drugs that prolong QT interval.

- SIDE-EFFECTS
  » Common or very common Anxiety · confusion · constipation · depression · diarrhoea · drowsiness · dysphagia · hypotension · insomnia · nausea · parkinsonism · vomiting
  » Uncommon Altered consciousness level · extrapyramidal disorders · hyperthermia
  » Rare Neuroleptic malignant syndrome
  » Very rare Rhabdomyolysis
  » Frequency not known Agitation · amnesia · ataxia · bradycardia · disorientation · dizziness · dry mouth · dyspepsia
- PREGNANCY Avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Use half initial dose and slower dose titration in mild to moderate impairment. Use with caution in severe impairment.
- RENAL IMPAIRMENT Use with caution.
- TREATMENT CESSATION Avoid abrupt withdrawal.

TREATMENT CESSATION
Avoid abrupt withdrawal.
PATIENT AND CARER ADVICE May affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS

TETRABENAZINE (Non-proprietary)
- Tetrabenazine 25 mg Tetrabenazine 25mg tablets | 112 tablet POM no price available DT price = £100.00
- Revocon (Sun Pharmaceuticals UK Ltd) Tetrabenazine 25 mg Revocon 25mg tablets | 112 tablet POM £100.00 DT price = £100.00
- Xenazine (Alliance Pharmaceuticals Ltd) Tetrabenazine 25 mg Xenazine 25 tablets | 112 tablet POM £100.00 DT price = £100.00

NEUROPROTECTIVE AGENTS

Riluzole

INDICATIONS AND DOSE
To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease

BY MOUTH
- Adult: 50 mg twice daily

CONTRA-INDICATIONS
- Acute porphyria

CAUTIONS
- History of abnormal hepatic function (consult product literature for details) - Interstitial lung disease

CAUTIONS, FURTHER INFORMATION
- Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.

SIDE-EFFECTS
- Common or very common Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · tachycardia · vomiting
- Uncommon Anaemia · angioedema · interstitial lung disease · pancreatitis
- Rare Neutropenia
- Very rare Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION
- Neutropenia White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.

PREGNANCY
- Avoid—no information available.

BREAST FEEDING
- Avoid—no information available.

HEPATIC IMPAIRMENT
- Avoid.

RENAL IMPAIRMENT
- Avoid—no information available.

PATIENT AND CARER ADVICE
- Dizziness or vertigo may affect performance of skilled tasks (e.g. driving). Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Riluzole for motor neurone disease (January 2001) NICE TA20 Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner. www.nice.org.uk/TA20

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

Tablet
- RILUZOLE (Non-proprietary) Riluzole 50 mg Riluzole 50mg tablets | 56 tablet POM £320.00 DT price = £29.61
- Rilutek (Sanofi) Riluzole 50 mg Rilutek 50mg tablets | 56 tablet POM £320.33 DT price = £29.61

Tafamidis

INDICATIONS AND DOSE
Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision)

BY MOUTH
- Adult: 20 mg once daily

SIDE-EFFECTS
- Abdominal pain · diarrhoea · urinary tract infection · vaginal infection

CONCEPTION AND CONTRACEPTION
- Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.

PREGNANCY
- Avoid (toxicity in animal studies).

BREAST FEEDING
- Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Caution in severe impairment—no information available.

PRESCRIBING AND DISPENSING INFORMATION
- Tafamidis should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS
- Vyndaqel (Pfizer Ltd)
  - Tafamidis 20 mg Vyndaqel 20mg capsules | 30 capsule POM £10.685.00

NEUROTOXINS (BOTULINUM TOXINS)

Botulinum toxin type A

INDICATIONS AND DOSE
- Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) | Blepharospasm (specialist use only) | Hemifacial spasm (specialist use only) | Spasmodytic torticolis (specialist use only) | Severe hyperhidrosis of the axillae (specialist use only) | Prophylaxis of headaches in adults with chronic migraine (specialist use only) | Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) | Ankle disability due to lower limb spasticity associated with stroke (specialist use only) | Management of bladder dysfunctions (specialist use only) | Temporary improvement of moderate to severe crow’s feet (specialist use only)

BY SUBCUTANEOUS INJECTION OR BY INTRADERMAL INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: (consult product literature)

Dose equivalence and conversion
Important: information is specific to each individual preparation.
When used for axillary hyperhidrosis

When used for blepharospasm

▶ When used for focal upper-limb specificity associated with stroke: nausea

When used for hemifacial spasm

When used for spasmodic torticollis

▶ When used for hemifacial spasm

When used for blepharospasm or hemifacial spasm

When used for axillary hyperhidrosis

When used for blepharospasm

▶ When used for focal upper-limb specificity associated with stroke.
Botulinum toxin type B

INDICATIONS AND DOSE
Spasmodic torticollis (cervical dystonia) (specialist use only)
by intramuscular injection
- Adult: Initially 5000–10 000 units, adjusted according to response, dose to be divided between 2–4 most affected muscles
Dose equivalence and conversion
Important: information specific to each individual preparation.

CONTRA-INDICATIONS
Neuromuscular disorders - neuromuscular junctional disorders

CAUTIONS
History of dysphagia or aspiration - off-label use (risk of toxin spread) - tolerance may occur

SIDE-EFFECTS
- Common or very common
  - Dry mouth - dyspepsia - dysphagia - dysphonia - headache - increased electromyographic jitter in some distant muscles - influenza-like symptoms - myasthenia - neck pain - taste disturbances - visual disturbances - worsening torticollis
- Frequency not known
  - Aspiration pneumonia - constipation - exaggerated muscle weakness - malaise - paresthesia - respiratory disorders - vomiting

PREGNANCY
Low risk of systemic absorption but avoid unless essential.

BREAST FEEDING
Low risk of systemic absorption but avoid unless essential.

DIRECTIONS FOR ADMINISTRATION
Injection may be diluted with sodium chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION
Important: not interchangeable with other botulinum toxin preparations.

PATIENT AND CARER ADVICE
Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- NeuroBloc (Elisai Ltd)
  - Botulinum toxin type B 5000 unit per 1 ml NeuroBloc 5000 units/1ml solution for injection vials | 1 vial PDR £148.27 (Hospital only)
  - Botulinum toxin type B 1000 units/0.5ml solution for injection vials | 1 vial PDR £197.69 (Hospital only)
  - Botulinum toxin type B 2500 units/0.5ml solution for injection vials | 1 vial PDR £111.20 (Hospital only)

3.2 Parkinson’s disease

Parkinson’s disease

Parkinson’s disease
In idiopathic Parkinson’s disease, the progressive degeneration of pigmented neurons in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients’ quality of life.

Patients with suspected Parkinson’s disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson’s disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson’s disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson’s disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. Levodopa, non-ergot-derived dopamine-receptor agonists, or monoamine-oxidase-B inhibitors can be prescribed for initial treatment in early Parkinson’s disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

Elderly
Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

Dopaminergic drugs used in Parkinson’s disease
Dopamine-receptor agonists
The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson’s disease is often with the dopamine-receptor agonist pramipexole p. 336, ropinirole p. 338, and rotigotine p. 339. The ergot-derived dopamine-receptor agonists bromocriptine p. 333, cabergoline p. 334, and pergolide p. 336 are rarely used because of the risk of fibrotic reactions.

When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa.

Dopamine-receptor agonists are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced.

Apomorphine hydrochloride p. 332 is a potent dopamine-receptor agonist that is sometimes helpful in advanced
disease for patients experiencing unpredictable ‘off’ periods with levodopa treatment. Apomorphine hydrochloride should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an ‘off’ episode, the threshold dose of apomorphine hydrochloride is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine hydrochloride by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an ‘off’ episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications.

**Levodopa**

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa p. 328) and carbidopa (in co-careldopa p. 329).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone p. 346 can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period. ‘End-of-dose’ deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with ‘end-of-dose’ deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

**Monoamine-oxidase-B inhibitors**

Rasagiline p. 340 and selegeline hydrochloride p. 340 are monoamine-oxidase-B inhibitors used in Parkinson’s disease. Early treatment with selegeline hydrochloride alone can delay the need for levodopa therapy.

**Antimuscarinic drugs used in parkinsonism**

Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine hydrochloride below, procyclidine hydrochloride p. 326, and trihexyphenidyl hydrochloride p. 326 reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.

There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 267 can be given for life-threatening acute drug-induced dystonic reactions.

**Drugs used in essential tremor, chorea, tics, and related disorders**

Tetrabenazine p. 321 is mainly used to control movement disorders in Huntington’s chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 306 [unlicensed indication], olanzapine p. 315 [unlicensed indication], risperidone p. 319 [unlicensed indication], and quetiapine p. 318 [unlicensed indication] can also be used to suppress chorea in Huntington’s disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related chorea. Other treatments for Tourette syndrome include pimozide p. 308 [unlicensed indication] (important: ECG monitoring required), clonidine hydrochloride p. 137 [unlicensed indication], and sulphpride p. 310 [unlicensed indication]. Trihexyphenidyl hydrochloride p. 326 in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 304 and haloperidol p. 306 are used to relieve intractable hiccup.

Propranolol hydrochloride p. 146 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 401 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 321 is used as an adjunctive treatment for myoclonus of cortical myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 322 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

**Torsion dystonia and other involuntary movements**

Treatment with botulinum toxin type A p. 322 can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.

**ANTIMUSCARINICS**

**Orphenadrine hydrochloride**

- **DRUG ACTION** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**

Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

- **BY MOUTH**
  - **Adult:** Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
  - **Elderly:** Preferably dose at lower end of range
Nervous system

**MEDICINAL FORMS**

- Tablet
  - ORPHENADINE HYDROCHLORIDE (Non-proprietary)
    - Procyclidine hydrochloride 50 mg
  - Dispal (Astellas Pharma Ltd)
    - Orphenadrine hydrochloride 50 mg tablets
    - 28 tablet (£4.45 DT price = £1.87)
    - 100 tablet (£8.94)
    - 500 tablet (£44.63)

**ORPHENADINE HYDROCHLORIDE (Non-proprietary)**

- Orphenadrine hydrochloride 10 mg per 1 ml
  - 150 ml (£27.30)

**INDICATIONS AND DOSE**

**Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)**

- Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day.
- Elderly: Lower end of range preferable

**SIDE-EFFECTS**

- Urinary retention
- Drowsiness
- Impaired coordination
- Insomnia
- Seizures
- Very rare: Angle-closure glaucoma
- Frequency not known: Anxiety, blurred vision, confusion, constipation, dizziness, dry mouth, euphoria, hallucinations, impaired memory, nausea, rash, restlessness, tachycardia, vomiting

**INTERACTIONS**

- Nervous system: Acute porphyrias p. 864 - gastrointestinal obstruction - myasthenia gravis
- Cardiovascular disease: elderly - hypertension - in patients susceptible to angle-closure glaucoma - liable to abuse - prostatic hypertrophy - psychotic disorders - pyrexia
- INTERACTIONS → Appendix 1 (antimuscarinics).
- Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

**CONTRA-INDICATIONS**

- Acute dystonia
- BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION
  - Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
  - Elderly: Lower end of range preferable

**TREATMENT CESSATION**

**PREGNANCY**

- Use only if potential benefit outweighs risk.

**BREAST FEEDING**

- No information available.

**RENAI IMPAIRMENT**

- Use with caution.

**SIDE-EFFECTS**

- Angle-closure glaucoma - blurred vision - confusion - constipation - dizziness - dry mouth - euphoria - gingivitis - hallucinations - impaired memory - nausea - rash - tachycardia - vomiting

**TREATMENT CESSATION**

**PATIENT AND CARER ADVICE**

- May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

- ORPHENADINE HYDROCHLORIDE (Non-proprietary)
  - Procyclidine hydrochloride 5 mg
  - Dispal (Astellas Pharma Ltd)
  - Orphenadrine hydrochloride 50 mg tablets
  - 28 tablet (£6.45 DT price = £1.87)
  - 100 tablet (£8.94)
  - 500 tablet (£44.63)

**Oral solution**

- ORPHENADINE HYDROCHLORIDE (Non-proprietary)
  - Orphenadrine hydrochloride 10 mg per 1 ml
  - 150 ml (£27.30)

**Trihexyphenidyl hydrochloride**

**DRUG ACTION**

- Trihexyphenidyl exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**

- Parkinson's disease (if used in combination with carbidopa or co-beneldopa)
  - Adult: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia
Parkinson's disease 327

**INDICATIONS AND DOSE**
Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

**BY MOUTH**
- Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day

**CONTRA-INDICATIONS**
- History of neuroleptic malignant syndrome - history of non-traumatic rhabdomyolysis - phaeochromocytoma

**CAUTIONS**
- Concurrent levodopa dose may need to be reduced by about 10–30% - ischaemic heart disease

**SIDE-EFFECTS**
- Common or very common Abdominal pain - abnormal dreams - confusion - constipation - diarrhea - dizziness - dry mouth - dyskinesia - dystonia - fatigue - hallucinations - insomnia - ischaemic heart disease - nausea - sweating - urine may be coloured reddish-brown - vomiting
- Uncommon Myocardial infarction
- Rare Rash
- Very rare Agitation - anorexia - urticaria - weight loss
- Frequency not known Colitis - hepatitis - neuroleptic malignant syndrome - rhabdomyolysis - skin, hair, and nail discoloration

**PREGNANCY**
- Avoid—no information available.

**BREAST FEEDING**
- Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
- Avoid.

**TREATMENT CESSATION**
- Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**
- Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**
- ENTCPHONEHALYDROCHLORIDE (Non-proprietary)
  - Trimepyridyld hydrochloride 2 mg: Trimepyridyld 2mg tablets | 84 tablet [POM] £11.80 DT price = £9.22
  - Trimepyridyld hydrochloride 5 mg: Trimepyridyld 5mg tablets | 84 tablet [POM] £17.91 DT price = £17.91

**Oral solution**
- EXCIPIENTS: May contain Propylene glycol
- Trimepyridyld hydrochloride 1 mg per 1 ml Trimepyridyld 5mg/5ml oral solution | 200 ml [POM] £20.00 DT price = £20.00

**Tolcapone**

**DRUG ACTION**
Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**
Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)

**BY MOUTH**
- Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks only if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances
Nervous system

Co-beneldopa

INDICATIONS
Phaeochromocytoma · previous history of hyperthermia · previous history of neuroleptic malignant syndrome · previous history of rhabdomyolysis · severe dyskinesia

CAUTIONS
Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

CAUTIONS, FURTHER INFORMATION
Hepatotoxicity Potentially life-threatening hepatotoxicity including fulminant hepatic failure reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcapone once discontinued.

INTERACTIONS
▶ Appendix 1 (tolcapone).

SIDE-EFFECTS
▶ Common or very common Abdominal pain · anorexia · chest pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dyskinesia · dyspepsia · dystonia · excessive dreaming · hallucinations · headache · hepatotoxicity · nausea · sleep disturbances · sweating · syncope · urinary discoloration · vomiting · xerostomia
▶ Frequency not known Neuroleptic malignant syndrome reported on dose reduction or withdrawal · rhabdomyolysis reported on dose reduction or withdrawal

PREGNANCY
Toxicity in animal studies—use only if potential benefit outweighs risk.

BREAST FEEDING
Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Avoid.

RENAL IMPAIRMENT
Caution if eGFR less than 60 mL/minute. Avoid.

