Ethosuximide p. 390 or sodium valproate p. 403 are the drugs of choice in absence seizures and syndromes; lamotrigine p. 394 is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam p. 410, clonazepam p. 411, levetiracetam p. 396, topiramate p. 406 or zonisamide p. 408 may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. Carbamazepine p. 387, gabapentin p. 392, oxcarbazepine p. 397, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406 and vigabatrin p. 407 are not recommended in absence seizures or syndromes.

Myoclonic seizures
Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate p. 403 is the drug of choice in newly diagnosed myoclonic seizures; topiramate p. 406 and levetiracetam p. 396 are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam p. 410, clonazepam p. 411, zonisamide p. 408 or piracetam p. 321.

Nervous system

Seizure type, age of onset, and EEG characteristics. Syndromes are specific types of epilepsy that are ineffective. Ethosuximide is also licensed for myoclonic treatment for absence seizures when monotherapy is ineffective. Lamotrigine can also be used as adjunctive treatment for the generalised tonic-clonic seizures that coexist with myoclonic seizures, such as lamotrigine p.

Atonic and tonic seizures

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate p. 403 is the drug of choice; lamotrigine p. 394 can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 402 or topiramate p. 406. Lamotrigine p. 387, gabapentin p. 392, oxcarbazepine p. 397, pregabalin p. 400, tiagabine p. 406 or vigabatrin p. 407 are not recommended in atonic and tonic seizures.

Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine p. 394 and rufinamide p. 402 in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

Antiepileptic drugs

Carbamazepine and related antiepileptics

Carbamazepine p. 387 is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine p. 397 is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate p. 390 is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

Ethisuximide

Ethisuximide p. 390 is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethisuximide is also licensed for myoclonic seizures.

Gabapentin and pregabalin

Gabapentin p. 392 and pregabalin p. 400 are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder. Gabapentin is an effective treatment for migraine prophylaxis [unlicensed].

Lamotrigine

Lamotrigine p. 394 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam

Levetiracetam p. 396 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Phenobarbital and primidone

Phenobarbital p. 409 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 401 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

Phenytoin

Phenytoin p. 398 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 391, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

Rufinamide

Rufinamide p. 402 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate

Topiramate p. 406 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Topiramate is also licensed for prophylaxis of migraine.

Valproate

Sodium valproate p. 403 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in a primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures.
seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential.

Valproic acid p. 275 (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

Zonisamide
Zonisamide p. 408 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines
Clobazam p. 410 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 411 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 965, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 321 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus
Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 882 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 882 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 412 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 267 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam p. 267 from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam p. 414 oromucosal solution can be given into the buccal cavity.

Important
If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium p. 391, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 412, midazolam p. 414, or a non-barbiturate anaesthetic such as propofol p. 1095 [unlicensed indication], should be instituted with full intensive care support.

Phenytoin sodium can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium p. 391 (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium p. 391 should be expressed in terms of phenytoin sodium.

Non-convulsive status epilepticus
The urgency to treat non-convulsive status epilepticus depends on the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete loss of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions
Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 354), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. Prolonged febrile convulsions (those lasting 5 minutes or longer), or recurrent febrile convulsions without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

Drugs used for Seizures not listed below; Acetazolamide, p. 965 - Lidocaine hydrochloride, p. 1116 - Magnesium sulfate, p. 858

ANTIEPILEPTICS

Carbamazepine

INDICATIONS AND DOSE
Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
- Elderly: Reduce initial dose

BY RECTUM

- Adult: Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible

Trigeminal neuralgia
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 100 mg 1–2 times a day, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 200 mg 3–4 times a day; increased if necessary up to 1.6 g daily

Prophylaxis of bipolar disorder unresponsive to lithium
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 400 mg daily in divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day

Treatment of alcohol withdrawal
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 800 mg daily in divided doses, then reduced to 200 mg daily usual treatment duration 7–10 days, dose to be reduced gradually over 5 days

Diabetic neuropathy
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 100 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 200 mg 3–4 times a day; increased if necessary up to 1.6 g daily

Continued
Focal and generalised tonic-clonic seizures

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Dose equivalence and conversion

Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARRBEN® SR

Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures

BY MOUTH

- Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, usual dose 0.8–1.2 g daily in 1–2 divided doses; increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- Elderly: Reduce initial dose

Trigeminal neuralgia

BY MOUTH

- Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 600–800 mg daily in 1–2 divided doses; increased if necessary up to 1.6 g daily in 1–2 divided doses
- Child 12 years: Initially 5–10 mg/kg weekly, dose should be increased slowly

Prophylaxis of bipolar disorder unresponsive to lithium

BY MOUTH

- Adult: Initially 400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily in 1–2 divided doses; maximum 1.6 g per day

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

- Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL® PROLONGED RELEASE

Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures

BY MOUTH

- Adult: Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, usual dose 0.8–1.2 g daily in 2 divided doses; increased if necessary up to 1.6–2 g daily in 2 divided doses
- Elderly: Reduce initial dose

Trigeminal neuralgia

BY MOUTH

- Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, then increased to 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses, dose should be increased slowly

Prophylaxis of bipolar disorder unresponsive to lithium

BY MOUTH

- Adult: Initially 400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

- UNLICENSED USE
  - In children Suppositories not licensed for use in trigeminal neuralgia or prophylaxis of bipolar disorder.
  - In adults Use in the treatment of alcohol withdrawal is an unlicensed indication. Use in diabetic neuropathy is an unlicensed indication.

- CONTRA-INDICATIONS
  - Acute porphyrias p. 864 • AV conduction abnormalities (unless paced) • history of bone-marrow depression

- CAUTIONS
  - Cardiac disease • history of haematological reactions to other drugs • may exacerbate absence and myoclonic seizures • skin reactions • susceptibility to angle-closure glaucoma

- CAUTIONS, FURTHER INFORMATION
  - Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- Blood, hepatic, or skin disorders
  - Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

- INTERACTIONS → Appendix 1 (carbamazepine).

- SIDE-EFFECTS
  - Common or very common
    - Allergic skin reactions • aplastic anaemia • ataxia • blood disorders • blurring of vision • dermatitis • dizziness • drowsiness • dry mouth • eosinophilia • fatigue • haemolytic anaemia • headache • hypnolatraemia (leading in rare cases to water intoxication) • leucopenia • nausea • oedema • thrombocytopenia • unsteadiness • urticaria • vomiting
  - Uncommon
    - Constipation • diarrhoea • involuntary movements (including nystagmus) • visual disturbances
  - Rare
    - Abdominal pain • aggression • agitation • anorexia • cardiac conduction disorders • confusion • delayed multi-organ hypersensitivity disorder • depression • dysarthria • hallucinations • hepatitis • hypertension • hypotension • jaundice • lymph node enlargement • muscle weakness • paraesthesia • peripheral neuropathy • restlessness • systemic lupus erythematosus • vanishing bile duct syndrome
  - Very rare
    - Arthralgia • muscle spasm • acne • alopecia • alterations in skin pigmentation • angle-closure glaucoma • aseptic meningitis • AV block with syncope • circulatory collapse • conjunctivitis • dyspnoea • exacerbation of coronary artery disease • galactorrhoea • gynaecomastia • hearing disorders • hepatic failure • hirsutism • hypercholesterolaemia • impaired male fertility •
interstitial nephritis • muscle pain • neuroleptic malignant syndrome • osteomalacia • osteoporosis • pancreatitis • photosensitivity • pneumonia • pneumonitis • psychosis • pulmonary hypersensitivity • purpura • renal failure • sexual dysfunction • Stevens-Johnson syndrome • stomatitis • sweating • taste disturbance • thromboembolism • thrombophlebitis • toxic epidermal necrolysis • urinary frequency • urinary retention

▶ Frequency not known Suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION
Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

Overdose
For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1123.

ALLERGY AND CROSS-SENSITIVITY
Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 383 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

PREGNANCY
Doses should be adjusted on the basis of plasma-drug concentration monitoring.

BREAST FEEDING
Amount probably too small to be harmful. Monitor infant for possible adverse reactions.

HEPATIC IMPAIRMENT
Metabolism impaired in advanced liver disease.

RENAL IMPAIRMENT
Use with caution.

PRE-TREATMENT SCREENING
Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

MONITORING REQUIREMENTS
Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.

Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

TREATMENT CESSATION
When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

DIRECTIONS FOR ADMINISTRATION
In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect). Tegretol® Prolonged Release tablets can be halved but should not be chewed.

PRESCRIBING AND DISPENSING INFORMATION
Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

PATIENT AND CARER ADVICE
Medicines for Children leaflet Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Carbamazepine Tablets may be prescribed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Eslicarbazepine acetate

INDICATIONS AND DOSE
Adjuvant treatment in adults with focal seizures with or without secondary generalisation

BY MOUTH
- Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

CONTRA-INDICATIONS Second- or third-degree AV block

CAUTIONS Elderly - hyponatraemia - PR-interval prolongation

INTERACTIONS → Appendix 1 (eslicarbazepine). Caution—avoid concomitant administration of drugs that prolong PR interval.

SIDE-EFFECTS
- Common or very common Dizziness - drowsiness - fatigue - gastrointestinal disturbances - headache - impaired coordination - rash - tremor - visual disturbances
- Very rare Leucopenia - pancreatitis - thrombocytopenia
- Frequency not known PR-interval prolongation - suicidal ideation

ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 383 for more information.

PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

HEPATIC IMPAIRMENT Avoid in severe impairment—no information available.

Renal IMPAIRMENT Reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m², adjusted according to response. Avoid if eGFR less than 30 mL/minute/1.73 m².

PRE-TREATMENT SCREENING Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

MONITORING REQUIREMENTS Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

PRESCRIBING AND DISPENSING INFORMATION Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (October 2010) that eslicarbazepine acetate (Zebinix®) is accepted for restricted use within NHS Scotland as adjuvant therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS B
- Ethosuximide (Eisai Ltd)
- Eslicarbazepine acetate 800 mg Zebinix 800mg tablets 30 tablet (Re drastically £136.00)

Ethosuximide

INDICATIONS AND DOSE
Absence seizures | Atypical absence seizures | Myoclonic seizures

BY MOUTH
- Child 1 month-5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
- Child 6-17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily
- Adult: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily

CAUTIONS Avoid in Acute porphyrias p. 864

INTERACTIONS → Appendix 1 (ethosuximide).

SIDE-EFFECTS
- Common or very common anorexia - abdominal pain - diarrhoea - gastro-intestinal disturbances - nausea - vomiting - weight loss
- Uncommon Aggression - ataxia - dizziness - drowsiness - euphoria - fatigue - headache - hiccups - impaired concentration - irritability
- Rare Depression - dyskinesia - gingival hypertrophy - increased libido - myopia - photophobia - psychosis - rash - sleep disturbances - tongue swelling - vaginal bleeding
- Frequency not known Agranulocytosis - aplastic anaemia - blood disorders - hyperactivity - increase in seizure frequency - leucopenia - pancytopenia - Stevens-Johnson syndrome - suicidal ideation - systemic lupus erythematosus

SIDE-EFFECTS, FURTHER INFORMATION
Blood disorders Blood counts required if features of infection.

PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Present in milk. Hyperexcitability and sedation reported.

HEPATIC IMPAIRMENT Use with caution.

RENAL IMPAIRMENT Use with caution.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Ethosuximide for preventing seizures www.medicinesforchildren.org.uk/ethosuximide-for-preventing-seizures

Blood disorders Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Fosphenytoin sodium

**Dose equivalence and conversion**

Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

---

Fosphenytoin sodium is a pro-drug of phenytoin.

### Indications and dose

#### Status epilepticus

**By intravenous infusion**
- **Adult:** Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg (PE)/kg daily in 1–2 divided doses, dose to be adjusted at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- **Elderly:** Consider 10–25% reduction in dose or infusion rate

#### Prophylaxis or treatment of seizures associated with neurosurgery or head injury

**By intramuscular injection or by intravenous infusion**
- **Adult:** Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- **Elderly:** Consider 10–25% reduction in dose or infusion rate

#### Temporary substitution for oral phenytoin

**By intramuscular injection or by intravenous infusion**
- **Adult:** Intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, same dose and same dosing frequency as oral phenytoin therapy
- **Elderly:** Consider 10–25% reduction in dose or infusion rate

#### Dose equivalence and conversion

Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.
Gabapentin

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation

BY MOUTH

- Child 6–11 years: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day, divided doses; maximum 6 g daily
- Child 12–17 years: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; increased in steps of 300 mg every 2 days
- Child 18 years or over: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; increased in steps of 300 mg every 3–5 days

Monotherapy for focal seizures with or without secondary generalisation

BY MOUTH

- Child 12–17 years: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; increased in steps of 300 mg every 2–3 days
- Adult: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; increased in steps of 300 mg every 2–3 days

Neuropathic pain

BY MOUTH

- Adult: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; increased in steps of 300 mg every 2–3 days

Migraine prophylaxis

BY MOUTH

- Adult: Initially 300 mg daily; then increased to up to 4 g daily in divided doses; adjusted according to response

**UNLICENSED USE**

- In children: Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.
- In adults: Not licensed for migraine prophylaxis.

**CAUTIONS**

- Diabetes mellitus: elderly → high doses of oral solution in adolescents and adults with low body-weight → history of psychotic illness → mixed seizures (including absences)

**INTERACTIONS** → Appendix 1 (gabapentin).

**SIDE-EFFECTS**

- Common or very common: Abdominal pain → abnormal reflexes → abnormal thinking → acne → amnesia → anorexia → anxiety → arthralgia → ataxia → confusion → constipation → convulsions → cough → depression → diarrhoea → dizziness → drowsiness → dry mouth → dry throat → dyspepsia → dyspnha → emotional lability → fever → flatulence → flu syndrome → gingivitis → headache → hostility → hypertension → impotence → increased appetite → insomnia → leucopenia → malaise → movement disorders → myalgia → nausea → nervousness → nyctagmus → oedema → paraesthesia → pharyngitis → pruritus → rash → rhinitis → speech disorder → tremor → twitching → vasodilatation → vertigo → visual disturbances → vomiting → weight gain

- Uncommon: Palpitations

- Frequency not known: Acute renal failure → alopoeia → blood glucose fluctuations in patients with diabetes → breast hypotrophy → gynaecomastia → hallucinations → hepatitis → hypersensitivity syndrome → incontience → pancreatitis → Stevens-Johnson syndrome → suicidal ideation → thrombocytopenia → tinnitus

**PREGNANCY**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Present in milk → manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**

- In adults: Reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m². Reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m² → consult product literature.

- In children: Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

**EFFECT ON LABORATORY TESTS**

False positive readings with some urinary protein tests.

**DIRECTIONS FOR ADMINISTRATION**

Capsules can be opened but the bitter taste is difficult to mask.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Gabapentin for neuropathic pain www.medicinesforchildren.org.uk/gabapentin-for-neuropathic-pain

Medicines for Children leaflet: Gabapentin for preventing seizures www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures

**Important safety information**

The levels of propylene glycol, ascorbate K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg) → consult product literature.
Lacosamide

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation

BY MOUTH OR BY INTRAVENOUS INFUSION

Child 16-17 years: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily).

Adult: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily).

Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

BY MOUTH OR BY INTRAVENOUS INFUSION

Child 16-17 years: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

Adult: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be

given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

CONTRA-INDICATIONS Second- or third-degree AV block

CAUTIONS Conduction problems - elderly (in adults) - risk of PR-interval prolongation - severe cardiac disease

INTERACTIONS → Appendix 1 (lacosamide). Caution with concomitant use of drugs that prolong PR interval.

SIDE-EFFECTS

Common or very common Abnormal gait - blurred vision - cognitive disorder - constipation - depression - dizziness - drowsiness - fatigue - flatulence - headache - impaired coordination - nausea - nyctagmus - pruritus - tremor - vomiting

Rare Multi-organ hypersensitivity reaction

ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 383 for more information.

PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Titrate with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment—no information available.

RENAL IMPAIRMENT Loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution. Titrate with caution in severe impairment, max. 250 mg daily.

In adults Consult product literature for loading dose if eGFR less than 30 mL/minute/1.73 m².

In children Consult product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

In children For intravenous infusion, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

In adults For intravenous infusion (Vimpat® 51), give intermittently in Glucose 5% or Sodium Chloride 0.9%. May be administered undiluted.

PRESCRIBING AND DISPENSING INFORMATION Flavours of syrup may include strawberry.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2009) that lacosamide (Vimpat® 29) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
Tablet

**INDICATIONS AND DOSE**

**Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome**

**BY MOUTH**

- **Child 12-17 years:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures with valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate**

**BY MOUTH**

- **Child 2-11 years (body-weight up to 13 kg):** Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- **Child 2-11 years (body-weight 13 kg and above):** Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- **Child 12-17 years:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Oral solution**

**EXCipients:** May contain Aspartame, propylene glycol

**ELECTROLYTES:** May contain Sodium

**Vimpat (UCB Pharma Ltd)**

Lacosamide 10 mg per 1 ml Vimpat 10mg/ml syrup (sugar-free) | 200 ml (£25.74 DT price = £25.74)

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

**Vimpat (UCB Pharma Ltd)**

Lacosamide 10 mg per 1 ml Vimpat 200mg/200ml solution for infusion vials | 1 vial (£29.70)

---

**Lamotrigine**

1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

- **Adult:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate**

**BY MOUTH**

- **Child 2-11 years:** Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
- **Child 12-17 years:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate**

**BY MOUTH**

- **Child 2-11 years:** Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- **Child 12-17 years:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate**

**BY MOUTH**

- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

7 days; maintenance 200 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimen—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

Adju nctive therapy of bipolar disorder with valproate

BY MOUTH

Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; maintenance 100 mg daily in 1–2 divided doses; patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimen—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

Adju nctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate

BY MOUTH

Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimen—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

Important safety information
SAFE PRACTICE
Do not confuse the different combinations or indications.

● CAUTIONS Myoclonic seizures (may be exacerbated) - Parkinson’s disease (may be exacerbated) (in adults)

● INTERACTIONS ➔ Appendix 1 (lamotrigine)

● SIDE-EFFECTS

● Common or very common blurred vision, aggression, agitation, ataxia, back pain, diarrhea, diplopia, dizziness, drowsiness, dry mouth, headache, insomnia, nausea, nystagmus, rash, tremor, vomiting

● Rare Conjunctivitis

● Very rare Anaemia, blood disorders, confusion, exacerbation of Parkinson’s disease (in adults), hallucination, hepatic failure, hypersensitivity syndrome, increase in seizure frequency, leucopenia, lupus erythematosus-like reactions, movement disorders, pancreatitis, thrombocytopenia, unsteadiness

● Frequency not known Aseptic meningitis, suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Skin reactions Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

● ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 383 for more information.

● PREGNANCY Doses should be adjusted on the basis of plasma-drug concentration monitoring.

● BREAST FEEDING Present in milk, but limited data suggest no harmful effect on infant.

● HEPATIC IMPAIRMENT Halve dose in moderate impairment. Quarter dose in severe impairment.

● RENAL IMPAIRMENT Consider reducing maintenance dose in significant impairment. Caution in renal failure; metabolite may accumulate.

● TREATMENT CESSATION Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.

● PRESCRIBING AND DISPENSING INFORMATION Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product. Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-for-preventing-seizures

Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop. Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

● MEDICINAL FORMS

Levetiracetam

**INDICATIONS AND DOSE**

Monotherapy of focal seizures with or without secondary generalisation

BY MOUTH OR BY INTRAVENOUS INFUSION

- **Child 16-17 years:** Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

- **Adult:** Initially 250 mg once daily for 1–2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

Adjunctive therapy of focal seizures with or without secondary generalisation

BY MOUTH

- **Child 1-5 months:** Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks

- **Child 6 months–17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

- **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

BY INTRAVENOUS INFUSION

- **Child 4-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

- **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

- **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

BY MOUTH OR BY INTRAVENOUS INFUSION

- **Child 12-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

- **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

- **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

**SPECIAL CONSIDERATIONS**

- In adults Levetiracetam doses in BNF may differ from those in product literature.

**INTERACTIONS**

Appendix 1 (levetiracetam).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - aggression - anorexia - anxiety - ataxia - convulsion - cough - depression - diarrhoea - dizziness - drowsiness - dyspepsia - headache - insomnia - irritability - malaise - nasopharyngitis - nausea - rash - tremor - vertigo - vomiting

- **Uncommon** Agitation - alopecia - amnesia - blurred vision - confusion - diplopia - eczema - impaired attention - leucopenia - myalgia - paraesthesia - pruritus - psychosis - suicidal ideation - thrombocytopenia - weight changes

- **Rare** Agranulocytosis - choreoathetosis - drug reaction with eosinophilia and systemic symptoms (DRESS) - dyskinesia - erythema multiforme - hepatic failure - hyponatraemia - neutropenia - pancreatitis - pancytopenia - Stevens-Johnson syndrome - toxic epidermal necrolysis

**Frequency not known** Completed suicide - pancytopenia - Stevens-Johnson syndrome

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

**BREAST FEEDING** Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- In adults Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m².

- In children Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

**RENAL IMPAIRMENT**

- In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).

- In adults Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m². Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m³. Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m³.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9% to give over 15 minutes.

- With oral use For administration of oral solution, requisite dose may be diluted in a glass of water.

**PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Levetiracetam for preventing seizures www.medicinesforchildren.org.uk/levetiracetam-for-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 8

- **LEVERTIRACETAM (Non-proprietary)**

Levetiracetam 250 mg Levetiracetam 250mg tablets | 60 tablet [PDM] £28.01 DT price = £3.53

Levetiracetam 500 mg Levetiracetam 500mg tablets | 60 tablet [PDM] £49.32 DT price = £4.75

Levetiracetam 750 mg Levetiracetam 750mg tablets | 60 tablet [PDM] £64.02 DT price = £6.88

Levetiracetam 1 g Levetiracetam 1g tablets | 60 tablet [PDM] £95.34 DT price = £8.38
Oxcarbazepine

**INDICATIONS AND DOSE**

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

**BY MOUTH**

- Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

**BY MOUTH**

- Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**TREATMENT OF PRIMARY GENERALISED TONIC-CLONIC SEIZURES**

**BY MOUTH**

- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, acne, agitation, alopecia, amnesia, asthenia, ataxia, confusion, constipation, depression, diarrhoea, diplopia, dizziness, drowsiness, headache, hyponatraemia, impaired concentration, nausea, nyctagmus, rash, tremor, visual disorders, vomiting
- **Very rare** Ecchymosis, erythema multiforme, erythematous rash, thrombocytopenia, toxic epidermal necrolysis
- **Frequency not known** Aplastic anaemia, bone marrow depression, hypertension, hypothyroidism, neutropenia, osteoporotic bone disorders, pancytopenia, suicidal ideation
- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 383 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.
- **RENAI IMPAIRMENT**
  - In adults: Halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.
  - In children: Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS**
  - Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
  - Monitor body-weight in patients with heart failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with clinicians.
the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**

Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-preventing-seizures

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

**CAUTIONARY AND ADVISORY LABELS** 3, 8

- **OXCARBAZEPINE (Non-proprietary)**
  - Oxcarbazepine 150 mg Oxcarbazepine 150mg tablets | 50 tablet [PBM] £11.14 DT price = £9.81
  - Oxcarbazepine 300 mg Oxcarbazepine 300mg tablets | 50 tablet [PBM] £22.61 DT price = £19.48
  - Oxcarbazepine 600 mg Oxcarbazepine 600mg tablets | 50 tablet [PBM] £45.19 DT price = £40.23
- **Trileptal** (Novartis Pharmaceuticals UK Ltd)
  - Oxcarbazepine 150 mg Trileptal 150mg tablets | 50 tablet [PBM] £10.30 DT price = £9.81
  - Oxcarbazepine 300 mg Trileptal 300mg tablets | 50 tablet [PBM] £20.40 DT price = £19.48

Oral suspension

**CAUTIONARY AND ADVISORY LABELS** 3, 8

**EXCIPIENTS:** May contain Propylene glycol

- **Trileptal** (Novartis Pharmaceuticals UK Ltd)
  - Oxcarbazepine 60 mg per 1 ml Trileptal 60mg/ml oral suspension (sugar-free) | 250 ml [PBM] £40.80

### Perampanel

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalised seizures

**BY MOUTH**

- Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

Dose adjustments due to interactions

Titrated at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

**INTERACTIONS** Appendix 1 (perampanel).

**SIDE-EFFECTS** Aggression · anxiety · ataxia · back pain · blurred vision · changes in appetite · confusion · diplopia · dizziness · drowsiness · dysarthria · gait disturbance · irritability · malaise · nausea · suicidal behaviour · suicidal ideation · vertigo · weight increase

**PREGNANCY** Manufacturer advises avoid.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid in moderate or severe impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic perampanel product.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Fycompa** (Eisai Ltd)
  - Perampanel 2 mg Fycompa 2mg tablets | 7 tablet [PBM] £35.00 | 28 tablet [PBM] £140.00
  - Perampanel 4 mg Fycompa 4mg tablets | 28 tablet [PBM] £140.00
  - Perampanel 6 mg Fycompa 6mg tablets | 28 tablet [PBM] £140.00
  - Perampanel 8 mg Fycompa 8mg tablets | 28 tablet [PBM] £140.00
  - Perampanel 10 mg Fycompa 10mg tablets | 28 tablet [PBM] £140.00

Phenytoin

**INDICATIONS AND DOSE**

**Tonic-clonic seizures | Focal seizures**

**BY MOUTH**

- Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
- Adult: Initially 3–4 mg/kg daily, alternatively 150–300 mg once daily, alternatively 150–300 mg daily in 2 divided doses, then increased to 200–500 mg daily, to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-phenytoin concentration monitoring), exceptionally, higher doses may be used

Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery

Initially by slow intravenous injection or by intravenous infusion

- Adult: Loading dose 20 mg/kg (max. per dose 2 g), to be given at a rate not exceeding 1 mg/kg/minute (max. 50 mg per minute), to be given with blood pressure and ECG monitoring, then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-concentration monitoring, to be given with blood pressure and ECG monitoring, adjusted according to plasma-phenytoin concentration
Status epilepticus | Acute symptomatic seizures associated with trauma or neurosurgery

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

► Child 1 month–11 years: Loading dose 20 mg/kg, then 2.5–5 mg/kg twice daily, to be given with blood pressure and ECG monitoring

► Child 12–17 years: Loading dose 20 mg/kg, then up to 100 mg 3–4 times a day, to be given with blood pressure and ECG monitoring

Dose equivalence and conversion
Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy, however, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

► UNLICENSED USE
  ► With oral use Licensed for use in children (age range not specified by manufacturer).
  ► With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

► CONTRA-INDICATIONS
  GENERAL CONTRA-INDICATIONS
  Acute porphyrias p. 864

SPECIFIC CONTRA-INDICATIONS
  ► With intravenous use second- and third-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome
  ► CAUTIONS
  GENERAL CAUTIONS
  Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

SPECIFIC CAUTIONS
  ► With intravenous use heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

CAUTIONS, FURTHER INFORMATION
Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium. Intramuscular phenytoin should not be used (absorption is slow and erratic).

► INTERACTIONS  Appendix 1 (phenytoin).

► SIDE-EFFECTS
  GENERAL SIDE-EFFECTS
  ► Common or very common Acne · anorexia · coarsening of facial appearance · constipation · dizziness · drowsiness · gingival hypertrophy and tenderness (maintain good oral hygiene) · headache · hirsutism · insomnia · nausea · paraesthesia · rash · transient nervousness · tremor · vomiting
  ► Rare Leucopenia · aplastic anaemia · blood disorders · dyskinesia · hepatotoxicity · lupus erythematosus · lymphadenopathy · megaloblastic anaemia · osteomalacia · peripheral neuropathy · polyanarthropathia nodosa · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis
  ► Frequency not known Hypersensitivity syndrome · interstitial nephritis · pneumonitis · polyarthropathy · suicidal ideation

SPECIFIC SIDE-EFFECTS
  ► Common or very common
  ► With intravenous use Alterations in respiratory function · arrhythmias · cardiovascular collapse · cardiovascular depression (particularly if injection too rapid) · CNS depression (particularly if injection too rapid) · hypotension · respiratory arrest
  ► Frequency not known
  ► With intravenous use Purple glove syndrome · tonic seizures

SIDE-EFFECTS, FURTHER INFORMATION
Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

Hepatotoxicity Discontinue immediately and do not re-administer.

► With intravenous use Reduce rate of administration if bradycardia or hypotension occurs.

Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.

Overdose Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

► ALLERGY AND CROSS-SENSITIVITY
  Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 383 for more information.

► PREGNANCY
Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.

► BREAST FEEDING
Small amounts present in milk, but not known to be harmful.

► HEPATIC IMPAIRMENT
Reduce dose to avoid toxicity.

► PRE-TREATMENT SCREENING
HLA* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

► MONITORING REQUIREMENTS
  ► In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.
  ► In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).

Manufacturer recommends blood counts (but evidence of practical value uncertain).

► Monitor ECG and blood pressure with intravenous use.

► DIRECTIONS FOR ADMINISTRATION
  ► With intravenous use in children Before and after administration flush intravenous line with Sodium Chloride 0.9%. For intravenous infusion, give into a large vein at rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). For intravenous infusion, dilute to a concentration not exceeding 10 mg/ml with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation.

  ► With intravenous use in adults For intravenous infusion (Epanutin®), give intermittently in Sodium chloride 0.9%. Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/ml) and give
into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation. To avoid local venous irritation each injection or infusion should be preceded and followed by an injection of sterile physiological saline through the same needle or catheter.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

- **PATIENT AND CARER ADVICE**
  Simple leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures
  Blood or skin disorders. Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

- **UNLICENSED USE**
  Pregabalin doses in BNF may differ from those in product literature.