MONITORING REQUIREMENTS
Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

TREATMENT CESSATION
Avoid abrupt withdrawal.

PATIENT AND CARER ADVICE
Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 14, 25

Tolcapone 100 mg. Tasmar 100mg tablets | 100 tablet | £95.20

DOPAMINE PRECURSORS

Co-beneldopa

INDICATIONS AND DOSE
Parkinson’s disease
INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: Initially 50 mg 3–4 times a day, then (by mouth) increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; (by mouth) maintenance 400–800 mg daily in divided doses
▶ Elderly: Initially 50 mg 1–2 times a day, then (by mouth) increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

Parkinson’s disease (in advanced disease)
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

Parkinson’s disease (patients not taking levodopa/dopa-decarboxylase inhibitor therapy)
BY MOUTH USING MODIFIED-RELEASE MEDICINES
▶ Adult: Initially 1 capsule 3 times a day; maximum 6 capsules per day

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)
BY MOUTH USING MODIFIED-RELEASE MEDICINES
▶ Adult: Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1.2 g levodopa—consider alternative therapy.

Dose equivalence and conversion
Dose is expressed as levodopa.

Important safety information

IMPEL CONTROL DISORDERS
Treatment with levodopa is associated with impulse control disorders, including pathologic gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CAUTIONS
Cushing’s syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma

INTERACTIONS
▶ Appendix 1 (co-beneldopa, levodopa).

SIDE-EFFECTS
▶ Common or very common Abnormal dreams · anorexia · anxiety · arrhythmias · chorea · confusion · dementia · depression · dizziness · drowsiness · dry mouth · dyskinesia · dystonia · euphoria · fatigue · insomnia · nausea · palpitations · postural hypotension · psychosis · syncope · taste disturbances · vomiting
▶ Uncommon Ataxia · chest pain · constipation · diarrhoea · dysphagia · flatulence · hand tremor · hoarseness · hypersalivation · hypertension · malaise · muscle cramps · oedema · reddish discoloration of the urine and other body fluids · weakness · weight changes
▶ Rare Abdominal pain · activation of Hornet’s syndrome · activation of malignant melanoma · agitation · agranulocytosis · alopecia · blepharospasm · blurred vision · bruxism · convulsions · diplopia · disorientation · duodenal ulcer · dyspepsia · dysphonia · exantherma · flushing · gastro-intestinal bleeding · haemolytic anaemia · headache · Henoch-Schönlein purpura · hiccups · leucopenia · neuroleptic malignant syndrome (associated with abrupt withdrawal) · non-haemolytic anaemia · oculogyric crisis · paraesthesia · phlebitis · priapism · pupil dilatation · reduced mental acuity · sweating · thrombocytopenia · trismus · urinary incontinence · urinary retention
▶ Very rare Angle-closure glaucoma · suicidal ideation
▶ Frequency not known Compulsive behaviour
PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter). When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%. When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour. Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

MEDI C INAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 10, 14, 21

Madopar (Roche Products Ltd)
Benserazide (as Benserazide hydrochloride) 12.5 mg, Levodopa 50 mg Madopar 50mg/12.5mg dispersible tablets (sugar-free) | 100 tablet (PSt) £5.90 DT price = £5.90
Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg Madopar 100mg/25mg dispersible tablets (sugar-free) | 100 tablet (PSt) £10.45 DT price = £10.45

Capsule

CAUTIONARY AND ADVISORY LABELS 10, 14, 21

Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg/Benserazide hydrochloride 10 mg, Levodopa 200 mg by mouth using modified-release tablets

INDICATIONS AND DOSE

Parkinson’s disease

BY MOUTH

Adult: Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 25/100 mg once daily or on alternate days, adjusted according to response; dose increased until 800 mg levodopa (with 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

Parkinson’s disease—alternative regimen

BY MOUTH

Adult: Initially 12.5/50 mg 3–4 times a day, alternatively initially 10/100 mg 3–4 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 10/100 mg once daily or on alternate days, adjusted according to response; dose increased until 800 mg levodopa (with up to 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

Dose equivalence and conversion

The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

CARAMENT® CR

Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)

BY MOUTH USING MODIFIED-RELEASE TABLETS

Adult: Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

BY MOUTH USING MODIFIED-RELEASE TABLETS

Adult: Discontinue previous preparation at least 12 hours before first dose of Carament®; substitute Carament® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days.

continued
UNCOMMON

Common or very common

INTERACTIONS

myocardial infarction with residual arrhythmia
• Severe Parkinson's disease inadequately controlled by other preparations
  • Adult: Administered as intestinal gel, for use with enteral tube (consult product literature)

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

• CAUTIONS
  • Cushing’s syndrome • diabetes mellitus • endocrine disorders • history of convulsions • history of myocardial infarction with residual arrhythmia • history of peptic ulcer • hypothyroidism • osteomalacia • phaeochromocytoma • psychiatric illness (avoid if severe and discontinue if deterioration) • severe cardiovascular disease • severe pulmonary disease • susceptibility to angle-closure glaucoma

• INTERACTIONS → Appendix 1 (co-careldopa, levodopa).

• SIDE-EFFECTS
  • Common or very common
    • Abnormal dreams • anorexia • anxiety • arrhythmias • chorea • confusion • dementia • depression • dizziness • drowsiness • dry mouth • dyskinesia • dystonia • euphoria • fatigue • insomnia • nausea • palpitations • postural hypotension • psychosis • syncope • taste disturbances • vomiting
  • Uncommon
    • Ataxia • chest pain • constipation • diarrhoea • dysphagia • flatulence • hand tremor • hoarseness • hypersalivation • hypertension • malaise • muscle cramps • oedema • reddish discoloration of the urine and other body fluids • weakness • weight changes
  • Rare
    • Abdominal pain • activation of Horner’s syndrome • activation of malignant melanoma • agitation • agranulocytosis • alopecia • blepharospasm • blurred vision • bruxism • convulsions • diplopia • disorientation • duodenal ulcer • dyspepsia • dysphonia • exanthema • flushing • gastro-intestinal bleeding • haemolytic anaemia • headache • Henoch-Schönlein purpura • hiccups • leucopenia • neuroleptic malignant syndrome (associated with abrupt withdrawal) • non-haemolytic anaemia • ocular crisis • paraesthesia • phlebitis • priapism • pupil dilatation • reduced mental acuity • sweating • thrombocytopenia • trismus • urinary incontinence • urinary retention
  • Very rare
    • Angle-closure glaucoma • suicidal ideation
  • Frequency not known
    • Compulsive behaviour

• PREGNANCY
  • Use with caution—toxicity has occurred in animal studies.

• BREAST FEEDING
  • May suppress lactation; present in milk—avoid.

• HEPATIC IMPAIRMENT
  • Use with caution.

• RENAL IMPAIRMENT
  • Use with caution.

• EFFECT ON LABORATORY TESTS
  • False positive tests for urinary ketones have been reported.

• TREATMENT CESSATION
  • Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

• PRESCRIBING AND DISPENSING INFORMATION
  • Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

  When transferring patients from another levodopa/dopacarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

  Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

  2 tablets Sinemet® 12.5 mg/50 mg ≡ 1 tablet Sinemet® Plus 25 mg/100 mg.

• MEDICINAL FORMS
  • There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

SINEMET® CR

Parkinson’s disease (patients not receiving levodopa/dopacarboxylase inhibitor therapy)

BY MOUTH
  • Adult: Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopacarboxylase inhibitor preparations)

BY MOUTH
  • Adult: 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release Sinemet® tablets (substitute Sinemet® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

HALF SINEMET® CR

Parkinson’s disease (for fine adjustment of Sinemet® CR dose)

BY MOUTH
  • Adult: (consult product literature)

DUODOPA®

Severe Parkinson’s disease inadequately controlled by other preparations

BY MOUTH
  • Adult: Administered as intestinal gel, for use with enteral tube (consult product literature)
Carbidopa with entacapone and levodopa

The properties listed below are those particular to the combination only. For the properties of the components please consider, entacapone p. 327, co-carbeldopa p. 329.

INDICATIONS AND DOSE

**STALEVO® 75/18.75/200**
Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 50/12.5/200**
Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 150/37.5/200**
Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 200/50/200**
Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**
- Adult: 1 tablet for each dose; maximum 7 tablets per day

**STALEVO® 125/31.25/200**
Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 175/43.75/200**
Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**
- Adult: 1 tablet for each dose; maximum 8 tablets per day

**PRESCRIBING AND DISPENSING INFORMATION**

Patients receiving standard-release co-carbeldopa or co-beneldopa alone, initiate Stalevo® at a dose that provides similar (or slightly lower) amount of levodopa. Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to Stalevo® (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-carbeldopa or co-beneldopa, initiate Stalevo® at a dose that provides similar (or slightly higher) amount of levodopa.

**PATIENT AND CARER ADVICE**

**Sudden onset of sleep**
Excessive daytime sleepiness and sudden onset of sleep can occur with Stalevo®. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Brands may include Sastravi; Stanek

**DOPAMINE RECEPTOR AGONISTS**

**Amantadine hydrochloride**

**DRUG ACTION**
Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.
MEDICINAL FORMS

INDICATIONS AND DOSE

Parkinson’s disease

BY MOUTH
- Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
- Elderly: 100 mg daily, adjusted according to response

Post-herpetic neuralgia

BY MOUTH
- Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

Treatment of influenza A (but not recommended)

BY MOUTH
- Adult: 100 mg daily 4–5 days

Prophylaxis of influenza A (but not recommended)

BY MOUTH
- Adult: 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

CONTRA-INDICATIONS
- Epilepsy · history of gastric ulceration
- CAUTIONS
- Confused or hallucinatory states · congestive heart disease (may exacerbate oedema) · elderly · tolerance to the effects of amantadine may develop in Parkinson’s disease

INTERACTIONS → Appendix 1 (amantadine).

SIDE-EFFECTS
- Common or very common
  - Anorexia · anxiety · dizziness · dry mouth · gastro-intestinal disturbances · hallucinations · headache · impaired concentration · insomnia · lethargy · livedo reticularis · mood changes · myalgia · palpitation · peripheral oedema · postural hypotension · slurred speech · sweating
  - Uncommon
  - Confusion · movement disorders · neuroleptic malignant syndrome · psychosis · rash · seizure · tremor · urinary incontinence · urinary retention · visual disturbances
- Frequency not known
- Heart failure · leucopenia · photosensitisation
- PREGNANCY
  - Avoid; toxicity in animal studies.
- BREAST FEEDING
  - Avoid; present in milk; toxicity in infant reported.

HEPATIC IMPAIRMENT
  - Use with caution.

RENAL IMPAIRMENT
- Reduce dose. Avoid if eGFR less than 15 mL/minute/1.73 m².

TREATMENT CESSION
- Avoid abrupt withdrawal in Parkinson’s disease.

PATIENT AND CARER ADVICE
- May affect performance of skilled tasks (e.g. driving).

NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)

Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
- Amantadine is not recommended for prophylaxis of influenza. www.nice.org.uk/TA158

Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168
- Amantadine is not recommended for treatment of influenza. www.nice.org.uk/TA168

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Capsule
- AMANTADINE HYDROCHLORIDE (Non-proprietary)
  - Amantadine hydrochloride 100 mg
  - 14 capsule | £7.45–£7.50
  - 56 capsule | £29.80

Oral solution
- AMANTADINE HYDROCHLORIDE (Non-proprietary)
  - Amantadine hydrochloride 10 mg per 1 ml
  - Oral solution sugar free (sugar-free) | 150 ml | PO £89.30–£117.20
  - DT price = £103.25

Apomorphine hydrochloride

INDICATIONS AND DOSE

Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

BY SUBCUTANEOUS INJECTION
- Adult: Initially 1 mg, dose to be administered at the first sign of 'off' episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

Refractory motor fluctuations in Parkinson's disease ('off' episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

BY CONTINUOUS SUBCUTANEOUS INFUSION
- Adult: Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

Important safety information
- IMPULSE CONTROL DISORDERS
  - Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CONTRA-INDICATIONS
- Avoid if 'on' response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression
- CAUTIONS
  - Cardiovascular disease · history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to QT-interval prolongation

INTERACTIONS → Appendix 1 (apomorphine).

SIDE-EFFECTS
- Common or very common
  - Confusion · drowsiness · hallucinations · nausea · sudden onset of sleep · vomiting · yawning
Uncommon Dyskinesias during ‘on’ periods (may require discontinuation) - dyspnoea - haemolytic anaemia (with levodopa) - postural hypotension - rash - thrombocytopenia (with levodopa)

Rare Eosinophilia

Frequency not known Compulsive behaviour - dizziness - peripheral oedema

ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to opioids.

PREGNANCY Avoid unless clearly necessary.

BREAST FEEDING No information available; may suppress lactation.

HEPATIC IMPAIRMENT Avoid.

RENAL IMPAIRMENT Use with caution.

MONITORING REQUIREMENTS
- Monitor hepatic, haemopoietic, renal, and cardiovascular function.
- With concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).

TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE
- Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
- Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk. 2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see Drugs and driving under Guidance on prescribing p. 1.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

MEdICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 10
EXCIPIENTS: May contain Sulphites

Apomorphine hydrochloride 10 mg per 1 ml APO-go 50mg/5ml solution for injection ampoules | 5 ampoule \[POM\] £17.96

APO-go 20mg/2ml solution for injection ampoules | 5 ampoule \[POM\] £17.96

Bromocriptine

DRUG ACTION Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

INDICATIONS AND DOSE

Prevention of lactation

BY MOUTH
- Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

Suppression of lactation

BY MOUTH
- Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility

BY MOUTH
- Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly

BY MOUTH
- Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma

BY MOUTH
- Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson’s disease

BY MOUTH
- Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

Important safety information

FIBROTIC REACTIONS
Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

IMPULSE CONTROL DISORDERS
Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders.
There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS** Avoid in pre-eclampsia - cardiac valvulopathy (exclude before treatment) - hypertension in postpartum women or in puerperium

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unmitting headache, or signs of CNS toxicity develop.

**CAUTIONS** Acute porphyrias p. 864 - cardiovascular disease - history of peptic ulcer (particularly in acromegalic patients) - history of serious mental disorders (especially psychotic disorders) - Raynaud’s syndrome

**CAUTIONS, FURTHER INFORMATION**

Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

**INTERACTIONS** → Appendix 1 (bromocriptine).

Tolerance may be reduced by alcohol.

**SIDE-EFFECTS**

- **Common or very common** Constipation - headache - nasal congestion - nausea
- **Uncommon** Confusion (particularly with high doses) - dizziness - dry mouth - fatigue - hallucinations (particularly with high doses) - postural hypotension - psychomotor excitation (particularly with high doses) - vomiting
- **Rare** Abdominal pain - arrhythmia - bradycardia - diarrhoea - gastric ulcer - gastrointestinal bleeding - insomnia - paraesthesia - psychosis - tachycardia - tinnitus - visual disturbances
- **Very rare** Neuroleptic malignant syndrome on withdrawal - vasospasm of fingers and toes (particularly in patients with Raynaud’s syndrome)
- **Frequency not known** Allergic skin reactions - alopecia - cardiac valvulopathy - constriective pericarditis - drowsiness - dyskinesia - hypersexuality - hyponatraemia - hypotension - increased libido - leg cramps - leucopenia - pathological gambling - pericardial effusion - peripheral oedema - pleural effusion - pleural fibrosis - pleuritis - pulmonary fibrosis - retroperitoneal fibrosis - reversible hearing loss - thrombocytopenia - urinary incontinence

**SIDE-EFFECTS, FURTHER INFORMATION**

Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.