- **CAUTIONS**
  Conditions that may precipitate encephalopathy. • severe congestive heart failure

- **SIDE-EFFECTS**
  Common or very common. • Appetite changes. • blurring vision. • confusion. • constipation. • diplopia. • disturbances in muscle control and movement. • dizziness. • drowsiness. • dry mouth. • euphoria. • fatigue. • impaired attention. • impaired memory. • insomnia. • irritability. • malaise. • oedema. • paraesthesia. • sexual dysfunction. • speech disorder. • visual disturbances. • visual field defects. • vomiting. • weight gain

- **COMMON OR VERY COMMON**
  Abdominal distension. • abnormal dreams. • agitation. • arthralgia. • chills. • cognitive impairment. • depersonalisation. • depression. • dry eye. • dysphagia. • dysuria. • first-degree AV block. • flushing. • gastrointestinal reflux disease. • hallucinations. • hyperacusis. • hypercalcaemia. • hypotension. • hypotension. • lacrimation. • myalgia. • nasal dryness. • nasopharyngitis. • panic attacks. • rash. • stuper. • sweating. • syncope. • tachycardia. • tachypnoea. • taste disturbance. • thirst. • thrombocytopenia. • urinary incontinence

- **RARE**
  Arrhythmia. • ascites. • bradycardia. • breath discharge. • breath hypertrophy. • breast pain. • cold extremities. • cough. • dysphagia. • epistaxis. • hypercalcaemia. • hypokalaemia. • leucopenia. • menstrual disturbances. • neutropenia. • oliguria. • pancreatitis. • parosmia. • renal failure. • rhabdomyolysis. • rhinitis. • urticaria. • weight loss

- **FREQUENTLY NOT KNOWN**
  Aggression. • congestive heart failure. • convulsions. • diarrhoea. • encephalopathy. • headache. • keratitis. • nausea. • pruritus. • QT-interval prolongation. • Stevens-Johnson syndrome. • suicidal ideation. • urinary retention

- **RENAL IMPAIRMENT**
  Initially 75 mg daily and maximum 300 mg daily if eGFR 30–60 mL/minute/1.73 m². Initially 25–50 mg daily and maximum 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m². Initially 25 mg once daily and maximum 75 mg once daily if eGFR less than 15 mL/minute/1.73 m².

- **TREATMENT CESSATION**
  Avoid abrupt withdrawal (taper over at least 1 week).

- **PRESCRIBING AND DISPENSING INFORMATION**
  Flavours of oral liquid formulations may include strawberry.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (July 2007) that pregabalin (Lyrica®) is not recommended for the treatment of central neuropathic pain. The Scottish Medicines Consortium has advised (April 2009) that pregabalin (Lyrica®) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain.
neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

  - Lupus erythematosus
  - Psychosis

- **Very rare**
  - Antiepileptic hypersensitivity syndrome

**NEXT**

- **Allergy and Cross-Sensitivity**
  - Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 383 for more information.

**PREGNANCY**

- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT**

- Reduce dose. May precipitate coma.

**RENAL IMPAIRMENT**

- Use with caution.

**MONITORING REQUIREMENTS**

- Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).

**TREATMENT CESSATION**

- Avoid abrupt withdrawal (dependence with prolonged use).

**PRESCRIBING AND DISPENSING INFORMATION**

- Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**CAUTIONS**

- Avoid in acute porphyria
- Children
- Debilitated
- Elderly
- History of alcohol abuse
- History of drug abuse
- Respiratory depression (avoid if severe)

- **CAUTIONS, FURTHER INFORMATION**

- Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

**Primidone**

**INDICATIONS AND DOSE**

**All forms of epilepsy except typical absence seizures**

**BY MOUTH**

- Child 1 month–1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily

- Child 2-4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily

- Child 5–8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily

- Child 9–17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response.

- Adult: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 3 days, adjusted according to response; maintenance 0.75–1.5 g daily in 2 divided doses

**Essential tremor**

**BY MOUTH**

- Adult: Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks

**CAUTIONS**

- Avoid in acute porphyria
- Children
- Debilitated
- Elderly
- History of alcohol abuse
- History of drug abuse
- Respiratory depression (avoid if severe)

**TREATMENT CESSATION**

- Avoid abrupt withdrawal (dependence with prolonged use).

**PRESCRIBING AND DISPENSING INFORMATION**

- Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.
Retigabine

INDICATIONS AND Dose
Adjunctive treatment of drug-resistant focal seizures with or without secondary generalisation when other appropriate drug combinations have proved inadequate or have not been tolerated

BY MOUTH
- Adult: Initially up to 300 mg daily in 3 divided doses, then increased in steps of up to 150 mg every 1 week, adjusted according to response; maintenance 0.6–1.2 g daily
- Elderly: Initially 150 mg daily in 3 divided doses, then increased in steps of up to 150 mg every 1 week, adjusted according to response; maximum 900 mg per day

CAUTIONS
Known QT-interval prolongation - risk of urinary retention

CAUTIONS, FURTHER INFORMATION
QT-interval prolongation Patients with known QT-interval prolongation, or with the following risk factors for QT interval prolongation, should be carefully monitored while taking retigabine: cardiac failure, ventricular hypertrophy, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval.

INTERACTIONS
- Appendix 1 (retigabine).

SIDE-EFFECTS
- Common or very common Amnesia • anxiety • blurred vision • confusion • constipation • diplopia • discoloration of lips • discoloration of nails • discoloration of ocular tissue • discolouration of skin • dizziness • drowsiness • dry mouth • dysuria • haematuria • impaired attention • impaired coordination • impaired speech • increased appetite • malaise • myoclonus • nausea • paraesthesia • peripheral oedema • psychosis • tremor • vertigo • visual impairment • weight gain
- Uncommon Dyspepsia • dysphagia • hypokinesia • nephrolithiasis • rash • suicidal ideation • sweating • urinary retention

PREGNANCY
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

HEPATIC IMPAIRMENT
Reduce dose by 50% in moderate to severe impairment; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).

RENAL IMPAIRMENT
Reduce dose by 50% if eGFR less than 50 mL/minute/1.73 m²; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).

MONITORING REQUIREMENTS
- Ophthalmological monitoring A comprehensive ophthalmological examination (including visual acuity test, slit-lamp examination, and dilated fundoscopy) should be performed at initiation of treatment and at least every 6 months thereafter during treatment. Changes in vision or retinal pigment should lead to re-assessment of the benefits and risks of continuing treatment—discontinue unless no other treatment options are available. Monitoring should be increased if treatment is continued.
- Monitor for discoloration of ocular tissue and visual impairment.
- Monitor for blue-grey discoloration of nails, lips and skin—continue treatment only if potential benefit outweighs risk.

PRESCRIBING AND DISPENSING INFORMATION
Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic retigabine product.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Retigabine for the adjunctive treatment of partial onset seizures in epilepsy (July 2011) NICE TA232
Retigabine is recommended as an option for the adjunctive treatment of partial onset seizures with or without secondary generalisation in adults aged 18 years and older with epilepsy, only when previous treatment with carbamazepine, clobazam, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, and topiramate has not provided an adequate response, or has not been tolerated. www.nice.org.uk/TA232

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2011) that retigabine (Trobalt®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted use for refractory epilepsy.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Rufinamide

INDICATIONS AND Dose
Adjunctive treatment of seizures in Lennox-Gastaut syndrome

BY MOUTH
- Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4-17 years (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Adult (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Child 4-17 years (body-weight 50-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- Adult (body-weight 50-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate

BY MOUTH

- Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Rufinamide 400 mg Inovelon 400mg tablets | 60 tablet £102.96

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8, 21

EXCipients: May contain Propylene glycol

- Inovel (Eisai Ltd)

Rufinamide 40 mg per 1 ml Inovelon 40mg/ml oral suspension (sugar-free) 460 ml £94.71

Sodium valproate

INDICATIONS AND DOSE

All forms of epilepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily

- Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–200 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day

- Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily, alternatively maintenance 20–30 mg/kg daily; maximum 2.5 g per day

Initiation of valproate treatment

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; usual dose 1–2 g daily, (20–30 mg/kg daily), intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: If switching from oral therapy to intravenous therapy give current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

EPILIM CHRONO®

All forms of epilepsy

BY MOUTH

- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPIVAL®

All forms of epilepsy

BY MOUTH

- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA® CAPSULES

All forms of epilepsy

BY MOUTH

- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania

BY MOUTH

- Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring
### EPISODENT® GRANULES

**All forms of epilepsy**

**BY MOUTH**

- **Adult:** Total daily dose to be given in 1–2 divided doses (consult product literature)

**Mania**

**BY MOUTH**

- **Adult:** Initially 750 mg daily in 1–2 divided doses, adjusted according to response. Usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

**EPISODENT CHRONOSPHERE®**

**All forms of epilepsy**

**BY MOUTH**

- **Adult:** Total daily dose to be given in 1–2 divided doses (consult product literature)

**Migraine prophylaxis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

### UNLICENSED USE

- In adults Not licensed for migraine prophylaxis.

### CONTRA-INDICATIONS

- Family history of severe hepatic dysfunction - known mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) - personal or family history of severe hepatic dysfunction - porphyria - suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths)

### CAUTIONS

- Systemic lupus erythematosus

### CAUTIONS, FURTHER INFORMATION

**Liver toxicity**

Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

### INTERACTIONS

- Appendix 1 (sodium valproate)

### SIDE-EFFECTS

- **Common or very common** Aggression · anaemia · confusion · convulsion · deafness · diarrhea · extrapyramidal disorders · gastric irritation · haemorrhage · headache · hypoglycaemia · memory impairment · menstrual disturbance · nausea · nystagmus · somnolence · stupor · thrombocytopenia · transient hair loss (regrowth may be curly) · tremor · weight gain

- **Uncommon** Angioedema · ataxia · coma · encephalopathy · increased alertness · lethargy · leucopenia · pancytopenia · paraesthesia · peripheral oedema · rash · reduced bone mineral density · syndrome of inappropriate secretion of antidiuretic hormone · vasculitis

- **Rare** Behavioural disturbance · blood disorders · bone marrow failure · dementia (in adults) · drowsiness · drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · enuresis · Fanconi’s syndrome · hallucinations · hearing loss · hyperactivity · hyperammonaemia · hypothyroidism · learning disorders · male infertility · myelodysplastic syndrome · polycystic ovaries · Stevens-Johnson syndrome · systemic lupus erythematosus · toxic epidermal necrolysis

- **Very rare** Acne · gynaecomastia · hepatic dysfunction · hirsutism · increase in bleeding time · pancreatitis

- **Frequency not known** Hypersensitivity reactions · suicidal ideation

### SIDE-EFFECTS, FURTHER INFORMATION

**Hepatic dysfunction**

Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

**CONCEPTION AND CONTRACEPTION**

Valproate is associated with teratogenic risks and should not be used in women of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for women of child-bearing age. Effective contraception advised in women of child-bearing potential.

**PREGNANCY**

Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Avoid use in the treatment of epilepsy and bipolar disorder unless there is no safer alternative and only after a careful discussion of the risks—effective contraception advised in women of child-bearing potential. Avoid use for the prophylaxis of migraine (unlicensed) — exclude pregnancy before treatment and ensure effective contraception is used during treatment. Neonatal bleeding (related to hypofibrinogenemia) reported. Neonatal hepatotoxicity also reported. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Present in milk—risk of haematological disorders in breast-fed newborns and infants.

**HEPATIC IMPAIRMENT**

Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

**RENAL IMPAIRMENT**

Reduce dose.

**MONITORING REQUIREMENTS**

- Plasma—valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

- Monitor liver function before therapy and during first 6 months especially in patients most at risk.

- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

**EFFECT ON LABORATORY TESTS**

False-positive urine tests for ketones.

**DIRECTIONS FOR ADMINISTRATION**

- With rectal use in children For rectal administration, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).

- With intravenous use in children For intravenous injection, may be diluted in Glucose 5% or Sodium Chloride 0.9% and given over 3–5 minutes. For intravenous infusion, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%.

- With intravenous use in adults For intravenous infusion (Epilim®, Episenta®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute Epilim® with solvent provided then dilute with infusion fluid.
EPIVAL® Tablets may be halved but not crushed or chewed.

EPISENTA® CAPSULES Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPISENTA® GRANULES Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPILIM® CHRONOSPHERE® Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

EPILIM® ORAL SOLUTION May be diluted, preferably in Syrup BP; use within 14 days.

## Tiagabine

**INDICATIONS AND DOSE**

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

**BY MOUTH**

- Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses
- Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

**BY MOUTH**

- Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses
- Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses

### CAUTIONS

Avoid in Acute porphyrias p. 864

**CAUTIONS, FURTHER INFORMATION**

Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

**INTERACTIONS** → Appendix 1 (tiagabine).

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea - dizziness - emotional lability - impaired concentration - nervousness - speech impairment - tiredness - tremor
- **Rare** Bruising - confusion - depression - drowsiness - non-convulsive status epilepticus - psychosis - suicidal ideation - visual disturbances
- **Frequency not known** Leucopenia

**PREGNANCY**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT**

In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

May impair performance of skilled tasks (e.g. driving).

Medicines for Children leaflet: Tiagabine for preventing seizures [www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures](http://www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
- **Gabitril** (Teva UK Ltd)

- Tiagabine (as Tiagabine hydrochloride monohydrate) 15 mg Gabitril 15mg tablets | 100 tablet (PhR) £156.13

## Topiramatate

**INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

**BY MOUTH**

- Child 6-17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 25–50 mg weekly by 25–50 mg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 75 mg/kg twice daily), if child cannot tolerate titration regimen, then smaller steps or longer interval between steps may be used; maximum 500 mg per day
- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

**BY MOUTH**

- Child 2-17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen, then smaller steps or longer interval between steps may be used; maximum 400 mg per day
- Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

**Migraine prophylaxis**

**BY MOUTH**

- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every 1 week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

**UNLICENSED USE**

Not licensed for use in children for migraine prophylaxis.

**CAUTIONS**

Avoid in Acute porphyrias p. 864 • risk of metabolic acidosis • risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

**INTERACTIONS** → Appendix 1 (topiramatate).

**SIDE-EFFECTS**

- **Uncommon** Abdominal distension - altered sense of smell - blepharospasm - blood disorders - bradycardia - dry eye -
flatulence · flushing · gingival bleeding · glossodynia · haematuria · halitosis · hearing loss · hypokalaemia · hypotension · increased lacrimation · influenza-like symptoms · leucopenia · metabolic acidosis · mydriasis · neutropenia · palpitation · pancreatitis · panic attack · peripheral neuropathy · photophobia · postural hypotension · psychosis · reduced sweating · salivation · sexual dysfunction · skin discoloration · suicidal ideation · thirst · thrombocytopenia · urinary calculus

- **Rare** Abnormal skin odour · calcinosis · hepatic failure · hepatitis · periportal oedema · Raynaud’s syndrome · Stevens-Johnson syndrome · unilateral blindness
- **Very rare** Angle-closure glaucoma
- **Frequency not known** Encephalopathy · hyperammonaemia · maculopathy · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Acute myopia with secondary angle-closure glaucoma** Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intraocular pressure occurs:
- seek specialist ophthalmological advice;
- use appropriate measures to reduce intraocular pressure;
- stop topiramate as rapidly as feasible

**PREGNANCY** Increased risk of cleft palate if taken in the first trimester of pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

**BREAST FEEDING** Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—clearance may be reduced.

**RENAL IMPAIRMENT**
- in adults: Half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.
- in children: Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.

**DIRECTIONS FOR ADMINISTRATION** Topiramate® Sprinkle capsules can either be swallowed whole or the contents of the capsule can be sprinkled on soft food and swallowed immediately without chewing.

**TOPAMAX® CAPSULES** Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

**PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic topiramate product.

**PATIENT AND CARER ADVICE**

**Medicines for Children leaflet: Topiramate for preventing seizures** www.medicinesforchildren.org.uk/topiramate-for-preventing-seizures

Patients should be counselled on the administration of Topiramate® Sprinkle capsules.

Patients or carers should be given advice on how to administer Topamax® capsules.

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

**BY MOUTH**
- **Child 1 month–2 years:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg/kg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg twice daily)
- **Child 2–11 years:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg/kg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g twice daily)
- **Child 12–17 years:** Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
- **Adult:** Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every 1 week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

**BY RECTUM**
- **Child 1 month–1 year:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg/kg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg twice daily) continued→
Nervous system

With rectal use

MONITORING REQUIREMENTS

▶ In children

CAUTIONS

UNLICENSED USE

Granules not licensed for rectal use.

Tablets not licensed to be crushed and dispersed in liquid.

Vigabatrin doses in BNF publications may differ from those in product literature.

CONTRA-INDICATIONS

Visual field defects

CAUTIONS, FURTHER INFORMATION

Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

Visual field defects

Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion.

Gradual withdrawal of vigabatrin should be considered.

INTERACTIONS → Appendix 1 (vigabatrin).

SIDE-EFFECTS

▶ Common or very common

▶ Uncommon

Ataxia - mania - occasional increase in seizure frequency (especially if myoclonic) - psychosis - rash

▶ Rare

Peripheral retinal neuropathy - retinal disorders - suicidal ideation

▶ Very rare

Hepatitis - optic atrophy - optic neuritis

▶ Frequency not known

Movement disorders in infantile spasms

SIDE-EFFECTS, FURTHER INFORMATION

Visual field defects

About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.

PREGNANCY

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING

Present in milk—manufacturer advises avoid.

RENAL IMPAIRMENT

▶ In adults

Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².

▶ In children

Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

monitor weight throughout treatment (fatal cases of weight loss reported in children) - metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) - risk factors for renal stone formation (particularly predisposition to nephrolithiasis)

Zonisamide

INDICATIONS AND DOSE

Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy

BY MOUTH

▶ Adult: Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

BY MOUTH

▶ Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days (max. per dose 500 mg once daily), usual maintenance 6–8 mg/kg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

▶ Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

▶ Adult: Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300–500 mg daily in 1–2 divided doses, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

▶ Child 2–11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g twice daily)

▶ Child 12–17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-for-preventing-seizures

Patients and their carers should be warned to report any new visual symptoms that develop.

MEDITINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 8

Sabril (Sanofi) Vigabatrin 500 mg Sabril 500mg tablets | 100 tablet £37.01 DT price = £37.01

Powder

CAUTIONARY AND ADVISORY LABELS 3, 8, 13

Sabril (Sanofi) Vigabatrin 500 mg Sabril 500mg oral powder sachets (sugar-free) | 50 sachet £20.50 DT price = £20.50
CAUTIONS, FURTHER INFORMATION
Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children).

INTERACTIONS → Appendix 1 (zonisamide).
- In adults Caution with concomitant use of drugs that increase risk of hyperthermia, metabolic acidosis, or nephrolithiasis.
- In children Caution with concomitant use of drugs that increase risk of nephrolithiasis. Contraindicated with use of drugs that increase risk of hyperthermia or metabolic acidosis.

SIDE-EFFECTS
Common or very common Abdominal pain - agitation - alopecia - anorexia - ataxia - confusion - constipation - depression - diarrhoea - diplopia - dizziness - drowsiness - ecchymosis - fatigue - impaired attention - impaired memory - insomnia - irritability - nausea - nystagmus - paraesthesia - peripheral oedema - pruritus - psychosis - pyrexia - rash (consider withdrawal) - speech disorder - tremor - weight loss
- Uncommon Aggression - cholecystitis - cholelithiasis - dyspepsia - hypokalaemia - pneumonia - seizures - suicidal ideation - urinary calculus - urinary tract infection - vomiting

ALLERGY AND CROSS-SENSITIVITY Contraindicated in sulfonamide hypersensitivity. Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 383 for more information.

CONCEPTION AND CONTRACEPTION Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.

PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Manufacturer advises avoid for 4 weeks after last dose.

HEPATIC IMPAIRMENT Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

TREATMENT CESSION Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

PRESCRIBING AND DISPENSING INFORMATION Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic zonisamide product.

PATIENT AND CARER ADVICE Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures
Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule
CAUTIONARY AND ADVISORY LABELS 3, 8, 10
- zonisamide (Eisai Ltd)
  - Zonisamide 25 mg Zonegran 25mg capsules | 14 capsule £8.82 DT price = £8.82
  - Zonisamide 50 mg Zonegran 50mg capsules | 56 capsule £47.04 DT price = £47.04
  - Zonisamide 100 mg Zonegran 100mg capsules | 56 capsule £62.72 DT price = £62.72

BARBITURATES
Phenobarbital
(Phenobarbital

INDICATIONS AND DOSE
All forms of epilepsy except typical absence seizures
BY MOUTH
- Child 1 month-11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day
- Child 12-17 years: 60–180 mg once daily, dose to be taken at night
- Adult: 60–180 mg once daily, dose to be taken at night

Status epilepticus
BY INTRAVENOUS INJECTION
- Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections
- Child 11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
- Child 12-17 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
- Child 17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 100 mg twice daily

Dose equivalence and conversion
For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

CAUTIONS Avoid in Acute porphyrias p. 654 - children - debilitated - elderly - history of alcohol abuse - history of drug abuse - respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION
Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

INTERACTIONS → Appendix 1 (phenobarbital).

SIDE-EFFECTS
Common or very common Agranulocytosis - allergic skin reactions - ataxia - behavioural disturbances - cholostasis - depression - drowsiness - hallucinations - hepatitis - hyperactivity particularly in the elderly and in children - hypotension - impaired cognition - impaired memory -
irritability · lethargy · megaloblastic anaemia (may be treated with folic acid) · myasthenia · osteomalacia · paradoxical excitement (in adults) · respiratory depression · thrombocytopenia

- Very rare Antiepileptic Hypersensitivity Syndrome · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- Frequency not known Hyperkinesia (in children)

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1123.

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 383 for more information.

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Avoid if possible; drowsiness may occur.

**HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS**
- Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 μg/ml); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.

**TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

**DIRECTIONS FOR ADMINISTRATION** Solution for injection must be diluted before intravenous administration.
- With intravenous use in children For intravenous injection, dilute to a concentration of 20 mg/ml with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).
- With oral use in children For administration by mouth, tablets may be crushed.

**PRESCRIBING AND DISPENSING INFORMATION**
Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer’s product. Some hospitals supply alcohol-free formulations of varying phenobarbital strengths.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures

**MEDICINE FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablet, capsule

- **PHENOBARBITAL (Non-proprietary)**
  - Phenobarbital 3 mg per 1 ml Phenobarbital 15mg/5ml elixir | 500 ml £83.00 DT price + £83.00 Schedule 3 (CD No Register Phenobarbital)

**BENZODIAZEPINES**

**Clobazam**

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

**INDICATIONS AND DOSE**

**Adjunct in epilepsy**

**BY MOUTH**

- Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime; higher doses should be divided; maximum 60 mg per day
- Adult: 20–30 mg daily, then increased if necessary up to 60 mg daily

**Anxiety (short-term use)**

**BY MOUTH**

- Adult: 20–30 mg daily in divided doses, alternatively 20–30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose
- Elderly: 10–20 mg daily

**UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed as monotherapy.

**CONTRA-INDICATIONS** Chronic psychosis (in adults) · hyperkinesia · not for use alone to treat anxiety associated with depression (in adults) · obsessive states · phobic states · respiratory depression

**CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**
The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

**SIDE-EFFECTS**

- Common or very common Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- Uncommon Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
- Rare Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)

- Frequency not known Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · psychosis (in children) · restlessness (in children)

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
**INDICATIONS AND DOSE**

**All forms of epilepsy**

**BY MOUTH**

- Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 1-4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 5-11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- Child 12-17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- Elderly: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary

**SIDE-EFFECTS**

- Rare Aggression - anxiety - blood disorders - dysarthria - gastro-intestinal symptoms - headache - paradoxical effects - pruritus - respiratory depression - reversible hair loss - sexual dysfunction - skin pigmentation changes - suicidal ideation (in adults) - urinary incontinence - urticaria - visual disturbances on long-term treatment
- Very rare Increase in seizure frequency

**BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**MONITORING REQUIREMENTS** Routine measurement of plasma concentrations of antiepileptic drugs is not
usually justified, because the target concentration ranges
are arbitrary and often vary between individuals.
However, plasma drug concentrations may be measured in
children with worsening seizures, status epilepticus,
suspected noncompliance, or suspected toxicity.
Similarly, haematological and biochemical monitoring
should not be undertaken unless clinically indicated.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when
  switching between oral formulations in the treatment of
  epilepsy. The need for continued supply of a particular
  manufacturer’s product should be based on clinical
  judgement and consultation with the patient or their carer,
taking into account factors such as seizure frequency and
treatment history.

Patients being treated for epilepsy may need to be
maintained on a specific manufacturer’s branded or
generic oral clonazepam product.

- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Clonazepam for preventing
  seizures www.medicinesforchildren.org.uk/clonazepam-
  preventing-seizures-0

**6.2 Status epilepticus**

**Drugs used for Status epilepticus not listed below:**
Diazepam, p. 267 · Phosphenytoin sodium, p. 391 ·
Phenobarbital, p. 409 · Phenytoin, p. 398

**BARBITURATES**

Thiopental sodium
(Thiopentone sodium)

**INDICATIONS AND DOSE**
Status epilepticus (only if other measures fail)

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 75–125 mg for 1 dose, to be administered as a
    2.5% (25 mg/mL) solution

Induction of anaesthesia

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 100–150 mg, to be administered over
    10–15 seconds usually as a 2.5% (25 mg/mL) solution,
    followed by 100–150 mg after 0.5–1 minute if
    required, dose to be given in fit and premedicated
    adults; debilitated patients or adults over 65 years may
    require a lower dose or increased administration time,
    alternatively initially up to 4 mg/kg (max. per dose
    500 mg)

**Anaesthesia of short duration**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 100–150 mg, to be administered over
    10–15 seconds usually as a 2.5% (25 mg/mL) solution,
    followed by 100–150 mg after 0.5–1 minute if
    required, dose to be given in fit and premedicated
    adults; debilitated patients or adults over 65 years may
    require a lower dose or increased administration time,
    alternatively initially up to 4 mg/kg (max. per dose
    500 mg)

**Reduction of raised intracranial pressure if ventilation**
controlled

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 1.5–3 mg/kg, repeated if necessary

**Important safety information**
Thiopental sodium should only be administered by, or
under the direct supervision of, personnel experienced
in its use, with adequate training in anaesthesia and
airway management, and when resuscitation equipment
is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · myotonic
dystrophy
- **CAUTIONS** Acute circulatory failure (shock) · avoid intra-
arterial injection · cardiovascular disease · elderly · fixed
cardiac output · hypovolaemia · reconstituted solution is
highly alkaline (extravasation causes tissue necrosis and
severe pain)
- **INTERACTIONS** Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Arrhythmias · cough · headache ·
hypersensitivity reactions · hypotension · laryngeal spasm ·
myocardial depression · rash · sneezing
- **PREGNANCY** May depress neonatal respiration when used
during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon
as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution—reduce dose.
- **RENAL IMPAIRMENT** Caution in severe impairment.
- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks
Patients given sedatives and analgesics during minor
outpatient procedures should be very carefully warned
about the risk of driving or undertaking skilled tasks
afterwards. For a short general anaesthetic the risk
extends to at least 24 hours after administration.
Responsible persons should be available to take patients
home. The dangers of taking alcohol should also be
emphasised.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines
  containing the same drug. Forms available from special-order
  manufacturers include: solution for injection

**Powder for solution for injection**

- THIOPENTAL SODIUM (Non-proprietary)
  Thiopental sodium 500 mg Thiopental 500mg powder for solution
  for injection vials 25 vial (PO) £1.43

**BNF 70**

Lorazepam

The properties listed below are those particular to the drug
only. For properties common to the class, see
Benzo diazepines, p. 266.
### INSTRUCTIONS AND DOSE

**Status epilepticus | Febrile convulsions | Convulsions caused by poisoning**

#### BY SLOW INTRAVENOUS INJECTION INTO LARGE VEIN
- Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose
- Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose
- Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose

#### Short-term use in anxiety

**BY MOUTH**
- Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 0.5–2 mg daily in divided doses

#### Short-term use in insomnia associated with anxiety

**BY MOUTH**
- Adult: 1–2 mg daily, to be taken at bedtime

#### Acute panic attacks

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

#### Conscious sedation for procedures

**BY MOUTH**
- Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

**BY INTRAMUSCULAR INJECTION**
- Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

### UNLICENSED USE

### Important safety information

**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**CONTRA-INDICATIONS**

Avoid injections containing benzyl alcohol in neonates - chronic psychosis (in adults) - CNS depression - compromised airway - hyperkinesia - not for use alone to treat depression (or anxiety associated with depression) (in adults) - obsessional states - phobic states - respiratory depression

**CAUTIONS**

Muscle weakness - organic brain changes - parenteral administration - personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

### CAUTIONS, FURTHER INFORMATION

**Special precautions for parenteral administration**

When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

**Paradoxical effects**

A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

#### SIDE-EFFECTS

- **Common or very common** Amnesia - ataxia (in children) - ataxia (especially in the elderly) (in adults) - confusion (in children) - confusion (especially in the elderly) (in adults) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression

- **Uncommon** Changes in libido (in adults) - dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - headache (in adults) - hypotension (in adults) - incontinence - salivation changes - slurred speech (in adults) - tremor - urinary retention (in adults) - vertigo (in adults) - visual disturbances

- **Rare** Apnoea - blood disorders - changes in libido (in children) - headache (in children) - hypotension (in children) - jaundice - respiratory depression - skin reactions - urinary retention (in children) - vertigo (in children)

- **Frequency not known** Delusions (in children) - excitement (in children) - hallucinations (in children) - irritability (in children) - marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential) - pain (on intravenous injection) - psychosis (in children) - restlessness (in children) - thrombophlebitis (on intravenous injection)

**PREGNANCY**

Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

**BREAST FEEDING**

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT**

Can precipitate coma. Start with smaller initial doses or reduce dose. If treatment is necessary, benzodiazepines with shorter half-lives are safer. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Start with small doses in severe impairment.

### DIRECTIONS FOR ADMINISTRATION

- **In children** For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

- **In adults** For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible). For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.
PATIENT AND CARER ADVICE
May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned that these drugs may impair judgement and reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS: 2, 19

Adult:

▶ Elderly:

▶ Adult:

▶ Elderly:

▶ Elderly:

▶ Elderly:

BY SUBCUTANEOUS INFUSION

Adult: 20–60 minutes before administration

BY INTRAVENOUS INJECTION

Adult: 10–20 mg; 4 hours, adjusted according to response; usual dose 20–60 mg; 24 hours

Convolusions in palliative care

Adult: Initially 20–40 mg/24 hours

Midazolam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Status epilepticus | Febrile convulsions

BY BUCAL ADMINISTRATION

Child 1-2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg (max. per dose 2.5 mg) if required

Child 3-11 months: 2.5 mg, then 2.5 mg after 10 minutes if required

Child 1-4 years: 5 mg, then 5 mg after 10 minutes if required

Child 5-9 years: 7.5 mg, then 7.5 mg after 10 minutes if required

Adult: 10 mg, then 10 mg after 10 minutes if required

Conscious sedation for procedures

BY SLOW INTRAVENOUS INJECTION

Adult: Initially 2–2.5 mg, to be administered

5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course

Elderly: Initially 0.5–1 mg, to be administered

5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 0.5–1 mg if required; maximum 3.5 mg per course

Sedative in combined anaesthesia

INITIALLY BY INTRAVENOUS INJECTION

Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour

Elderly: Lower doses needed

PREMEDICATION

BY DEEP INTRAVASCULAR INJECTION

Adult: 70–100 micrograms/kg, to be administered

20–60 minutes before induction, for debilitated patients, use elderly dose

Elderly: 25–50 micrograms/kg, to be administered

20–60 minutes before induction

BY INTRAVENOUS INJECTION

Adult: 1–2 mg, repeated if necessary, to be administered

5–30 minutes before procedure, for debilitated patients, use elderly dose

Elderly: 0.5 mg, repeated if necessary, to be administered

5–30 minutes before procedure, repeat dose slowly as required

INDUCTION OF ANAESTHESIA (BUT RARELY USED)

BY SLOW INTRAVENOUS INJECTION

Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose

Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

Sedation of patient receiving intensive care

INITIALLY BY SLOW INTRAVENOUS INJECTION

Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

Confusion and restlessness in palliative care

BY SUBCUTANEOUS INFUSION

Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

Convolusions in palliative care

BY CONTINUOUS SUBCUTANEOUS INFUSION

Adult: Initially 20–40 mg/24 hours

UNLICENSED USE

Oromucosal solution not licensed for use in children under 3 months. Oromucosal solution not licensed for use in adults over 18 years. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature. Injection not licensed for use in status epilepticus or febrile convulsions.

Important safety information

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

PRESCRIBING OF MIDAZOLAM IN PALLIATIVE CARE

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and where the risk of overdose has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

CONTRA-INDICATIONS

CNS depression · compromised airway · severe respiratory depression
• **CAUTIONS** Cardiac disease - children (particularly if cardiovascular impairment) - concentration of midazolam in children under 15 kg to not exceed 1 mg/mL - debilitated patients (reduce dose) - hypothermia - hypovolaemia (risk of severe hypotension) - neonates - risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) - vasoconstriction

**CAUTIONS, FURTHER INFORMATION**

**Recovery when used for sedation** Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Amnesia - anaphylaxis - ataxia - blood disorders - bronchospasm - cardiac arrest - changes in libido (in adults) - confusion - convulsions (more common in neonates) - depression of consciousness - dizziness - drowsiness - dry mouth - dysarthria - euphoria - fatigue (in children) - gastro-intestinal disturbances - hallucinations - headache - heart rate changes - hiccups - hypotension - incontinence - increased appetite - injection-site reactions - involuntary movements - jaundice - laryngospasm - muscle weakness - paradoxical aggression (especially in children and elderly) - paradoxical excitement (especially in children and elderly) - respiratory arrest (particularly with high doses or on rapid injection) - respiratory depression (may be severe with sedative and peri-operative use—facilities for its treatment are essential) - respiratory depression (particularly with high doses or on rapid injection) - restlessness (with sedative and peri-operative use) (in children) - salivation changes - severe disinhibition (with sedative and peri-operative use) (in children) - skin reactions - thrombosis - urinary retention - vertigo - visual disturbances

**SPECIFIC SIDE-EFFECTS**

• With intranasal use - burning sensation (in children) - laceration (in children) - severe irritation of nasal mucosa (in children)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Sedation** Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

**Overdose** There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

**BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

**HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epileptics and febrile convulsions: use with caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution in chronic renal failure.

**DIRECTIONS FOR ADMINISTRATION**

For **intravenous infusion** (Hypnovel®), give continuously in Glucose 5% or Sodium chloride 0.9%. For neonate and children under 15 kg dilute to a maximum concentration of 1 mg/mL.

• With intravenous use in children For **intravenous injection** in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonate.

• With intravenous use in neonates Neonatal intensive care, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.

• With oral use in children For administration by mouth for sedation and premedication, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.

• With rectal use in children For rectal administration of the injection solution for sedation and premedication, attach a plastic applicator onto the end of a syringe; if the volume to be given rectally is too small, dilute with Water for Injections.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Midazolam for stopping seizures www.medicinesforchildren.org.uk/midazolam-for-stopping-seizures

Patients or carers should be given advice on how to administer midazolam oromucosal solution.

Patients given sedatives and analgescis during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration.

Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, solution for infusion, oral solution, oromucosal solution, infusion

**Oromucosal solution**

**CAUTIONARY AND ADVISORY LABELS**

Sleep disorders

7 Insomnia

Hypnotics and anxiolytics

Most hypnotics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 265 and barbiturates are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdose.

Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient’s clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal of prescribed long-term benzodiazepine patients is as follows:
- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg
- alprazolam 250 micrograms
- clonazepam 10 mg
- clonazepam 250 micrograms
- flurazepam 7.5–15 mg
- chloridiazepoxide 12.5 mg
- loprazolam 0.5–1 mg
- lorazepam 500 micrograms
- lormetazepam 0.5–1 mg
- nitrazepam 5 mg
- oxazepam 10 mg
- temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be avoided where possible.

Counselling can be of considerable help both during and after the taper.

Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others underestimate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.
Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 294 or mirtazapine p. 291 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should **not** be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to routine prescribing is undesirable. They should be reserved for patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and recommended for patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting. Benzodiazepines and the Z drugs, but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependency occurs.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Elderly**

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

**Dental patients**

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 420 or diazepam p. 267. Temazepam p. 420 is preferred when it is important to minimise any residual effect the following day.

**Benzodiazepines**

Benzodiazepines used as hypnotics include nitrazepam p. 419 and flurazepam p. 418 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Lorazepam p. 418, lorormetazepam p. 419, and temazepam p. 420 act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam p. 267 given as a single dose at night may effectively treat both symptoms.

**Zaleplon, zolpidem, and zopiclone**

Zaleplon p. 422, zolpidem tartrate p. 423 and zopiclone p. 423 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.

**Chloral and derivatives**

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

**Clomethiazole**

Clomethiazole p. 421 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

**Antihistamines**

Some antihistamines such as promethazine hydrochloride p. 291 are on sale to the public for transient insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

**Alcohol**

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

**Melatonin**

Melatonin p. 422 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

**Anxiolytics**

Benzodiazepines anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 248) for their sedative effect in anxiety is not appropriate.

**Beta-adrenoceptor blocking drugs**

Beta-blockers do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

**Benzodiazepines**

Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided. Diazepam p. 267, alprazolam p. 266, clorazepate hydrochloride p. 267, and clobazam p. 410 have a sustained action. Shorter-acting compounds such as lorazepam p. 412 and oxazepam p. 420 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In panic disorders (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam p. 267 or lorazepam p. 412 are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

**Buspirone**

Buspirone hydrochloride p. 269 is thought to act at specific serotonin (5HT1A) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is,
however, licensed for short-term use only (but specialists occasionally use it for several months).

**Meprobamate**
Meprobamate p. 265 is less effective than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is not recommended.

**Barbiturates**
The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis. The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 412 is used in anaesthesia. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

**Flurazepam**

**BENZODIAZEPINES**

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

**BY MOUTH**

- **Adult:** 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- **Elderly:** 15 mg once daily, dose to be taken at bedtime

**CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis - not for use alone to treat depression (or anxiety associated with depression) - respiratory depression

**CAUTIONS**

Acute porphyrias p. 864 - hypoalbuninaemia - marked personality disorder - muscle weakness

**CAUTIONS, FURTHER INFORMATION**

**Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**SIDE-EFFECTS**

- Common or very common: Amnesia, ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
- Rare: Apnoea - blood disorders - jaundice - respiratory depression - skin reactions

**BREAST FEEDING**

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe impairment. Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**NATIONAL FUNDING/ACCESS DECISIONS**

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

*CAUTIONARY AND ADVISORY LABELS 19*

#### INDICATIONS AND DOSE

**Anxiety (short-term use)**

BY MOUTH
- Adult: 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose
- Elderly: 10–20 mg 3–4 times a day

**Insomnia associated with anxiety**

BY MOUTH
- Adult: 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

- CONTRA-INDICATIONS
  Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obessional states · phobic states · respiratory depression

- CAUTIONS
  Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

- CAUTIONS, FURTHER INFORMATION
  Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- SIDE-EFFECTS
  - Common or very common
    Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
  - Uncommon
    Changes in libido · dizziness · dysarthria · gastrointestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
  - Rare
    Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

- BREAST FEEDING
  Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- HEPATIC IMPAIRMENT
  If treatment is necessary, benzodiazepines with shorter half-lives are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

- RENAL IMPAIRMENT
  Start with small doses in severe impairment.

- PATIENT AND CARER ADVICE
  May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**
  CAUTIONARY AND ADVISORY LABELS 2

### Temazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

#### INDICATIONS AND DOSE

**Insomnia (short-term use)**

BY MOUTH
- Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

**Conscious sedation for dental procedures**

BY MOUTH
- Adult: 15–30 mg, to be administered 30–60 minutes before procedure

**Premedication before surgery or investigatory procedures**

BY MOUTH
- Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
- Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

- **UNLICENSED USE**
  Temazepam doses in BNF may differ from those in product literature. Not licensed for conscious sedation for dental procedures.

- CONTRA-INDICATIONS
  CNS depression · compromised airway · hyperkinesia · not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · obessional state · phobic states · respiratory depression

- CAUTIONS
  Hypoaalbuminaemia · muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

- CAUTIONS, FURTHER INFORMATION
  Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
**SIDE-EFFECTS**

- **Common or very common** Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
- **Uncommon** Changes in libido - dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - headache - hypotension - incontinence - salivation changes - slurred speech - tremor - urinary retention - vertigo - visual disturbances
- **Rare** Apnoea - blood disorders - jaundice - skin reactions
- **Frequency not known** Respiratory depression (may be marked when used for sedation; facilities for its treatment are essential)

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** If treatment is necessary, benzodiazepines with shorter half-lives are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary. Temazepam Tablets may be prescribed. Temazepam Oral Solution may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, enema

**Tablet**

**CNS DEPRESSANTS**

**Chloral hydrate**

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 0.5–2 g daily, dose to be taken at bedtime

**WELLDOM® ELIXIR**

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 15–45 mL, alternatively 0.4–1.3 g, dose to be taken with water or milk at bedtime; maximum 70 mL per day; maximum 2 g per day

**CONTRA-INDICATIONS**

Acute porphyrias p. 864 · gastritis · severe cardiac disease

**CAUTIONS**

Avoid contact with mucous membranes · avoid contact with skin · avoid prolonged use (and abrupt withdrawal thereafter) · reduce dose in debilitated · reduce dose in elderly

**INTERACTIONS**

→ Appendix 1 (anxiolytics and hypnotics).

**SIDE-EFFECTS**

Abdominal distention · delirium (especially on abrupt withdrawal) · dependence · excitement · flatulence · gastrointestinal irritation · headache · ketonuria · nausea · rash · tolerance · vomiting

**PREGNANCY**

Avoid.

**BREAST FEEDING** Risk of sedation in infant—avoid.

**HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment.

Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use For administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include blackcurrant. When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 mL in a suitable vehicle.

**PATIENT AND CARER ADVICE**

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**LESS SUITABLE FOR PRESCRIBING**

Chloral hydrate is less suitable for prescribing in insomnia.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, enema

**Side-Effects, Further Information**

Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **Pregnancy** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **Breast Feeding** Small amounts present in milk—avoid.
- **Hepatic Impairment** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **Renal Impairment** Use with caution.
- **Patient and Carer Advice** Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g. driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.

Narcolepsy

7.2 Narcolepsy

Drugs used for Narcolepsy not listed below:
Dexamfetamine sulfate, p. 270 · Methylphenidate hydrochloride, p. 273

CNS STIMULANTS

Modafinil

INDICATIONS AND DOSE
Excessive sleepiness associated with narcolepsy with or without cataplexy

BY MOUTH
- Adult: Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily
- Elderly: Initially 100 mg daily

- CONTRA-INDICATIONS Arhythmia · history of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) · history of cor pulmonale · history of left ventricular hypertrophy · moderate uncontrolled hypertension · severe uncontrolled hypertension

- CAUTIONS History of alcohol abuse · history of depression · history of drug abuse · history of mania · history of psychosis · possibility of dependence

- INTERACTIONS → Appendix 1 (modafinil).

- SIDE-EFFECTS
  - Common or very common Abdominal pain · anxiety · appetite changes · asthenia · chest pain · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · gastrointestinal disturbances · headache · nausea · palpitation · paraesthesia · sleep disturbances · tachycardia · vasodilatation · visual disturbances
  - Uncommon Abnormal dreams · acne · aggression · agitation · amnesia · arhythmia · arthralgia · bradycardia · decreased libido · dry eye · dyskinesia · dysphagia · dyspnoea · emotional lability · eosinophilia · epistaxis · flattulence · glossitis · hypercholesterolaemia · hyperglycaemia · hypertension · hypertonia · hypotension · leucopenia · menstrual disturbances · migraine · mouth ulcers · muscle cramps · myalgia · myasthenia · peripheral oedema · pruritis · rash · reflux · rhabdomyolysis · sinusitis · suicidal ideation · sweating · taste disturbance · thirst · tremor · urinary frequency · vomiting · weight changes

- Rare Hallucinations · mania · psychosis
  - Frequency not known Multi-organ hypersensitivity reaction · psychiatric symptoms · Stevens-Johnson syndrome · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Rash Discontinue treatment if rash develops.
Psychiatric symptoms Discontinue treatment if psychiatric symptoms develop.

- PREGNANCY Avoid.

- BREAST FEEDING Avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT Halve dose in severe impairment.

- RENAL IMPAIRMENT Use with caution—limited information available.

- PRE-TREATMENT SCREENING ECG required before initiation.

- MONITORING REQUIREMENTS Monitor blood pressure and heart rate in hypertensive patients.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Uncommon Dizziness · drowsiness · dry mouth · headache · nauasea · vomiting

Rare Amnesia · confusion · depression · hallucinations · nightmares

Very rare Incoordination · light headedness

Frequency not known Paradoxical effects · sleep-walking

SIDE-EFFECTS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

PREGNANCY Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

BREAST FEEDING Present in milk—avoid.

HEPATIC IMPAIRMENT Reduce dose to 3.75 mg in mild to moderate impairment, dose can be increased with caution if necessary. Avoid in severe impairment—can precipitate encephalopathy.

RENAL IMPAIRMENT Start with reduced dose of 3.75 mg. Increased cerebral sensitivity.

PATIENT AND CARER ADVICE

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

NATIONAL FUNDING/ACCESS DECISIONS

PATIENT AND CARER ADVICE

## CNS DEPRESSANTS

### Sodium oxybate

- **Drug action**: A central nervous system depressant.

#### INDICATIONS AND DOSE

**Narcolepsy with cataplexy (under expert supervision)**

**By mouth**

- **Adult**: Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses; dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

- **Contra-indications**: Major depression · succinic semialdehyde dehydrogenase deficiency

- **Caution**: Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms

- **Interactions**: Appendix 1 (sodium oxybate). If sodium oxybate and sodium valproate or valproic acid used concomitantly, reduce initial dose of sodium oxybate to 1.8 g on retiring and repeat 2.5–4 hours later.

- **Side-effects**: Common or very common: Abdominal pain · anorexia · anxiety · arthralgia · asthma · back pain · blurred vision · confusion · depression · diarrhoea · disorientation · dizziness · drowsiness · dysphonia · headache · hypertension · hypoesthesia · impaired attention · muscle spasm · nasal congestion · nausea · nocturnal enuresis · palpitation · paraesthesia · peripheral oedema · rash · sleep disorders · sleep paralysis · sleep walking · sweating · taste disturbance · tremor · urinary incontinence · vertigo · vomiting

- **Uncommon**: Agitation · amnesia · faecal incontinence · hallucination · myoclonus · paraesthesia · psychosis · restless legs syndrome · suicidal behaviour

- **Frequency not known**: Dependence · euphoria · respiratory depression · seizures · sleep apnoea · suicidal ideation · urticaria

- **Pregnancy**: Avoid.

- **Breastfeeding**: No information available.

- **Hepatic impairment**: Halve initial dose.

- **Renal impairment**: Caution—contains 3.96 mmol Na⁺ per mL.

- **Directions for administration**: Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

- **Patient and carer advice**: Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

---

### Substance dependence

Patients or carers should be given advice on how to administer sodium oxybate oral solution.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

### 8 Substance dependence

**Substance dependence**

**Alcohol dependence**

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by The Severity of Alcohol Dependence Questionnaire (SADQ); other assessment questionnaires are also available.

**Acute alcohol withdrawal**

People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually clomethiazole p. 267, are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with uncomplicated liver disease should be treated under specialist supervision.

Carbamazepine p. 387 [unlicensed indication] is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole p. 421 is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol p. 306 or olanzapine p. 315 [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam p. 412 [unlicensed indication] or rectal diazepam p. 267) should be prescribed; thereafter an increase in the dose of
oral benzodiazepine should be considered to prevent further seizures from occurring.

**Alcohol dependence**

Acamprosate calcium p. 429 and naltrexone hydrochloride p. 430 are effective treatments for relapse prevention in patients with alcohol dependence; disulfiram p. 428 is an alternative. Disulfiram should only be used in patients in whom acamprosate calcium and naltrexone hydrochloride are not suitable, or if the patient prefers disulfiram. Nalmefene p. 429 is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification.

Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 882 (as **Pabrinex**<sup>®</sup>) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine p. 882 should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke’s encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhoea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed **pancreatic enzyme supplements**; supplements are not indicated when pain is the only symptom. **Corticosteroids** are used in patients with severe acute alcohol-related hepatitis.

**Drugs used in alcohol dependence**

**Acamprosate**

Acamprosate calcium p. 429, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium p. 429 is not effective in all patients, so efficacy should be regularly assessed.

**Disulfiram**

Disulfiram p. 428 gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

**Nalmefene**

Nalmefene p. 429 should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene p. 429 is not recommended for patients aiming to achieve immediate abstinence.

**Naltrexone**

Naltrexone hydrochloride p. 430 is an opioid-receptor antagonist, but is useful as an adjunct in the treatment of alcohol dependence after a successful withdrawal. Treatment should be initiated by a specialist and continued under specialist supervision. Naltrexone hydrochloride p. 430 should be stopped if drinking continues for 4–6 weeks after starting treatment.

**Nicotine dependence**

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support. Therapy to aid smoking cessation is chosen according to the smoker’s likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker’s preferences. **Nicotine replacement therapy**, bupropion hydrochloride p. 433, and varenicline p. 432 are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion hydrochloride is not recommended.

**Concomitant medication**

Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline, cinacalcet, ropinirole, and some antipsychotics (including clozapine, olanzapine, chlorpromazine hydrochloride, and haloperidol), may need to be reduced. Regular monitoring for adverse effects is advised.

Bupropion hydrochloride p. 433 has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

**Nicotine replacement therapy**

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

**Choice**

Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from nicotine replacement therapy prescribed for treatment of suspected Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 882 (as **Pabrinex**<sup>®</sup>) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine p. 882 should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke’s encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhoea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed **pancreatic enzyme supplements**; supplements are not indicated when pain is the only symptom. **Corticosteroids** are used in patients with severe acute alcohol-related hepatitis.

**Drugs used in alcohol dependence**

**Acamprosate**

Acamprosate calcium p. 429, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium p. 429 is not effective in all patients, so efficacy should be regularly assessed.

**Disulfiram**

Disulfiram p. 428 gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

**Nalmefene**

Nalmefene p. 429 should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene p. 429 is not recommended for patients aiming to achieve immediate abstinence.
from using a combination of an immediate-release preparation and patches to achieve abstinence.

**Side-effects of specific nicotine preparations**

Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and inhalation cartridges can cause irritation of the throat, gum, lozenges, and oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the oral spray can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches, oral spray, and sublingual tablets. Lozenges cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The oral spray may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely patches and oral spray can cause arrhythmia. Patch, lozenges, and oral spray can cause chest pain. The inhalator can very rarely cause reversible atrial fibrillation.

Parasthesia is a common side-effect of oral spray. Abnormal dreams can occur with patches; removal of the patch before bed may help. Lozenges and oral spray may cause rash and hot flushes. Sweating and myalgia can occur with patches and oral spray; the patches can also cause arthralgia.

**Opioid dependence**

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber. Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 436 or buprenorphine p. 434 withdrawal occurs later, with longer-lasting symptoms.

**Opioid substitution therapy**

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

**Missed doses**

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine p. 434 because of the risk of precipitated withdrawal.

**Buprenorphine**

Buprenorphine p. 434 is preferred by some patients because it is less sedating than methadone hydrochloride p. 436; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naloxone hydrochloride p. 430 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 436 (Suboxone®) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1133 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

**Methadone**

Methadone hydrochloride p. 436, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus,
titation to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

**Opioid substitution during pregnancy**

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute. Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective sucking, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

**Opioid substitution during breastfeeding**

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

**Adjunctive therapy and symptomatic treatment**

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 56 may be used for the control of diarrhoea; mebeverine hydrochloride p. 75 for controlling stomach cramps; paracetamol p. 354 and non-steroidal anti-inflammatory drugs for muscular pains and headaches; metoclopramide hydrochloride p. 347 or prochlorperazine p. 309 may be useful for nausea or vomiting. Topical rubefacients can be helpful for relieving muscle pain associated with methadone hydrochloride p. 436 withdrawal. If a patient is suffering from insomnia, short-acting benzodiazepines or zopiclone p. 423 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

**Lofexidine**

Lofexidine hydrochloride p. 434 may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

**Opioid-receptor antagonists**

Patients dependant on opioids can be given a supply of naloxone hydrochloride p. 1133 to be used in case of accidental overdose. Naltrexone hydrochloride p. 430 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

**Opioid dependence in children**

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

### 8.1 Alcohol dependence

#### ALDEHYDE DEHYDROGENASE INHIBITORS

**Disulfiram**

**INDICATIONS AND DOSE**

Adjunct in the treatment of alcohol dependence (under expert supervision)

**BY MOUTH**

- Adult: 200 mg daily, increased if necessary up to max. 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Cardiac failure - coronary artery disease - history of cerebrovascular accident - hypertension - psychosis - severe personality disorder - suicide risk
- **CAUTIONS** Alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) - avoid in Acute porphyrias p. 864 - diabetes mellitus - epilepsy - respiratory disease
- **INTERACTIONS** Appendix 1 (disulfiram).

Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.

- **SIDE-EFFECTS**
  - Common or very common Drowsiness - fatigue - halitosis - nausea - reduced libido - vomiting
  - Rare Allergic dermatitis - depression - hepatic cell damage - mania - paranoia - peripheral neuritis - psychotic reactions - schizophrenia
- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENA L IMPAIRMENT** Use with caution.
PRE-TREATMENT SCREENING  Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.

MONITORING REQUIREMENTS  During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.

PATIENT AND CARER ADVICE  Patient counselling is advised (alcohol reaction).

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

GAMMA-AMINOBUTYRIC ACID ANALOGUES AND DERIVATIVES

Acamprosate calcium

INDICATIONS AND DOSE

Maintenance of abstinence in alcohol-dependent patients

BY MOUTH

- Adult 18–65 years (body-weight up to 60 kg): 666 mg once daily, dose to be taken with breakfast and 333 mg twice daily, dose to be taken at midday and at night
- Adult 18–65 years (body-weight 60 kg and above): 666 mg 3 times a day

CAUTIONS  Continued alcohol abuse (risk of treatment failure)

SIDE-EFFECTS

- Common or very common  Abdominal pain · diarrhoea · fluctuation in libido · maculopapular rash · nausea · pruritus · vomiting
- Rare  Bullous skin reactions
- PREGNANCY  Avoid.
- BREAST FEEDING  Avoid.
- HEPATIC IMPAIRMENT  Avoid if severe.
- RENAL IMPAIRMENT  Avoid if serum-creatinine greater than 120 micromol/litre.
- PRESCRIBING AND DISPENSING INFORMATION

Acamprosate sodium has been used for the maintenance of abstinence in alcohol dependence in children aged 16 years and over [unlicensed].

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

PRESCRIPTIONS

CONTRA-INDICATIONS  Recent history of acute alcohol withdrawal syndrome · recent or current opioid use

CAUTIONS  Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness

INTERACTIONS  Appendix 1 (nalmefene). Avoid concomitant use of opioids—discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic may be necessary (monitor for opioid intoxication).

SIDE-EFFECTS

- Common or very common  Confusion · decreased appetite · decreased libido · disturbance in attention · dizziness · dry mouth · headache · hyperhidrosis · hypoaesthesia · malaise · muscle spasms · nausea · palpitation · paraesthesia · restlessness · sleep disorders · somnolence · tachycardia · tremor · vomiting · weight loss
- Frequency not known  Dissociation · hallucinations

PREGNANCY  Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING  Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT  Use with caution—avoid in severe impairment.

RENAI IMPAIRMENT  Use with caution—avoid in severe impairment.

PRE-TREATMENT SCREENING  Before initiating treatment, prescribers should evaluate the patient’s clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.

MONITORING REQUIREMENTS  During treatment, patients should be monitored regularly and the need for continued treatment assessed.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014) NICE TA325

Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:

- who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization’s drinking risk levels) without physical withdrawal symptoms, and
- who do not require immediate detoxification.

The marketing authorisation states that nalmefene should:
Naltrexone hydrochloride

**INDICATIONS AND DOSE**

Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7-10 days) (initiated under specialist supervision)

**BY MOUTH**
- Adult: Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)

**INDICATIONS AND DOSE**

**BY MOUTH**
- Adult: 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

**UNLICENSED USE**

Unlicensed for use in children under 18 years. 25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.

**CONTRA-INDICATIONS**

Patients currently dependent on opioids

**INTERACTIONS**

Avoid concomitant use of opioids but increased dose of opioid analgesic may be required for pain (monitor for opioid intoxication).

**SIDE-EFFECTS**
- Common or very common: joint and muscle pain, abdominal pain, anxiety, chest pain, chills, constipation, decreased potency, delayed ejaculation, diarrhoea, dizziness, headache, increased energy, increased lacrimation, increased sweating, increased thirst, irritability, mood swings, nausea, rash, reduced appetite, sleep disorders, urinary retention, vomiting
- Rare: Depression, hepatic dysfunction, speech disorders, suicidal ideation, tinnitus
- Very rare: Exanthema, hallucinations, idiopathic thrombocytopenia, tremor

**PREGNANCY**

Use only if benefit outweighs risk.

**BREAST FEEDING**

Avoid—potential toxicity.

**HEPATIC IMPAIRMENT**

Avoid in acute hepatitis, hepatic failure, or severe impairment.

**RENAL IMPAIRMENT**

Avoid in severe impairment.

**PRE-TREATMENT SCREENING**

Test for opioid dependence with naloxone before treatment.

**MONITORING REQUIREMENTS**

Liver function tests needed before and during treatment.

**PATIENT AND CARER ADVICE**

Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Naltrexone for the management of opioid dependence (January 2007) NICE TA115

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly. www.nice.org.uk/TA115

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

**Tablet**

---

**Nicotine**

**INDICATIONS AND DOSE**

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

**BY MOUTH USING CHEWING GUM**
- Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

**BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
- Adult: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

**BY MOUTH USING CHEWING GUM**
- Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, patients should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

**BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
- Adult: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy

**BY INHALATION USING INHALATOR**
- Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, patients should not exceed 12 cartridges of the 10-mg
Nicotine dependence

When used by inhalation bronchospastic disease - chronic throat disease - obstructive lung disease

CAUTIONS, FURTHER INFORMATION
Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

INTERACTIONS → Appendix 1 (nicotine).

SIDE-EFFECTS
- Common or very common Bloating - blurred vision - constipation - coughing - diarrhoea - dry mouth - dyspepsia - dysphagia - epistaxis - flatulence - gastritis - gastrointestinal disturbances (may be caused by swallowed nicotine) - hiccup - increased salivation - irritation of the throat - mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine.
- Minor skin irritation - mouth ulcers - nasal irritation - nausea - oesophagitis - paraesthesia - sneezing - vomiting - watery eyes
- Uncommon Gingival bleeding - halitosis - thirst
- Rare Arrhythmia
- Very rare Reversible atrial fibrillation
- Frequency not known Abdominal pain - abnormal dreams (may occur with patches, removal of the patch before bed may help) - arthralgia - chest pain - flatulence - hot flushes - myalgia - palpitations - rash - sweating - taste disturbance - ulcerative stomatitis

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See Substance dependence p. 425. Nicotine replacement therapy for specific side-effects of individual preparations.

Nicotine withdrawal Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms.

Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

PREGNANCY The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

BREAST FEEDING Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

HEPATIC IMPAIRMENT Use with caution in moderate to severe hepatic impairment.

RENAL IMPAIRMENT Use with caution in severe renal impairment.

DIRECTIONS FOR ADMINISTRATION Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.

Administration by transdermal patch Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure
adhesion; place next patch on a different area and avoid using the same site for several days.
Administration by nasal spray Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.
Administration by oral spray The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.
Administration by sublingual tablet Each tablet should be placed under the tongue and allowed to dissolve. Administration by lozenge Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use. Administration by medicated chewing gum Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

PRESCRIBING AND DISPENSING INFORMATION Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

Varenicline

DRUG ACTION Varenicline is a selective nicotine-receptor partial agonist.

INDICATIONS AND DOSE

To aid smoking cessation

BY MOUTH

Adult: Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

Important safety information

MHRA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation,
Medicinal forms

Varenicline for smoking cessation (July 2011 NICE)

- National funding/access decisions
  
  - NICE technology appraisals (TAs)
    
    Varenicline for smoking cessation (July 2007) NICE TAI23
    
    Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support. www.nice.org.uk/TAI23

- Medicinal forms
  
  There can be variation in the licensing of different medicines containing the same drug.