**ALLERGY AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.

**CONCEPTION AND CONTRACEPTION** Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

**BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary.

**MONITORING REQUIREMENTS**

- Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
- Monitor for fibrotic disease.
- Monitor blood pressure for a few days after starting treatment and following dosage increase.

**TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PATIENT AND CARER ADVICE**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Cabergoline**

**DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

**INDICATIONS AND DOSE**

**Prevention of lactation**

- **BY MOUTH**
  - Adult: 1 mg, to be taken as a single dose on the first day postpartum

**Suppression of established lactation**

- **BY MOUTH**
  - Adult: 250 micrograms every 12 hours for 2 days

**Hyperprolactinaemic disorders**

- **BY MOUTH**
  - Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on
epigastric pain, gastritis, hallucinations, headache, nausea, syncope

- Rare Digital vasospasm, epistaxis, hot flushes, muscle weakness, palpitation, paraesthesia, transient hemianopia, vomiting.

- Frequency not known Allergic skin reactions, alopecia, cardiac valvulopathy, constrictive pericarditis, drowsiness, dyskinesia, erythromelalgia, hypersexuality, hypotension, increased libido, leg cramps, pathological gambling, pericardial effusion, peripheral oedema, pleural effusion, pleural fibrosis, pleuritis, pulmonary fibrosis, retroperitoneal fibrosis.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Gastro-intestinal bleeding** Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).

- **PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).

- **BREAST FEEDING** Suppresses lactation; avoid breast-feeding if lactation prevention fails.

- **HEPATIC IMPAIRMENT** Reduce dose in severe hepatic impairment.

- **MONITORING REQUIREMENTS**
  - Monitor for fibrotic disease.
  - Monitor blood pressure for a few days after starting treatment and subsequently at 6–12 month intervals.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

- **PATIENT AND CARER ADVICE**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

**Important safety information**

**FIBROTIC REACTIONS**

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPALE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia; cardiac valvulopathy (exclude before treatment); history of pericardial fibrotic disorders; history of puerperal syndrome; history of pulmonary fibrotic disorders; history of retroperitoneal fibrotic disorders.

- **CAUTIONS**
  - Acute porphyria p. 864; cardiovascular disease; history of peptic ulcer (particularly in acromegalic patients); history of serious mental disorders (especially psychotic disorders) — Raynaud’s syndrome.

**CAUTIONS, FURTHER INFORMATION**

Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** Appendix 1 (cabergoline).

Tolerance may be reduced by alcohol.

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain, angina, breast pain, confusion, constipation, depression, dyspepsia, epigastric pain, gastritis, hallucinations, headache, nausea, syncope.
Pergolide

INDICATIONS AND DOSE

Monotherapy in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

- Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 2.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

- Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

Important safety information

FIBROTIC REACTIONS

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CONTRA-INDICATIONS

Cardiac valvulopathy (exclude before treatment) - history of fibrotic disorders

CAUTIONS

Acute porphyrias p. 864 - arhythmias - dyskinesia (may exacerbate) - hallucinations - history of confusion - psychosis - underlying cardiac disease

INTERACTIONS

Appendix 1 (pergolide).

SIDE-EFFECTS

PREGNANCY

Use only if potential benefit outweighs risk.

BRACST FEEDING

May suppress lactation.

TREATMENT CESSATION

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep

Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions

Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

PERGOLIDE (Non-proprietary)

Pergolide (as Pergolide mesilate) 50 microgram Pergolide 50microgram tablets | 100 tablet [PDR] £33.00 DT price = £32.66

Pergolide (as Pergolide mesilate) 250 microgram Pergolide 250microgram tablets | 100 tablet [PDR] £35.00–£36.00 DT price = £35.92

Pergolide (as Pergolide mesilate) 1 mg Pergolide 1mg tablets | 100 tablet [PDR] £125.00–£140.00 DT price = £131.66

Pramipexole

INDICATIONS AND DOSE

Parkinson’s disease, used alone or as an adjunct to co-beneldopa or co-careldopa

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 88 micrograms 3 times a day, increased if tolerated to 350 micrograms 3 times a day, dose to be increased by doubling dose every 5–7 days, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 260 micrograms once daily, increased to 1.05 mg once daily, dose to be increased by doubling dose every 5–7 days, then increased in steps of 520 micrograms every 1 week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day
Restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

Dose equivalence and conversion

Doses and strengths are stated in terms of pramipexole (base).

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:
- 88 micrograms base = 125 micrograms salt;
- 180 micrograms base = 250 micrograms salt;
- 350 micrograms base = 500 micrograms salt;
- 700 micrograms base = 1 mg salt.

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:
- 260 micrograms base = 375 micrograms salt;
- 520 micrograms base = 750 micrograms salt;
- 1.05 mg base = 1.5 mg salt;
- 1.57 mg base = 2.25 mg salt;
- 2.1 mg base = 3 mg salt;
- 2.62 mg base = 3.75 mg salt;
- 3.15 mg base = 4.5 mg salt.

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- CAUTIONS
  - Psychotic disorders: risk of visual disorders (ophthalmological testing recommended) - severe cardiovascular disease

- INTERACTIONS
  - Appendix 1 (pramipexole).

- SIDE-EFFECTS
  - Common or very common Confusion, constipation, decreased appetite, dizziness, drowsiness, dyskinesia, hallucinations, headache, hyperkinesia, hypotension, nausea, peripheral oedema, postural hypotension, restlessness, sleep disturbances, sudden onset of sleep, visual disturbances, vomiting, weight changes
  - Uncommon Amnesia, binge eating, cardiac failure, compulsive behaviour, delusion, dysphoria, hiccups, paranoia, pnuemonia, pruritis, rash, syncope

- Frequency not known Paradoxical worsening of restless legs syndrome

- PREGNANCY
  - Use only if potential benefit outweighs risk—no information available.

- BREAST FEEDING
  - May suppress lactation; avoid—present in milk in animal studies.

- RENAL IMPAIRMENT
  - For immediate-release tablets in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR. For immediate-release tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m². For modified-release tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 250 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily. For modified-release tablets, avoid if eGFR less than 30 mL/minute/1.73 m².

- MONITORING REQUIREMENTS
  - Risk of postural hypotension (especially on initiation)—monitor blood pressure.

- TREATMENT CESSATION
  - Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- PATIENT AND CARER ADVICE
  - Sudden onset of sleep: Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

  - Hypotensive reactions: Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

**Ropinirole**

**INDICATIONS AND DOSE**

Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

Adult: Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 4–6 mg daily divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

**Moderate to severe restless legs syndrome**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

Adult: Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

**Dose adjustments due to interactions**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**UNLICENSED USE**

Doses in the BNF may differ from those in product literature.

**Important safety information**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CAUTIONS**

Elderly • major psychiatric disorders • severe cardiovascular disease (risk of hypotension—monitor blood pressure)

**INTERACTIONS** → Appendix 1 (ropinirole).

**SIDE-EFFECTS**

**Common or very common** Abdominal pain • confusion • constipation • dizziness • dyskinesia • dyspepsia • fatigue • gastro-oesophageal reflux disease • hallucinations • hypotension • nausea • nervousness • peripheral oedema • sudden onset of sleep • syncope • vomiting

**Uncommon** Compulsive behaviour • psychosis

**Very rare** Hepatic disorders

**Frequency not known** Paradoxical worsening of restless legs syndrome

**PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING** May suppress lactation—avoid.

**HEPATIC IMPAIRMENT** Avoid—no information available.

**RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

**TREATMENT CESSATION** Anti-parkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PATIENT AND CARER ADVICE**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of
sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour. Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2006) that rotigotine should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

- **Ropinirole** (as Ropinirole hydrochloride) 8 mg [Requip XL 8mg tablets | 28 tablet (RoS) £42.11 DT price = £12.11
- **Brands may include Aimpact XL; Epinix XL; Ralnea XL; Raponer XL; Repiniz XL; Spirico XL**

### Important safety information

#### IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

#### CAUTIONS

Avoid exposure of patch to heat - remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion.

#### INTERACTIONS

- Appendix 1 (rotigotine).

#### SIDE-EFFECTS

- **Common or very common** Abnormal behaviour - abnormal thinking - aggression - application site reactions - confusion - constipation - dizziness - drowsiness - dry mouth - dyskinesia - dysphoria - hallucinations - headache - hiccups - hypertension - malaise - nausea - palpitation - paroixia - peripheral oedema - postural hypotension - pruritis - psychosis - rash - sleep disturbances - sudden onset of sleep - sweating - syncope - vomiting - weight changes

- **Uncommon** Abdominal pain - atrial fibrillation - erectile dysfunction - hypotension - impulse control disorders - visual disturbances

- **Rare** Irritability - obsessive compulsive disorder - seizures - tachycardia

#### PREGNANCY

Avoid—no information available.

#### BREAST FEEDING

May suppress lactation; avoid—present in milk in animal studies.

#### HEPATIC IMPAIRMENT

Caution in severe impairment—no information available.

#### MONITORING REQUIREMENTS

Ophthalmic testing recommended.

#### TREATMENT CESSATION

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

#### DIRECTIONS FOR ADMINISTRATION

Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days).
PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised that Neupro® is accepted for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007). The Scottish Medicines Consortium has advised that Neupro® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007). The Scottish Medicines Consortium has advised (April 2009) that rotigotine (Neupro®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

| CAUTIONARY AND ADVISORY LABELS | 10 |
| Rotigotine 1 mg per 24 hour | Neupro 1mg/24hours transdermal patches | 28 patch | £7.44 |
| Rotigotine 2 mg per 24 hour | Neupro 2mg/24hours transdermal patches | 7 patch | £19.77 |
| Rotigotine 3 mg per 24 hour | Neupro 3mg/24hours transdermal patches | 28 patch | £102.35 |
| Rotigotine 4 mg per 24 hour | Neupro 4mg/24hours transdermal patches | 7 patch | £223.60 |
| Rotigotine 6 mg per 24 hour | Neupro 6mg/24hours transdermal patches | 28 patch | £149.93 |
| Rotigotine 8 mg per 24 hour | Neupro 8mg/24hours transdermal patches | 7 patch | £149.93 |

MONOAMINE-OXIDASE B INHIBITORS

Rasagiline

DRUG ACTION Rasagiline is a monoamine-oxidase B inhibitor.

INDICATIONS AND DOSE Parkinson’s disease, used alone or as adjunct to co- beneldopa or co-careldopa for ‘end-of-dose’ fluctuations by mouth

Adult: 1 mg daily

INTERACTIONS Appendix 1 (rasagiline).

SIDE-EFFECTS

Common or very common Abnormal dreams • angina • anorexia • arthralgia • conjunctivitis • constipation • depression • dry mouth • dyspepsia • flatulence • hallucinations • headache • influenza-like symptoms • leucopenia • rash • rhinitis • skin carcinoma • urinary urgency • vertigo • weight loss

Uncommon Cerebrovascular accident • myocardial infarction

PREGNANCY Use with caution.

BREAST FEEDING Use with caution—may suppress lactation.

HEPATIC IMPAIRMENT Use with caution in mild impairment. Avoid in moderate to severe impairment.

TREATMENT CESSATION Avoid abrupt withdrawal.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Azilect (Teva UK Ltd)

Rasagiline (as Rasagiline mesilate) 1 mg Azilect 1mg tablets | 28 tablet | £70.72 DT price = £70.72

Selegiline hydrochloride

DRUG ACTION Selegiline is a monoamine-oxidase-B inhibitor.

INDICATIONS AND DOSE Parkinson’s disease, used alone or as adjunct to co- beneldopa or co-careldopa to reduce ‘end of dose’ deterioration | Symptomatic Parkinsonism by mouth using immediate-release medicines

Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning

BY MOUTH USING ORAL LYPHILISATE

Adult: 1.25 mg once daily, dose to be taken before breakfast

Dose equivalence and conversion

1.25–mg oral lyphilisate is equivalent to 10-mg tablet.

Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyphilisates (Zelapar®) 1.25 mg.

CONTRA-INDICATIONS Active duodenal ulceration • active gastric ulceration • avoid or use with great caution in postural hypotension (when used in combination with levodopa)

CAUTIONS Angina • arrhythmias • avoid in Acute porphyrias p. 864 • duodenal ulceration • gastric ulceration • history of hepatic dysfunction • patients predisposed to confusion and psychosis • psychosis • uncontrolled hypertension

INTERACTIONS Appendix 1 (selegiline). Avoid with drugs that increase blood pressure.

SIDE-EFFECTS

Common or very common Arthralgia • bradycardia • confusion • constipation • depression • diarrhoea • dizziness • dry mouth • fatigue • hair loss • headache • hypertension • hypotension • impaired balance • mouth ulcers • movement disorders • muscle cramps • myalgia • myopathy • nasal congestion • nausea • psychosis • sleeping disorders • stomatitis • sweating • tremor

Uncommon Agitation • angina • ankle oedema • anxiety • arrhythmias • blurred vision • dyspnoea • leucocytopenia • loss of appetite • micturition difficulties • palpitation • postural hypotension • skin reactions • supraventricular tachycardia • thrombocytopenia

Frequency not known Hypersexuality
Nausea and labyrinth disorders

Nausea and labyrinth disorders

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 94 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting. Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 309, perphenazine p. 308, and trifluoperazine p. 310 are less sedating than chlorpromazine hydrochloride p. 304; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine p. 309 can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 306 and levomepromazine p. 345 are used for the relief of nausea and vomiting in terminal illness. Metoclopramide hydrochloride p. 347 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Dopaminedone p. 346 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood–brain barrier. In Parkinson’s disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 348 and ondansetron p. 349 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 350 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

Dexamethasone p. 581 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine p. 309, lorazepam p. 412, or a 5HT₃-receptor antagonist.

Aprepitant p. 351 and fosaprepitant p. 351 are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone p. 581 and a 5HT₃-receptor antagonist.

Nabilone p. 346 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Prochlorperazine p. 309 or metoclopramide hydrochloride p. 347 are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought.

Hyperemesis gravidarum is a more serious condition, which requires regular antihistamine therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 882 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used,
Nervous system

Less sedating antihistamine such as cyclizine p. generally better tolerated than hyoscine. If a sedative effect is required, and associated with migraine.

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and during postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT3-receptor antagonists, droperidol p. 345, dexamethasone p. 581, some phenothiazines (e.g. prochlorperazine p. 309), and antihistamines (e.g. cyclizine p. 343). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 344. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine p. 343 or cinnarizine below is preferred. Domperidone p. 346, metoclopramide hydrochloride p. 347, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat.

Betahistine dihydrochloride p. 352 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière’s disease; antihistamines (such as cinnarizine below), and phenothiazines (such as prochlorperazine p. 309) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

Cytotoxic chemotherapy, palliative care, and migraine

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

Drugs used for Nausea and labyrinth disorders not listed below; Chlorpromazine hydrochloride, p. 304 · Haloperidol, p. 306 · Lorazepam, p. 412 · Perphenazine, p. 308 · Prochlorperazine, p. 309 · Promethazine hydrochloride, p. 251 · Promazine teoclante, p. 252 · Trifluoperazine, p. 310
Cinnarizine with dimenhydrinate

The properties listed below are those particular to the combination only. For the properties of the components please consider, cinnarizine.