Serpentine and noradrenaline re-uptake inhibitors

**Butropion hydrochloride**

(Amfebutamone hydrochloride)

- Indications and dose
  
  **To aid smoking cessation in combination with motivational support in nicotine-dependent patients**
  
  **BY MOUTH**
  
  - Adult: Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
  
  - Elderly: 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- Contra-indications
  
  - Acute alcohol withdrawal - acute benzodiazepine withdrawal - bipolar disorder - CNS tumour - eating disorders - history of seizures - severe hepatic cirrhosis
  
  - Alcohol abuse - diabetes - elderly - history of head trauma - predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- Interactions
  
  - Appendix 1 (bupropion).
  
  Caution with concomitant use of drugs that lower seizure threshold.

- Side-effects
  
  - Common or very common Agitation - anxiety - depression - dizziness - dry mouth - fever - gastrointestinal disturbances - headache - impaired concentration - insomnia (reduced by avoiding dose at bedtime) - pruritus - rash - sexual dysfunction - sweating - tachycardia - thirst - tinnitus - tremor - vaginal discharge - visual disturbances - weight gain
  
  - Rare Cerebrovascular accident
  
  - Frequency not known Aggression - diabetes mellitus - hyperglycaemia - irritability - myoclonic infarction - psychosis - sleep-walking - Stevens-Johnson syndrome - suicidal ideation

- Pregnancy
  
  Avoid — toxicity in animal studies.

- Breast feeding
  
  Avoid — present in milk in animal studies.

- Renal impairment
  
  If eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.

- Treatment cessation
  
  Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.

- National funding/access decisions
  
  - NICE technology appraisals (TAs)

8.3 Opioid dependence

**ALPHA₂ ADRENOCEPTOR AGONISTS**

**Lofexidine hydrochloride**

- **DRUG ACTION** Lofexidine is an alpha₂-adrenergic agonist.

**INDICATIONS AND DOSE**

Management of symptoms of opioid withdrawal

- **BY MOUTH**
  - Adult: Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required for 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

- **CAUTIONS** Bradycardia · cerebrovascular disease · depression · history of QT prolongation · hypotension (monitor pulse rate and blood pressure) · metabolic disturbances · recent myocardial infarction · severe coronary insufficiency

- **INTERACTIONS** → Appendix 1 (lofexidine).

- **SIDE-EFFECTS** Bradycardia · dizziness · drowsiness · dry mucous membranes · hypotension · QT-interval prolongation

- **PREGNANCY** Use only if benefit outweighs risk—no information available.

- **BREAST FEEDING** Use only if benefit outweighs risk—no information available.

- **RENAI IMPAIRMENT** Caution in chronic impairment.

- **MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

- **PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years for the management of symptoms of opioid withdrawal

- **TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.

- **PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**OPIOIDS**

**Buprenorphine**

The properties listed below are those particular to the drug only. For properties common to the class, see opioids, p. 357.

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

**INDICATIONS AND DOSE**

- **Moderate to severe pain**
  - **BY SUBLINGUAL ADMINISTRATION**
    - Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
    - Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
  - **BY TRANSDERMAL APPLICATION USING PATCHES**
    - Adult: Patients who have not previously received strong opioid analgesics initially 35 micrograms/hour up to every 72 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**PHARMACOKINETICS**

It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**TRANSTEC**

- **Moderate to severe chronic cancer pain | Severe pain unresponsive to non-opioid analgesics**

**BY SUBLINGUAL ADMINISTRATION**

- Adult: Patients who have not previously received strong opioid analgesics, initially 35 micrograms/hour up to every 96 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually
in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**PHARMACOKINETICS**
It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**BUTRANS®**
Moderate, non-malignant pain unresponsive to non-opioid analgesics

**BY TRANSDERMAL APPLICATION USING PATCHES**
> Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

**UNLICENSED USE**
Sublingual tablets not licensed for use in children under 6 years. Injection not licensed for use in children under 6 months.

**CAUTIONS**
**GENERAL CAUTIONS**
Impaired consciousness

**SPECIFIC CAUTIONS**
> With transdermal use other opioids should not be administered within 24 hours of patch removal (long duration of action) (in adults)
> When used for adjunct in the treatment of opioid dependence hepatitis B infection (in adults) - hepatitis C infection (in adults) - pre-existing liver enzyme abnormalities (in adults)

**INTERACTIONS**
Caution with concomitant use of hepatotoxic drugs.

**SIDE-EFFECTS**
> Common or very common Abdominal pain - agitation - anorexia - anxiety - asthenia - diarrhoea - dyspepsia - dryness - fatigue - mild withdrawal symptoms in patients dependent on opioids - paraesthesia - vasodilatation
> Rare Divertercitis (in children) - dysphagia - impaired concentration - paralytic ileus - psychosis
> Very rare Hiccups - hyperventilation - muscle fasciculation - retching
> Frequency not known Hepatic necrosis - hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Fever or external heat**
Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).

**Overdose**
The effects of buprenorphine are only partially reversed by naloxone.

**HAPOCTASIN®**
In view of the long duration of action, patients who have severe side-effects should be monitored for up to 25 hours after removing patch.

**TRANSTEC®**
In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch.

**BREAST FEEDING**
Present in low levels in breast milk.

**RENAL IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRE-TREATMENT SCREENING**
Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

**MONITORING REQUIREMENTS**
Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

**DIRECTIONS FOR ADMINISTRATION**
> With sublingual use in children For administration by mouth, tablets may be halved.

**HAPOCTASIN®**
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

**TRANSTEC®**
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).

**BUTRANS®**
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

**PRESCRIBING AND DISPENSING INFORMATION**
Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.

**PATIENT AND CARER ADVICE**
HAPOCTASIN® TRANSTEC® BUTRANS®
Patients or carers should be given advice on how to administer buprenorphine transdermal patches.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
> Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. www.nice.org.uk/TA114

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**

Buprenorphine with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 434, naloxone hydrochloride p. 1133.

INDICATIONS AND DOSE
Adjunct in the treatment of opioid dependence (dose expressed as buprenorphine)

BY SUBLINGUAL ADMINISTRATION
> Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Methadone hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see opioids, p. 357.

INDICATIONS AND DOSE
Severe pain
BY MOUTH OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
> Adult: 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours
Adjunct in treatment of opioid dependence
BY MOUTH USING ORAL SOLUTION
> Adult: Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily
Adjunct in treatment of opioid dependence if tolerance low or not known
BY MOUTH USING ORAL SOLUTION
> Adult: Initially 10–20 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily
the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

**Adjunct in treatment of opioid dependence if tolerance high** (under expert supervision)

- **MOUTH USING ORAL SOLUTION**
  - Adults: Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

**Cough in terminal disease**

- **INITIALLY BY MOUTH USING LINCTUS**
- Adults: 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

**Dose equivalence and conversion**

See p. 434 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

- **UNLICENSED USE** Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

**Important safety information**

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Family history of sudden death (ECG monitoring recommended) - history of cardiac conduction abnormalities

**CAUTIONS, FURTHER INFORMATION**

- **Q1 interval prolongation** Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

- **SIDE-EFFECTS** Dry eyes - dysmenorrhoea - hyperprolactinaemia - hypothermia. QT interval prolongation - raised intracranial pressure - restlessness - torsade de pointes

**SIDE-EFFECTS, FURTHER INFORMATION**

Methadone is a long-acting opioid therefore effects may be cumulative. Methadone, even in low doses is a **special hazard** for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

**Overdose** Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

**BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).

**RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**TREATMENT CETSSION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.

**METHADOSE® ORAL SOLUTION**

The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

**Important** — care is required in prescribing and dispensing the **correct strength** since any confusion could lead to an overdose; this preparation should be dispensed only **after dilution** as appropriate with Methadose® Diluent (life of diluted solution 3 months) and is for drug dependent persons.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. [www.nice.org.uk/TA114](http://www.nice.org.uk/TA114)

**LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, suppository, solution for injection, oral suspension, oral solution, capsule, impregnated cigarette

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

Chapter 5
Infection

1  Amoebic infection

Drugs used for Amoebic infection not listed below; Metronidazole, p. 475  Tinidazole, p. 476

Diloxanide furoate

INDICATIONS AND DOSE
Chronic amoebiasis  Acute amoebiasis as adjunct to metronidazole or tinidazole
BY MOUTH
— Child 12–17 years: 500 mg 3 times a day for 10 days
— Adult: 500 mg 3 times a day for 10 days

• SIDE-EFFECTS Flatulence  pruritus  urticaria  vomiting
• PREGNANCY Manufacturer advises avoid—no information available.
• BREAST FEEDING Manufacturer advises avoid.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
CAUTIONARY AND ADVISORY LABELS 9
— DILOXANIDE FUROATE (Non-proprietary)
Diloxanide furoate 500 mg  Diloxanide 500mg tablets 30 tablet £93.50

Mepacrine hydrochloride

INDICATIONS AND DOSE
Giardiasis
BY MOUTH
— Adult: 100 mg every 8 hours for 5–7 days

• UNLICENSED USE Not licensed for use in giardiasis.
• CAUTIONS Avoid in psoriasis  elderly  history of psychosis
• INTERACTIONS Appendix 1 (mepacrine).
• SIDE-EFFECTS Aplastic anaemia (on prolonged treatment)  blue/black discoloration of nails  blue/black discoloration of palate  chronic dermatoses (on prolonged treatment)  CNS stimulation (with large doses)  corneal deposits with visual disturbances  dizziness  gastrointestinal disturbances  headache  hepatitis (on prolonged treatment)  nausea (with large doses)  severe exfoliative dermatitis (on prolonged treatment)  transient acute toxic psychosis (with large doses)  vomiting (with large doses)  yellow discoloration of skin (on prolonged treatment)  yellow discoloration of urine (on prolonged treatment)

• HEPATIC IMPAIRMENT Use with caution.
• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

2  Bacterial infection

Antibacterials, principles of therapy

Choice of a suitable drug
Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 483 but sensitive to
nitrofurantoin p. 512 (can cause nausea), gentamicin p. 450 (can be given only by injection and best avoided in pregnancy), tetracycline p. 498 (causes dental discoloration) and trimethoprim p. 462 (folic acid antagonist therefore theoretical teratogenic risk), and cefalexin p. 456. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin p. 456 would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

**Antibacterial policies**

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

**Before starting therapy**

The following precepts should be considered before starting:

- **Viral infections should not be treated with antibacterials.** However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- **Samples should be taken for culture and sensitivity testing;** ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- **Knowledge of prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- **The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection.** The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- **The route of administration of an antibacterial often depends on the severity of the infection.** Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration of therapy depends on the nature of the infection and the response to treatment.** Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

**Superinfection**

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections or antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

**Therapy**

When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

**Notifiable diseases**

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

**Antibacterials, use for prophylaxis**

**Prevention of recurrence of rheumatic fever**

Phenoxyoxymethylpenicillin p. 481 or sulfadiazine p. 495.

**Prevention of secondary case of invasive group A streptococcal infection**

Phenoxyoxymethylpenicillin p. 481.

Patients who are penicillin allergic, *either* erythromycin p. 471 or azithromycin p. 469 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

**Prevention of secondary case of meningococcal meningitis**

Ciprofloxacin p. 490 or rifampicin p. 508 or i/m ceftriaxone p. 459 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).
England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

**Prevention of secondary case of Haemophilus influenzae type b disease**

Rifampicin p. 508 or (if rifampicin cannot be used) i/m or i/v ceftriaxone p. 459 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with underlying medical conditions (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

**Prevention of secondary case of diphtheria in non-immune patient**

Erythromycin p. 471 (or azithromycin p. 469 or clarithromycin p. 470).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment.

**Prevention of pertussis**

Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**

Phenoxymethylpenicillin p. 481.

If penicillin-allergic, erythromycin p. 471.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive**

Isoniazid p. 506 or isoniazid + rifampicin p. 508 or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin.

For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control).

**Prevention of infection from animal and human bites**

Co-amoxiclav p. 484 alone (or doxycycline p. 496 + metronidazole p. 475 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1065 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

**Prevention of early-onset neonatal infection**

i/v benzylpenicillin sodium p. 480 (or i/v clindamycin p. 467 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteruria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

**Prevention of infection in gastro-intestinal procedures**

Operations on stomach or oesophagus

Single dose of i/v gentamicin p. 450 or i/v cefuroxime p. 460 or i/v co-amoxiclav p. 484 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

Open biliary surgery

Single dose of i/v cefuroxime p. 460 + i/v metronidazole p. 475 or i/v gentamicin p. 450 + i/v metronidazole or i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

Single dose of i/v gentamicin p. 450 + i/v metronidazole p. 475 or i/v cefuroxime p. 460 + i/v metronidazole or i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Endoscopic retrograde cholangiopancreatography**

Single dose of i/v gentamicin p. 450 or oral or i/v ciprofloxacin p. 490.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 482 or i/v teicoplanin p. 464 (or vancomycin p. 465).

**Percutaneous endoscopic gastrostomy or jejunostomy**

Single dose of i/v co-amoxiclav p. 484 or i/v cefuroxime p. 460.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin p. 464 (or vancomycin p. 465) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

**Prevention of infection in orthopaedic surgery**

**Joint replacement including hip and knee**

Single dose of i/v cefuroxime p. 460 alone or i/v flucloxacillin p. 486 + i/v gentamicin p. 450 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Closed fractures**

Single dose of i/v cefuroxime p. 460 or i/v flucloxacillin p. 486 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Open fractures**

Use i/v co-amoxiclav p. 484 alone or i/v cefuroxime p. 460 + i/v metronidazole p. 475 (or i/v clindamycin p. 467 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

**High lower-limb amputation**

Use i/v co-amoxiclav p. 484 alone or i/v cefuroxime p. 460 + i/v metronidazole p. 475.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin p. 450 + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Prevention of infection in urological procedures**

**Transrectal prostate biopsy**

Single dose of oral ciprofloxacin p. 490 or oral metronidazole p. 475 or i/v gentamicin p. 450 + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole p. 475 is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Transurethral resection of prostate**

Single dose of oral ciprofloxacin p. 490 or i/v gentamicin p. 450 or i/v cefuroxime p. 460 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin p. 450 if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in obstetric and gynaecological surgery**

**Caesarean section**

Single dose of i/v cefuroxime p. 460 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin p. 467 if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Hysterectomy**

Single dose of i/v cefuroxime p. 460 + i/v metronidazole p. 475 or i/v gentamicin p. 450 + i/v metronidazole or i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin p. 464 (or vancomycin p. 465) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Termination of pregnancy**

Single dose of oral metronidazole p. 475 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genitai chlamydial infection cannot be ruled out, give doxycycline p. 496 postoperatively.

**Prevention of infection in cardiology procedures**

**Cardiac pacemaker insertion**

Single dose of i/v cefuroxime p. 460 alone or i/v clavulanic acid p. 480

If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin. (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant Staphylococcus aureus (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in vascular surgery**

**Reconstructive arterial surgery of abdomen, pelvis or legs**

Single dose of i/v cefuroxime p. 460 alone or i/v clavulanic acid p. 480 + i/v gentamicin p. 450 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 475 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of endocarditis**

**NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures** (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is not recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genitourinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genitourinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

**Dermatological procedures**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

**Joint prostheses and dental treatment**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Immunosuppression and indwelling intraperitoneal catheters**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Blood infections, bacterial**

**Antibacterial therapy for septicaemia: community-acquired**

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 479, ticarcillin with clavulanic acid p. 480) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 460)

If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 462 (or teicoplanin p. 464).

If anaerobic infection suspected, add metronidazole p. 475 to broad-spectrum cephalosporin.

If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 454).
Antibacterial therapy for septicaemia: hospital-acquired

- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam p. 479, ticarcillin with clavulanic acid p. 480, cefotaxime p. 458, imipenem with cilastatin p. 454, or meropenem p. 454)
  - If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).
  - If anaerobic infection suspected, add metronidazole p. 475 to broad-spectrum cephapslorin

**Septicaemia related to vascular catheter**

- Benzylpenicillin sodium p. 465 (or teicoplanin p. 464)
  - If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
  - Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, *pestomonas*, or *Candida* species.

**Meningococcal septicemia**

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 480 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 457 may be an alternative in meningococcal disease; chloramphenicol p. 452 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 449)
- *If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol*
  - To eliminate nasopharyngeal carriage, ciprofloxacin p. 490, or rifampicin p. 508, or ceftriaxone may be used.

**Cardiovascular system infections, bacterial**

**Antibacterial therapy for endocarditis: initial ‘blind’ therapy**

- **Native valve endocarditis**, amoxicillin p. 482 (or ampicillin p. 483)
  - Consider adding low-dose gentamicin p. 450
  - If penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 465 + low-dose gentamicin
  - If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 454
- **If prosthetic valve endocarditis**, vancomycin + rifampicin p. 508 + low-dose gentamicin

**Antibacterial therapy for native-valve endocarditis caused by staphylococci**

- Flucloxacinil p. 486
  - *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- *If penicillin-allergic or if meticillin-resistant Staphylococcus aureus*, vancomycin p. 465 + rifampicin
  - *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

**Antibacterial therapy for prosthetic valve endocarditis caused by staphylococci**

- Flucloxacinil p. 486 + rifampicin p. 508 + low-dose gentamicin
  - *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin p. 450 at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If penicillin-allergic or if meticillin-resistant Staphylococcus aureus*, vancomycin p. 465 + rifampicin + low-dose gentamicin
  - *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

**Antibacterial therapy for endocarditis caused by fully-sensitive streptococci**

- Benzylpenicillin sodium p. 480
  - *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- *If penicillin-allergic, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
  - *Suggested duration of treatment* 4–6 weeks (stop gentamicin p. 450 after 2 weeks)

**Antibacterial therapy for endocarditis caused by less-sensitive streptococci**

- Benzylpenicillin sodium p. 480 + low-dose gentamicin
  - *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin p. 450 at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- *If penicillin-allergic or highly penicillin-resistant, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
  - *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

**Antibacterial therapy for endocarditis caused by enterococci**

- Amoxicillin p. 482 (or ampicillin p. 483) + low dose gentamicin p. 450 or benzylpenicillin sodium p. 480 + low-dose gentamicin
  - *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If penicillin-allergic or penicillin-resistant, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
  - *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If gentamicin resistant, amoxicillin (or ampicillin)
  - Add streptomycin p. 451 (if susceptible) for 2 weeks
  - *Suggested duration of treatment* at least 6 weeks
Antibacterial therapy for endocarditis caused by Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingella species (‘HACEK’ micro-organisms)

- Amoxicillin p. 482 (or ampicillin p. 483) + low-dose gentamicin
  Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin p. 450 after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 459 (or cefotaxime p. 457) + low-dose gentamicin
  Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, bacterial

Antibacterial therapy for meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 480 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 457 may be an alternative in penicillin allergy; chloramphenicol p. 452 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 581 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.
- Adult and child 3 months–50 years, cefotaxime (or ceftriaxone p. 459)
  Consider adding vancomycin p. 465 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
  Suggested duration of treatment at least 10 days
- Adult over 50 years cefotaxime (or ceftriaxone) + amoxicillin p. 482 (or ampicillin p. 483)
  Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
  Suggested duration of treatment at least 10 days

Antibacterial therapy for meningitis caused by meningococci

- Benzylpenicillin sodium p. 480 or cefotaxime p. 457 (or ceftriaxone p. 459)
  Suggested duration of treatment 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
  Suggested duration of treatment 7 days.

Antibacterial therapy for meningitis caused by pneumococci

- Cefotaxime p. 457 (or ceftriaxone p. 459)
  Consider adjunctive treatment with dexamethasone p. 581, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial. (may reduce penetration of vancomycin p. 465 into cerebrospinal fluid).
  If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium p. 480. If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 508.
  Suggested duration of antibacterial treatment 14 days

Central nervous system infections, bacterial

Antibacterial therapy for meningitis caused by Haemophilus influenzae

- Cefotaxime p. 457 (or ceftriaxone p. 459)
  Consider adjunctive treatment with dexamethasone p. 581, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  Suggested duration of antibacterial treatment 10 days. For H. influenzae type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
  Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  Suggested duration of antibacterial treatment 10 days. For H. influenzae type b give rifampicin p. 508 for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Antibacterial therapy for meningitis caused by Listeria

- Amoxicillin p. 482 (or ampicillin p. 483) + gentamicin
  Suggested duration of treatment 21 days.
- If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole
  Suggested duration of treatment 21 days.

Ear infections, bacterial

Antibacterial therapy for otitis externa

For topical treatments, consider Otitis externa, under Ear p. 976.
Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.
- Fluocinolone
  If penicillin-allergic, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  If Pseudomonas suspected, ciprofloxacin p. 490 (or an aminoglycoside)

Antibacterial therapy for otitis media

Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression,
Eye infections, bacterial

Antibacterial therapy for purulent conjunctivitis
- Chloramphenicol eye drops p. 955.

Gastro-intestinal system infections, bacterial

Antibacterial therapy for gastro-enteritis
Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated

Antibacterial therapy for campylobacter enteritis
Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
- Alternative, ciprofloxacin
  Strains with decreased sensitivity to ciprofloxacin p. 490 isolated frequently

Antibacterial therapy for salmonella (non-typhoid)
 Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin p. 490 or cefotaxime p. 457

Antibacterial therapy for shigellosis
Antibacterial not indicated for mild cases.
- Ciprofloxacin p. 490 or azithromycin p. 469
- Alternatives if micro-organism sensitive, amoxicillin p. 482 or trimethoprim p. 462

Antibacterial therapy for typhoid fever
Infections from Middle–East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime p. 457 (or ceftriaxone p. 459)
  Azithromycin p. 469 may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- Alternative if micro-organism sensitive, ciprofloxacin p. 490

Antibacterial therapy for Clostridium difficile infection
- For first episode of mild to moderate infection, oral metronidazole
  Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole p. 475, or in patients intolerant of metronidazole, oral vancomycin
  For severe infection in patients with multiple comorbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin p. 468 can replace vancomycin p. 465
  Suggested duration of treatment 10–14 days
- For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
  For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
  Suggested duration of treatment 10–14 days

Antibacterial therapy for biliary-tract infection
- Ciprofloxacin p. 490 or gentamicin p. 450 or a cephalosporin

Antibacterial therapy for peritonitis
- A cephalosporin + metronidazole p. 1008 or gentamicin p. 450 or metronidazole or gentamicin + clindamycin p. 467 or piperacillin with tazobactam p. 479 alone

Antibacterial therapy for peritonitis: peritoneal dialysis-associated
- Vancomycin p. 465 (or teicoplanin p. 464) + cefazidime p. 458 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin p. 490 by mouth
  Suggested duration of treatment 14 days or longer

Genital system infections, bacterial

Antibacterial therapy for bacterial vaginosis
- Oral metronidazole
  Suggested duration of treatment 5–7 days (or high-dose metronidazole p. 475 as a single dose)
- Alternatively, topical metronidazole for 5 days or topical clindamycin p. 467 for 7 days

Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection
Contact tracing recommended.
- Azithromycin or doxycycline
  Suggested duration of treatment azithromycin p. 469 as a single dose or doxycycline p. 496 for 7 days
- Alternatively, erythromycin p. 471.
  Suggested duration of treatment 14 days

Antibacterial therapy for gonorrhoea: uncomplicated
Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.
- Azithromycin p. 469 + i/m ceftriaxone
  Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, when parenteral administration is not possible, cefixime p. 457 + azithromycin
  Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, if micro-organism is sensitive to a quinolone, ciprofloxacin p. 490 + azithromycin
  Suggested duration of treatment is a single-dose of each antibacterial
446 Bacterial infection

- Pharyngeal infection, azithromycin p. 469 + i/m ceftriaxone
  
  Suggested duration of treatment is a single-dose of each antibacterial

Antibacterial therapy for pelvic inflammatory disease

Contact tracing recommended.
- Doxycycline p. 496 + metronidazole p. 475 + single-dose of i/m ceftriaxone p. 459 or ofloxacin p. 494 + metronidazole
  
  Suggested duration of treatment 14 days (except i/m ceftriaxone p. 459).
  
  In severely ill patients initial treatment with doxycycline p. 496 + i/v ceftriaxone p. 459 + i/v metronidazole p. 475, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment

Antibacterial therapy for early syphilis (infection of less than 2 years)

Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
  
  Suggested duration of treatment single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
  
  Alternatively, doxycycline p. 496 or erythromycin
  
  Suggested duration of treatment 14 days

Antibacterial therapy for late latent syphilis (asymptomatic infection of more than 2 years)

Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
  
  Suggested duration of treatment once weekly for 2 weeks

  Alternatively, doxycycline p. 496
  
  Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis

- Doxycycline p. 496
  
  Suggested duration of treatment 14 days

Musculoskeletal system infections, bacterial

Antibacterial therapy for osteomyelitis

Seek specialist advice if chronic infection or prostheses present.
- Flucloxacillin p. 486
  
  Consider adding fusidic acid p. 463 or rifampicin p. 508 for initial 2 weeks.
  
  Suggested duration of treatment 6 weeks for acute infection

  If penicillin-allergic, clindamycin p. 467
  
  Consider adding fusidic acid or rifampicin for initial 2 weeks.
  
  Suggested duration of treatment 6 weeks for acute infection

  If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 465 (or teicoplanin p. 464)
  
  Consider adding fusidic acid or rifampicin for initial 2 weeks.
  
  Suggested duration of treatment 6 weeks for acute infection

Antibacterial therapy for septic arthritis

Seek specialist advice if prostheses present.
- Flucloxacillin p. 486
  
  Suggested duration of treatment 4–6 weeks (longer if infection complicated).

  If penicillin-allergic, clindamycin p. 467
  
  Suggested duration of treatment 4–6 weeks (longer if infection complicated).

  If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 465 (or teicoplanin p. 464)
  
  Suggested duration of treatment 4–6 weeks (longer if infection complicated).

  If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 457 (or ceftriaxone p. 459)
  
  Suggested duration of treatment 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

Nose infections, bacterial

Antibacterial therapy for sinusitis

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 482 (or amoxicillin p. 483) or doxycycline p. 496 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  
  Suggested duration of treatment 7 days.

  Consider oral co-amoxiclav p. 484 if no improvement after 48 hours.

  In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 460 may be required.

Oral bacterial infections

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to...
maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 475 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

**Penicillins**

Phenoxymethylpenicillin p. 481 is effective for dentoalveolar abscess.

**Broad-spectrum penicillins**

Amoxicillin p. 482 is as effective as phenoxymethylpenicillin p. 481 but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases. Amoxicillin may be useful for short course oral regimens. Co-amoxiclav p. 484 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

**Cephalosporins**

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 456 and cefadroxil p. 458 have been used in the treatment of oral infections.

**Tetracyclines**

In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 496 has a longer duration of action than tetracycline p. 498 or oxytetracycline p. 498 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

**Macrolides**

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

**Clindamycin**

Clindamycin p. 467 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole p. 475.

**Metronidazole and tinidazole**

Metronidazole p. 475 is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin p. 482 is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 476 is licensed for the treatment of acute ulcerative gingivitis.

**Respiratory system infections, bacterial**

**Antibacterial therapy for haemophilus influenzae epiglottitis**

- Cefotaxime p. 457 (or ceftriaxone p. 459)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 452

**Antibacterial therapy for chronic bronchitis: acute exacerbations**

Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

- Amoxicillin p. 482 (or ampicillin p. 483) or a tetracycline p. 496
  - Some pneumococci and Haemophilus influenzae strains tetracycline-resistant; approx. 20% H. influenzae strains amoxicillin-resistant
  - **Suggested duration of treatment** 5 days; longer treatment may be necessary in severely ill patients
- **Alternative**, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  - **Suggested duration of treatment** 5 days; longer treatment may be necessary in severely ill patients

**Antibacterial therapy for pneumonia: low-severity community-acquired**

- Amoxicillin p. 482 (or ampicillin p. 483)
  - Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
  - If atypical pathogens suspected, add clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471).
  - If staphylococci suspected (e. g. in influenza or measles), add flucloxacinil p. 486.
  - **Suggested duration of treatment** 7 days (14–21 days for infections caused by staphylococci)
- **Alternatives**, doxycycline p. 496 or clarithromycin (or azithromycin or erythromycin)
  - **Suggested duration of treatment** 7 days (14–21 days for infections caused by staphylococci)

**Antibacterial therapy for pneumonia: moderate-severity community-acquired**

- Amoxicillin p. 482 (or ampicillin p. 483) + clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or doxycycline p. 496 alone
  - Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
  - If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 465 (or teicoplanin p. 464).
  - **Suggested duration of treatment** 7 days (14–21 days for infections caused by staphylococci)
Antibacterial therapy for pneumonia: high-severity community-acquired

- Benzylpenicillin sodium p. 480 + clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or benzylpenicillin sodium + doxycycline
  If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 465 (or teicoplanin p. 464).
  **Suggested duration of treatment 7–10 days** (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 484 + clarithromycin (or azithromycin or erythromycin)
  If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin)
  **Suggested duration of treatment 7–10 days** (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 460 + clarithromycin (or azithromycin or erythromycin) or cefotaxime (or ceftriaxone p. 459) + clarithromycin (or azithromycin or erythromycin)
  If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
  **Suggested duration of treatment 7–10 days** (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Antibacterial therapy for pneumonia possibly caused by atypical pathogens

- Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  If high-severity Legionella infection, add rifampicin p. 508 for the first few days.
  **Suggested duration of treatment 14 days** (usually 7–10 days for Legionella)
- Alternative if Legionella infection suspected, a quinolone
  If high-severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
  **Suggested duration of treatment usually 7–10 days**
- Alternative for chlamydial or mycoplasma infections, doxycycline p. 496
  **Suggested duration of treatment 14 days**

Antibacterial therapy for pneumonia: hospital-acquired

- Early-onset infection less than 5 days after admission to hospital, co-amoxiclav p. 484 or cefuroxime
  If life-threatening infection, or if history of antibiotic treatment in the last 3 months, or if resistant micro-organisms suspected, treat as for late-onset hospital-acquired pneumonia.
  **Suggested duration of treatment 7 days**
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 479) or a broad-spectrum cephalosporin (e.g. cefazidime p. 458) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 490)
  If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 465.
  For severe illness caused by Pseudomonas aeruginosa, consider adding an aminoglycoside.
  **Suggested duration of treatment 7 days** (longer if Pseudomonas aeruginosa confirmed)

Antibacterial therapy for impetigo: small areas of skin infected

Seek local microbiology advice before using topical treatment in hospital.

- Topical fusidic acid p. 1008
  **Suggested duration of treatment 7 days** is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant Staphylococcus aureus, topical mupirocin p. 1009
  **Suggested duration of treatment 7 days** is usually adequate (max. 10 days).