**INDICATIONS AND DOSE**

**Vertigo**

**BY MOUTH**

- Adult: 1 tablet 3 times a day

**BY RECTUM**

**Nausea and vomiting associated with palliative care**

**BY SUBCUTANEOUS INFUSION**

- Adult: 150 mg, dose to be given over 24 hours

**BY MOUTH**

- Adult: 50 mg up to 3 times a day

**UNLICENSED USE**

**CONTRA-INDICATIONS**

Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe) - neonate (due to significant antimuscarinic activity) (in neonates)

**CAUTIONS**

Epilepsy - glaucoma - may counteract haemodynamic benefits of opioids - neuromuscular disorders - increased risk of transient paralysis with intravenous use - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - severe heart failure - may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure - susceptibility to angle-closure glaucoma - urinary retention

**INTERACTIONS**

Appendix 1 (antihistamines).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Drowsiness

- Rare Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - paradoxical stimulation (especially with high doses in children) (in children) - paradoxical stimulation (especially with high doses in the elderly) (in adults) - photosensitivity reactions - rashes - sleep disturbances - tremor

**SPECIFIC SIDE-EFFECTS**

- Rare

- With intravenous use transient paralysis

- Frequency not known

- With subcutaneous use local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY**

Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING**

No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**

Avoid in severe liver disease—increased risk of coma

**DIRECTIONS FOR ADMINISTRATION**

For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care Cyclicine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9%
ANTIMUSCARINICS

Hyoscine hydrobromide (Scopolamine hydrobromide)
The properties listed below are those particular to the drug only. For properties common to the class, see Antimuscarinics, Systemic, p. 668.

INDICATIONS AND DOSE
Motion sickness
BY MOUTH
- Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
- Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

BY TRANSDERMAL APPLICATION
- Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
- Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Hypersalivation associated with clozapine therapy
BY MOUTH
- Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

Excessive respiratory secretion (in palliative care)
BY SUBCUTANEOUS INJECTION
- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

BY CONTINUOUS SUBCUTANEOUS INFUSION
- Adult: 1.2–2 mg/24 hours

Bowel colic in palliative care
BY SUBCUTANEOUS INJECTION
- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary

BY SUBCUTANEOUS INFUSION
- Adult: 1.2–2 mg/24 hours

or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.

- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution

  **Tablet**
  CAUTIONARY AND ADVISORY LABELS 2
  CYCLIZINE (Non-proprietary)
  Cyclizine hydrochloride 50 mg Cyclizine 50mg tablets | 100 tablet £13.64 DT price = £10.97

  **Solution for injection**
  CYCLIZINE (Non-proprietary)
  Cyclizine lactate 50 mg per 1 ml Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule £8.65 DT price = £8.65

**ANTIMUSCARINICS**

Hyoscine hydrobromide

**INDICATIONS AND DOSE**

**Motion sickness**

**BY MOUTH**
- Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
- Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

Bowel colic pain in palliative care

**BY MOUTH**
- Adult: 300 micrograms 3 times a day, Sublingually as Kwells®

Premedication

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

**UNLICENSED USE**
- In children Not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy.

**Important safety information**
Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**CAUTIONS**

**Epilepsy**

**CAUTIONS, FURTHER INFORMATION**

**Anticholinergic syndrome** In some patients, especially children and the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Use with caution.

**DIRECTIONS FOR ADMINISTRATION**
- With topical use *Patch* applied to hairless area of skin behind ear; if less than whole patch required *either* cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin.
- With oral use in children For administration by *mouth*, injection solution may be given orally.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.

**PATIENT AND CARER ADVICE**
- With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.

**Driving and skilled tasks**
- With transdermal use Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2
- **HYOSCINE HYDROBROMIDE (Non-proprietary)**
  Hyoscine hydrobromide 300 microgram Hyoscine hydrobromide 300microgram tablets | 12 tablet £1.67
  Kwell (Bayer Plc)
  Hyoscine hydrobromide 150 microgram Kwells Kids 150microgram tablets | 12 tablet £1.67
  Orbelle hydrobromide 300 microgram Kwells 300microgram tablets | 12 tablet £1.67
  Brands may include Travel Calm
Chewable tablet
CAUTIONARY AND ADVISORY LABELS 2, 24
- Joy-Rides (Forest Laboratories UK Ltd)
Droperidol 150 microgram chewable tablets (sugar-free) | 12 tablet | £1.55

Solution for injection
- HYOSCINE HYDROBROMIDE (Non-proprietary)
Hyoscine hydrobromide 400 microgram per 1 ml | 10 ampoule | £31.06–£31.29 DT price = £31.29

Transdermal patch
CAUTIONARY AND ADVISORY LABELS 19
- Scopoderm (Novartis Consumer Health UK Ltd)
Hyoscine 1 mg per 72 hour | 2 patch | £4.52 DT price = £4.52

ANTIPSYCHOTICS (FIRST-GENERATION)
Droperidol
The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.
- DRUG ACTION Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

INDICATIONS AND DOSE
Prevention and treatment of postoperative nausea and vomiting
BY INTRAVENOUS INJECTION
- Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
- Elderly: 625 micrograms, dose to be given every 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient controlled analgesia (PCA)
BY INTRAVENOUS INJECTION
- Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

- CONTRA-INDICATIONS Bradycardia - CNS depression - comatose states - hypokalaemia - hypomagnesaemia - phaeochromocytoma - QT-interval prolongation
- CAUTIONS Chronic obstructive pulmonary disease - electrolyte disturbances - history of alcohol abuse - respiratory failure
- INTERACTIONS Appendix 1 (droperidol). Avoid concomitant administration of drugs that prolong QT interval.
- SIDE-EFFECTS Anxiety - cardiac arrest - hallucinations - inappropriate antiidiuretic hormone secretion
- PREGNANCY Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- BREAST FEEDING Limited information available—avoid repeated administration.
- HEPATIC IMPAIRMENT In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required. For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

- RENAL IMPAIRMENT In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required. For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.
- MONITORING REQUIREMENTS Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule
Solution for injection
- Xomolix (ProStrakan Ltd)
Droperidol 2.5 mg per 1 ml | 10 ampoule | £39.40

Levomepromazine
(Methotrimeprazine)
The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

INDICATIONS AND DOSE
Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)
BY CONTINUOUS SUBCUTANEOUS INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION
- Adult: Seek specialist advice
Restlessness and confusion in palliative care
BY CONTINUOUS SUBCUTANEOUS INFUSION
- Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
- Child 12-17 years: 12.5–200 mg, to be administered over 24 hours
BY MOUTH
- Adult: 6 mg every 2 hours as required
BY SUBCUTANEOUS INJECTION
- Adult: 6.25 mg every 2 hours as required
BY SUBCUTANEOUS INFUSION
- Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

Nausea and vomiting in palliative care
BY CONTINUOUS INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INFUSION
- Child 1 month-11 years: 100–400 micrograms/kg, to be administered over 24 hours
- Child 12-17 years: 5–25 mg, to be administered over 24 hours
BY MOUTH
- Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily
BY SUBCUTANEOUS INFUSION
- Adult: 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily
BY SUBCUTANEOUS INFUSION
- Adult: 5–25 mg/24 hours, sedation can limit the dose
Schizophrenia
BY MOUTH
- Adult: Initially 25–50 mg daily in divided doses, dose can be increased as necessary
BY SUBCUTANEOUS INFUSION
- Adult: 5–25 mg/24 hours, sedation can limit the dose

Schizophrenia (bed patients)
BY MOUTH
- Adult: Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily
RISK OF POSTURAL HYPOTENSION; NOT RECOMMENDED FOR AMBULANT PATIENTS OVER 50 YEARS UNLESS RISK OF HYPTENSIVE REACTION ASSESSED.

SIDE-EFFECTS

RAISED ERYTHROCYTE SEDIMENTATION RATE

PREGNANCY

EXTRAPYRAMIDAL EFFECTS AND WITHDRAWAL SYNDROME HAVE BEEN REPORTED OCCASIONALLY IN THE NEONATE WHEN ANTIPSYCHOTIC DRUGS ARE TAKEN DURING THE THIRD TRIMESTER OF PREGNANCY. FOLLOWING MATERNAL USE OF ANTIPSYCHOTIC DRUGS IN THE THIRD TRIMESTER, NEONATES SHOULD BE MONITORED FOR SYMPTOMS INCLUDING AGITATION, HYPTONIA, HYPOTONIA, TREMOR, DROWSINESS, FEEDING PROBLEMS, AND RESPIRATORY DISTRESS.

BREAST FEEDING

THERE IS LIMITED INFORMATION AVAILABLE ON THE SHORT- AND LONG-TERM EFFECTS OF ANTIPSYCHOTIC DRUGS ON THE BREAST-FED INFANT. ANIMAL STUDIES INDICATE POSSIBLE ADVERSE EFFECTS OF ANTIPSYCHOTIC MEDICINES ON THE DEVELOPING NERVOUS SYSTEM. CHRONIC TREATMENT WITH ANTIPSYCHOTIC DRUGS Whilst BREAST-FEEDING SHOULD BE AVOIDED UNLESS ABSOLUTELY NECESSARY. PHENOTHIAZINE DERIVATIVES ARE SOMETIMES USED IN BREAST-FEEDING WOMEN FOR SHORT-TERM TREATMENT OF NAUSEA AND VOMITING.

HEPATIC IMPAIRMENT

CAN PRECIPITATE COMA; PHENOThIAZINES ARE HEPATOTOXIC.

RENAL IMPAIRMENT

START WITH SMALL DOSES IN SEVERE RENAL IMPAIRMENT BECAUSE OF INCREASED CEREBRAL SENSITIVITY.

DIRECTIONS FOR ADMINISTRATION

WITH SUBCUTANEOUS USE IN CHILDREN FOR ADMINISTRATION BY SUBCUTANEOUS INFUSION DILUTE WITH A SUITABLE VOLUME OF SODIUM CHLORIDE 0.9%.

MEDICINAL FORMS

THERE CAN BE VARIATION IN THE LICENSING OF DIFFERENT MEDICINES CONTAINING THE SAME DRUG. FORMS AVAILABLE FROM SPECIAL-ORDER MANUFACTURERS INCLUDE: ORAL SOLUTION, ORAL SUSPENSION

CANNABINOIDS

Nabilone

INDICATIONS AND DOSE

NAUSEA AND VOMITING CAUSED BY CYTOXIC CHEMOTHERAPY, UNRESPONSIVE TO CONVENTIONAL ANTIEMETICS (PREFERABLY IN HOSPITAL SETTING) (UNDER CLOSE MEDICAL SUPERVISION) BY MOUTH

Adult: Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of

CYTOXIC DRUG, DAILY DOSE MAXIMUM SHOULD BE GIVEN IN 3 DIVIDED DOSES; MAXIMUM 6 MG PER DAY

CAUTIONS

ADVERSE EFFECTS ON MENTAL STATE CAN PERSIST FOR 48–72 HOURS AFTER STOPPING. ELDERLY, HEART DISEASE, HISTORY OF PSYCHIATRIC DISORDER, HYPTENSION

SIDE-EFFECTS

COMMON OR VERY COMMON Ataxia, concentration difficulties, drowsiness, dry mouth, dysthria, euphoria, headache, hypotension, nausea, sleep disturbance, vertigo, visual disturbance

FREQUENCY NOT KNOWN Abdominal pain, confusion, decreased appetite, decreased coordination, depression, disorientation, hallucinations, psychosis, tachycardia, tremors

SIDE-EFFECTS, FURTHER INFORMATION

DROWSINESS AND DIZZINESS OCCUR FREQUENTLY WITH STANDARD DOSES.

PREGNANCY

AVOID UNLESS ESSENTIAL.

BREAST FEEDING

AVOID—NO INFORMATION AVAILABLE.

HEPATIC IMPAIRMENT

AVOID IN SEVERE IMPAIRMENT.

PATIENT AND CARER ADVICE

DROWSINESS MAY AFFECT PERFORMANCE OF SKILLED TASKS (E.G. DRIVING). EFFECTS OF ALCOHOL ENHANCED.

For information on 2015 Legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and driving under Guidance on prescribing p. 1. Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

MEDIcINAL FORMS

THERE CAN BE VARIATION IN THE LICENSING OF DIFFERENT MEDICINES CONTAINING THE SAME DRUG. FORMS AVAILABLE FROM SPECIAL-ORDER MANUFACTURERS INCLUDE: CAPSULE

Capsule

CAUTIONARY AND ADVISORY LABELS 2

Nabilone 250 microgram Nabilone 250 microgram capsules | 20 capsule (PO) £96.11 Schedule 2 (CD)

Nabilone 1 mg Nabilone 1 mg capsules | 20 capsule (PO) £125.84 Schedule 2 (CD)

DOPAMINE RECEPTOR ANTAGONISTS

Domperidone

INDICATIONS AND DOSE

RELIEF OF NAUSEA AND VOMITING BY MOUTH

Child (body-weight up to 35 kg): 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day

Child 12–17 years (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

Adult (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

Gastro-intestinal pain in palliative care

BY MOUTH

Adult: 10 mg 3 times a day, before meals

UNLICENSED USE

NOT LICENSED FOR USE IN CHILDREN FOR GASTRO-OESOPHAGEAL REFUX DISEASE.
duration of treatment have been made, and new contra-
indications added:  
- Domperidone should only be used for the relief of the 
symptoms of nausea and vomiting;  
- Domperidone should be used at the lowest effective
dose for the shortest possible duration (max. 
treatment duration should not normally exceed 1 
week);  
- Domperidone is contra-indicated for use in conditions
where cardiac conduction is, or could be, impaired, or 
where there is underlying cardiac disease, when 
administered concomitantly with drugs that prolong
the QT interval or potent CYP3A4 inhibitors, and in 
severe hepatic impairment;  
- The recommended dose in adults and adolescents
over 12 years and over 35 kg is 10 mg up to 3 times
daily;  
- The recommended dose in children under 35 kg is 
250 micrograms/kg up to 3 times daily;  
- Oral liquid formulations should be given via an
appropriately designed, graduated oral syringe to 
ensure dose accuracy. 
This advice does not apply to unlicensed uses of
domperidone (e.g. palliative care).  
- CONTRA-INDICATIONS Cardiac disease • conditions 
where cardiac conduction is, or could be, impaired (in adults) • 
gastro-intestinal haemorrhage (in children) • if increased 
gastrointestinal motility harmful (in adults) • mechanical 
obstruction (in children) • mechanical perforation (in 
children) • predisposition to cardiac conduction disorders
(in children) • prolactinoma  
- CAUTIONS Children • if there are cardiac concerns, obtain
ECG before and during treatment (in children) • patients 
on over 60 years—increased risk of ventricular arrhythmia (in adults)  
- INTERACTIONS → Appendix 1 (domperidone). 
Contra-indicated with concomitant use of drugs that 
prolong the QT interval. Contra-indicated with concomitant use of potent CYP3A4 
inhibitors.  
- SIDE-EFFECTS  
- Common or very common Drowsiness • dry mouth • malaise  
- Uncommon Anxiety • breast pain • decreased libido • 
diarhoea • galactorrhoea • headache • pruritus • rash  
- Frequency not known Agitation • amenorrhoea • 
convulsions • extrapyramidal disorders • gynaecomastia • 
nervousness • oculogyric crisis • QT-interval prolongation • 
sudden cardiac death • urinary retention • ventricular
arrhythmias  
- PREGNANCY Use only if potential benefit outweighs risk.  
- BREAST FEEDING Amount too small to be harmful.  
- HEPATIC IMPAIRMENT Avoid in moderate or severe 
impairment.  
- RENAL IMPAIRMENT Reduce frequency.  
- PATIENT AND CARER ADVICE 
Arrhythmia Patients and their carers should be told how 
to recognise signs of arrhythmia and advised to seek medical 
attention if symptoms such as palpitation or syncope 
develop. 
Medicines for Children leaflet: Domperidone for gastro-
oesophageal reflux www.medicinesforchildren.org.uk/
domperidone-for-gastro-oesophageal-reflux