Impetigo: widespread infection

- Oral flucloxacillin p. 486
  If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 481.
  **Suggested duration of treatment 7 days**.
- If penicillin-allergic, oral clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  **Suggested duration of treatment 7 days**.

Antibacterial therapy for erysipelas

- Phenoxymethylpenicillin p. 481 or benzylpenicillin sodium
  If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin p. 486
  **Suggested duration of treatment at least 7 days**.
- If penicillin-allergic, clindamycin p. 467 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  **Suggested duration of treatment at least 7 days**.

Antibacterial therapy for cellulitis

- Flucloxacillin p. 486 (high-dose)
  If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin p. 481 or benzylpenicillin sodium p. 480
  If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibiotics.
- If penicillin-allergic, clindamycin p. 467 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or vancomycin p. 465 (or teicoplanin p. 464)
  If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Antibacterial therapy for animal and human bites

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1065 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Co-amoxiclav p. 484.
- If penicillin-allergic, doxycycline p. 496 + metronidazole p. 475
Antibacterial therapy for mastitis during breast-feeding

Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection.

- Flucloxacillin p. 486, if penicillin-allergic, erythromycin

Continue breast-feeding or expressing milk during treatment. Suggested duration of treatment 10–14 days.

AMINOGLYCOSIDES

Aminoglycosides

These include amikacin p. 450, gentamicin p. 450, neomycin sulfate p. 451, streptomycin p. 451, and tobramycin p. 452. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against Pseudomonas aeruginosa; streptomycin is active against Mycobacterium tuberculosis and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p.

Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary Ps. aeruginosa infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in patients receiving parenteral aminoglycosides and must be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)

- CONTRA-INDICATIONS Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- CAUTIONS
  - GENERAL CAUTIONS
    - Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related)- conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) - if possible, dehydration should be corrected before starting an aminoglycoside
  - SPECIFIC CAUTIONS
    - Whenever possible, parenteral treatment should not exceed 7 days
  - INTERACTIONS → Appendix 1 (aminoglycosides).
    - If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable.
  - SIDE-EFFECTS
    - Rare Antimicrobial-associated colitis - electrolyte disturbances - hypocalcaemia - hypokalaemia - hypomagnesaemia on prolonged therapy - nausea - peripheral neuropathy - stomatitis - vomiting
    - Very rare Blood disorders - CNS effects - convulsions - encephalopathy - headache
    - Frequency not known Auditory damage - impaired neuromuscular transmission - impaired neuromuscular transmission - irreversible ototoxicity - nephrotoxicity - transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery - vestibular damage
  - SIDE-EFFECTS, FURTHER INFORMATION
    - Nephrotoxicity Occurs most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.
    - PREGNANCY There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.
If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Otoxicity and nephrotoxicity occur commonly in patients with renal failure. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

- **MONITORING REQUIREMENTS**
  - Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.
  - Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in the elderly, obesity, if high doses are being given and in cystic fibrosis.
  - In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration) and also just before the next dose (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the interval between doses must be increased. If the post-dose (‘peak’) concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
  - Renal function should be assessed before starting an aminoglycoside and during treatment.
  - Auditory and vestibular function should also be monitored during treatment.

**INDICATIONS AND DOSE**

**Gentamicin**

**AMIKACIN (Non-proprietary)**

- **Indications and dosages**
  - **Serious Gram-negative infections resistant to gentamicin**
    - Multiple daily dose regimen
    - Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course
  - **Serious Gram-negative infections resistant to gentamicin**
    - Once daily dose regimen: pre-dose (‘trough’) concentration should be less than 5 mg/litre.
  - **Indications for administration**
    - For intravenous infusion (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.
  - **Prescribing and dispensing information**
    - Once daily dose regimens not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.
  - **Medication forms**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Solution for injection**
      - Amikacin (as Amikacin sulfate) 250 mg per 1 ml
      - Amikacin 500mg/2ml solution for injection vials | 5 vial (Actavis) £60.00
      - Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Amikacin (as Amikacin sulfate) 50 mg per 1 ml
      - Amikin 100mg/2ml solution for injection vials | 5 vial (Potter) £10.33

**Amikacin**

**INDICATIONS AND DOSE**

Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)

- **By intramuscular injection or by slow intravenous injection or by intravenous infusion**
  - Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen
  - Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis

- **By intravenous infusion**
  - Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes
  - Surgical prophylaxis (including joint replacement surgery)
    - By slow intravenous injection
      - Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures and joint replacement surgery; up to 3 further doses may be given
  - By intravenous infusion
    - Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely.

**Side-effects**

- Uncommon Rash

**Monitoring requirements**

- Multiple daily dose regimen: one-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre.

**Side-effects**

- Uncommon Rash

**Monitoring requirements**

For multiple daily dose regimen, one-hour (‘peak’) serum concentration should be 5–10 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre.
Neomycin sulfate

**INDICATIONS AND DOSE**

**BY MOUTH**

- **Adult:** 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

**Hepatic coma**

- **Adult:** Up to 4 g daily in divided doses usually for 5–7 days

**CONTRA-INDICATIONS**

Intestinal obstruction - myasthenia gravis (aminoglycosides may impair neuromuscular transmission).

**CAUTIONS**

Avoid prolonged use

**CAUTIONS, FURTHER INFORMATION**

Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.

**INTERACTIONS**

→ Appendix 1 (aminoglycosides).

**SIDE-EFFECTS**

- **Common or very common** Rash
- **Frequency not known** Impaired intestinal absorption with steatorrhea and diarrhoea - increased salivation

**SIDE-EFFECTS, FURTHER INFORMATION**

Although neomycin is associated with the same side effects as other aminoglycosides it is generally considered toxic for systemic use.

**PRESCRIBING AND DISPENSING INFORMATION**

Local guidelines may vary in the dosing advice provided for once daily administration.

**MEDICATIONS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, oral solution, cream

**Solution for injection**

- **GENTAMICIN (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule £22.50 (Hospital only)
  - Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial £11.25
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial £20.00
  - Gentamicin 80mg/2ml solution for injection ampoules | 10 ampoule £30.00
  - **Cidomycin** (Sanofi)
    - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial £6.88
    - Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule £6.88

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, cream

**Tablet**

- **NEOMYCIN SULFATE (Non-proprietary)**
  - Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet £3.49

**Streptomycin**

**INDICATIONS AND DOSE**

Tuberculosis, resistant to other treatment, in combination with other drugs

**BY DEEP INTRAMUSCULAR INJECTION**

- **Adult:** 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

**Adjunct to doxycycline in brucellosis (administered on expert advice)**

**BY DEEP INTRAMUSCULAR INJECTION**

- **Adult:** (consult local protocol)

**Enterococcal endocarditis**

- **Adult:** (consult local protocol)

**UNLICENSED USE**

Use in tuberculosis is an unlicensed indication.

**Important safety information**

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

**SIDE-EFFECTS**

- **Common or very common** Rash
- **Frequency not known** Hypersensitivity reactions - paraesthesia of mouth

**RENAI IMPAIRMENT** Should preferably be avoided. If essential, use with great care and consider dose reduction.

**MONITORING REQUIREMENTS**

- One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection
Tobramycin

INDICATIONS AND DOSE
Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
> Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg as soon as clinically indicated

Inhalation
BY INTRAMUSCULAR INJECTION
> Adult: 2–3 mg/kg for 1 dose

Chronic Pseudomonas aeruginosa infection in patients with cystic fibrosis
BY INHALATION OF NEBULISED SOLUTION
> Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

BY INHALATION OF POWDER
> Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, use ideal weight for height to calculate parental dose and monitor serum-tobramycin concentration closely.

CAUTIONS
> When used by inhalation Severe haemoptysis—risk of further haemorrhage

SIDE-EFFECTS
> Uncommon
> With intramuscular use Rash
> With intravenous use Rash
> Frequency not known
> When used by inhalation Bronchospasm—cough (more frequent by inhalation of powder) — dysphonia — epistaxis — haemoptysis — laryngitis — mouth ulcers — pharyngitis — salivary hypersecretion — taste disturbances

MONITORING REQUIREMENTS
> With intramuscular use or intravenous use One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
> When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Monitor renal function before treatment and then annually.

DIRECTIONS FOR ADMINISTRATION
> With intravenous use For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL, given over 20–60 minutes.
> When used by inhalation Other inhaled drugs should be administered before tobramycin.

PATIENT AND CARER ADVICE
Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

NATIONAL FUNDING/ACCESS DECISIONS
NICe technology appraisals (TAs)
> Tobramycin dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276
Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by Pseudomonas aeruginosa in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contraindications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to the secondary, tertiary and secondary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA276

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection
> TOBRAMYCIN (Non-proprietary)
Tobramycin (as Tobramycin sulfate) 40 mg per 1 ml Tobramycin 40mg/2ml solution for injection vials | 10 vial | £37.00 | 10 vial (Hospital only) Tobramycin 80mg/2ml solution for injection vials | 5 vial | £20.80 | 10 vial | £37.72 | 10 vial (Hospital only) Tobramycin 240mg/6ml solution for injection vials | 1 vial | £19.20
> Brands may include Nebcin

Inhalation powder
> Tobi Podhaler (Novartis Pharmaceuticals UK Ltd)
Tobramycin 28 mg Tobi Podhaler 28mg inhalation powder capsules with device | 56 capsule | £44.50 | 224 capsule | £1,790.00

Nebuliser liquid
> Bramitol (Chesi Ltd)
Tobramycin 75 mg per 1 ml Bramitol 300mg/4ml nebuliser solution 4ml ampoules | 56 ampoule | £1,177.00
> TOBI (Novartis Pharmaceuticals UK Ltd)
Tobramycin 60 mg per 1 ml Tobi 300mg/5ml nebuliser solution 5ml ampoules | 56 ampoule | £1,187.20 DT price | £1,187.20
> Brands may include Tymbrel

BACTERIAL TRANSEPITIDATION INHIBITORS
Chloramphenicol

DRUG ACTION
Chloramphenicol is a potent broad-spectrum antibiotic.

INDICATIONS AND DOSE
Life threatening infections particularly those caused by Haemophilus influenzae | Typhoid fever
BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
> Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated

CONTRA-INDICATIONS
Acute porphyrias p. 864

CAUTIONS
Avoid repeated courses and prolonged treatment

INTERACTIONS
> Appendix 1 (chloramphenicol).

SIDE-EFFECTS
Blood disorders—depression—diarrhoea—dry mouth—erythema multiforme—glossitis—headache—nausea—nighturnal haemoglobinuria—optic neuritis—peripheral neuritis—reversible and irreversible aplastic anaemia (with reports of resulting leukaemia)—stomatitis—urticaria—vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

PREGNANCY
Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

BREAST FEEDING
Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant;
concentration in milk usually insufficient to cause ‘grey syndrome’.

- **HEPATIC IMPAIRMENT**
  Avoid if possible—increased risk of bone-marrow depression.
  Reduce dose and monitor plasma-cloramphenicol concentration in hepatic impairment.

- **RENAL IMPAIRMENT**
  Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.

- **MONITORING REQUIREMENTS**
  Plasma concentration monitoring preferred in the elderly.
  Recommended peak plasma concentration (approx. 2 hours after administration by mouth; intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘ trough’ ) concentration should not exceed 15 mg/litre.
  Blood counts required before and periodically during treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  For *intra venous infusion* (*Kemicetine*®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - **CHLORAMPHENICOL (Non-proprietary)**
  - Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule (£377.00)

  **Powder for solution for injection**
  - **ELECTROLYTES:** May contain Sodium
  - Kemicetine (Pfizer Ltd)
  - Chloramphenicol (as Chloramphenicol sodium succinate) 1 gram
  - Kemicetine 1g powder for solution for injection vials | 1 vial (£1.39)

### CARBAPENEMES

**Carbapenems**

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; *imipenem* (imipenem with cilastatin p. 454) and meropenem p. 454 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem below is licensed for treating abdominal and surgical infections, skin and soft-tissue infections, and complicated infections and polymicrobial infections including those of other beta-lactam antibiotics. Meropenem has less specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

### Ertapenem

#### INDICATIONS AND DOSE

**Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia**

**BY INTRAVENOUS INFUSION**
- Adult: 1 g once daily

**Diabetic foot infections of the skin and soft tissue**

**BY INTRAVENOUS INFUSION**
- Adult: 1 g once daily

**Surgical prophylaxis, colorectal surgery**

**BY INTRAVENOUS INFUSION**
- Adult: 1 g for 1 dose, dose to be completed within 1 hour before surgery

- **CAUTIONS**
  - CNS disorders—risk of seizures • elderly

- **INTERACTIONS**
  - Appendix 1 (ertapenem).

- **SIDE-EFFECTS**
  - Common or very common
    - Diarrhoea • headache • injection-site reactions • nausea • pruritus • raised platelet count • rash (also reported with eosinophilia and systemic symptoms) • vomiting
  - Uncommon
    - Abdominal pain • anorexia • antibiotic-associated colitis • asthenia • bradycardia • chest pain • confusion • constipation • dizziness • dry mouth • dyspepsia • dysphoria • hypotension • melaena • oedema • ototoxicity • pharyngeal discomfort • raised glucose • seizures • sleep disturbances • taste disturbances
  - Rare
    - Agitation • anxiety • arrhythmia • blood disorders • cholecytitis • cough • depression • dysphagia • electrolyte disturbances • haemorrhage • hypoglycaemia • increase in blood pressure • jaundice • liver disorder • muscle cramp • nasal congestion • neutropenia • pelvic peritonitis • renal impairment • scleral disorder • syncope • thrombocytopenia • tremor • wheezing
  - Frequency not known
    - Dyskinesia • hallucinations

- **ALLERGY AND CROSS-SENSITIVITY**
  - Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING**
  - Present in milk—manufacturer advises avoid.

- **RENAL IMPAIRMENT**
  - Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - For *intra venous infusion* (*Invanz®*), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain Sodium
  - *Invanz* (Merck Sharp & Dohme Ltd)
  - Ertapenem (as Ertapenem sodium) 1 gram
  - Invanz 1g powder for solution for infusion vials | 1 vial (£31.65)
Imipenem with cilastatin

INDICATIONS AND DOSE
Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired sepsicaemia

**BY INTRAVENOUS INFUSION**
- Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

Infection caused by *Pseudomonas* or other less sensitive organisms
Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

**BY INTRAVENOUS INFUSION**
- Adult: 1 g every 6 hours

**CAUTIONS**
- CNS disorders | epilepsy

**INTERACTIONS**
- Appendix 1 (imipenem with cilastatin).

**SIDE-EFFECTS**
- Common or very common | Diarrhoea | eosinophilia | nausea (may reduce rate of infusion) | rash | vomiting
- Uncommon | Confusion | dizziness | drowsiness | hallucinations | hypotension | leucopenia | myoclonic activity | seizures | thrombocytopenia | thrombocytosis
- Rare | Acute renal failure | anaphylactic reactions | antibiotic-associated colitis | encephalopathy | hearing loss | hepatitis | paraesthesia | polyuria | Stevens-Johnson syndrome | taste disturbances | tooth | tongue or urine discoloration | toxic epidermal necrolysis | tremor
- Very rare | Abdominal pain | aggravation of myasthenia gravis | asthenia | ataxia | cyanosis | dyspnoea | flushing | glossitis | haemolytic anaemia | headache | heartburn | hyperhidrosis | hyperkalaemia | hyperventilation | palpitation | polyarthralgia | tachycardia | tinnitus
- Frequency not known | Neurotoxicity (at high dose, renal failure, CNS disease)

**ALLERGY AND CROSS-SENSITIVITY**
Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**
Present in milk but unlikely to be absorbed.

**RENAL IMPAIRMENT**
Risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m² — consult product literature.

**EFFECT ON LABORATORY TESTS**
Positive Coombs’ test.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (imipenem) over 20–30 minutes, give dose greater than 500 mg (imipenem) over 40–60 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**
Dose expressed in terms of imipenem.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

| ELECTROLYTES: May contain Sodium |
| IMIPENEM WITH CILASTATIN (Non-proprietary) |
| Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Primaxin IV 500mg powder for solution for infusion vials | 1 vial £12.00 |
| Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Primaxin 500mg powder for solution for infusion vials | 1 vial £10.00 |
| 5 vial £60.00 (Hospital only) | 10 vial £55.45–65.45 |
| Primaxin IV (Merk Sharp & Dohme Ltd) |
| Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Primaxin IV 500mg powder for solution for infusion vials | 1 vial £12.00 |

**Meropenem**

INDICATIONS AND DOSE
Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital acquired sepsicaemia

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**
- Adult: 0.5–1 g every 8 hours

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**
- Adult: 2 g every 8 hours

Meningitis

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**
- Adult: 2 g every 8 hours

Endocarditis (in combination with another antibacterial)

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**
- Adult: 2 g every 8 hours

**UNLICENSED USE**
Not licensed for use in endocarditis.

**INTERACTIONS**
- Appendix 1 (meropenem).

**SIDE-EFFECTS**
- Common or very common | Abdominal pain | diarrhoea | disturbances in liver function tests | headache | nausea | pruritus | rash | thrombocytopenia | vomiting
- Uncommon | Eosinophilia | leucopenia | paraesthesia | thrombocytopenia
- Rare | Convulsions | Frequency not known | Antibiotic-associated colitis | haemolytic anaemia | Stevens-Johnson syndrome | toxic epidermal necrolysis

**ALLERGY AND CROSS-SENSITIVITY**
Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY**
Use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING**
Unlikely to be absorbed (however, manufacturer advises avoid).

**HEPATIC IMPAIRMENT**
Monitor liver function in hepatic impairment.

**RENAL IMPAIRMENT**
Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m². Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS**
Positive Coombs’ test.

**DIRECTIONS FOR ADMINISTRATION**
Intravenous injection to be administered over 5 minutes. For intravenous infusion (Meropenem®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

**MEDIcular FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

| ELECTROLYTES: May contain Sodium |
| MEROPENEM (Non-proprietary) |
| Meropenem (as Meropenem trihydrate) 500 mg | Meropenem 500mg powder for solution for injection vials | 10 vial £92.70–£88.00 |
| Meropenem (as Meropenem trihydrate) 1 gram | Meropenem 1g powder for solution for injection vials | 10 vial £139.20–£171.90 |
| Meropenem (as Meropenem trihydrate) 500 mg | Meropenem 500mg powder for solution for injection vials | 10 vial £103.14 |
| Meropenem (as Meropenem trihydrate) 1 gram | Meropenem 1g powder for solution for injection vials | 10 vial £206.28 |
CEPHALOSPORINS

Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 457 and ceftriaxone p. 459 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of alternative antibiotic is not available, then cefixime p. 457, cefotaxime, ceftazidime p. 458, ceftriaxone, or cefuroxime p. 450 can be used with caution; cefaclor below, cefadroxil p. 456, cefalexin p. 456, cefradine p. 458, and cefotetan fosamil p. 458 should be avoided.

The orally active ‘first generation’ cephalosporins, cefalexin, cefadroxil, and cefadroxil and the ‘second generation’ cephalosporin, cefaclor below, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor below has good activity against *H. influenzae*.

**Cefuroxime axetil**, an ester of the ‘second generation’ cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active ‘third generation’ cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a ‘second generation’ cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the ‘second generation’ cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria. Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Cefadroxil fosamil is a ‘fifth generation’ cephalosporin with bactericidal activity similar to cefotaxime; however, cefadroxil fosamil has an extended spectrum of activity against Gram-positive bacteria that includes meticillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Cefadroxil fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by meticillin-resistant *S. aureus*.

Cephalosporins

**INTERACTIONS** → Appendix 1 (cephalosporins).

**SIDE-EFFECTS**

- Rare Antibiotic-associated colitis
- Frequency not known Abdominal discomfort, agranulocytosis, allergic reactions, anaphylaxis, aplastic anaemia, blood disorders, confusion, diarrhoea, disturbances in liver enzymes, dizziness, eosinophilia, haemolytic anaemia, hallucinations, headache, hyperactivity, hypertension, leucopenia, nausea, nervousness, pruritus, rashes, reversible interstitial nephritis, serum sickness-like reactions with rashes, fever and arthralgia, sleep disturbances, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, transient cholestatic jaundice, transient hepatitis, urticaria, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Antibiotic-associated colitis Antibiotic-associated colitis may occur more commonly with second- and third-generation cephalosporins.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity. Cross-sensitivity with other beta-lactam antibacterials About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.

**EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs’ test.

Cefaclor

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

**INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 1-11 months: 20 mg/kg daily in 3 divided doses, alternatively (by mouth) 62.5 mg 3 times a day
- Child 1-4 years: 20 mg/kg daily in 3 divided doses, alternatively (by mouth) 125 mg 3 times a day
- Child 5-11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively (by mouth) 250 mg 3 times a day
- Child 12-17 years: 250 mg 3 times a day; maximum 4 g per day
- Adult: 250 mg 3 times a day; maximum 4 g per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- Adult: 375 mg every 12 hours, dose to be taken with food

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

**BY MOUTH**

- Child 1-11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
- Child 1-4 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

**BY MOUTH**

- **Child 6–17 years (body-weight up to 40 kg):** 0.5 g twice daily
- **Child 6–17 years (body-weight 40 kg and above):** 0.5–1 g twice daily
- **Adult:** 0.5–1 g twice daily

**Skin infections** | **Soft-tissue infections** | **Uncomplicated urinary-tract infections**

**BY MOUTH**

- **Child 6–17 years (body-weight 40 kg and above):** 1 g once daily
- **Adult:** 1 g daily

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT** In adults 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².

**MEDITCINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 9

- **CEFADROXIL (Non-proprietary)**
  - Cefadroxil (as Cefadroxil monohydrate) 500 mg Cefadroxil 500mg capsules | 20 capsule (£0.96) £22.36 DT price = £22.36 | 100 capsule (£0.96) £111.90

**Cefalexin**

(Chephalexin)

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

**BY MOUTH**

- **Child 1–11 months:** 12.5 mg/kg twice daily, alternatively 125 mg twice daily
- **Child 1–4 years:** 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
- **Child 5–11 years:** 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
- **Child 12–17 years:** 500 mg 2–3 times a day
- **Adult:** 250 mg every 6 hours, alternatively 500 mg every 6–12 hours; increased to 1–1.5 g every 6–8 hours, increased dose to be used for severe infections

**Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

**BY MOUTH**

- **Child 1 month–11 years:** 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
- **Child 12–17 years:** 1–1.5 g 3–4 times a day

**Prophylaxis of recurrent urinary-tract infection**

**BY MOUTH**

- **Child:** 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
- **Adult:** 125 mg once daily, dose to be taken at night

---

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

**Skin reactions** Cefaclor is associated with protracted skin reactions, especially in children.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT** No dose adjustment required. Manufacturer advises caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

Meningitis

| BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION |
| Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site |

Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)

| BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION |
| Child 1 month-11 years: 50 mg/kg for 1 dose |
| Child 12-17 years: 1 g for 1 dose |
| Adult: 1 g for 1 dose |
Cefradine (Cephradine)

INDICATIONS AND DOSE
Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis

BY MOUTH
- Child 7-11 years: 25–50 mg/kg daily in 2–4 divided doses
- Child 12-17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections
- Adult: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections

UNLICENSED USE
Not licensed for use in children for prevention of Staphylococcus aureus lung infection in cystic fibrosis.

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Present in milk in low concentration, but appropriate to use.

RENAL IMPAIRMENT
- In adults Use half normal dose if eGFR 5–20 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 5 mL/minute/1.73 m².
- In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Cefradine Capsules may be prescribed.

Ceftaroline fosamil

INDICATIONS AND DOSE
Community-acquired pneumonia

BY INTRAVENOUS INFUSION
- Adult: 600 mg every 12 hours for 5–7 days

Complicated skin and soft-tissue infections

BY INTRAVENOUS INFUSION
- Adult: 600 mg every 12 hours for 5–14 days

CAUTIONS
Seizure disorders

PREGNANCY
Manufacturer advises avoid unless essential—no information available.

BREAST FEEDING
Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT
400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m². Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested volume 40–100 mL, given over 20–60 minutes; incompatible with alkaline solutions.

Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg. Zinforo 600mg powder for concentrate for solution for infusion vials | 10 vial (£375.00)

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (Dec 2012) that ceftaroline fosamil (Zinforo)® is accepted for restricted use within NHS Scotland when meticillin–resistant S. aureus is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS
- CEFRADINE (Non-proprietary)
  - Cefradine 250 mg Cefradine 250mg capsules | 20 capsule (£4.79)
  - £6.00 DT price = £2.25 | 100 capsule (£23.73) no price available
  - Cefradine 500 mg Cefradine 500mg capsules | 20 capsule (£9.00) no price available
  - Brands may include Nicef

Ceftazidime

INDICATIONS AND DOSE
Prophylaxis for transurethral resection of prostate

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1 g, single dose to be administered up to 30 minutes before procedure and may be repeated if necessary when catheter removed

Complicated urinary-tract infection

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION
- Adult 18–79 years: 1–2 g every 8–12 hours
- Adult 80 years and over: 1–2 g every 8–12 hours; usual maximum 3 g per day
Pseudomonal lung infection in cystic fibrosis
BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION
Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day

Septicemia | Hospital-acquired pneumonia
BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION
Adult 18–79 years: 2 g every 8 hours
Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Fever during neutropenia
BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION
Adult 18–79 years: 2 g every 8 hours
Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Meningitis
BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION
Adult 18–79 years: 2 g every 8 hours
Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Susceptible infections due to sensitive Gram-positive and
Gram-negative bacteria
BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION
Adult 18–79 years: 1–2 g every 8 hours
Adult 80 years and over: 1–2 g every 8 hours; usual maximum 3 g per day

SIDE-EFFECTS
Paraesthesia - taste disturbances
PREGNANCY
Not known to be harmful.
BREAST FEEDING
Present in milk in low concentration, but appropriate to use.
HEPATIC IMPAIRMENT
Manufacturer advises caution in severe impairment.
RENAL IMPAIRMENT
Reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature.

DIRECTIONS FOR ADMINISTRATION
Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only. For intravenous infusion give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For Fortum® dilute further to a concentration of 40 mg/mL. For Kefadin® dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion, eye drops

Powder for solution for injection
ELECTROLYTES: May contain Sodium

Ceftazidime (Non-proprietary)
Ceftazidime (as Ceftazidime pentahydrate) 500 mg Ceftazidime 500 mg powder for solution for injection vials | 1 vial (Fortum) £4.33-£4.73
Ceftazidime (as Ceftazidime pentahydrate) 1 g gram Ceftazidime 1 g powder for solution for injection vials | 1 vial (Fortum) £7.90-£11.82 | 5 vial (PZN) £39.55 | 10 vial (PZN) £13.90
Ceftazidime (as Ceftazidime pentahydrate) 2 gram Ceftazidime 2 g powder for solution for injection vials | 1 vial (Fortum) £17.75-£22.10 | 5 vial (PZN) £79.15 | 10 vial (PZN) £21.30
Fortum (GlaxoSmithKline UK Ltd)
Ceftazidime (as Ceftazidime pentahydrate) 500 mg Fortum 500 mg powder for solution for injection vials | 1 vial (PZN) £4.40 (Hospital only)
Ceftazidime (as Ceftazidime pentahydrate) 1 gram Fortum 1 g powder for solution for injection vials | 1 vial (PZN) £8.79 (Hospital only)

Ceftazidime (as Ceftazidime pentahydrate) 2 gram Fortum 2 g powder for solution for injection vials | 1 vial (PZN) £17.59 (Hospital only)
Ceftazidime (as Ceftazidime pentahydrate) 3 gram Fortum 3 g powder for solution for injection vials | 1 vial (PZN) £25.76 (Hospital only)

Ceftazidime

INDICATIONS AND DOSE
Surgical prophylaxis
BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION
Adult: 1 g for 1 dose, to be administered up to 30 minutes before procedure

Prophylaxis before colorectal surgery
BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION
Adult: 2 g for 1 dose, to be administered up to 30 minutes before procedure, intramuscular doses over 1 g divided between more than one site

Uncomplicated gonorrhoea | Pelvic inflammatory disease
BY DEEP INTRAMUSCULAR INFUSION
Adult: 500 mg for 1 dose

Early syphilis
BY DEEP INTRAMUSCULAR INJECTION
Adult: 500 mg daily for 10 days

Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species (‘HACEK organisms’) (in combination with another antibacterial)
BY INTRAVENOUS INFUSION
Adult: 2–4 g daily

Susceptible infections due to sensitive Gram-positive and
Gram-negative bacteria
BY DEEP INTRAMUSCULAR INFUSION OR BY INTRAVENOUS INFUSION
Adult: 1 g daily; increased to 2–4 g daily, increased dose to be used for severe infections, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

Meningitis
BY INTRAVENOUS INFUSION
Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg daily, doses of 50 mg/kg and over to be administered by intravenous infusion only

BY DEEP INTRAMUSCULAR INFUSION OR BY INTRAVENOUS INFUSION
Child 1 month–11 years (body-weight 50 kg and above): 2–4 g daily, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

Prevention of secondary case of meningococcal meningitis
BY INTRAMUSCULAR INJECTION
Adult: 250 mg for 1 dose

Prevention of secondary case of Haemophilus influenzae type b disease
BY INTRAMUSCULAR INFUSION OR BY INTRAVENOUS INFUSION
Adult: 1 g daily for 2 days

UNLICENSED USE
Not licensed for prophylaxis of meningococcal meningitis or Haemophilus influenzae type b disease.
In adults Not licensed for early syphilis. Not licensed for endocarditis caused by haemophilus, actinobacillus, cardio bacterium, eikenella, and kingella species (HACEK organisms) (in combination with another antibacterial). Dose not licensed for treatment of uncomplicated gonorrhoea or pelvic inflammatory disease.

- **CONTRA-INDICATIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks corrected gestational age—risk of precipitation in urine and lungs - neonates less than 41 weeks corrected gestational age - neonates over 41 weeks corrected gestational age with jaundice, hypoa lbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding

- **CAUTIONS** Dehydration (risk of ceftriaxone precipitation in gall bladder) - may displace bilirubin from serum albumin, administer over 60 minutes in neonates - treatment longer than 14 days - use with caution in neonates

- **SIDE-EFFECTS**
  - Common or very common Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic - calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic
  - Rare  Pancreatitis, prolongation of prothrombin time

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

- **HEPATIC IMPAIRMENT** Reduce dose if both hepatic and severe renal impairment. Monitor plasma concentration if both hepatic and severe renal impairment.