Metoclopramide hydrochloride

INDICATIONS AND DOSE 
Symptomatic treatment of nausea and vomiting including 
that associated with acute migraine | Delayed (but not 
acute) chemotherapy-induced nausea and vomiting | 
Radiotherapy-induced nausea and vomiting | Prevention of 
postoperative nausea and vomiting  
BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY SLOW 
INTRAVENOUS INJECTION  
- Adult (body-weight up to 60 kg): Up to 500 micrograms/kg 
daily in 3 divided doses, when administered by slow 
intravenous injection, to be given over at least 3 
minutes  
- Adult (body-weight 60 kg and above): 10 mg up to 3 times 
a day, when administered by slow intravenous 
injection, to be given over at least 3 minutes  

Hiccups in palliative care  
BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY 
SUBLATEOUS INJECTION  
- Adult: 10 mg every 6–8 hours  
Nausea and vomiting in palliative care  
BY MOUTH  
- Adult: 10 mg 3 times a day  
BY SUBCUTANEOUS INJECTION  
- Adult: 30–100 mg/24 hours

Important safety information  
MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF 
NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND 
DURATION OF USE (AUGUST 2013) 
The benefits and risks of metoclopramide have been 
reviewed by the European Medicines Agency’s 
Committee on Medicinal Products for Human Use, 
which concluded that the risk of neurological effects 
such as extrapyramidal disorders and tardive dyskinesia 
outweigh the benefits in long-term or high-dose 
treatment. To help minimise the risk of potentially 
serious neurological adverse effects, the following 
restrictions to indications, dose, and duration of use 
have been made:  
- In adults over 18 years, metoclopramide should only 
be used for prevention of postoperative nausea and 
vomiting, radiotherapy-induced nausea and vomiting, 
delayed (but not acute) chemotherapy-induced 
nausea and vomiting, and symptomatic treatment of 
nausea and vomiting, including that associated with 
acute migraine (where it may also be used to improve 
absorption of oral analgesics);  
- Metoclopramide should only be prescribed for short-
term use (up to 5 days);  
- Usual dose is 10 mg, repeated up to 3 times daily; 
max. daily dose is 500 micrograms/kg;
Nervous system

MEDICINAL FORMS

DIRECTIONS FOR ADMINISTRATION

RENAL IMPAIRMENT

BREAST FEEDING

PREGNANCY

INTERACTIONS ➔ Appendix 1 (metoclopramide).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Specific side-effects

Very rare

With intravenous use cardiac conduction abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogryric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

PREGNANCY Not known to be harmful.

BREAST FEEDING Small amount present in milk; avoid.

HEPATIC IMPAIRMENT Reduce dose.

RENAL IMPAIRMENT Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.

DIRECTIONS FOR ADMINISTRATION Oral liquid preparation to be given via a graduated oral dosing syringe.

PATIENT AND CARER ADVICE Counselling on use of pipette advised with oral solution.

5HT3 RECEPTOR ANTAGONISTS

Granisetron

DRUG ACTION Granisetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

INDICATIONS AND DOSE

Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used

BY TRANSDERMAL APPLICATION USING PATCHES

Adult: Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

Prevention of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 ml and given over 30 seconds

Treatment of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

Adult: 1 mg, dose to be diluted to 5 ml and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

BY MOUTH

Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 ml and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

CAUTIONS Subacute intestinal obstruction • susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS ➔ Appendix 1 (5HT3-receptor Antagonists). Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Constipation • diarrhoea • headache • insomnia

GENERAL SIDE-EFFECTS

Common or very common Constipation • diarrhoea • headache • insomnia
Ondansetron

**DRUG ACTION**
Ondansetron is a specific 5HT3-receptor antagonist which blocks 5HT, receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**
Moderately emetogenic chemotherapy or radiotherapy

- **INITIALLY BY MOUTH**
  - Adult: Initially 8 mg, dose to be taken 1–2 hours before treatment, alternatively (by rectum) initially 16 mg, dose to be administered 1–2 hours before treatment, alternatively (by intramuscular injection or by slow intravenous injection) initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
  - Elderly: Initially 8 mg, dose to be taken 1–2 hours before treatment, alternatively (by rectum) initially 16 mg, dose to be administered 1–2 hours before treatment, alternatively (by intramuscular injection or by intravenous infusion) initially 8 mg, dose to be administered immediately before treatment, intravenous infusion dose to be administered over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

- **Prevention of postoperative nausea and vomiting**
  - **INITIALLY BY MOUTH**
    - Adult: 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

**TREATMENT OF POSTOPERATIVE NAUSEA AND VOMITING**
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

- Adult: 4 mg for 1 dose

**CONTRA-INDICATIONS**
Congenital long QT syndrome

**CAUTIONS**
Adenotonsillar surgery - subacute intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS**

- Appendix 1 (5HT3-receptor Antagonists).
Caution with concomitant use of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common: Constipation, flushing, headache, injection site-reactions
    - Uncommon: Arrhythmias, bradycardia, chest pain, hiccup, hypotension, movement disorders, seizures
  - **SPECIFIC SIDE-EFFECTS**
    - Rare
    - With intravenous use: dizziness, transient visual disturbances
    - Very rare
    - With intravenous use: transient blindness
    - Frequency not known
    - With rectal use: rectal irritation

- **PREGNANCY**
  - No information available; avoid unless potential benefit outweighs risk.

- **BREAST FEEDING**
  - Present in milk in animal studies—avoid.

- **HEPATIC IMPAIRMENT**
  - Maximum 8 mg daily in moderate or severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: For intravenous infusion (Zofran®), give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
  - With oral use: Orodispensible films and lyophylisates should be placed on the tongue, allowed to disperse and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer orodispensible films and lyophylisates.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

### Palonosetron

- **DRUG ACTION**
  - Palonosetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

### Indications and Dose

- **Moderately emetogenic chemotherapy**
  - Initially by mouth
    - Adult: 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection)
    - 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **Severely emetogenic chemotherapy**
  - By intravenous injection
    - Adult: 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **CAUTIONS**
  - History of constipation, intestinal obstruction, susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS**
  - Caution with concomitant use of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - Common or very common: Constipation, diarrhoea, dizziness, headache
  - Uncommon: Abdominal pain, anorexia, anxiety, arrhythmia, bradycardia, changes in blood pressure, dry mouth, dyspepsia, peripheral neuropathy

- **PREGNANCY**
  - Avoid—no information available.

- **BREAST FEEDING**
  - Avoid—no information available.

- **PATIENT AND CARER ADVICE**
  - Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving).
Fosaprepitant

**DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

**INDICATIONS AND DOSE**

Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**BY INTRAVENOUS INFUSION**

- Adult: 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (aprepitant).

**SIDE-EFFECTS**

- **Common or very common** Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- **Uncommon** Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hyponatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes

**CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

**PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (I vemend®), give intermittently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (I vemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- I vemend (Merck Sharp & Dohme Ltd) Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg I vemend 150mg powder for solution for infusion vials | 1 vial [PFS] £47.42

---

**NEUROKININ RECEPTOR ANTAGONISTS**

Aprepitant

**INDICATIONS AND DOSE**

Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**BY MOUTH**

- Adult: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (aprepitant).

**SIDE-EFFECTS**

- **Common or very common** Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- **Uncommon** Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hyponatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes

**CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.

**PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (I vemend®), give intermittently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (I vemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- I vemend (Merck Sharp & Dohme Ltd) Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg I vemend 150mg powder for solution for infusion vials | 1 vial [PFS] £47.42
4.1 Meniere’s disease

HISTAMINE ANALOGUES

Betahistine dihydrochloride

INDICATIONS AND DOSE
Vertigo, tinnitus and hearing loss associated with Ménière’s disease
BY MOUTH
• Adult: Initially 16 mg 3 times a day, dose preferably taken with food; maintenance 24–48 mg daily

CONTRA-INDICATIONS
Phaeochromocytoma

CAUTIONS
Asthma - history of peptic ulcer

INTERACTIONS
→ Appendix 1 (betahistine).

SIDE-EFFECTS
Gastro-intestinal disturbances - headache - pruritus - rashes

PREGNANCY
Avoid unless clearly necessary — no information available.

BREAST FEEDING
Use only if potential benefit outweighs risk — no information available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Table

| CAUTIONARY AND ADVISORY LABELS | 21 |

5 Pain

Analgesics

The non-opioid drugs, paracetamol p. 354 and aspirin p. 104 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol p. 354, a NSAID, codeine phosphate p. 360, or dihydrocodeine tartrate p. 362. Severe crises may require the use of morphine p. 367 or diamorphine hydrochloride p. 361; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 372 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

Dental and orofacial pain

Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine hydrochloride p. 993 mouthwash or spray until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol p. 354 or ibuprofen p. 927 is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen p. 927, diclofenac sodium p. 921, and aspirin p. 104. Paracetamol p. 354 has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate p. 362 act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 267, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

Dysmenorrhoea

Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol p. 354 or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 74) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Non-opioid analgesics and compound analgesic preparations

Aspirin p. 104 is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties.
Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly. Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium is a special hazard.

Paracetamol p. 354 is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irriant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Overdosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 356 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain. Some NSAIDs are also used in the short-term treatment of secondary bone tumours, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (ziconotide (Prialt®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin p. 104 or paracetamol p. 254) with an opioid component reduce the need for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol p. 354 or aspirin p. 104 with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets (unlicensed) may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Strong opioids

Morphine p. 367 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations). Buprenorphine p. 434 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1133.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine hydrochloride p. 361 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In palliative care the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 357, fentanyl p. 362 and remifentanil p. 1108 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 436 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitement (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 369 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Papaveretum p. 371 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 371 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on opioids. By injection it is more potent than dihydrocodeine tartrate or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should
be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 372 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride p. 361, are often preferred for obstetric pain.

Tapentadol p. 372 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 373 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

**Weak opioids**

Codeine phosphate p. 360 can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen have proved ineffective. Dihydrocodeine tartrate p. 362 has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 367 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

**Postoperative analgesia**

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine p. 367 is used most widely. Tramadol hydrochloride p. 373 is not as effective in severe pain as other opioid analogues. Buprenorphine p. 434 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride p. 372 is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

**Pain management and opioid dependence**

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**Drugs used for Pain not listed below:** Aspirin p. 104; Bupivacaine hydrochloride p. 1113; Buprenorphine with fentanyl p. 362; Diphenhydramine p. 534; Diclofenac potassium p. 920; Fenoprofen p. 926; Ibuprofen p. 927; Levothyroxine, p. 1115; Levetiracetam, p. 345; Mefenamic acid, p. 932; Methadone hydrochloride, p. 436; Nitrous oxide, p. 1096; Ropivacaine hydrochloride, p. 1121

**ANALGESICS**

**Aspirin with codeine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 104, codeine phosphate p. 360.

**INDICATIONS AND DOSE**

**Mild to moderate pain | Pyrexia**

**BY MOUTH**

- Adult: 1–2 tablets every 4–6 hours as required, dose to be dispersed in water; maximum 8 tablets per day

**PRESCRIBING AND DISPENSING INFORMATION** When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed.

**LESS SUITABLE FOR PRESCRIBING** Aspirin with codeine is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY** Aspirin with codeine can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS** 13, 21, 32

- **Codis** (Reckitt Benckiser Healthcare (UK) Ltd)
  - **Aspirin 500 mg, Codeine phosphate 8 mg** Codis 500 dispersible tablets (sugar-free) | 32 tablet [£3.23 Schedule 5 (CD Inv)]

    - **Aspirin 400 mg, Codeine 8 mg** Co-codaprin 8/400 mg dispersible tablets | 100 tablet [P] £37.65 Schedule 5 (CD Inv)

**Paracetamol**

**Acetaminophen**

**INDICATIONS AND DOSE**

**Mild to moderate pain | Pyrexia**

**BY MOUTH**

- Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

**BY INTRAVENOUS INFUSION**

- Adult (body-weight 10–50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
- Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

**BY RECTUM**

- Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day
Mild to moderate pain in patients with risk factors for hepatotoxicity

BY INTRAVENOUS INFUSION
- Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

Pain | Pyrexia with discomfort

BY MOUTH
- Child 3-5 months: 60 mg every 4–6 hours; maximum 4 doses per day
- Child 6 months-1 year: 120 mg every 4–6 hours; maximum 4 doses per day
- Child 2-3 years: 180 mg every 4–6 hours; maximum 4 doses per day
- Child 4-5 years: 240 mg every 4–6 hours; maximum 4 doses per day
- Child 6-7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
- Child 8-9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day
- Child 10-11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
- Child 12-15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
- Child 16-17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day

BY RECTUM
- Child 3-11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
- Child 1-4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
- Child 5-11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
- Child 12-17 years: 500 mg every 4–6 hours

Post-immunisation pyrexia in infants

BY MOUTH
- Child 2 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required

PANADOL OATM

Mild to moderate pain | Pyrexia

BY MOUTH
- Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

- UNLICENSED USE Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use in children under 2 months by mouth; under 3 months by rectum. Intravenous infusion not licensed in pre-term neonates, or children and neonates with body-weight under 10 kg.

- CAUTIONS Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepatocellular insufficiency

- INTERACTIONS → Appendix 1 (paracetamol).

- SIDE-EFFECTS
  - GENERAL SIDE-EFFECTS
    - Rare: Acute generalised exanthematous pustulosis - malaise - skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis
  - Frequency not known: Blood disorders - leucopenia - neutropenia - thrombocytopenia

- SPECIFIC SIDE-EFFECTS
  - Rare
    - With intravenous use: flushing - tachycardia
  - Frequency not known
    - With intravenous use: hypotension

Overdose

Important: liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1123

- PREGNANCY Not known to be harmful.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Dose-related toxicity—avoid large doses.

- RENAL IMPAIRMENT
  - In adults Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².
  - In children Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- DIRECTIONS FOR ADMINISTRATION
  - For intravenous infusion (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.

- PRESCRIBING AND DISPENSING INFORMATION
  - BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.
  - PATIENT AND CARER ADVICE
    - In children
      - Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildtomoderate-pain

- PROFESSION SPECIFIC INFORMATION
  - Dental practitioners’ formulary
    - Paracetamol Tablets may be prescribed. Paracetamol Soluble Tablets 500 mg may be prescribed. Paracetamol Oral Suspension may be prescribed.

- EXCEPTIONS TO LEGAL CATEGORY
  - Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution

INDICATIONS AND DOSE

| Moderate pain |
| BY MOUTH |
| ▶ Adult: Initially 60 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day |
**SIDE-EFFECTS, FURTHER INFORMATION**

**Hyperalgesia** Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.

**Respiratory depression** Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.

**Dependence and withdrawal** Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.

**Overdose** Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1123 and consider the specific antidote, naloxone hydrochloride p. 1133.

**PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

**HEPATIC IMPAIRMENT** Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.

**RENAL IMPAIRMENT** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

**PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and driving under Guidance on prescribing p. 1.

---

**Indications and Dose**

**Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures**

**BY INTRAVENOUS INJECTION**

- Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

**Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures**

**BY INTRAVENOUS INJECTION**

- Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg

---

**Alfentanil**

**INDICATIONS AND DOSE**

*Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures* 

*BY INTRAVENOUS INJECTION* 

- Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

*Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures* 

*BY INTRAVENOUS INJECTION* 

- Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg
**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures**

**BY INTRAVENOUS INFUSION**
- Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

**DIRECTIONS FOR ADMINISTRATION**

**BREAST FEEDING**
- Frequency not known
  - Uncommon

**SIDE-EFFECTS**
- **CAUTIONS**
  - **FURTHER INFORMATION**
  - Repeated intra-operative doses
  - Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed.

**SIDE-EFFECTS, FURTHER INFORMATION**
- **MUSCLE RIGIDITY** Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

**BREAST FEEDING**
- Present in milk— withhold breast-feeding for 24 hours.

**RENA L IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
- 5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, spray

**Solution for injection**
- **ALFENTANIL** (non-proprietary)
  - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml Alfentanil 1mg/2ml solution for injection ampoules | 10 ampoule (BNF) £7.00 Schedule 2 (CD)
  - Alfentanil 5mg/1ml solution for injection ampoules | 5 ampoule (BNF) £16.00 Schedule 2 (CD)
  - Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Alfentanil 5mg/1ml solution for injection ampoules | 10 ampoule (BNF) £25.00 Schedule 2 (CD)

**Co-codanol**

**INDICATIONS AND DOSE**
- **Mild to moderate pain (using co-codamol 8/500 preparations only)**
  - **BY MOUTH**
  - Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

- **Mild to moderate pain (using co-codamol 15/500 preparations only)**
  - **BY MOUTH**
  - Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

- **Severe pain (using co-codamol 30/500 preparations only)**
  - **BY MOUTH**
  - Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

**SOLPADOL® CAPLETS**
- **Severe pain**
  - **BY MOUTH**
  - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

**KAPAKE® 15/500**
- **Mild to moderate pain**
  - **BY MOUTH**
  - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

**SOLPADOL® EFFERVESCENT TABLETS**
- **Severe pain**
  - **BY MOUTH USING EF FERVESCENT TABLETS**
  - Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

**SOLPADOL® CAPSULES**
- **Severe pain**
  - **BY MOUTH**
  - Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

---

**Important safety information**

See codeine phosphate p. 360 for MHRA/CHM advice for restrictions on the use of codeine as an analgesic in children.

---

**CONTRA-INDICATIONS**
- Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

**CAUTIONS**
- Acute abdomen - alcohol dependence - avoid abrupt withdrawal after long-term treatment - cardiac arrhythmias - chronic alcoholism - chronic dehydration - chronic malnutrition - convulsive disorders - gallstones - hepatocellular insufficiency

---

**CAUTIONS, FURTHER INFORMATION**
- **Variation in metabolism** The capacity to metabolise codeine to morphine can vary considerably between
PRESCRIBING AND DISPENSING INFORMATION

HEPATIC IMPAIRMENT
Considerably in their capacity to metabolise codeine of morphine overdose in infant.

STATED
When co-codamol tablets, dispersible (or effervescent) are the strengths in milligrams of codeine phosphate and proportions are expressed in the form $x/y$, where $x$ and $y$ is a mixture of codeine phosphate and paracetamol; the manufacturers include: oral suspension, oral solution,

Co-codamol is less
8 mg and paracetamol

Dose-related toxicity with

malaise.

Depression (with larger doses)

seizures - thrombocytopenia

Overdose Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

Important:

Co-dyramol

INDICATIONS AND DOSE

Mild to moderate pain (using co-dyramol 10/500 preparations only)

BY MOUTH

- Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using co-dyramol 20/500 preparations only)

BY MOUTH

- Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using co-dyramol 30/500 preparations only)

BY MOUTH

- Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

Dose equivalence and conversion

A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, continued
**Pain**

where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

- **CAUTIONS** Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepatocellular insufficiency - pancreatitis - severe cor pulmonale

- **INTERACTIONS** → Appendix 1 (paracetamol).

- **SIDE-EFFECTS** Abdominal pain - acute generalised exanthematous pustulosis - blood disorders - leucopenia - malaise - neutropenia - pancreatitis - paraesthesia - paralytic ileus - skin reactions - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis

- **BREAST FEEDING** Codeine should not be used in breast-feeding mothers

- **INTERACTIONS**

- **RENAI IMPAIRMENT**

- **BREAST FEEDING**

- **INTERACTIONS**

- **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.

- **PRESCRIBING AND DISPENSING INFORMATION**

- **LESG SUITABLE FOR PRESCRIBING** Co-dyramol is less suitable for prescribing.

- **MILD SUITABLE FOR PRESCRIBING**

- **MEDICINAL FORMS**

- **CAUTIONARY AND ADVISORY LABELS** 2, 29, 30

  - **CO-DYDRAMOL (Non-proprietary)**

- **CODEINE PHOSPHATE**

  **INDICATIONS AND DOSE**

  **Acute diarrhoea**

  **BY MOUTH**

  - Child 12-17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
  - Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

  **Mild to moderate pain**

  **BY MOUTH**

  - Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day

  **BY INTRAMUSCULAR INJECTION**

  - Adult: 30–60 mg every 4 hours if required

  **Short-term treatment of acute moderate pain**

  **BY MOUTH OR BY INTRAMUSCULAR INJECTION**

  - Child 12-17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

  **CONTRA-INDICATIONS**

  - Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

  - Breastfeeding mothers

  **CAUTIONS**

  - Acute abdomen - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems

  **CAUTIONS, FURTHER INFORMATION**

  **Variation in metabolism** The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine
metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

**SIDE-EFFECTS** Abdominal pain - anorexia - antidiuretic effect - hypothermia - malaise - muscle fasciculation - pancreatitis - seizures

**BREAST FEEDING** Avoid - although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine - risk of morphine overdose in infant.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

**Diamorphine hydrochloride (Heroin hydrochloride)**

**INDICATIONS AND DOSE**

Acute pain

**BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**

▶ Adult: 5 mg every 4 hours if required

**BY SLOW INTRAVENOUS INJECTION**

▶ Adult: 1.25–2.5 mg every 4 hours if required

**Acute pain (heavier, well-muscled patients)**

**BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**

▶ Adult: Up to 10 mg every 4 hours if required

**BY SLOW INTRAVENOUS INJECTION**

▶ Adult: 2.5–5 mg every 4 hours if required

**Chronic pain not currently treated with a strong opioid analgesic**

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

▶ Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response

**BY SUBCUTANEOUS INFUSION**

▶ Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

**Acute pulmonary oedema**

**BY SLOW INTRAVENOUS INJECTION**

▶ Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

**Myocardial infarction**

**BY SLOW INTRAVENOUS INJECTION**

▶ Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Myocardial infarction (frail patients)**

**BY SLOW INTRAVENOUS INJECTION**

▶ Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**CONTRA-INDICATIONS** Delayed gastric emptying - phaeochromocytoma

**CAUTIONS** CNS depression - severe cor pulmonale - severe diarrhoea - toxic psychosis

**SIDE-EFFECTS** Anorexia - asthenia - myocardial infarction - raised intracranial pressure - syncope - taste disturbance

**BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection, suppository, solution for injection, oral solution, capsule, impregnated cigarette

**Tablet**

Dihydrocodeine tartrate

**INDICATIONS AND DOSE**

**Moderate to severe pain**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
- Child 12-17 years: 30 mg every 4–6 hours
- Adult: 30 mg every 4–6 hours as required

**BY DEEP SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

- Adult: Up to 50 mg every 4–6 hours if required

**Chronic severe pain**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Child 12-17 years: 60–120 mg every 12 hours
- Adult: 60–120 mg every 12 hours

**DF118 FORTE®**

**Severe pain**

**BY MOUTH**

- Child 12-17 years: 40–80 mg 3 times a day; maximum 240 mg per day
- Adult: 40–80 mg 3 times a day; maximum 240 mg per day

**SIDE-EFFECTS**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PROFESSIONAL INFORMATION**

Dental practitioners’ formulary Dihydrocodeine tablets 30 mg may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

  - Dihydrocodeine tartrate 2 mg/5ml oral solution 150 ml (CD Inv) £6.20 Schedule 5 (CD Inv)

**Solution for injection**

- DIHYDROCODEINE TARTRATE (Non-proprietary)
  - Dihydrocodeine tartrate 50 mg per 1 ml

**Dipipanone hydrochloride with cyclizine**

**INDICATIONS AND DOSE**

**Acute pain**

**BY MOUTH**

- Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

**CAUTIONS**

Diabetes mellitus - palliative care (not recommended) - phaeochromocytoma

**SIDE-EFFECTS**

Psychosis - raised intracranial pressure - restlessness

**BREAST FEEDING**

No information available.

**RENAI IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- DIPIPANONE HYDROCHLORIDE WITH CYCLIZINE (Non-proprietary)
  - Cyclizine hydrochloride 30 mg, Dipipanone hydrochloride 10 mg
  - Dipipanone 10mg / Cyclizine 30mg tablets 50 tablet (CD) £181.67 DT price = £181.67 Schedule 2 (CD)

**Fentanyl**

**INDICATIONS AND DOSE**

Chronic intractable pain not currently treated with a strong opioid analgesic

**BY TRANSDERMAL APPLICATION**

- Child 16-17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
- Adult: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic

**Price**

- £24.11 Schedule 5 (CD Inv)
therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

**Chronic intractable pain currently treated with a strong opioid analgesic**

**BY TRANSDERMAL APPLICATION**

- Child 2–17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long-term oral morphine to transdermal fentanyl, see *Pain management with opioids* under p. 20.
- Adult: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long-term oral morphine to transdermal fentanyl, see *Pain management with opioids* under p. 20.

**Spontaneous respiration: analgesia and enhancement of anaesthesia during operation**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required
- INTRAVENOUS INFUSION
  - Adult: 3–4.8 micrograms/kg/hour, adjusted according to response

**Assisted ventilation: analgesia and enhancement of anaesthesia during operation**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required
- INTRAVENOUS INFUSION
  - Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

**Assisted ventilation: analgesia and respiratory depression in intensive care**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required
- INTRAVENOUS INFUSION
  - Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**INITIALLY BY BUCCAL ADMINISTRATION USING LOZENGES**

- Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then (by buccal administration) 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia
- Adult: Initially 200 micrograms, dose to be given over 15 minutes, then (by buccal administration) 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

**BY BUCCAL ADMINISTRATION USING BUCCAL FILMS**

- Adult: Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**Dose equivalence and conversion**

Fentanyl films are not bioequivalent to other fentanyl preparations.

Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

**ABSTRAL®**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**BY MOUTH USING SUBLINGUAL TABLETS**

- Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

**RECVIT® SUBLINGUAL TABLETS**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**BY MOUTH**

- Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary: Consult product literature for dose adjustments, no more than 2 dose units, 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia; maximum 4 doses per day

**EFFENTORA®**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**BY MOUTH USING SUBLINGUAL TABLETS**

- Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration continued
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

**PECENT®**

Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

**INSTANYL®**

Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Abdominal pain • aethesiaphobia • anorexia • anxiety • appetite changes • application-site reactions • diarrhoea • dyspepsia • dysphoria • gastrointestinal reflux disease • hypertension • myocardial infarction • pharyngitis • rhinitis • stomatitis • tremor • vasodilation
- Uncommon Amnesia • arthralgia • blood disorders • chills • depressed level of consciousness • dysgeusia • flatulence • hyperventilation • ileus • impaired concentration • impaired coordination • loss of consciousness • malaise • parosmia • pyrexia • seizures • speech disorder • thirst • thrombocytopenia
- Rare Hiccups
- Very rare Apnoea • arrhythmia • ataxia • bladder pain • delusions • haemoptysis

**SPECIFIC SIDE-EFFECTS**

- Common or very common With intravenous use myoclonic movements
- Uncommon With intravenous use laryngospasm
- Rare With intravenous use astyole • insomia

**FURTHER INFORMATION**

**SIDE-EFFECTS, FURTHER INFORMATION**

**Fever or external heat** Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

**Muscle rigidity** Intravenous fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

**CAUTIONS**

**GENERAL CAUTIONS** Cerebral tumour • diabetes mellitus (with Actiq® lozenges) • impaired consciousness

**SPECIFIC CAUTIONS**

- With buccal use mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)

**CAUTIONS, FURTHER INFORMATION**

**Transdermal preparations** Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.

- Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid and in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.

**Repeated intra-operative doses** Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Fentanyl patches for pain

www.medicinesforchildren.org.uk/fentanyl-patches-for-pain

Medicines for Children leaflet: Fentanyl lozenges for pain

www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain

With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or
impaired speech, and patients and carers should seek prompt medical attention.

- With buccal use Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges.
- With intranasal use Patients or carers should be given advice on how to administer fentanyl nasal spray.

**ABSTRAL**

Patients should be advised not to eat or drink until the tablet is completely dissolved.

In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**RECVIT SUBLINGUAL TABLETS**

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**EFFENTORA**

Patients or carers should be given advice on how to administer Effentora buccal tablets. Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

**PECFENT INSTANYL**

Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer the spray.

### NATIONAL FUNDING/ACCESS DECISIONS

**ABSTRAL**

The Scottish Medicines Consortium has advised (January 2009) that Abstral sublingual tablets should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**EFFENTORA**

The Scottish Medicines Consortium has advised that Effentora buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**PECFENT**

The Scottish Medicines Consortium has advised that PecFent nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**INSTANYL**

The Scottish Medicines Consortium has advised that Instanyl nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion, infusion.

### SUBLINGUAL TABLET

Hydromorphone hydrochloride

INDICATIONS AND DOSE
Severe pain in cancer
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
- Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

CONTRA-INDICATIONS
- Acute abdomen
- Pancreatitis
- Acute abdomen

CAUTIONS
- Pancreatitis
- Abdominal pain
- Anxiety

SIDE-EFFECTS
- Common or very common: Abdominal pain, anorexia, anxiety
- Uncommon: Agitation, diarrhoea, dysgeusia, dyskinesia, myoclonus, paraesthesia, paralytic ileus, peripheral oedema, seizures, tremor
- No information available.

BREAST FEEDING
Avoid — no information available.

RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

DIRECTIONS FOR ADMINISTRATION
For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution.
Meptazinol

INDICATIONS AND DOSE
Moderate to severe pain, including post-operative and obstetric pain and renal colic
BY MOUTH
Adult: 200 mg every 3–6 hours as required
BY INTRAMUSCULAR INJECTION
Adult: 75–100 mg every 2–4 hours if required
BY SLOW INTRAVENOUS INJECTION
Adult: 50–100 mg every 2–4 hours if required
Obstetric analgesia
BY INTRAMUSCULAR INJECTION
Adult: 2 mg/kg, usual dose 100–150 mg

CONTRA-INDICATIONS
Myocardial infarction - phaeochromocytoma
SIDE-EFFECTS
Abdominal pain - can induce withdrawal symptoms in patients dependent on opioids - diarrhoea - dyspepsia - hypothermia
Overdose: Effects only partially reversed by naloxone.
BREAST FEEDING
Use only if potential benefit outweighs risk.
RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
CAUTIONARY AND ADVISORY LABELS 2
Meptazinol (as Meptazinol hydrochloride) 200 mg Meptid 200mg tablets | 112 tablet [Pos] £22.11 DT price = £22.11
Solution for injection
Meptazinol (as Meptazinol hydrochloride) 100 mg per 1 ml Meptid 100mg/1ml solution for injection ampoules | 10 ampoule [Pos] £19.21

Morphine

INDICATIONS AND DOSE
Pain
BY SUBCUTANEOUS INJECTION
Child 1–5 months: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
Child 6 months–1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
Child 2–11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
Child 12–17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response
BY INTRAVENOUS INJECTION
Child 1–5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
Child 6 months–11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
Child 12–17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
Child 1–2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
Child 2–11 months: 200 micrograms/kg every 4 hours, adjusted according to response
Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
Child 2–11 years: Initially 200–300 micrograms/kg every 4 hours, max. per dose 10 mg, adjusted according to response
Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

Acute pain
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration
BY SLOW INTRAVENOUS INJECTION
Adult: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

Chronic pain
BY MOUTH OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
BY RECTUM
Adult: Initially 15–30 mg every 4 hours, adjusted according to response
Pain (with modified-release 12-hourly preparations)
BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

**Dose equivalence and conversion**

The doses stated refer equally to morphine hydrochloride and sulfate.

**UNLICENSED USE**

**CONTRA-INDICATIONS**

Acute abdomen • delayed gastric emptying • heart failure secondary to chronic lung disease • phaeochromocytoma

**CAUTIONS**

Cardiac arrhythmias • pancreatitis • severe cor pulmonale

**SIDE-EFFECTS**

Abdominal pain • agitation • amenorrhœa • anorexia • asthenia • bronchospasm • delirium • disorientation • dyspepsia • exacerbation of pancreatitis • excitation • hypertension • hypothermia • inhibition of cough reflex • malaise • muscle fasciculation • myoclonus • nyctagmus • paraesthesia • paralytic ileus • raised intracranial pressure • restlessness • rhombomolysis • seizures • syncope • taste disturbance

**BREAST FEEDING**

Therapeutic doses unlikely to affect infant.

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- With intravenous use in neonates Neonatal intensive care, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.
- With oral use For modified release capsules—swallow whole or open capsule and sprinkle contents on soft food.

**PRESCRIBING AND DISPENSING INFORMATION**

Prescriptions must also specify the ‘form’.

- With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain

Patients or carers should be given advice on how to administer morphine modified-release capsules.

**EXCEPTIONS TO LEGAL CATEGORY**

Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL. Oral solutions of morphine can be prescribed by writing the formula: Morphine hydrochloride 5 mg Chloroform water to 5 mL

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for injection, solution for infusion, oral solution, gel, capsule, nebuliser liquid, infusion

Cyclizine with morphine

The properties listed below are those particular to the combination only. For the properties of the components please consider, cyclizine p. 343, morphine p. 367.

INDICATIONS AND DOSE

CYCLIMORPH-15®

Moderate to severe pain (short-term use only)

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

Adult: 1 ml, do not repeat dose more often than every 4 hours; maximum 3 doses per day

CYCLIMORPH-10®

Moderate to severe pain (short-term use only)

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

Adult: 1 ml, do not repeat dose more often than every 4 hours; maximum 3 doses per day

CAUTIONS

Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) - not recommended in palliative care

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

SOLUTION FOR INJECTION

Cyclimorph (AMCo)

Cyclizine tartrate 50 mg per 1 ml, Morphine tartrate 15 mg per 1 ml Cyclimorph 15 solution for injection 1ml ampoules | 5 ampoule (Pos) £9.12 Schedule 2 (CD)

Cyclizine tartrate 50 mg per 1 ml, Morphine tartrate 10 mg per 1 ml Cyclimorph 10 solution for injection 1ml ampoules | 5 ampoule (Pos) £7.77 Schedule 2 (CD)

Oxycodone hydrochloride

INDICATIONS AND DOSE

Postoperative pain | Severe pain | Moderate to severe pain in palliative care

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than dose maximum BY SLOW INTRAVENOUS INJECTION

Adult: 1–10 mg every 4 hours as required
Nervous system

370 Pain

BY INTRAVENOUS INFUSION
- Adult: Initially 2 mg/hour, adjusted according to response

BY SUBCUTANEOUS INJECTION
- Adult: Initially 5 mg every 4 hours as required

BY SUBCUTANEOUS INFUSION
- Adult: Initially 7.5 mg/24 hours, adjusted according to response

Patient controlled analgesia (PCA)

Dose equivalence and conversion
2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

CONTRA-INDICATIONS
- Acute abdomen - chronic constipation - cor pulmonale - delayed gastric emptying

CAUTIONS
- Pancreatitis - toxic psychosis

SIDE-EFFECTS
- Common or very common Abdominal pain - anorexia - anxiety - asthenia - bronchospasm - chills - diarrhoea - dyspepsia - dyspnoea - impaired cough reflex

BREAST FEEDING
- Present in milk—avoid.

HEPATIC IMPAIRMENT
- Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment. Avoid in moderate to severe impairment.

RENAL IMPAIRMENT
- Max. initial dose 2.5 mg every 6 hours in patients not currently with an opioid with mild to moderate impairment. Avoid if eGFR less than 10 mL/minute/1.73 m².

Opioid effects increased and prolonged and increased cerebral sensitivity occurs.

DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Oxynorm®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decision
The Scottish Medicines Consortium has advised (October 2004 and November 2010) that Oxynorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for infusion, oral solution

Oxycodone with naloxone
The properties listed below are those particular to the combination only. For the properties of the components please consider, naloxone hydrochloride p. 1133, oxycodone hydrochloride p. 369.
INDICATIONS AND DOSE
Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics
BY MOUTH
▶ Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours); dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose

Dose equivalence and conversion
Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS
2, 25
▶ Targinact (Napp Pharmaceuticals Ltd)
Naloxone hydrochloride 2.5 mg, Oxycodone hydrochloride 5 mg Targinact 5mg/2.5mg modified-release tablets | 28 tablet (P) £21.16 DT price = £21.16 Schedule 2 (CD)

Papaveretum

INDICATIONS AND DOSE
Postoperative analgesia | Severe chronic pain
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
▶ Adult: 7.7–15.4 mg every 4 hours if required
▶ Elderly: Initially 7.7 mg every 4 hours if required
BY INTRAVENOUS INJECTION
▶ Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

PREMEDICATION
BY INTRAVENOUS INJECTION
▶ Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

Important safety information
Do not confuse with papaverine.

CONTRA-INDICATIONS
Heart failure secondary to chronic lung disease · phaeochromocytoma

CAUTIONS
Supraventricular tachycardia

SIDE-EFFECTS
Hypothermia

BREAST FEEDING
Therapeutic doses unlikely to affect infant.

RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

PRESCRIBING AND DISPENSING INFORMATION
The name Ommopon was formerly used for papaveretum preparations. Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.

LESS SUITABLE FOR PRESCRIBING
Papaveretum is less suitable for prescribing.

Pentazocine

INDICATIONS AND DOSE
Moderate to severe pain
BY MOUTH
▶ Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

Moderate pain
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
OR BY INTRAVENOUS INJECTION
▶ Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

Severe pain
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
OR BY INTRAVENOUS INJECTION
▶ Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

CONTRA-INDICATIONS
Acute porphyrias p. 864 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)

CAUTIONS
Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension

SIDE-EFFECTS
Abdominal pain · blood disorders · chills · disorientation · hypertension · hypothermia · myalgia · paraesthesia · raised intracranial pressure · seizures · syncope · toxic epidermal necrolysis · tremor

OVERDOSE
Effects only partially reversed by naloxone.

BREAST FEEDING
Use with caution—limited information available.

RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

LESS SUITABLE FOR PRESCRIBING
Pentazocine is less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Pethidine hydrochloride
(Meperidine)

INDICATIONS AND DOSE

Acute pain
BY MOUTH
- Adult: 50–150 mg every 4 hours
- By subcutaneous injection or by intramuscular injection
- Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients
- Elderly: Initially 25 mg, then 25–100 mg after 4 hours

BY SLOW INTRAVENOUS INJECTION
- Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients
- Elderly: Initially 25 mg, then 25–50 mg after 4 hours

Obstetric analgesia
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

Premedication
BY INTRAMUSCULAR INJECTION
- Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients
- Elderly: 25 mg, dose to be given 1 hour before operation

Postoperative pain
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients
- Elderly: Initially 25 mg every 2–3 hours if required

CONTRA-INDICATIONS
Phaeochromocytoma

CAUTIONS
Accumulation of metabolites may result in neurotoxicity · cardiac arrhythmias · not suitable for severe continuing pain · severe cor pulmonale

SIDE-EFFECTS
Hypothermia · restlessness · tremor

Overdose
Convulsions reported in overdosage

BREAST FEEDING
Present in milk but not known to be harmful.

RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for injection, oral solution, capsule.

Tapentadol

INDICATIONS AND DOSE

Moderate to severe acute pain which can be managed only with opioid analgesics

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day

Severe chronic pain

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

SIDE-EFFECTS
Abdominal discomfort · anxiety · ataxia · decreased appetite · diarrhoea · dysarthria · dyspepsia · hypoaesthesia · malaise · muscle spasm · paraesthesia · seizures · tremor · weight loss

BREAST FEEDING
Avoid — no information available.

HEPATIC IMPAIRMENT
For immediate-release tablets, initial max. daily dose 150 mg; for modified-release tablets, initial max. daily dose 50 mg.

RENAL IMPAIRMENT
Manufacturer advises no dose adjustment needed in mild or moderate impairment. Avoid in severe impairment. Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (May 2011) that tapentadol (Palexia® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tramadol hydrochloride

**INDICATIONS AND DOSE**

Moderate to severe pain

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**

- **Adult:** 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

**Moderate to severe acute pain**

**BY MOUTH**

- **Child 12-17 years:** Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 400 mg per day
- **Adult:** Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 400 mg per day

**Moderate to severe chronic pain**

**BY MOUTH**

- **Child 12-17 years:** Initially 50 mg, then adjusted according to response to; maximum 400 mg per day
- **Adult:** Initially 50 mg, then adjusted according to response to; maximum 400 mg per day

**Postoperative pain**

**BY INTRAVENOUS INJECTION**

- **Adult:** Initially 100 mg, then 50 mg per 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

**Moderate to severe pain (with modified-release 12-hourly preparations)**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Child 12-17 years:** 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, maximum daily dose not usually required; maximum 400 mg per day
- **Adult:** 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, maximum daily dose not usually required; maximum 400 mg per day

**Moderate to severe pain (with modified-release 24-hourly preparations)**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Child 12-17 years:** Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily
- **Adult:** Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily

**Zydol® XL**

**Moderate to severe pain**

**BY MOUTH USING MODIFIED-RELEASE TABLETS**

- **Child 12-17 years:** Initially 150 mg once daily, increased if necessary up to 400 mg once daily
- **Adult:** Initially 150 mg once daily, increased if necessary up to 400 mg once daily

- **CONTRA-INDICATIONS** Acute intoxication with alcohol - acute intoxication with analgesics - acute intoxication with hypnotics - acute intoxication with opioids - not suitable for narcotic withdrawal treatment - uncontrolled epilepsy

- **CAUTIONS** Excessive bronchial secretions - history of epilepsy - use tramadol only if compelling reasons - impaired consciousness - not suitable as a substitute in opioid-dependent patients - not suitable in some types of general anaesthesia - susceptibility to seizures - use tramadol only if compelling reasons

**CAUTIONS, FURTHER INFORMATION**

**General anaesthesia** Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

**SIDE-EFFECTS**

- **Common or very common** Malaise
- **Uncommon** Diarrhoea - flatulence - gastritis - retching
- **Rare** Abnormal coordination - anorexia - anxiety - bronchospasm - changes in appetite - delirium - dysphoria - hypertension - muscle weakness - nightmares - paraesthesia - seizures - syncope - tremor - wheezing
- **Frequency not known** Blood disorders - hypoglycaemia - speech disorders

**PREGNANCY** Embryotoxic in animal studies—manufacturers advise avoid.

**BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Caution (avoid for oral drops) in severe impairment.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the content swallowed immediately without chewing—check individual preparations. For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION** Do not confuse modified-release 12-hourly preparations with 24-hourly preparations.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tramadol for pain

www.medicinesforchildren.org.uk/tramadol-for-pain

Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

**MEDICINAL FORMS**

5.1 Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin p. 104, paracetamol p. 354 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT1-receptor agonist (‘trip坦’). Ergot alkaloids are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease. Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin p. 104 or paracetamol p. 354 but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 381 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 920, flurbiprofen p. 927, and ibuprofen p. 927 are also licensed for use in migraine.

SHT1-receptor agonists

A 5HT1-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT1-receptor agonists (‘trip坦’) act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as SHT1/1D-receptor agonists. A 5HT1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics.

The SHT1-receptor agonists available for treating migraine are almotriptan p. 377, eletriptan p. 377, frovatriptan p. 378, naratriptan p. 378, rizatriptan p. 379, sumatriptan p. 379, and zolmitriptan p. 380. If a patient does not respond to one 5HT1-receptor agonist, an alternative SHT1-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a SHT1-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

Ergot Alkaloids

The value of ergotamine tartrate p. 376 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and
muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine tartrate should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

Antiemetics
Antiemetics, such as metoclopramide hydrochloride p. 347 or domperidone p. 346, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem.

Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.

Prophylaxis of migraine
Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:
- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migraineous infarction. The beta-blockers propranolol hydrochloride p. 146, atenolol p. 141, metoprolol tartrate p. 144, nadolol p. 145, and timolol maleate p. 147 are all effective. Propranolol hydrochloride p. 146 is the most commonly used.

Tricyclic antidepressants [unlicensed indication], topiramate p. 406, sodium valproate p. 403 [unlicensed indication], valproic acid p. 275 [unlicensed indication], and gabapentin p. 392 [unlicensed indication] are also effective for preventing migraine.

Pizotifen p. 376 is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine.

Cluster headache and the trigeminal autonomic cephalalgias
Cluster headache rarely responds to standard analgesics. Sumatriptan p. 379 given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan p. 380 nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 156 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 585 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride p. 156 during verapamil titration.

Ergotamine tartrate p. 376, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemianria (sensitive to indometacin p. 929), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Drugs used for Migraine not listed below: Amitriptyline hydrochloride, p. 292 • Atenolol, p. 141 • Botulinum toxin type A, p. 322 • Clonidine hydrochloride, p. 137 • Diclofenac potassium, p. 920 • Gabapentin, p. 392 • Metoprolol tartrate, p. 144 • Nadolol, p. 145 • Sodium valproate, p. 403 • Timolol maleate, p. 147 • Topiramate, p. 406 • Trifluoperazine, p. 310 • Valproic acid, p. 275

ANALGESICS
Buclizine hydrochloride with codeine phosphate and paracetamol
The properties listed below are those particular to the combination only. For the properties of the components please consider, codeine phosphate p. 360, paracetamol p. 354.