- **RENAL IMPAIRMENT** Use with caution in renal failure. Monitor plasma concentration if both hepatic and severe renal impairment.

  - In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
  - In children Max. 50 mg/kg daily (max. 2 g daily) in severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over at least 2–4 minutes.

  - With intravenous use in children For intravenous infusion, dilute reconstituted solution with Glucose 5% or 10% or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.

  - With intramuscular use in children For intramuscular injection ceftriaxone may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site; final concentration 250–350 mg/mL. Displacement value may be significant, consult local guidelines.

  - With intravenous use in adults For intravenous infusion (Rocephin®; Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes (60 minutes in neonates). Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

- **Powder for solution for injection**
  - **Ceftriaxone (Non-proprietary)**
    - Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial (PO) £1.80–£2.30 DT price = £2.40
    - Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial (PO) £9.58 DT price = £9.58 | 5 vial (PO) £45.75 | 10 vial (PO) £11.00
    - Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial (PO) £18.39 DT price = £15.18 | 10 vial (PO) £13.00
    - Ceftriaxone 2g powder for solution for infusion vials | 1 vial (PO) £19.10 DT price = £19.18
  - Rocephin (Roche Products Ltd)
    - Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial (PO) £2.40 DT price = £2.40
    - Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial (PO) £9.58 DT price = £9.58
    - Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial (PO) £13.18 DT price = £19.18

---

**Cefuroxime**

**INDICATIONS AND DOSE**

Susceptible infections due to Gram-positive and Gram-negative bacteria

**BY MOUTH**

- Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
- Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
- Child 12-17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

- Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis
- Adult: 750 mg every 6–8 hours; increased if necessary up to 1.5 g every 6–8 hours, increased dose used for severe infections

**Lyme disease**

**BY MOUTH**

- Adult: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

**Lower urinary-tract infection**

**BY MOUTH**

- Child 12-17 years: 125 mg twice daily
- Adult: 125 mg twice daily

**Pyelonephritis**

**BY MOUTH**

- Adult: 250 mg twice daily

**Surgical prophylaxis**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)
**DIAMINOPYRIMIDINES**

**Co-trimoxazole**

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

### INDICATIONS AND DOSE

**Treatment of susceptible infections**

**BY MOUTH**

- **Child**: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
- **Adult**: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections**

**BY MOUTH**

- **Child**: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
- **Adult**: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

**Dose equivalence and conversion**

480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

---

**Open fractures, prophylaxis**

**By intravenous infusion or by intravenous injection**

- **Adult**: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

**UNLICENSED USE** Duration of treatment in Lyme disease is unlicensed.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- In adults Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m². Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m².
- In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** Single doses over 750 mg should be administered by the intravenous route only.

- With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%, give over 30 minutes.
- With intravenous use in adults For intravenous infusion (Zinacef®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

**Tablet**

| Cefuroxime (as Cefuroxime sodium) 750 mg | Zinacef 750mg powder for injection vials | 5 vial (Pack) £4.70 |

### Important safety information

**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia; it is also indicated for nocardiosis, Stenotrophomonas maltophilia infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by Burkholderia cepacia in cystic fibrosis [unlicensed indication].

**CONTRA-INDICATIONS**

Acute porphyrias p. 864

**CAUTIONS**

Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - elderly (increased risk of serious side-effects) (in adults) - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkalaemia (in adults)

**INTERACTIONS**

Appendix 1 (trimethoprim, sulfamethoxazole).
In children
Monitor blood counts on prolonged treatment.

HEPATIC IMPAIRMENT

BREAST FEEDING
Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe liver disease.

RENAL IMPAIRMENT
Use half normal dose if eGFR 15–30 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

MONITORING REQUIREMENTS
Monitor blood counts on prolonged treatment.

In children Plasma concentration monitoring may be required with high doses; seek expert advice.

DIRECTIONS FOR ADMINISTRATION

With intravenous use in children For intermittent intravenous infusion, may be further diluted in glucose 5% or 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.

With intravenous use in adults For intravenous infusion (Septrin® for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.

PRESCRIBING AND DISPENSING INFORMATION
Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulfamethoxazole) in the proportions of 1 part to 5 parts.

SIDE-EFFECTS, FURTHER INFORMATION

Blood disorders or rash
Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, neutropenia, photosensitivity) develop.

PREGNANCY
Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

BREAST FEEDING
Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

Sulfamethoxazole 40 mg per 1 mL, Trimethoprim 8 mg per 1 mL Septrin Paediatric 40mg/200mg/5ml oral suspension (sugar-free) | 100 mL £2.45
Sulfamethoxazole 80 mg per 1 mL, Trimethoprim 16 mg per 1 mL Septrin Adult 80mg/400mg/5ml oral suspension | 100 mL £0.94.41
Solution for infusion
EXCIPIENTS: May contain Alcohol, propylene glycol, sulfites
ELECTROLYTES: May contain Sodium

Septrin (Aspen Pharma Trading Ltd)

Sulfamethoxazole 80 mg per 1 mL, Trimethoprim 16 mg per 1 mL Septrin Forte 160mg/800mg tablets | 100 tablet £3.46 DT price = £3.46

Septrin tablets | 100 tablet £15.52

Septrin for Infusion

Flavours of oral liquid formulations may include banana, or vanilla.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

INDICATIONS AND DOSE

Urinary-tract infections | Respiratory tract infections

BY MOUTH

Child 4-5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)

Child 6 weeks-5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily

Child 6 months-5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily

Child 6-11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily

Child 12-17 years: 200 mg twice daily

Adult: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

BY MOUTH

Child 4-5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night

Child 6 weeks-5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night

Child 6 months-5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night

Child 6-11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night

Child 12-17 years: 100 mg once daily, dose to be taken at night

Adult: 100 mg once daily, dose to be taken at night

Trimethoprim
Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

**BY MOUTH**
- Child: 5 mg/kg every 6–8 hours
- Adult: 5 mg/kg every 6–8 hours

**Acne resistant to other antibacterials**

**BY MOUTH**
- Adult: 300 mg twice daily

**Prostatitis**
- Adult: (consult product literature)

**Shigellosis | Invasive salmonella infection**
- BY MOUTH
  - Adult: (consult product literature)

---

**FUSIDATES**

**Fusidic acid**

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**

**BY MOUTH USING TABLETS**
- Child 12-17 years: 250 mg every 12 hours for 5-10 days
- Adult: 250 mg every 12 hours for 5-10 days

**Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials**

**BY MOUTH USING ORAL SUSPENSION**
- Child 12-17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections
- Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections

**Dose equivalence and conversion**

Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

- **INTERACTIONS** → Appendix 1 (fusidic acid).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - diarrhoea - dizziness - drowsiness - dyspepsia - nausea - vomiting
- **Uncommon** Anorexia - headache - malaise - pruritus - rash
- **Frequency not known** Acute renal failure (usually with jaundice) - blood disorders - reversible jaundice especially after high dosage (withdraw therapy if persistent)

**PREGNANCY** Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Present in milk—manufacturer advises caution.

**HEPATIC IMPAIRMENT** Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function in hepatic impairment.

**MONITORING REQUIREMENTS** Monitor liver function with high doses or on prolonged therapy.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and orange.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
GLYCOPEPTIDE ANTIBACTERIALS

Teicoplanin

**DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin reduced susceptibility to glycopeptides and increasing its bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant *Staphylococcus aureus*. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides.

**INDICATIONS AND DOSE**

- **Clostridium difficile infection**
  - **BY MOUTH**
    - Adult: 100–200 mg twice daily for 10–14 days
  - **Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft tissue infections, pneumonia)**
    - **BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION**
      - Adult (body-weight up to 70 kg): Initially 400 mg every 12 hours for 3 doses, followed by 400 mg once daily
      - Adult (body-weight 70 kg and above): Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily
  - **Streptococcal or enterococcal endocarditis (in combination with another antibacterial)**
    - Adult: Initially 10 mg/kg every 12 hours for 3–5 doses, then 10 mg/kg once daily, subsequent doses can be given by intramuscular injection
  - **Bone and joint infections**
    - Adult: Initially 12 mg/kg every 12 hours for 3–5 doses, then 12 mg/kg once daily, subsequent doses can be given by intramuscular injection, increased risk of fever and rash with doses of 12 mg/kg
  - **Surgical prophylaxis**
    - Adult: 400 mg, to be administered up to 30 minutes before the procedure
  - **Surgical prophylaxis in open fractures**
    - Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure
  - **Peritonitis associated with peritoneal dialysis (added to dialysis fluid)**
    - **BY INTRAPERITONEAL INFUSION**
      - Adult: (consult local protocol)
  - **PHARMACOKINETICS**
    - Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

**SIDE-EFFECTS**
- **Common or very common**
  - Pruritus
  - Rash
- **Uncommon**
  - Bronchospasm
  - Dizziness
  - Eosinophilia
  - Fever
  - Headache
  - Leucopenia
  - Mild hearing loss
  - Nausea
  - Thrombocytopenia
  - Thrombophlebitis
  - Tinnitus
  - Vestibular disorders
  - Vomiting
- **Frequency not known**
  - Exfoliative dermatitis
  - Nephrotoxicity
  - Renal failure
  - Stevens-Johnson syndrome
  - Toxic epidermal necrolysis

**ALLERGIC AND CROSS-SENSITIVITY**
- **Caution if history of vancomycin sensitivity.**
- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING**
  - No information available.
- **RENAL IMPAIRMENT**
  - Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 ml/min/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 ml/min/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.
- **MONITORING REQUIREMENTS**
  - Blood counts and liver and kidney function tests required.
  - With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose (‘trough’) concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Plasma-teicoplanin concentration should be measured in elderly patients.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion (Targocid®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.
  - With oral use Injection can be used to prepare solution for oral administration.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Powder and solvent for solution for injection**
- **ELECTROLYTES**: May contain Sodium
- **Targocid (Sanofi)**
  - **Teicoplanin 200 mg**
    - Targocid 200mg powder and solvent for solution for injection vials 1 vial £3.93
  - **Teicoplanin 400 mg**
    - Targocid 400mg powder and solvent for solution for injection vials 1 vial £7.32

**Telavancin**

**DRUG ACTION** Telavancin is a glycopeptide antibacterial; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant *Staphylococcus aureus*. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to
glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

**INDICATIONS AND DOSE**

Hospital-acquired pneumonia, known or suspected to be caused by meticillin-resistant Staphylococcus aureus when other antibacterials cannot be used

**BY INTRAVENOUS INFUSION**

- Adult: 10 mg/kg daily for 7–21 days

**CAUTIONS**

Conditions that predispose to renal impairment - predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)

**INTERACTIONS**

Use with caution if concomitant use with nephrotoxic drugs.

**SIDE-EFFECTS**

- **Common or very common** Acute renal failure, chills, constipation, diarrhoea, dizziness, fungal infection, headache, insomnia, malaise, nausea, pruritus, rash, taste disturbances, vomiting

- **Uncommon** Abdominal pain, agranulocytosis, alopecia, anaphylaxis, anorexia, arthralgia, atrial fibrillation, back pain, blood disorders, blurred vision, bradycardia, confusion, congestive cardiac failure, decreased appetite, depression, dry mouth, dyspepsia, dysphonia, dysuria, electrolyte disturbances, erythema, eye irritation, flatulence, flushing, haematuria, haemorrhage, hepatic failure, hepatitis, hiccups, hyperhidrosis, hypertension, hypotension, increased INR, microalbuminuria, myalgia, nasal congestion, oedema, oliguria, oral hypoesthesia, palpitation, paraesthesia, pharyngolaryngeal pain, phlebitis, pollakiuria, pyrexia, QT interval prolongation, sinus tachycardia, somnolence, supraventricular extrasystoles, tinnitus, tremor, urinary tract infection, urticaria, ventricular extrasystoles

- **Rare** Deafness

- **Frequency not known** Flushing of the upper body (‘red man’ syndrome), non-cardiac chest pain

**ALLERGY AND CROSS-SENSITIVITY**

Use with caution in patients with vancomycin or teicoplanin sensitivity.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Avoid (teratogenic in animal studies).

**BREAST FEEDING**

Manufacturer advises avoid unless potential benefit outweighs risk - no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment - no information available.

**RENAL IMPAIRMENT**

In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m². Avoid in acute renal failure - risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Vibativ®). Avoid rapid infusion (can cause ‘red man’ syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL, give over at least 60 minutes.

**INDICATIONS AND DOSE**

Clostridium difficile infection

**BY MOUTH**

- Adult: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day

Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, sepsicaemia and soft-tissue infections

**BY INTRAVENOUS INFUSION**

- Adult: 1–1.5 g every 12 hours
- Elderly: 500 mg every 12 hours, alternatively 1 g once daily

**SUPRATHEMICAL PROPHYLAXIS**

(when high risk of MRSA)

**BY INTRAVENOUS INFUSION**

- Adult: 1 g

Peritonitis associated with peritoneal dialysis

**BY INTRAPERITONEAL ADMINISTRATION**

Adult: (consult local protocol)

**PHARMACOKINETICS**

Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

**UNLICENSED USE**

Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

**CAUTIONS**

**GENERAL CAUTIONS**

Avoid if history of deafness, elderly

**SPECIFIC CAUTIONS**

- With oral use - Systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses

**INTERACTIONS**

Appendix 1 (vancomycin).

**SIDE-EFFECTS**

- **Common or very common**

- **Rare**

- **Frequency not known**

- **With intravenous use** Anaphylaxis, cardiac arrest on rapid infusion, chills, dysphoria, eosinophilia, exfoliative
Bacterial infection

**DERMATITIS** - fever, flushing of the upper body (‘red man’ syndrome) - nausea - pain and muscle spasm of back and chest - phlebitis (irritant to tissue) - pruritus - rashes - severe hypotension on rapid infusion - shock on rapid infusion - Stevens-Johnson syndrome - toxic epidermal necrolysis - urticaria - vasculitis - wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**

**Nephrotoxicity** - Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- **ALLERGY AND CROSS-SENSITIVITY**
  - **Caution** if teicoplanin sensitivity.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk. Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

- **BREAST FEEDING**
  - Present in milk—significant absorption following oral administration unlikely.

- **RENAI IMPAIRMENT**
  - Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function.

- **MONITORING REQUIREMENTS**
  - All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
  - Pro-dose (‘ trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant *Staphylococcus aureus* or for complicated infections caused by *S. aureus*). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines.
  - All patients require blood counts, urinalysis, and renal function tests.
  - Monitor auditory function in elderly.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions and rotate infusion sites.
  - For intravenous infusion (Vancocin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
  - With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, oral suspension, oral solution, pastille, infusion

  **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS 9**
  - **VANCYMYOCIN (Non-proprietary)**
    - Vancomycin (as Vancomycin hydrochloride) 125 mg
    - Vancomycin 125 mg capsules | 28 capsule PDr | £13.47
    - Vancomycin (as Vancomycin hydrochloride) 250 mg
    - Vancomycin 250 mg capsules | 28 capsule PDr | £14.08
  - **Brands may include Vancocin Matrigel**

  **Powder for solution for infusion**
  - **VANCYMYOCIN (Non-proprietary)**
    - Vancomycin (as Vancomycin hydrochloride) 500 mg
    - Vancomycin 500 mg powder for solution for infusion vials | 1 vial PDr | £6.25–£7.25
    - Vancomycin 500 mg powder for concentrate for solution for infusion vials | 1 vial PDr | £7.50–£8.50
    - Vancomycin (as Vancomycin hydrochloride) 1 gram
    - Vancomycin 1 g powder for solution for infusion vials | 1 vial PDr | £12.50–£14.50
    - (Hospital only) | 1 vial PDr | £17.25

  - **Vancocin (Flynn Pharma Ltd)**
    - Vancomycin (as Vancomycin hydrochloride) 500 mg
    - Vancomycin 500 mg powder for solution for infusion vials | 1 vial PDr | £6.25
    - Vancomycin (as Vancomycin hydrochloride) 1 gram
    - Vancomycin 1 g powder for solution for infusion vials | 1 vial PDr | £12.50

  **GLYCYLCYCLINE ANTIBACTERIALS**

  **Tigecycline**
  - **DRUG ACTION** Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

  **INDICATIONS AND DOSE**
  - Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes

  **CAUTIONS**
  - Cholestasis

  **INTERACTIONS** → Appendix 1 (tigecycline).

  **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - anorexia - bilirubinaemia - diarrhoea - dizziness - dyspepsia - headache - hypoglycaemia - injection-site reactions - nausea - prolonged activated partial thromboplastin time - prolonged prothrombin time - pruritus - rash - vomiting
  - **Uncommon** Cholestatic jaundice - hypoproteinaemia - pancreatitis
  - **Frequency not known** Antibiotic-associated colitis - hepatic failure - Stevens-Johnson syndrome - thrombocytopenia

  **SIDE-EFFECTS, FURTHER INFORMATION**
  - Side-effects similar to those of the tetracyclines can potentially occur.

  **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.

  **PREGNANCY** Tetracyclines should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parental doses.

  **BREAST FEEDING** Manufacturer advises caution—present in milk in animal studies.

  **HEPATIC IMPAIRMENT** Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.

  **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tygacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

  **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - **Tygacil (Pfizer Ltd)**
    - Tigecycline 50 mg
    - Tigecycline 50 mg powder for solution for infusion vials | 10 vial PDr | £323.10
LINCOSAMIDE ANTIBACTERIALS

Clindamycin

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

**INDICATIONS AND DOSE**

Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Metacillin-resistant Staphylococcus aureus (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

- **ERYSIPHELS or CELLULITIS in penicillin-allergic patients**
  - **BY MOUTH**
    - **Child:** 3–6 mg/kg 4 times a day (max. per dose 450 mg)
    - **Adult:** 150–300 mg every 6 hours; increased if necessary up to 450 g every 6 hours if required, increased dose used in severe infection
  - **BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION**
    - **Adult:** 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used if life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g.

- **TREATMENT OF MILD TO MODERATE PNEUMOCYSTIS PNEUMONIA (IN COMBINATION WITH PRIMAQUINE)**
  - **BY MOUTH**
    - **Child:** 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
    - **Adult:** 450 mg every 8 hours for 7 days

**DACLACIN T® PREPARATIONS**

- **ACNE VULGARIS**
  - **TO THE SKIN**
    - **Adult:** Apply twice daily, to be applied thinly
  - **ZINDACLIN® GEL**
    - **TO THE SKIN**
      - **Adult:** Apply once daily, to be applied thinly

- **UNLICENSED USE** Not licensed for treatment of falciparum malaria. Not licensed for treatment of mild to moderate pneumocystis infection.

- **CONTRA-INDICATIONS** Diarrhoeal states • Avoid injections containing benzyl alcohol in neonates

- **CAUTIONS** Avoid in Acute porphyrias p. 864 • middle-aged and elderly women, especially after an operation (antibiotics-associated colitis more common)

- **INTERACTIONS** Appendix 1 (clindamycin).

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS** Abdominal discomfort • anaphylactoid reactions • antibiotic-associated colitis • diarrhoea (discontinue treatment) • eosinophilia • exfoliative dermatitis • jaundice • leukopenia • nausea • oesophageal ulcers • oesophagitis • polyarthralgia • pruritus • rash • Stevens-Johnson syndrome • taste disturbances • thrombocytopenia • toxic epidermal necrolysis • urticaria • vesiculobullous dermatitis • vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - **With intramuscular use** Induration (after intramuscular injection) • abscess (after intramuscular injection) • pain (after intramuscular injection)
    - **With intravenous use** Thrombophlebitis (after intravenous injection)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Antibiotic-associated colitis** Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

- **MONITORING REQUIREMENTS**
  - **Monitor liver and renal function if treatment exceeds 10 days.**
  - **In children** Monitor liver and renal function in infants.

- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid intravenous administration.

  - With intravenous use in children For **intravenous infusion**, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.

  - With intravenous use in adults For **intravenous infusion** *(Dalacin® C Phosphate)*, give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops. Capsules should be swallowed with a glass of water.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary Clindamycin Capsules may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Capsule**

| CAUTIONARY AND ADVISORY LABELS | 9, 27 |

- **CLINDAMYCN (NON-PROPRIETARY)**
  - Clindamycin (as Clindamycin hydrochloride) 150 mg Clindamycin 150mg capsules | 24 capsule (£) £7.80 DT price = £3.38 | 100 capsule (£) £66.18
  - Clindamycin (as Clindamycin hydrochloride) 300 mg Clindamycin 300mg capsules | 30 capsule (£) £10.20 DT price = £3.19
  - Dalacin C (Pfizer Ltd)
  - Clindamycin (as Clindamycin hydrochloride) 75 mg Dalacin C 75mg capsules | 24 capsule (£) £7.45 DT price = £7.45
  - Clindamycin (as Clindamycin hydrochloride) 150 mg Dalacin C 150mg capsules | 24 capsule (£) £11.72 DT price = £3.38 |
  - 100 capsule (£) £66.18

**Solution for injection**

| EXCIPIENTS: May contain Benzyl alcohol |

- **CLINDAMYCN (NON-PROPRIETARY)**
  - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Clindamycin 600mg/4ml solution for injection ampoules | 5 ampoule (£) £61.75
  - Clindamycin 300mg/2ml solution for injection ampoules | 5 ampoule (£) £28.50–£31.01
  - Dalacin C (Pfizer Ltd)
  - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Dalacin C Phosphate 300mg/2ml solution for injection ampoules | 5 ampoule (£) £31.01
  - Dalacin C Phosphate 600mg/4ml solution for injection ampoules | 5 ampoule (£) £61.75

**Liquid**

| EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol |
Daptomycin

**DRUG ACTION** Daptomycin is a lipopeptide antibiotic with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

**INDICATIONS AND DOSE**

**Complicated skin and soft-tissue infections caused by Gram-positive bacteria, including meticillin-resistant Staphylococcus aureus (MRSA)**

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 4 mg/kg once daily; increased to 6 mg/kg once daily, increase dose only if associated with *Staphylococcus aureus* bacteraemia

Staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin (in combination with other antibacterials)

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 6 mg/kg once daily

**UNLICENSED USE** Not licensed for use in left-sided endocarditis.

**INTERACTIONS** → Appendix 1 (daptomycin).

Monitor creatine kinase more frequently than weekly during treatment if receiving another drug known to cause myopathy (preferably avoid concomitant use).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - anaemia - anxiety - arthralgia - asthenia - constipation - diarrhoea - dizziness - flatulence - headache - hypertension - hypotension - injection-site reactions - isoniazid - nausea - pruritis - rash - vomiting

- **Rare** Jaundice - rhabdomyolysis

- **Frequency not known** Antibiotic-associated colitis - elevated creatine kinase - eosinophilic pneumonia - peripheral neuropathy - syncope - wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**

**Muscle effects** If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment—no information available.

**RENAL IMPAIRMENT** Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m². If eGFR less than 80 mL/minute/1.73 m², monitor renal function, and monitor creatine kinase before treatment and then at least weekly during treatment.

**MONITORING REQUIREMENTS** Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment).

**EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cubicin®), give intermittently in Sodium chloride 0.9%; reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For intravenous injection, give over 2 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2008) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Cubicin (Novartis Pharmaceuticals UK Ltd)
  - Daptomycin 350 mg (Cubicin 350mg powder for concentrate for solution for infusion vials) 1 vial (PMD) £62.00
  - Daptomycin 500 mg (Cubicin 500mg powder for concentrate for solution for infusion vials) 1 vial (PMD) £88.57 (Hospital only)

**MACROCYCLIC ANTIBACTERIALS**

Fidaxomicin

**DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

**INDICATIONS AND DOSE**

**Clostridium difficile infection**

**BY MOUTH**

- Adult: 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

**CAUTIONS** Inflammatory bowel disease - severe or life-threatening *C. difficile* infection

**INTERACTIONS** → Appendix 1 (fidaxomicin).

**SIDE-EFFECTS**

- **Common or very common** Constipation - nausea - vomiting

- **Uncommon** Abdominal distension - decreased appetite - dizziness - dry mouth - flatulence - headache - taste disturbance

**ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
MACROLIDES AND RELATED DRUGS

Macrolides

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against Haemophilus influenzae, non-gonococcal urethritis. Erythromycin has poor activity against Streptococcus pneumoniae, is suspected higher doses are needed.

Erythromycin p. 471 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and uncomplicated gonococcal urethritis. Erythromycin has poor activity against Haemophilus influenzae. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including H. influenzae. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 470 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for Helicobacter pylori eradication.

Telithromycin p. 473 is a ketolide derivative of erythromycin with an antibacterial spectrum similar to that of other macrolides and it is also active against penicillin- and erythromycin-resistant Streptococcus pneumoniae.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 500.

Macrolides

- **Cautions** Electrolyte disturbances (predisposition to QT interval prolongation) - may aggravate myasthenia gravis - predisposition to QT interval prolongation

- **Side-effects**

  **General side-effects**

  - Common or very common Abdominal discomfort - diarrhoea - nausea - vomiting
  - Uncommon Cholestatic jaundice - hepatotoxicity - rash
  - Rare Antibiotic-associated colitis - arrhythmias - pancreatitis - QT interval prolongation - Stevens-Johnson syndrome - toxic epidermal necrolysis
  - Frequency not known Reversible hearing loss (sometimes with tinnitus) can occur after large doses

**Specific side-effects**

- With intravenous use Local tenderness - phlebitis

- **Side-effects, further information**

Gastro-intestinal side-effects are mild and less frequent with azithromycin and clarithromycin than with erythromycin.

Azithromycin

**Indications and dose**

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

**By mouth**

- Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- Child 12-17 years: 500 mg once daily for 5 days
- Adult: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

**By mouth**

- Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
- Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
- Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
- Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
- Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

**By mouth**

- Child 12-17 years: 1 g for 1 dose
- Adult: 1 g for 1 dose

Uncomplicated gonorrhoea

**By mouth**

- Adult: 1 g for 1 dose

Lyme disease

**By mouth**

- Adult: 500 mg daily for 7–10 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

**By mouth**

- Adult: 500 mg daily for 7 days

Community-acquired pneumonia, low to moderate severity

**By mouth**

- Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

continued
Community-acquired pneumonia, high severity
INITIALLY BY INTRavenous INFUSION
- Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days

Antibacterial prophylaxis for insertion of intra-uterine device
BY MOUTH
- Adult: 1 g for 1 dose

UNLICENSED USE Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

INTERACTIONS Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

SIDE-EFFECTS
- Common or very common Anorexia · arthralgia · arthralgia · disturbances in taste · disturbances in vision · dizziness · dyspepsia · flatulence · headache · malaise · paraesthesia · reversible hearing loss (sometimes with tinnitus) after long-term therapy.
- Uncommon Anxiety · chest pain · constipation · gastritis · hyperaesthesia · leucopenia · oedema · photosensitivity · sleep disturbances
- Rare Agitation
- Frequency not known Acute renal failure · convulsions · haemolytic anaemia · interstitial nephritis · smell disturbances · syncope · thrombocytopenia · tongue discoloration

PREGNANCY Manufacturers advise use only if adequate alternatives not available.

BREAST FEEDING Present in milk; use only if no suitable alternatives.

HEPATIC IMPAIRMENT Manufacturers advise avoid in severe liver disease–no information available.

RENAL IMPAIRMENT
- In adults Use with caution if eGFR less than 10 mL/minute/1.73 m².
- In children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Zedbac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry or banana.

PATIENT AND CARER ADVICE Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/ azithromycin-bacterial-infections-0

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic Chlamydia trachomatis genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet
CAUTIONARY AND ADVISORY LABELS 5, 9
- AZITHROMYCIN (Non-proprietary)
  - Azithromycin 250 mg Azithromycin 250mg tablets | 4 tablet | £10.11 DT price = £15.11
  - Azithromycin 500 mg Azithromycin 500mg tablets | 3 tablet | £15.11

- Zithromax (Pfizer Ltd)
  - Azithromycin (as Azithromycin dihydrate) 250 mg Zithromax 250mg capsules | 4 capsule | £0.10 | 6 capsule | £0.15 DT price = £0.15

- Zithromax (as Azithromycin dihydrate) 250 mg Zithromax 250mg capsules | 6 capsule | £0.10 DT price = £0.15

Oral suspension
CAUTIONARY AND ADVISORY LABELS 5, 9
- AZITHROMYCIN (Non-proprietary)
  - Azithromycin 40 mg per 1 ml Azithromycin 200mg/5ml oral suspension | 15 ml | £0.18 DT price = £0.20 | 30 ml | £0.20 DT price = £0.40
  - Azithromycin (as Azithromycin dihydrate) 250 mg Zithromax 250mg/5ml oral suspension | 15 ml | £0.06 DT price = £0.10 | 30 ml | £0.10 DT price = £0.20

Powder for solution for infusion
ELECTROLYTES: May contain Sodium
- Zedbac (Aspire Pharma Ltd)
  - Azithromycin (as Azithromycin dihydrate) 500 mg Zedbac 500mg powder for solution for infusion vials | 1 vial | £0.30

Clarithromycin

INDICATIONS AND DOSE
Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
- Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- Adult: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
- Adult: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)

BY INTRAVENOUS INFUSION
- Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
**Bacterial infection** 471

**Lyme disease**

**BY MOUTH**
- Child 12–17 years: 500 mg twice daily for 14–21 days
- Adult: 500 mg twice daily for 14–21 days

**Prevention of pertussis**

**BY MOUTH**
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
- Child 12–17 years: 500 mg twice daily for 7 days
- Adult: 500 mg twice daily for 7 days

**Helicobacter pylori eradication in combination with a proton pump inhibitor and amoxicillin**

**BY MOUTH**
- Adult: 500 mg twice daily

**Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole**

**UNLICENSED USE** Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months. Intravenous infusion not licensed for use in children under 12 years.

**INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

**SIDE-EFFECTS**
- **Common or very common** Dyspepsia; headache; hyperhidrosis; insomnia; taste disturbances
- **Uncommon** Anorexia; anxiety; blood disorders; chest pain; constipation; dizziness; dry mouth; flattulence; gastritis; glossitis; hepatic dysfunction including jaundice; leucopenia; malaise; myalgia; stomatitis; tinnitus; tremor
- **Frequency not known** Abnormal dreams; confusion; convulsions; depression; hypoglycaemia; interstitial nephritis; myopathy; paraesthesia; psychotic disorders; renal failure; smell disturbances; tongue discoloration; tooth discoloration

**PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

**HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.

**RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.
- In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid **Klaricid XL®** or clarithromycin m/t preparations if eGFR less than 30 mL/minute/1.73 m²
- In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid **Klaricid XL®** or clarithromycin m/t preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children: For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

- With intravenous use in adults: For intravenous infusion (Klaricid® I.V.), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

**PATIENT AND CARER ADVICE**

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary** Clarithromycin Tablets may be prescribed. Clarithromycin Oral Suspension may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**
- **CLARITHROMYCIN (Non-proprietary)**
  - Clarithromycin 250 mg Clarithromycin 250mg tablets | 14 tablet (£6.72 DT price = £6.72)
  - Clarithromycin 500 mg Clarithromycin 500mg tablets | 14 tablet (£12.15 DT price = £12.15)

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS**
- **CLARITHROMYCIN (Non-proprietary)**
  - Clarithromycin 25 mg per 1 ml Clarithromycin 25mg/5ml oral suspension | 70 ml (£6.72 DT price = £6.72)
  - Clarithromycin 50 mg per 1 ml Clarithromycin 250mg/5ml oral suspension | 70 ml (£21.75 DT price = £21.75)

**Granules**

**CAUTIONARY AND ADVISORY LABELS**
- **Klaricid** (BGP Products Ltd)
  - Clarithromycin 500 mg Klaricid Adult 250mg granules sachets | 14 sachet (£6.68)

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**
- **CLARITHROMYCIN (Non-proprietary)**
  - Clarithromycin 25 mg per 1 ml Clarithromycin 125mg/5ml oral suspension | 70 ml (£4.22 DT price = £4.22)
  - Clarithromycin 50 mg per 1 ml Clarithromycin 250mg/5ml oral suspension | 70 ml (£6.17 DT price = £6.17)

**Powder for solution for infusion**

**ELECTROLYTES** May contain Sodium

**CLARITHROMYCIN (Non-proprietary)**
- Clarithromycin 500 mg Clarithromycin 500mg powder for solution for infusion vials | 1 vial (£9.45 DT price = £9.45)

**Klaricid** (BGP Products Ltd)
- Clarithromycin 500 mg Clarithromycin 125mg/5ml oral suspension | 70 ml (£3.15 DT price = £3.15)

**Klaricid IV** (BGP Products Ltd)
- Clarithromycin 500 mg Clarithromycin 500mg powder for solution for infusion vials | 1 vial (£9.45 DT price = £9.45)

**ERYTHROMYCIN**

**INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

**BY MOUTH**
- Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 250 mg 4 times a day in severe infections
- Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500 mg 4 times a day in severe infections
472 Bacterial infection

- Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500–1000 mg 4 times a day in severe infections
- Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500–1000 mg 4 times a day in severe infections

**BY INTRAVENOUS INFUSION**
- Child: 1.25 mg/kg every 6 hours (max. per dose 1 g)
- Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible; increased to 12.5 mg/kg every 6 hours in severe infections

### Lyme disease
**BY MOUTH**
- Adult: 500 mg 4 times a day for 14–21 days

### Early syphilis
**BY MOUTH**
- Adult: 500 mg 4 times a day for 14 days

### Uncomplicated genital chlamydia | Non-gonococcal urethritis
**BY MOUTH**
- Adult: 500 mg twice daily for 14 days

### Chronic prostatitis
**BY MOUTH**
- Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 4 g daily in divided doses in severe infections

**BY INTRAVENOUS INFUSION**
- Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible. Increased to 12.5 mg/kg every 6 hours in severe infections

### Prevention and treatment of pertussis
**BY MOUTH**
- Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 250 mg 4 times a day in severe infections
- Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500 mg 4 times a day in severe infections
- Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500–1000 mg 4 times a day in severe infections
- Adult: (consult local protocol)

### Prevention of secondary case of diphtheria in non-immune patient
**BY MOUTH**
- Child 1 month-1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

### Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients
**BY MOUTH**
- Child 1 month-1 year: 125 mg every 6 hours for 10 days
- Child 2-7 years: 250 mg every 6 hours for 10 days
- Child 8-17 years: 250–500 mg every 6 hours for 10 days
- Adult: 250–500 mg every 6 hours for 10 days

### Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease, and who are penicillin allergic
**BY MOUTH**
- Child 1 month-1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
- Child 2-7 years: 125 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- Child 8-17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

### Prevention of recurrence of rheumatic fever
**BY MOUTH**
- Child 1 month-1 year: 125 mg twice daily
- Child 2-17 years: 250 mg twice daily

### Rosacea
**BY MOUTH**
- Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

### Acne
**BY MOUTH**
- Adult: 500 mg twice daily

### UNLICENSED USE
- With intravenous use or oral use in children Not licensed for use in gastro-intestinal stasis.
- **CAUTIONS** Avoid in Acute porphyrias p. 864 .- neonate under 2 weeks (risk of hypertrophic pyloric stenosis) (in neonates)

### STIEMYCIN®
Some manufacturers advise preparations containing alcohol are not suitable for use with benzyl peroxide

**INTERACTIONS** → See Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

### PREGNANCY
- Not known to be harmful.

### BREAST FEEDING
- Only small amounts in milk—not known to be harmful.

### HEPATIC IMPAIRMENT
- May cause idiosyncratic hepatotoxicity.

### RENAL IMPAIRMENT
- In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
- In children Reduce dose in severe renal impairment (ototoxicity).

### DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
- With intravenous use in adults For intravenous infusion (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.
**Prescribing and dispensing information** Flavours of oral liquid formulations may include banana.

**Patient and carer advice**

**Profession specific information**

Dental practitioners’ formulation Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Cautionary and advisory labels**

- Erythromycin (A/Mo)
  - Erythromycin (as Erythromycin stearate) 250 mg Erythromycin 250 tablets | 100 tablet (PBS) £18.20 DT price = £18.20
  - Erythromycin (as Erythromycin stearate) 500 mg Erythromycin 500 tablets | 100 tablet (PBS) £36.40 DT price = £36.40
- Erythroped A (A/Mo)
  - Erythromycin (as Erythromycin ethyl succinate) 500 mg Erythroped A 500mg tablets | 28 tablet (PBS) £10.78 DT price = £10.78
  - Brains may include Erythromycin Gastro-resistant tablet

**Oral suspension**

**Cautionary and advisory labels**

- Erythromycin (Non-commercial)
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant tablets | 28 tablet (PBS) £3.33 DT price = £3.33
  - Erythromycin (as Erythromycin ethyl succinate) 25 mg per 1 ml Erythromycin ethyl succinate 125mg/5ml oral suspension | 100 ml (PBS) £3.53 DT price = £3.53
  - Erythromycin ethyl succinate 125mg/5ml oral suspension sugar free (sugar-free) | 100 ml (PBS) £4.00 DT price = £4.00
- Erythromycin (as Erythromycin ethyl succinate) 50 mg per 1 ml Erythromycin ethyl succinate 250mg/5ml oral suspension | 100 ml (PBS) £5.54 DT price = £5.54
  - Erythromycin ethyl succinate 250mg/5ml oral suspension sugar free (sugar-free) | 100 ml (PBS) £7.99 DT price = £7.99
  - Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythromycin ethyl succinate 500mg/5ml oral suspension | 100 ml (PBS) £10.43 DT price = £10.43
  - Erythromycin ethyl succinate 500mg/5ml oral suspension sugar free (sugar-free) | 100 ml (PBS) £12.99 DT price = £12.99
- Erythroped (A/Mo)
  - Erythromycin (as Erythromycin ethyl succinate) 25 mg per 1 ml Erythroped Pi SF 125mg/5ml oral suspension (sugar-free) | 140 ml (PBS) £3.06
  - Erythromycin (as Erythromycin ethyl succinate) 50 mg per 1 ml Erythroped SF 250mg/5ml oral suspension (sugar-free) | 140 ml (PBS) £5.95
  - Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythroped Forte SF 500mg/5ml oral suspension (sugar-free) | 140 ml (PBS) £10.56
- Powder for solution for infusion
  - Erythromycin (A/Mo)
  - Erythromycin (as Erythromycin-lactobionate) 1 gram Erythromycin IV lactobionate 1g powder for solution for infusion vials | 1 vial (PBS) £0.80

**Renal impairment**

Manufacturer advises avoiding if eGFR less than 30 mL/minute/1.73 m²—if no other options are available.

**Contra-indications**

Congenital history of QT interval prolongation (if not excluded by ECG) • family history of QT interval prolongation (if not excluded by ECG) • history of telithromycin-associated hepatitis • history of telithromycin-associated jaundice • myasthenia gravis • prolongation of QT interval

**Caution** Avoid in Acute porphyrias p. 864 • bradycardia—risk of QT interval prolongation • coronary heart disease—risk of QT interval prolongation • hypokalaemia—risk of QT interval prolongation • hypomagnesaemia—risk of QT interval prolongation • ventricular arrhythmias—risk of QT interval prolongation

**Interactions**

Appendix 1 (telithromycin). Caution with concomitant use of drugs that prolong the QT interval.

**Side-effects**

- Common or very common Abdominal pain • diarrhoea • dizziness • flatulence • headache • nausea • taste disturbances • vomiting
- Uncommon Anorexia • blurred vision • constipation • drowsiness • eosinophilia • flushing • hepatitis • insomnia • nervousness • palpitations • pruritus • rash • stomatitis • urticaria
- Rare Arrhythmias • cholestatic jaundice • diplopia • hypotension • paraesthesia • transient loss of consciousness
- Very rare Altered sense of smell • antibiotic-associated colitis • erythema multiforme • muscle cramp
- Frequency not known Arthralgia • confusion • hallucinations • pancreatitis

**Pregnancy**

Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**Breast feeding**

Manufacturer advises avoid—present in milk in animal studies

**Hepatic impairment**

Manufacturer advises caution.

**Renal impairment**

Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no other options are available.

**Telithromycin**

**Drug action**

The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant Streptococcus pneumoniae.

**Indications and dose**

Treatment of sinusitis or exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated

**By mouth**

- Adult: 800 mg once daily for 5 days

Treatment of community-acquired pneumonia if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated

**By mouth**

- Adult: 800 mg once daily for 7–10 days

Treatment of beta-haemolytic streptococcal pharyngitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated

**By mouth**

- Child 12-17 years: 800 mg once daily for 5 days

- Adult: 800 mg once daily for 5 days

**Contra-indications**

Congenital history of QT interval prolongation (if not excluded by ECG) • family history of QT interval prolongation (if not excluded by ECG) • history of telithromycin-associated hepatitis • history of telithromycin-associated jaundice • myasthenia gravis • prolongation of QT interval

**Caution** Avoid in Acute porphyrias p. 864 • bradycardia—risk of QT interval prolongation • coronary heart disease—risk of QT interval prolongation • hypokalaemia—risk of QT interval prolongation • hypomagnesaemia—risk of QT interval prolongation • ventricular arrhythmias—risk of QT interval prolongation

**Interactions**

Appendix 1 (telithromycin). Caution with concomitant use of drugs that prolong the QT interval.

**Side-effects**

- Common or very common Abdominal pain • diarrhoea • dizziness • flatulence • headache • nausea • taste disturbances • vomiting
- Uncommon Anorexia • blurred vision • constipation • drowsiness • eosinophilia • flushing • hepatitis • insomnia • nervousness • palpitations • pruritus • rash • stomatitis • urticaria
- Rare Arrhythmias • cholestatic jaundice • diplopia • hypotension • paraesthesia • transient loss of consciousness
- Very rare Altered sense of smell • antibiotic-associated colitis • erythema multiforme • muscle cramp
- Frequency not known Arthralgia • confusion • hallucinations • pancreatitis

**Pregnancy**

Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**Breast feeding**

Manufacturer advises avoid—present in milk in animal studies

**Hepatic impairment**

Manufacturer advises caution.

**Renal impairment**

Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no other options are available.
alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose.

**PATIENT AND CARER ADVICE** Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected. Hepatic disorders Counselling on hepatic disorders is advised. Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop.

**MEDICINAL FORMS**
Medicines not identified.

**MONOCYCLIC BETA-LACTAM ANTIBACTERIALS**

**Aztreonam**

**DRUG ACTION** Aztreonam is a monocylic beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

**INDICATIONS AND DOSE**
Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

**BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**
- Adult: 1 g every 9 hours, alternatively 2 g every 12 hours, single doses over 1 g by intravenous route only
- Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis
  - By intravenous infusion or by intravenous injection
    - Adult: 2 g every 6–8 hours
  - Gonorrhoea / Cystitis
    - By intramuscular injection
      - Adult: 1 g for 1 single dose
  - Urinary-tract infections
    - By deep intramuscular injection or by intravenous infusion or by intravenous injection
      - Adult: 0.5–1 g every 8–12 hours
  - Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis
    - By inhalation of nebulised solution
      - Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

**CAUTIONS**
- When used by inhalation Haemoptysis—risk of further haemorrhage

**INTERACTIONS** → Appendix 1 (aztreonam).

**SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**
- Rare
  - Frequency not known Bronchospasm - rash
  - When used by inhalation Arthralgia - cough - haemoptysis - pharyngolaryngeal pain - pyrexia - rhinorrhea - wheezing
  - With systemic use Abdominal pain - diarrhea - erythema multiforme - flushing - mouth ulcers - nausea - taste disturbances - toxic epidermal necrolysis - vomiting

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity. Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

**PREGNANCY**
- With systemic use No information available; manufacturer of injection advises avoid.
- When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

**BREAST FEEDING** Amount in milk probably too small to be harmful.

**HEPATIC IMPAIRMENT**
- With systemic use Use injection with caution. Monitor liver function.

**RENAI IMPAIRMENT**
- With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

**MONITORING REQUIREMENTS**
- When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous injection, give over 3–5 minutes. For intravenous infusion (Azactam®), give intermittently in glucose 5% or sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
- When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥ 2% decline in forced expiratory volume in 1 second).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Azactam (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Aztreonam 1 gram Azactam 1g powder for solution for injection vials | 1 vial (PO) £9.40 (Hospital only)
- Aztreonam 2 gram Azactam 2g powder for solution for injection vials | 1 vial (PO) £18.82 (Hospital only)

**Powder and solvent for nebuliser solution**
- Cayston (Gilead Sciences International Ltd)
- Aztreonam (as Aztreonam lysine) 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial (PO) £2,181.53
**5-NITROIMIDAZOLE DERIVATIVES**

**Metronidazole**

**DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

**INDICATIONS AND DOSE**

**Anaerobic infections**

- **BY MOUTH**
  - Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
  - Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
  - Child 12–17 years: 400 mg every 8 hours
  - Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

- **BY RECTUM**
  - Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
  - Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
  - Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
  - Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
  - Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

- **BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

**Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

- **BY MOUTH**
  - Adult: 400 mg twice daily

**Helicobacter pylori eradication; combination with amoxicillin and omeprazole**

- **BY MOUTH**
  - Adult: 400 mg 3 times a day

**Helicobacter pylori eradication failure (two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratabismuthate plus tetracycline)**

- **BY MOUTH**
  - Adult: 400–500 mg 3 times a day for 2 weeks

**Fistulating Crohn’s disease**

- **BY MOUTH**
  - Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

**Leg ulcers and pressure sores**

- **BY MOUTH**
  - Adult: 400 mg every 8 hours for 7 days

**Bacterial vaginosis (notably *Gardnerella vaginalis* infection)**

- **BY MOUTH**
  - Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Bacterial vaginosis**

- **BY VAGINA USING VAGINAL GEL**
  - Adult: 1 applicatorful daily for 5 days, dose to be administered at night

**Pelvic inflammatory disease**

- **BY MOUTH**
  - Adult: 400 mg twice daily for 14 days

**Acute ulcerative gingivitis**

- **BY MOUTH**
  - Child 1–2 years: 50 mg every 8 hours for 3–7 days
  - Child 3–6 years: 100 mg every 12 hours for 3–7 days
  - Child 7–9 years: 100 mg every 8 hours for 3–7 days
  - Child 10–17 years: 200–250 mg every 8 hours for 3 days
  - Adult: 200–250 mg every 8 hours for 3 days

**Acute oral infections**

- **BY MOUTH**
  - Child 1–2 years: 50 mg every 8 hours for 3–7 days
  - Child 3–6 years: 100 mg every 12 hours for 3–7 days
  - Child 7–9 years: 100 mg every 8 hours for 3–7 days
  - Adult: 200 mg every 8 hours for 3–7 days

**Surgical prophylaxis**

- **BY MOUTH**
  - Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

- **BY RECTUM**
  - Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

- **BY INTRAVENOUS INFUSION**
  - Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

**Invasive intestinal amoebiasis / Extra-intestinal amoebiasis (including liver abscess)**

- **BY MOUTH**
  - Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

**Urogenital trichomoniasis**

- **BY MOUTH**
  - Child 1–2 years: 50 mg 3 times a day for 7 days
  - Child 3–6 years: 100 mg twice daily for 7 days
  - Child 7–9 years: 100 mg 3 times a day for 7 days
  - Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
  - Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Giardiasis**

- **BY MOUTH**
  - Child 1–2 years: 500 mg once daily for 3 days

continued
- **Child 3–6 years:** 600–800 mg once daily for 3 days
- **Child 7–9 years:** 1 g once daily for 3 days
- **Child 10–17 years:** 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
- **Adult:** 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

**Established case of tetanus**

**BY INTRAVENOUS INFUSION**

- **Child 10 g once daily for 3 days**
- **Child 12 g once daily for 3 days**
- **Child 17 g once daily for 3 days**

**INDICATIONS AND DOSE**

**Anoanal infections**

- **Adult:** 2 g once daily for 3 days

**Bacterial vaginosis | Acute ulcerative gingivitis**

- **Adult:** 2 g once daily for 3 days

**Intestinal amoebiasis**

- **Child 1 month to 11 years:** 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- **Child 12–17 years:** 2 g once daily for 2–3 days
- **Adult:** 2 g once daily for 2–3 days

**DRUG ACTION**

**Tinidazole** is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

**INDICATIONS AND DOSE**

**Anaerobic infections**

- **BY MOUTH**
  - **Adult:** Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

**Bacterial vaginosis | Acute ulcerative gingivitis**

- **BY MOUTH**
  - **Adult:** 2 g for 1 single dose

**Intestinal amoebiasis**

- **BY MOUTH**
  - **Child 1 month to 11 years:** 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
  - **Child 12–17 years:** 2 g once daily for 2–3 days
  - **Adult:** 2 g once daily for 2–3 days
**Amoebic involvement of liver**

**BY MOUTH**
- Child 1 month-11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- Child 12-17 years: 1.5–2 g once daily for 3–6 days
- Adult: 1.5–2 g once daily for 3–6 days

**Urogenital trichomoniasis | Giardiasis**

**BY MOUTH**
- Child 1 month-11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- Child 12-17 years: 2 g for 1 single dose, dose may be repeated once if necessary
- Adult: 2 g for 1 single dose

**Helicobacter pylori eradication**

**BY MOUTH**
- Adult: consult local protocol

---

**INDICATIONS AND DOSE**

**Bacterial infection**

Pneumonia (when other antibacterials e.g. a glycopetide, such as vancomycin, cannot be used) (initiated under specialist supervision)

**Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)**

**BY MOUTH**
- Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

**BY INTRAVENOUS INFUSION**
- Adult: 600 mg every 12 hours

---

**Important safety information**

**CHM ADVICE (OPTIC NEUROPATHY)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:
- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**BLOOD DISORDERS**

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:
- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

---

**CAUTIONS**

- Acute confusional states
- Bipolar depression
- Carcinoid tumour
- Elderly (increased risk of blood disorders)
- History of seizures
- Phaeochromocytoma
- Schizophrenia
- Thyrotoxicosis
- Uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION**

**Close observation**

Unless close observation and blood pressure monitoring is possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

**INTERACTIONS**

- Appendix 1 (linezolid, MAOIs).
- Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI).

Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.

---

**OXAZOLIDINONE ANTIBACTERIALS**

**Linezolid**

**DRUG ACTION**

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

### Infection

#### Bacterial infection

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Diarrhoea - eosinophilia - headache - nausea - taste disturbances - vomiting
- **Rare** Renal failure - tachycardia - transient ischaemic attacks
- **Frequency not known** Anaemia - antibiotic-associated colitis - convulsions - hyponatraemia - lactic acidosis - optic neuropathy reported on prolonged therapy - pancytopenia - peripheral neuropathy reported on prolonged therapy - Stevens-Johnson syndrome - tooth discoloration - toxic epidermal necrolysis

**SPECIFIC SIDE-EFFECTS**

- **Uncommon**
- **With intravenous use** injection-site reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk — no information available.
- **BREAST FEEDING** Manufacturer advises avoid — present in milk in animal studies.
- **HEPATIC IMPAIRMENT** In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION** Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS 9, 10**
  - **Zyvox** (Pfizer Ltd)
  - Linezolid 600 mg: Zyvox 600mg tablets | 10 tablet (Pf) £445.00
  - **Oral suspension**
    - **CAUTIONARY AND ADVISORY LABELS 9, 10**
    - **EXCIPIENTS:** May contain Aspartame
    - **Zyvox** (Pfizer Ltd)
    - Linezolid 20 mg per 1 ml: Zyvox 100mg/5ml granules for oral suspension | 150 ml (Pf) £222.50
  - **Infusion**
    - **EXCIPIENTS:** May contain Glucose
    - **ELECTROLYTES:** May contain Sodium
    - **Zyvox** (Pfizer Ltd)
    - Linezolid 2 mg per 1 ml: Zyvox 600mg/300ml infusion bags | 10 bag (Pf) £445.00

**Penicillins**

**Benzylpenicillin and phenoxymethylpenicillin**

Benzylpenicillin sodium p. 480 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, lephtospirosis, and treatment of Lyme disease.

Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 1008 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection.

**Benzathine benzylpenicillin** is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 481 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

**Penicillinase-resistant penicillins**

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 486, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 487 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter spp.*

**Broad-spectrum penicillins**

Ampicillin p. 483 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 482) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.
Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Co-amoxiclav p. 484 consists of amoxicillin with the betalactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of Staphylococci aureus, E. coli, and H. influenzae, as well as many Bacteroides and Klebsiella spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin p. 486 (as co-fluampicil) p. 485 is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

**Antipseudomonal penicillins**

**Piperacillin**, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

**Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam below against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Both preparations have a broad spectrum of activity against Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam below against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Both preparations have a broad spectrum of activity against Gram-negative bacteria, and anaerobes.

**Mecillinams**
Pivmecillinam hydrochloride p. 486 has significant activity against many Gram-negative bacteria including Escherichia coli, klebsiella, enterobacter, and salmonellae. It is not active against Pseudomonas aeruginosa or enterococci. Pivmecillinam hydrochloride p. 486 is hydrolysed to mecillinam, which is the active drug.

**Penicillins (antipseudomonal)**

**Piperacillin with tazobactam**

**INDICATIONS AND DOSE**

**Hospital-acquired pneumonia** | **Septicaemia** | **Complicated infections involving the urinary-tract or skin and soft tissues**
---|---|---
BY INTRAVENOUS INFUSION
- Adult: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
- Complicated intra-abdominal infections
  - Adult 18 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
- Infections in neutropenic patients
  - BY INTRAVENOUS INFUSION
    - Adult: 4.5 g every 6 hours

**SIDE-EFFECTS**

- **Common or very common** Anaphylaxis | Angioedema | Diarrhoea | Fever | Hypersensitivity reactions | Joint pains | Rash | Serum sickness-like reaction | Urticaria
- **Rare** Cerebral irritation | CNS toxicity (including convulsions) | Coagulation disorders | Encephalopathy | Haemolytic anaemia | Interstitial nephritis | Leucopenia | Thrombocytopenia
- **Frequency not known** Antibiotic-associated colitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**CNS toxicity** A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation.

This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.

**Diarrhoea** Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

**ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind.

Other beta-lactam antibiotics (including cephalosporins) can be used in these patients. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

**BNF 70**

**Bacterial infection** 479
Ticarcillin with clavulanic acid

**INDICATIONS AND DOSE**

Infections due to *Pseudomonas* and *Proteus* spp

- **BY INTRAVENOUS INFUSION**
  - Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

**CAUTIONS**

High doses may lead to hypernatraemia (owing to sodium content of preparations)

**CAUTIONS, FURTHER INFORMATION**

- **Cholestatic jaundice**
  - Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **SIDE-EFFECTS**
  - Eosinophilia. haemorrhagic cystitis (more frequent in children); hypokalaemia; injection-site reactions; nausea. Stevens-Johnson syndrome. toxic epidermal necrolysis; vomiting

- **PREGNANCY**
  - Not known to be harmful.

- **BREAST FEEDING**
  - Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT**
  - Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m². Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

- **EFFECT ON LABORATORY TESTS**
  - False-positive urinary glucose (if tested for reducing substances).

### BENZYLPCILLIN SODIUM (Penicillin G)

#### PENICILLINS (BETA-LACTAMASE SENSITIVE)

**INDICATIONS AND DOSE**

Mild to moderate susceptible infections | Throat infections | Otitis media | Cellulitis | Pneumonia

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

Endocarditis (in combination with other antibacterial if necessary)

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

Anthrax (in combination with other antibacterials)

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 2.4 g every 4 hours

Intrapartum prophylaxis against group B streptococcal infection

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

Meningitis | Meningococcal disease

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 2.4 g every 4 hours

**BY INTRAVENOUS INFUSION**

- Neonate up to 6 days: 50 mg/kg every 12 hours.
- Neonate 7-28 days: 50 mg/kg every 8 hours.
**Phenoxyethylpenicillin (Penicillin V)**

**INDICATIONS AND DOSE**

**Prevention of recurrence of rheumatic fever BY MOUTH**

| Child 1 month-5 years: 125 mg twice daily | Child 6-17 years: 250 mg twice daily | Adult: 250 mg twice daily |

**Prevention of secondary case of invasive group A streptococcal infection BY MOUTH**

| Child 1-11 months: 62.5 mg every 6 hours for 10 days | Child 1-5 years: 125 mg every 6 hours for 10 days | Child 6-11 years: 250 mg every 6 hours for 10 days |
| Child 12-17 years: 500 mg every 6 hours for 10 days | Adult: 250–500 mg every 6 hours for 10 days |

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease BY MOUTH**

| Child 1-11 months: 62.5 mg twice daily | Child 1-5 years: 125 mg twice daily | Child 6-11 years: 250 mg twice daily |
| Child 12-17 years: 500 mg twice daily | Adult: 250 mg twice daily |

**UNLICENSED USE** Phenoxyethylpenicillin doses in the BNF may differ from product literature.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amounts in milk, but appropriate to use.

**CAUTIONS** Accumulation of sodium from injection can occur with high doses.

**RENAI IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.

| In adults | Reduce dose—consult product literature. |
| In children | Estimated glomerular filtration rate 10–50 mL/minute/1.73 m²; use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours. |

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children: Intravenous route recommended in neonates and infants. *For intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
- With intravenous use in adults: *For intravenous infusion* (Cryspan™), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, eye drops.

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

- BENZYLPPENICILLIN SODIUM (Non-proprietary)
  - Benzylpenicillin sodium 600 mg: Benzylpenicillin 600 mg powder for solution for injection vials | 2 vial (DT price £4.67 DT price + £4.67) | 25 vial (DT price £58.37–£58.38) | Benzylpenicillin sodium 1.2 gram: Benzylpenicillin 1.2 g powder for solution for injection vials | 25 vial (DT price £78.64 DT price + £78.64)
**Penicillins (Broad-Spectrum)**

**Amoxicillin** *(Amoxycillin)*

### INDICATIONS AND DOSE

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
  - Adult: 500 mg every 8 hours, increased if necessary to 1 g every 8 hours, increased dose used in severe infections

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 500 mg every 8 hours

- **BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, use increased dose in severe infections

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - Child 5-17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)
  - Adult: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

**Anthrax (treatment and post-exposure prophylaxis)**

- **BY MOUTH**
  - Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
  - Child (body-weight 20 kg and above): 500 mg 3 times a day
  - Adult: 500 mg 3 times a day

**Dental abscess (short course)**

- **BY MOUTH**
  - Adult: 3 g, then 3 g after 8 hours

**Urinary-tract infections (short course)**

- **BY MOUTH**
  - Adult: 3 g, then 3 g after 10–12 hours

**Listerial meningitis (in combination with another antibiotic)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 2 g every 4 hours

---

**Penicillins (Broad-Spectrum)**

**Amoxicillin** *(Amoxycillin)*

### INDICATIONS AND DOSE

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

- **BY MOUTH**
  - Adult: 125 mg twice daily
  - Adult 5-11 years: 250 mg twice daily
  - Adult 12-17 years: 500 mg twice daily

**Endocarditis (in combination with another antibiotic if necessary)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 2 g every 4 hours

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for Haemophilus influenzae

- **BY MOUTH**
  - Child 1 month–4 years: 125 mg twice daily
  - Child 5–11 years: 250 mg twice daily
  - Child 12–17 years: 500 mg twice daily

**Helicobacter pylori eradication in combination with metronidazole and omeprazole**

- **BY MOUTH**
  - Adult: 500 mg 3 times a day

**Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

- **BY MOUTH**
  - Adult: 1 g twice daily

---

**Amoxicillin doses in BNF Publications may differ from those in product literature. Amoxicillin is not licensed for use for treatment of Lyme disease.**

**CAUTIONS**

- **GENERAL CAUTIONS**
  - Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common) - maintain adequate hydration with high doses (particularly during parenteral therapy)

**SPECIFIC CAUTIONS**

- With intravenous use. Accumulation of sodium can occur with high parenteral doses

**SIDE-EFFECTS**

- **Common or very common** Nausea · Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

If rash occurs, discontinue treatment.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amount in milk, but appropriate to use.

**RENAL IMPAIRMENT** Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of sodium from injection can occur in patients with renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children. Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.

- With intravenous use in adults. For intravenous infusion *(Amoxicil®)*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.
Ampicillin

INDICATIONS AND DOSE
Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

BY MOUTH

- Child 1–11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day.
- Child 1–4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day.
- Child 5–11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g).
- Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day, use increased dose in severe infection.

- Adult: 0.5–1 g every 6 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: 500 mg every 4–6 hours

BY INTRAMUSCULAR INJECTION

- Adult: 500 mg every 4–6 hours

Endocarditis (in combination with another antibiotic if necessary) | Listerial meningitis (in combination with another antibiotic) 

BY INTRAVENOUS INFUSION

- Adult: 2 g every 4 hours

UNLICENSED USE

Ampicillin doses in BNF may differ from those in product literature.

CAUTIONS

GENERAL CAUTIONS
Acute lymphocytic leukaemia (increased risk of erythematous rashes) | Chronic lymphocytic leukaemia (increased risk of erythematous rashes) | Cytomegalovirus infection (increased risk of erythematous rashes) | Glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- With intravenous use: Accumulation of electrolytes contained in parenteral preparations can occur with high doses.

SIDE-EFFECTS

- Common or very common: Nausea, vomiting

SIDE-EFFECTS, FURTHER INFORMATION

If rash occurs, discontinue treatment.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Trace amounts in milk, but inappropriate to use.

RENAI IMPAIRMENT

Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

- In adults: Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.
- In children: If estimated glomerular filtration rate less than 10 mL/minute/1.73 m²: reduce dose or frequency; rashes more common.

DIRECTIONS FOR ADMINISTRATION

- With oral use: Administer at least 30 minutes before food.
- With intravenous use in children: Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.
- With intravenous use in adults: For intravenous infusion (Penbritin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%.
**CONTRA-INDICATIONS**

- **associated jaundice or hepatic dysfunction** recommended.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **AMPICILLIN (Non-proprietary)**
    - Ampicillin 250 mg
      - Ampicillin 250/500 mg capsules | 28 capsule
      - £25.00 DT price = £4.75
      - £35.00 DT price = £21.37
    - Penbritin (Chemidex Pharma Ltd)
      - Ampicillin 250 mg
        - £2.10 DT price = £4.75
      - Ampicillin 500 mg
        - £5.28 DT price = £21.37

- **Oral suspension**
  - **AMPICILLIN (Non-proprietary)**
    - Ampicillin 25 mg per 1 ml
      - Ampicillin 125mg/5ml oral suspension | 100 ml
        - £29.86 DT price = £29.86
    - Ampicillin 50 mg per 1 ml
      - Ampicillin 250mg/5ml oral suspension | 100 ml
        - £38.86 DT price = £38.86

- **Powder for solution for injection**
  - **AMPICILLIN (Non-proprietary)**
    - Ampicillin (as Ampicillin sodium) 500 mg
      - Ampicillin 500mg powder for solution for injection vials | 10 vial
        - £76.30

---

**Co-amoxiclav**

**INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory, skin and urinary tract infections, wound infections, and cellulitis and animal bites.

**INITIALLY BY MOUTH USING TABLETS**

- **Child 12-17 years**: 250/125 mg every 8 hours; (by mouth) increased to 500/125 mg every 8 hours, increased dose used for severe infection.
- **Adult**: 250/125 mg every 8 hours; (by mouth) increased to 500/125 mg every 8 hours, increased dose used for severe infection.

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- **Adult**: 1.2 g every 8 hours, intravenous injection to be administered over 3–4 minutes.

**Severe dental infection with spreading cellulitis**

**BY MOUTH USING TABLETS**

- **Child 12-17 years**: 250/125 mg every 8 hours for 5 days.
- **Adult**: 250/125 mg every 8 hours for 5 days.

**Surgical prophylaxis**

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- **Adult**: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures.

**Dose equivalence and conversion**

Doses are expressed as co-amoxiclav.

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

**CONTRA-INDICATIONS**

History of co-amoxiclav-associated jaundice or hepatic dysfunction. History of penicillin-associated jaundice or hepatic dysfunction.

**CAUTIONS**

**GENERAL CAUTIONS**

- Acute lymphocytic leukaemia (increased risk of erythematous rashes) • chronic lymphocytic leukaemia (increased risk of erythematous rashes) • cytomegalovirus infection (increased risk of erythematous rashes) • glandular fever (erythematous rashes common) – maintain adequate hydration with high doses (particularly during parenteral therapy).

**SPECIFIC CAUTIONS**

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses.

**CAUTIONS, FURTHER INFORMATION**

Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Cholestatic jaundice • hepatitis • nausea • vomiting
- **Rare** Dizziness • headache • prolongation of bleeding time
- **Frequency not known** Exfoliative dermatitis • Steven-Johnson syndrome • toxic epidermal necrolysis • vasculitis

**SPECIFIC SIDE-EFFECTS**

- **Rare**
- **With intravenous use** phlebitis at injection site
- **With oral use** superficial staining of teeth with suspension

**SIDE-EFFETS, FURTHER INFORMATION**

Rash If rash occurs, discontinue treatment.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amount in milk, but appropriate to use.

**HEPATIC IMPAIRMENT** Monitor liver function in liver disease.

**RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).

- **With oral use in adults** Co-amoxiclav 250/125 tablets or 500/250 tablets: If eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/250 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours. Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m².

- **With intravenous use in adults** Co-amoxiclav injection (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

- **With oral use in children** Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 suspension, 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**BNF 70**

chloride 0.9%. Continuous infusion not usually recommended.

Co-fluamcipil

INDICATIONS AND DOSE Mixed infections involving beta-lactamase-producing staphylococci
BY MOUTH
Child 1-9 years: 125/250 mg every 6 hours
Child 10-17 years: 250/500 mg every 6 hours
Adult: 500/1000 mg every 6 hours
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: 250/500 mg every 6 hours
Severe mixed infections involving beta-lactamase-producing staphylococci
BY MOUTH
Child 1-9 years: 250/500 mg every 6 hours
Child 10-17 years: 500/500 mg every 6 hours
Adult: 500/500 mg every 6 hours
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: 500/500 mg every 6 hours

Important safety information
HEPATIC DISORDERS
Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloracill has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:
- Flucloracill should not be used in patients with a history of hepatic dysfunction associated with flucloracill;
- Flucloracill should be used with caution in patients with hepatic impairment;
CO-FLUAMPICIL (Non-proprietary)

Flucloxacillin sodium) 250 mg

There can be variation in the licensing of different medicines containing the same drug.

CO-FLUAMPICIL (Non-proprietary)

Ampicillin 125mg/125mg/5ml oral suspension | 100 ml | £31.99 |

PENICILLINS (PENICILLINASE-RESISTANT)

Flucloxacillin

INDICATIONS AND DOSE

Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis

BY MOUTH

Child 1 month-1 year: 62.5–125 mg 4 times a day
Child 2–9 years: 125–250 mg 4 times a day
Temocillin

**INDICATIONS AND DOSE**

Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 1–2 g every 12 hours, give over 3–4 minutes when administered by intravenous injection

**CAUTIONS**

- Accumulation of sodium from injection can occur with high doses

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Trace amounts in milk.

---

**BREAST FEEDING**

- Common or very common
- Gastrointestinal disturbances
- Very rare
- Cholestatic jaundice - hepatitis
- Not known to be harmful.
- Trace amounts in milk, but appropriate to use.

**HEPATIC IMPAIRMENT**

- Use with caution.

**RENAL IMPAIRMENT**

- In adults: Reduce dose if eGFR less than 10 mL/minute/1.73 m². Accumulation of electrolytes can occur in patients with renal failure.

- In children: Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS**

- False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion (Fluropen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes, via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

**重要的安全信息**

**HEPATIC DISORDERS**

- Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors.

Healthcare professionals are reminded that:

- Flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin

- Flucloxacillin should be used with caution in patients with hepatic impairment

- Careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

---

**Cautions**

- With intravenous use: Accumulation of electrolytes can occur with high doses.

**Side-effects**

- Common or very common: Gastrointestinal disturbances

- Very rare: Cholestatic jaundice - hepatitis

- Not known to be harmful.

- Trace amounts in milk, but appropriate to use.
**RENAL IMPAIRMENT** 1 g every 12 hours if eGFR 30–60 mL/minute/1.73 m². 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m². 1 g every 48 hours or 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m². Accumulation of sodium from injection can occur in patients with renal failure.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Negaban®), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Negaban** (Eumedica Pharmaceuticals)
  - Temocillin (as Temocillin sodium) 1 gram Negaban 1g powder for solution for injection vials | 1 vial (£0.30) no price available

**FOSPHONIC ACID ANTIBACTERIALS**

**Fosfomycin**

**DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

**INDICATIONS AND DOSE**

Uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

**BY MOUTH**

- Adult (female): 3 g for 1 dose.
- Adult (male): 3 g for 1 dose, then 3 g after 3 days.

Osteomyelitis when first-line treatments are inappropriate or ineffective

Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

**BY INTRAVENOUS INFUSION**

- Adult: 12–24 g once daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

**BY INTRAVENOUS INFUSION**

- Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

Bacterial meningitis when first-line treatment ineffective or inappropriate

**BY INTRAVENOUS INFUSION**

- Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Gastro-intestinal disturbances • rash
- Uncommon Diarrhoea • nausea • vomiting
- Frequency not known Abdominal pain

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Decreased appetite • dyspnoea • fatigue • headache • hyperpyrexia • hypokalaemia • taste disturbances • vertigo
- Rare
- With intravenous use Aplastic anaemia • blood disorders • eosinophilia
- Very rare
- With intravenous use Fatty liver • visual impairment
- Frequency not known
- With intravenous use Antibiotic-associated colitis • bronchospasm • confusion • hepatitis • jaundice • tachycardia

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

**RENA L IMPAIRMENT**

- With oral use Avoid if eGFR less than 10 mL/minute/1.73 m².
- With intravenous use Use with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- With intravenous use Monitor electrolytes and fluid balance.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Fomicyt®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Although oral preparations containing fosfomycin are not marketed in the UK, they can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Doses expressed as fosfomycin base.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2015) that Fosfomycin (Fomicyt®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

- **Granules**
  - CAUTIONARY AND ADVISORY LABELS 9, 13, 23
  - **FOSFOMYCIN** (Non-proprietary)
    - Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet (£0.45)
  - Powder for solution for infusion
    - **ELECTROLYTES:** May contain Sodium
      - **Fomicyt** (Nordic Pharma Ltd)
        - Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial (£0.37) £150.00
        - Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial (£0.70) £300.00

- **UNLICENSED USE** Oral preparations containing fosfomycin are not marketed in the UK and use of these preparations is unlicensed.

**CAUTIONS**

- With intravenous use Cardiac insufficiency • elderly (high doses) • hyperaldosteronism • hyperpyrexia • hypertension • pulmonary oedema

**INTERACTIONS** → Appendix 1 (fosfomycin).
POLYMIXYN ANTIBACTERIALS

Colistimethate sodium (Colistin sulphomethate sodium)

**DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulphomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

**INDICATIONS AND DOSE**
Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumanii* and *Klebsiella pneumoniae*

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult (body-weight up to 59 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection

**Adjunct to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis**

**BY INHALATION OF NEBULISED SOLUTION**
- Adult: 1–2 million units twice daily; increased to 2 million units 3 times a day, dose only to be increased for subsequent respiratory isolates of *Pseudomonas aeruginosa*

**BY INHALATION OF POWDER**
- Adult: 1.66 million units twice daily

**CONTRA-INDICATIONS** Myasthenia gravis

**CAUTIONS**

**GENERAL CAUTIONS**
Acute porphyrias p. 864

**SPECIFIC CAUTIONS**
- When used by inhalation Severe haemoptysis — risk of further haemorrhage

**INTERACTIONS** → Appendix 1 (polymyxins).

**SIDE-EFFECTS**
- Common or very common
  - When used by inhalation Bronchospasm • cough • dysphonhia • nausea • sore mouth • sore throat • taste disturbances • vomiting
  - Uncommon
  - When used by inhalation Hyrosalivation • thirst
- Rare
  - With intravenous use Vasomotor instability
  - Frequency not known
  - With intravenous use Apnoea • confusion • headache • muscle weakness • nephrotoxicity • neurotoxicity reported especially with excessive doses • perioral paraesthesia • peripheral paraesthesia • psychosis • rash • slurred speech • vertigo • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

**Dose-related side-effects** The major adverse effects are dose-related neurotoxicity and nephrotoxicity.

**PREGNANCY**
- When used by inhalation Clinical use suggests probably safe.
- With intravenous use Use only if potential benefit outweighs risk.

**BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

**RENAL IMPAIRMENT**
- With intravenous use Reduce dose. In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended ‘peak’ plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–12 mg/litre; pre-dose (‘trough’) concentration 2–6 mg/litre.

**MONITORING REQUIREMENTS**
- With intravenous use Monitor renal function.
- When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

**DIRECTIONS FOR ADMINISTRATION**
- When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For nebulisation administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection
- With intravenous use For intravenous infusion (Colomycin®, Promixin®), give intermittently in Sodium chloride 0.9% (or Glucose 5% for Promixin® brand only); dilute with 50 mL infusion fluid and give over 30 minutes.

**COLOMYCIN® POWDER FOR SOLUTION FOR INJECTION**
Colomycin® Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

**PRESCRIBING AND DISPENSING INFORMATION**
Colistimethate sodium is included in some preparations for topical application.

**PATIENT AND CARER ADVICE**
Patient should be advised to rinse mouth with water after each dose of dry powder inhalation.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)
NICE TA276
Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

**www.nice.org.uk/TA276**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops, oral solution

**Tablet**
- Colomycin® (Forest Laboratories UK Ltd)
  - Colistin sulfate 1500000 unit Colomycin 1.5 million unit tablets | 50 tablet (PSt) £55.00

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium
- **COLOMYCIN® SODIUM (Non-proprietary)**
  - Colistimethate sodium 1000000 unit Colistimethate 1 million unit powder for solution for injection vials | 10 vial (PSt) £18.00
  - 10 vial (Bo) £16.79 (Hospital only)
- Colomycin® (Forest Laboratories UK Ltd)
  - Colistimethate sodium 1000000 unit Colomycin 1 million unit powder for solution for injection vials | 10 vial (PSt) £18.00
  - Colistimethate sodium 2000000 unit Colomycin 2 million unit powder for solution for injection vials | 10 vial (Bo) £32.40

Bacterial infection 489
**Bacterial infection**

**Quinolones**

Nalidixic acid p. 493 and norfloxacin p. 493 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin below is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and infections of the gastro-intestinal system (including typhoid fever). It is particularly active against Gram-negative organisms. It has greater activity against *Pneumococci* than ciprofloxacin. Moxifloxacin is not active against *Streptococcus pneumoniae* but it is more active against *Staphylococcus aureus* (MRSA).

Moxifloxacin should be reserved for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Moxifloxacin is also licensed for the treatment of respiratory tract infections.

Although ciprofloxacin, levofloxacin, moxifloxacin p. 492, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

**INDICATIONS AND DOSE**

**Fistulating Crohn’s disease**

- **BY MOUTH**
  - Adult: 500 mg twice daily

**Respiratory tract infections**

- **BY MOUTH**
  - Adult: 500–750 mg twice daily
  - **BY INTRAVENOUS INFUSION**
    - Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

**CONTRA-INDICATIONS**

History of tendon disorders related to quinolone use.

**CAUTIONS**

Can prolong the QT interval · conditions that predispose to seizures · exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation)

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea · dizziness · headache · nausea · vomiting
- **Uncommon** Abdominal pain · anorexia · anxiety · arthralgia · arthrosis · blood disorders · confusion · depression · disturbances in taste · disturbances in vision · dyspepsia · eosinophilia · hallucinations · leucopenia · myalgia · rash · sleep disturbances · thrombocytopenia · tremor
- **Rare** Antibiotic-associated colitis · convulsions · disturbances in hearing · disturbances in smell · dyspnoea · hepatic dysfunction · hepatitis · hypotension · interstitial nephritis · jaundice · photosensitivity · psychoses · renal failure · symptoms of peripheral neuropathy (sometimes irreversible) · tendon damage · tendon inflammation · vasculitis
- **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

**ALLERGY AND CROSS-SENSITIVITY**

Use of quinolones contraindicated in quinolone hypersensitivity.

**PREGNANCY**

Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

**Promixin (Profile Pharma Ltd)**

- Colistimethate sodium 1000000 unit Promixin 1mlln unit powder for solution for injection vials | 10 vial £30.00 (Hospital only)

**Inhalation powder**

**INDICATIONS AND DOSE**

**Acute sinusitis**
**BY MOUTH**
- Adult: 500 mg once daily for 10–14 days

**Acute exacerbation of chronic bronchitis**
**BY MOUTH**
- Adult: 500 mg once daily for 7–10 days

**Community-acquired pneumonia**
**BY MOUTH**
- Adult: 500 mg 1–2 times a day for 7–14 days
- Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

**Urinary-tract infections**
**BY MOUTH**
- Adult: 500 mg once daily for 7–14 days

**Urinary-tract infections (uncomplicated infection)**
**BY MOUTH**
- Adult: 250 mg once daily for 3 days

**Complicated urinary-tract infections**
**BY INTRAVENOUS INFUSION**
- Adult: 500 mg once daily, to be given over at least 60 minutes

**Chronic prostatitis**
**BY MOUTH**
- Adult: 500 mg once daily for 28 days
- Adult: 500 mg once daily, to be given over at least 60 minutes

**Complicated skin and soft tissue infections**
**BY MOUTH**
- Adult: 500 mg 1–2 times a day for 7–14 days
- Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

**Inhalation of anthrax (treatment and post-exposure prophylaxis)**
**BY MOUTH**
- Adult: 500 mg once daily for 8 weeks
- Adult: 500 mg once daily, to be given over at least 60 minutes

**CAUTIONS**
- Acute myocardial infarction (risk factor for QT interval prolongation)
- Bradycardia (risk factor for QT interval prolongation)
- Congenital long QT syndrome (risk factor for QT interval prolongation)
- Electrolyte disturbances (risk factor for QT interval prolongation)
- Heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation)
- History of psychiatric illness (risk factor for QT interval prolongation)
- History of symptomatic arrhythmias (risk factor for QT interval prolongation)
- Risk factors for QT interval prolongation

**INTERACTIONS**
- Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**
- **Common or very common** Constipation · flatulence · hyperhidrosis
- **Uncommon** Dysphagia · Rhabdomyolysis
- **Rare** Abnormal dreams · hypoglycaemia · palpitation · tachycardia · tinnitus
- **Frequency not known** Benign intracranial hypertension · extrapyramidal symptoms · hyperglycaemia · local reactions · peripheral neuropathy · pneumonitis · potentially life-threatening hepatic failure · rhabdomyolysis · stomatitis · syncope · transient hypotension

**BREAST FEEDING**
- Manufacturer advises avoid.

**RENAL IMPAIRMENT**
- Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**
- May impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 6, 9, 25

- **LEVOFLOXACIN (Non-proprietary)**
  - Levofloxacin (as Levofloxacin hemihydrate) 250 mg Levofloxacin 250mg tablets | 5 tablet **PO** £7.23 | 10 tablet **PO** £14.45 DT price + £11.36

  - Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml Levofloxacin 500mg/100ml solution for infusion vials | 1 vial **PO** £25.00
  - Levofloxacin 500mg/100ml solution for infusion bottles | 10 bottle **PO** £224.00–£251.00
- Brands may include Evoxil

**Moxifloxacin**

**INDICATIONS AND DOSE**

**Sinusitis**
**BY MOUTH**
- Adult: 400 mg once daily for 7 days
Community-acquired pneumonia
BY MOUTH
- Adult: 400 mg once daily for 7–14 days
BY INTRAVENOUS INFUSION
- Adult: 400 mg once daily for 7–14 days, to be given over 60 minutes

Exacerbations of chronic bronchitis
BY MOUTH
- Adult: 400 mg once daily for 5–10 days

Mild to moderate pelvic inflammatory disease
BY MOUTH
- Adult: 400 mg once daily for 7–21 days

Complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials
BY MOUTH
- Adult: 400 mg once daily for 7–21 days, to be given over 60 minutes

CONTRA-INDICATIONS
- Acute myocardial infarction (risk factor for QT interval prolongation) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS
- + Appendix 1 (quinolones). Avoid concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS
- Common or very common Angina - arrhythmias - constipation - flatulence - gastritis - hyperlipidaemia - palpitation - sweating - vasodilatation
- Uncommon Dyspnoea
- Rare Abnormal dreams - anemia - dysphagia - hyperglycaemia - hypertension - hyperuricaemia - incoordination - myopathy - oedema - peripheral neuropathy - stomatitis - syncope
- Very rare Potentially life-threatening hepatic failure - rhabdomyolysis

SPECIFIC SIDE-EFFECTS
- With intravenous use Pain at injection site - phlebitis at injection site

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe impairment.

PATIENT AND CARER ADVICE
May impair performance of skilled tasks (e.g., driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### Tablet

**CAUTIONARY AND ADVISORY LABELS**
- **MOXIFLOXACIN (Non-proprietary)**
  - Moxifloxacin (as Moxifloxacin hydrochloride) 400 mg Moxifloxacin 400mg tablets | 5 tablet [POD] £8.05–£11.81
  - Avelox (Bayer Plc)

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium
- **MOXIFLOXACIN (Non-proprietary)**
  - Moxifloxacin (as Moxifloxacin hydrochloride) 1.6 mg per 1 ml Moxifloxacin 400mg/250ml solution for infusion bottles | 1 bottle [POD] £39.95
  - Avelox (Bayer Plc)

**Nalidixic acid**

**INDICATIONS AND DOSE**

Urinary-tract infections
BY MOUTH
- Adult: 900 mg every 6 hours for 7 days, then reduced to 600 mg every 6 hours for prolonged therapy in chronic infections

CAUTIONS
- Acute myocardial infarction (risk factor for QT interval prolongation) - avoid in Acute porphyrias p. 864 - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS
- Caution if concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS
- Cranial nerve palsy - increased intracranial pressure - metabolic acidosis - peripheral neuropathy - toxic psychosis

BREAST FEEDING
Risk to infant very small but one case of haemolytic anaemia reported.

HEPATIC IMPAIRMENT
Manufacturer advises caution in liver disease.

RENAL IMPAIRMENT
Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

EFFECT ON LABORATORY TESTS
False positive urinary glucose (if tested for reducing substances).

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include raspberry and strawberry.

MEDICINAL FORMS
Medicines not identified.

**Norfloxacin**

**INDICATIONS AND DOSE**

‘Lower’ urinary-tract infections
BY MOUTH
- Adult: 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)

Chronic relapsing ‘lower’ urinary-tract infections
BY MOUTH
- Adult: 400 mg twice daily for up to 12 weeks; reduced to 400 mg once daily, if adequate suppression within first 4 weeks

Chronic prostatitis
BY MOUTH
- Adult: 400 mg twice daily for 28 days
**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**
- Frequency not known
- Rare
- Common or very common
- Epiphora · tinnitus
- Pancreatitis
- Extrapyramidal symptoms
- Hyperhidrosis
- Arrhythmias
- Tinnitus
- Nasopharyngitis
- Hot flushes
- Severe or complicated infections
- To be given over at least 30 minutes for each 200 mg

**SIDE-EFFECTS**
- Common or very common
- Epiphora · tinnitus
- Pancreatitis
- Extrapyramidal symptoms
- Hyperhidrosis
- Arrhythmias
- Tinnitus
- Nasopharyngitis
- Hot flushes
- Severe or complicated infections
- To be given over at least 30 minutes for each 200 mg

**MEDICINAL FORMS**

**INDICATIONS AND DOSE**

**Urinary-tract infections**
- Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

**Complicated urinary-tract infection**
- Adult: 200 mg daily increased to 400 mg twice daily, for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

**Acute or chronic prostatitis**
- Adult: 200 mg twice daily for 28 days

**Lower respiratory-tract infections**
- Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily

**Skin and soft-tissue infections**
- Adult: 400 mg twice daily

**Uncomplicated gonorrhoea**
- Adult: 400 mg once daily as a single dose

**Uncomplicated genital chlamydial infection | Non-gonococcal urethritis**
- Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

**Pelvic inflammatory disease**
- Adult: 400 mg twice daily for 14 days

**Septicaemia**
- Adult: 200 mg twice daily, increased to 400 mg twice daily, for severe or complicated infections. To be given over at least 30 minutes for each 200 mg

**INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | NORFLOXACIN (Non-proprietary) | Norfloxacin 400 mg | Norfloxacin 400mg tablets | 6 tablet | P hire | £5.46 | 14 tablet | P hire | £8.90 |

**INDICATIONS AND DOSE**

Rifaximin

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastrointestinal tract, and, therefore, should not be used to treat systemic infections.

**INDICATIONS AND DOSE**

Travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours

**BY MOUTH**

- Adult: 200 mg every 8 hours for 3 days

**Reduction in recurrence of hepatic encephalopathy**

**BY MOUTH**

- Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction

- **INTERACTIONS** Rifamycins interactions in Appendix 1 do not apply to rifaximin.

- **SIDE-EFFECTS** Rifamycins interactions in Appendix 1 do not apply to rifaximin.

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, depression, diarrhoea, dizziness, dyspnoea, flatulence, headache, muscle spasm, nausea, pruritus, rash, vomiting
  - Uncommon: Anorexia, antibiotic-associated colitis, anxiety, blood disorders, convulsions, dry mouth, dysuria, glycosuria, hyperkalaemia, hypoaesthesia, influenza-like symptoms, memory impairment, paraesthesia, peripheral oedema, polynephroaemia, polyuria, sleep disturbances, taste disturbances
  - Rare: Blood pressure changes, constipation, frequency not known: Syncope

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of rifamycin hypersensitivity.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Unlike to be present in milk in significant amounts, but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as Campylobacter and Shigella.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015) NICE TA337
    - Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults.

  www.nice.org.uk/TA337

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - CAUTIONARY AND ADVISORY LABELS 14, 9
    - Targaxan (Norgine Pharmaceuticals Ltd)
      - Rifaximin 550 mg Targaxan 550mg tablets | 56 tablet [POM] £259.23 DT price = £259.23
    - Xifaxanta (Norgine Pharmaceuticals Ltd)
      - Rifaximin 200 mg Xifaxanta 200mg tablets | 9 tablet [POM] £15.15

- **SULFONAMIDES**

  **Sulfadiazine** (Sulphadiazine)

  - **DRUG ACTION** Sulfadiazine is a short-acting sulfonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

  **INDICATIONS AND DOSE**

  Prevention of rheumatic fever recurrence

  **BY MOUTH**

  - Adult (body-weight up to 30 kg): 500 mg daily
  - Adult (body-weight 30 kg and above): 1 g daily

  - **UNLICENSED USE** Not licensed for use in toxoplasmosis.

  - **CONTRA-INDICATIONS** Acute porphyrias p. 864

  - **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · elderly · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia

  - **INTERACTIONS** → Appendix 1 (sulfonamides).

  - **SIDE-EFFECTS**
    - Common or very common: Diarrhoea, headache, hyperkalaemia, nausea, rash
    - Uncommon: Vomiting
    - Rare: Agranulocytosis · bone marrow depression
    - Very rare: Anorexia, antibiotic-associated colitis, arthralgia, aseptic meningitis, ataxia, blood disorders, convulsions, cough, depression, esophagitis, glossitis, hallucinations, hepatic necrosis, hypoglycaemia, hyponatraemia, interstitial nephritis, jaundice, leucopenia, liver damage, megaloblastic anaemia, myocarditis, pancreatitis, peripheral neuropathy, photosensitivity, pulmonary infiltrates, renal disorders, shortness of breath, Stevens-Johnson syndrome, stomatitis, systemic lupus erythematosus, thrombocytopenia, tinnitus, toxic epidermal necrosis, uraemia, vasculitis, vertigo
    - Frequency not known: Benign intracranial hypertension, photophobia, optic neurapathy, rhabdomyolysis reported in HIV-infected patients

  - **SIDE-EFFECTS, FURTHER INFORMATION**

  - Blood disorders or rash: Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrosis, photosensitivity) develop.

  - **PREGNANCY** Risk of neonatal haemolyis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

  - **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolyis in G6PD-deficient infants.

  - **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.

  - **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.

  - **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**

  - CAUTIONARY AND ADVISORY LABELS 9, 27
    - SULFADIAZINE (Non-proprietary)
      - Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet [POM] £78.59

- **Bacterial infection** 495
TETRACYCLINES AND RELATED DRUGS

Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline below with either streptomycin p. 451 or rifampicin p. 508), and the spirochaete, Borrelia burgdorferi (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in productive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 471).

Tetracyclines have a role in the management of meticillin-resistant Staphylococcus aureus (MRSA) infection. Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 498 which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) - systemic lupus erythematosus (may be exacerbated)
- **INTERACTIONS** 
  - Appendix 1 (tetracyclines).
  - Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines. Use with caution in those receiving potentially hepatotoxic drugs.
- **SIDE-EFFECTS**
  - **Rare** Anaphylaxis - angioedema - blood disorders - exfoliative dermatitis - hepatitis - hypersensitivity reactions - pancreatitis - pericarditis - photosensitivity (particularly with demeclocycline) - rash - Stevens-Johnson syndrome - urticaria
  - **Frequency not known** Antibiotic-associated colitis - benign intracranial hypertension - diarrhoea - dysphagia - headache - nausea - oesophageal irritation - visual disturbances - vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Benign intracranial hypertension Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).
- **PREGNANCY** Should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

HEPATIC IMPAIRMENT Should be avoided or used with caution in patients with hepatic impairment.

Demeclocycline hydrochloride

**INDICATIONS AND DOSE**
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH**
  - Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

Treatment of hypoaesthesia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable
- **BY MOUTH**
  - Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** Milk reduces absorption.
- **SIDE-EFFECTS** Acute renal failure - reversible nephrogenic diabetes insipidus
- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should not be given to patients with renal impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 7, 9, 11, 23

**DEMECLOCYCLINE HYDROCHLORIDE (Non-proprietary)**

Demeclocycline hydrochloride 150 mg Demeclocycline 150mg capsules | 28 capsule [Pack] £81.49 DT price = £81.49

Doxycycline

**INDICATIONS AND DOSE**
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH**
  - Child 12-17 years: Initially 200 mg daily for 1 dose, then 100 mg daily; 200 mg daily, increased dose used for severe infections including refractory urinary-tract infections
  - Adult: Initially 200 mg daily for 1 dose, then 100 mg daily; 200 mg daily, increased dose used for severe infections including refractory urinary-tract infections

Acne
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg daily
  - Adult: 100 mg daily

Rosacea
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 100 mg daily

Papulopustular facial rosacea (without ocular involvement)
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

Early syphilis
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 14 days
  