INDICATIONS AND DOSE
MIGRALEVE®
Acute migraine
BY MOUTH
- Child 12–14 years: Initially 1 pink tablet to be taken at onset of attack, or if it is imminent, followed by 1 yellow tablet every 4 hours if required; maximum 1 pink and 3 yellow tablets in 24 hours
- Child 15–17 years: Initially 2 pink tablets to be taken at onset of attack, or if it is imminent, followed by 2 yellow tablets every 4 hours if required; maximum 2 pink and 6 yellow tablets in 24 hours
- Adult: Initially 2 pink tablets to be taken at onset of attack, or if it is imminent, followed by 2 yellow tablets every 4 hours if required; maximum 2 pink and 6 yellow tablets in 24 hours

LESS SUITABLE FOR PRESCRIBING
Migraleve® is less suitable for prescribing.

Pizotifen

INDICATIONS AND DOSE
Prevention of vascular headache | Prevention of classical migraine | Prevention of common migraine | Prevention of cluster headache

BY MOUTH

▶

Adult: Initially 500 micrograms at night, increased gradually to 1.5 mg at night, alternatively increased gradually to 1.5 mg daily in 3 divided doses; further increased if necessary up to 4.5 mg daily (but rarely necessary); max. single dose 3 mg

Prophylaxis of migraine

BY MOUTH

▶

Child 5-17 years: Initially 500 micrograms at night, then increased gradually up to 1.5 mg daily in divided doses, max. single dose (at night) 1 mg

UNLICENSED USE

1.5-mg tablets not licensed for use in children.

CAUTIONS
Avoid abrupt withdrawal | history of epilepsy | susceptibility to angle-closure glaucoma | urinary retention

INTERACTIONS
Appendix 1 (pizotifen).

SIDE-EFFECTS

▶

Common or very common
Dizziness | drowsiness | dry mouth | increased appetite | nausea | weight gain

Uncommon
Constipation

Rare
Aggression | anxiety | arthralgia | depression | hallucination | insomnia | myalgia | paraesthesia

Very rare
Rash (in adults) | seizures | urticaria (in adults)

Frequency not known
Hepatitis | jaundice | muscle cramps

PREGNANCY
Avoid unless potential benefit outweighs risk.

Breast feeding
Amount probably too small to be harmful, but manufacturer advises avoid.

HEPATIC IMPAIRMENT
Use with caution.

RENAL IMPAIRMENT
Use with caution.

PATIENT AND CARER ADVICE
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Medicines for Children leaflet: Pizotifen to prevent migraine headaches www.medicinesforchildren.org.uk/pizotifen-to-prevent-migraine-headaches

ERGOT ALKALOIDS

Ergotamine tartrate

INDICATIONS AND DOSE
Management of cluster headache

BY MOUTH USING TABLETS

▶

Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

UNLICENSED USE
Not licensed for the management of cluster headache.

CONTRA-INDICATIONS
Acute porphyrias p. 864 | coronary heart disease | hyperthyroidism | inadequately controlled hypertension | obliterative vascular disease | peripheral vascular disease | Raynaud’s syndrome | sepsis | severe hypertension | temporal arteritis

CAUTIONS
Anaemia | cardiac disease | dependence | elderly | risk of peripheral vasospasm

INTERACTIONS
Appendix 1 (ergot alkaloids).

SIDE-EFFECTS

Common or very common
Abdominal pain | dizziness | nausea | vomiting

Uncommon
Cyanosis | diarrhoea | hypoaesthesia | pain in extremities | paraesthesia | peripheral vasoconstriction | weakness in extremities

Rare
Arrhythmias | bradycardia | dyspnoea | ergotism (including absence of pulse and numbness in extremities) | increased blood pressure | intestinal ischaemia | myalgia | rash | tachycardia | urticaria

Very rare
Gangrene | heart-vent fibrosis | myocardial infarction | myocardial ischaemia

Frequency not known
Anxiety | arthralgia | blood disorders | blurred vision | cerebral ischaemia | confusion | constipation | depression | drowsiness | dry mouth | extrapyramidal effects | hallucinations | renal artery spasm | seizures | sleep disturbances | thrombosis | tremor | urinary retention

PREGNANCY
Avoid: oxytocic effect on the uterus.

Breast feeding
Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.

HEPATIC IMPAIRMENT
Avoid in severe impairment—risk of toxicity increased.

RENAL IMPAIRMENT
Avoid; risk of renal vasoconstriction.
Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, cyclizine p. 343, ergotamine tartrate p. 376.

**INDICATIONS AND DOSE**
Treatment of acute migraine and migraine variants unresponsive to analgesics

**BY MOUTH**
- Adult: 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

**PATIENT AND CARER ADVICE**
Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).

**LESS SUITABLE FOR PRESCRIBING**
Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (Migril®) is less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 2, 18
  - Migril (Wockhardt UK Ltd)
    - Caffeine hydrate 100 mg, Cyclizine hydrochloride 50 mg, Ergotamine tartrate 2 mg
    - Migral tablets | 100 tablet | £5.00

**SHT1 RECEPTOR AGONISTS**

**Almotriptan**

**INDICATIONS AND DOSE**
Treatment of acute migraine

**BY MOUTH**
- Adult: 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding should not take second dose for same attack); maximum 25 mg per day

**UNLICENSED USE**
Not licensed for use in elderly.

**CONTRA-INDICATIONS**
Coronary vasospasm - ischaemic heart disease - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack

**CAUTIONS**
Conditions which predispose to coronary artery disease - elderly

**INTERACTIONS**
Appendix 1 (SHT1 agonists).

**SIDE-EFFECTS**
- Common or very common Drowsiness, transient increase in blood pressure
- Very rare Myocardial infarction - tachycardia
- Frequency not known Dizziness - fatigue - feeling of weakness - flushing - nausea - seizures - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

**ALLERGY AND CROSS-SENSITIVITY**
Caution in patients with sensitivity to sulfonamides.

**PREGNANCY**
There is limited experience of using SHT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

**BREAST FEEDING**
Present in milk in animal studies— withhold breast-feeding for 24 hours.

**HEPATIC IMPAIRMENT**
Caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m².

CAUTIONARY AND ADVISORY LABELS 3

Migard (A. Menarini Farmaceutica Internazionale SRL)

Frovatriptan (as Frovatriptan succinate monohydrate)

2.5 mg

Migard 2.5mg tablets ▶ 6 tablet (P) £16.67 DT price = £16.67

Naratriptan

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

Adult: 2.5 mg, followed by 2.5 mg after at least 4 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 5 mg per day

Unlicensed use Not licensed for use in elderly.

Contra-indications

Coronary vasospasm - ischaemic heart disease - moderate or severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina - severe hypertension - uncontrolled hypertension

Caution in patients with sensitivity to sulfonamides.

Rare Bradycardia - palpitation - tachycardia - visual disturbance

Frequency not known Dizziness - fatigue - feeling of weakness - flushing - nausea - vomiting

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

Allergy and cross-sensitivity

Caution in patients with sensitivity to sulfonamides.

Pregnancy

There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

Breast feeding

Withhold breast-feeding for 24 hours.

Hepatic impairment

Max. 2.5 mg in 24 hours in moderate impairment. Avoid if severe.

Renal impairment

Max. 2.5 mg in 24 hours. Avoid if eGFR less than 15 mL/minute/1.73 m².

Patient and carer advice

Drowsiness may affect performance of skilled tasks (e.g. driving).

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.
**INDICATIONS AND DOSE**

Treatment of acute migraine

**BY MOUTH**

- Adult: 10 mg, dose to be taken as soon as possible after onset, followed by 10 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 20 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm - ischaemic heart disease - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina - severe hypertension - uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease - elderly
- **INTERACTIONS** → Appendix 1 (SHT1 agonists).

**SIDE-EFFECTS**

- **Common or very common** Decreased alertness - diarrhoea - drowsiness - dry mouth - dysphoria - headache - palpitation - paraesthesia - pharyngeal discomfort - sweating - tachycardia - tremor
- **Uncommon** Arrhythmias - ataxia - blurred vision - confusion - dyspepsia - hypertension - insomnia - muscle weakness - myalgia - nervousness - pruritus - taste disturbances - thirst - urticaria - vertigo
- **Rare** Bradycardia - syncope
- **Frequency not known** Dizziness - fatigue - feeling of weakness - flushing - nausea - seizures - toxic epidermal necrolysis - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—continue if intense, may be due to coronary vasocstriction or to anaphylaxis).

- **PREGNANCY** There is limited experience of using SHT1 receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk in animal studies—withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose to 5 mg in mild to moderate impairment. Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Rizatriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed. Rizatriptan oral lyophilisates should be placed on the tongue and allowed to dissolve.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving). Patients or carers should be given advice on how to administer rizatriptan orodispersible tablets and oral lyophilisates.
UNLICENSED USE Not licensed for use in elderly.

CONTRA-INDICATIONS
- Coronary vasospasm - ischaemic heart disease - mild uncontrolled hypertension - moderate and severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina
- Parkinson-White syndrome

CAUTIONS Conditions which predispose to coronary artery disease - elderly - history of seizures - mild, controlled hypertension - pre-existing cardiac disease - risk factors for seizures

INTERACTIONS → Appendix 1 (SHT, agonists).

GENERAL SIDE-EFFECTS
- Common or very common Dizziness - drowsiness - dyspnoea - fatigue - flushing - myalgia - nausea - sensory disturbances - transient increase in blood pressure - vomiting - weakness

SPECIFIC SIDE-EFFECTS
- Common or very common Zolmitriptan

INDICATIONS AND DOSE
Treatment of acute migraine

BY MOUTH
- Adult: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day

BY INTRANASAL ADMINISTRATION
- Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

Treatment of acute cluster headache

BY INTRANASAL ADMINISTRATION
- Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

Dose adjustments due to interactions
Max. 5 mg in 24 hours with concomitant cimetidine, fluvoxamine, moclobemide, or quinolone antibiotics.

Dose equivalence and conversion
1 spray of Zomig™ nasal spray = 5 mg zolmitriptan.

CONTRA-INDICATIONS Arthralgias associated with accessory cardiac conduction pathways - coronary vasospasm - ischaemic heart disease - previous cerebrovascular accident - previous myocardial infarction - Prinzmetal’s angina - severe hypertension - transient ischaemic attack - uncontrolled hypertension - Wolff-Parkinson-White syndrome

CAUTIONS Conditions which predispose to coronary artery disease - elderly - should not be taken within 24 hours of any other SHT, receptor agonist

INTERACTIONS → Appendix 1 (SHT, agonists).
Aspirin with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 104, metoclopramide hydrochloride p. 347.

**SIDE-EFFECTS**

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal haemorrhage (two or more distinct episodes) - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

**FREQUENCY not known** Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - confusion - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - dysuria (most commonly in men) - euphoria - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - hallucination - headache -
The pain may occur in an area of sensory deficit nerve damage following acute herpes zoster infection and syringomyelia, and central pain.

5.2 Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g. due to Diabetes p. 588, chronic excessive alcohol intake, HIV infection p. 555, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g. pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs.

Amitriptyline hydrochloride p. 292 [unlicensed indication] and pregabalin p. 400 are effective treatments for neuropathic pain. Amitriptyline hydrochloride p. 292 and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 298 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 392 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 373, morphine p. 367, and oxycodone hydrochloride p. 369; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride p. 373 can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine hydrochloride p. 1116 medicated plasters, while awaiting specialist review.

Capsaicin p. 383 is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin p. 383 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin p. 383 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neurromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 387 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 398; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 391) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Drugs used for Neuropathic pain not listed below:

**Capsaicin**

**INDICATIONS AND DOSE**

**AXSAIN®**

Post-herpetic neuralgia

**TO THE SKIN**
- **Adult:** Apply 3–4 times a day, dose to be applied sparingly; **important; after** lesions have healed, not more often than every 4 hours

Painful diabetic neuropathy (under expert supervision)

**TO THE SKIN**
- **Adult:** Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

**ZACIN®**

Symptomatic relief in osteoarthritis

**TO THE SKIN**
- **Adult:** Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

**QUTENZA®**

Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)

**TO THE SKIN**
- **Adult:** (consult product literature)

**CAUTIONS**

**GENERAL CAUTIONS**
Avoid contact with broken skin - avoid contact with inflamed skin

**SPECIFIC CAUTIONS:**
- With topical use avoid contact with eyes - avoid hot shower or bath just before or after application (burning sensation enhanced) - avoid inhalation of vapours - not to be used under tight bandages
- With transdermal use avoid contact with the face, scalp or in proximity to mucous membranes - avoid holding near eyes or mucous membranes - recent cardiovascular events - uncontrolled hypertension

**SIDE-EFFECTS**
- Common or very common
  - With topical use transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily)
  - With transdermal use application site reactions - erythema - pruritus - transient burning - uncommon
  - With transdermal use burning sensation - cough - dysgeusia - eye irritation - first degree AV block - hypertension - hypoaesthesia - muscle spasm - nausea - pain in extremities - palpitations - peripheral oedema - pruritus - tachycardia - throat irritation
- Rare
  - With topical use cough - eye irritation - sneezing
  - Frequency not known
  - With topical use dyspnœa - exacerbation of asthma

**MONITORING REQUIREMENTS**
- With transdermal use Monitor blood pressure during treatment procedure.
- **HANDLING AND STORAGE**
  - With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).
  - With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

**NATIONAL FUNDING/ACCESS DECISIONS**

---

**6 Seizures**

**6.1 Epilepsy**

**Epilepsy**

**Control of the epilepsies**

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, comorbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 394, perampanel p. 398, phenobarbital p. 409, and phenytoin p. 398, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

**Management**

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination...
therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers’ products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using a generic; Reducing the generic name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

**Category 1**

Phenytoin p. 398, carbamazepine p. 387, phenobarbital p. 409, primidone p. 401. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product.

**Category 2**

Valproate, lamotrigine p. 394, perampanel p. 398, retigabine p. 402, rufinamide p. 402, clobazam p. 410, clonazepam p. 411, oxcarbazepine p. 397, eslicarbazepine acetate p. 390, zonisamide p. 408, topiramate p. 406. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

**Category 3**

Levetiracetam p. 396, lacosamide p. 393, tiagabine p. 406, gabapentin p. 292, pregabalin p. 400, ethosuximide p. 390, vigabatrin p. 407. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors Interactions.

**Antiepileptic hypersensitivity syndrome**

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine, stiripentol, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

**Interactions**

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

**Withdrawal**

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

**Driving**

Patients with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 5-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards.

Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

**Pregnancy**

Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital,
lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given contraceptive advice. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folic acid supplementation is advised before conception and throughout the first trimester.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register
All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding
Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation
Carbamazepine p. 387 and lamotrigine p. 394 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 397, sodium valproate p. 403 and levetiracetam p. 396 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 410, gabapentin p. 392, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 406. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 390, lacosamide p. 393, phenobarbital p. 409, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406, vigabatrin p. 407 and zonisamide p. 408.

Generalised seizures
Tonic-clonic seizures
Sodium valproate p. 403 is the first-line treatment for newly diagnosed generalised tonic-clonic seizures. Lamotrigine p. 394 is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine p. 387 and oxcarbazepine p. 397 may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam p. 410, lamotrigine p. 394, levetiracetam p. 396, sodium valproate or topiramate p. 406 may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures
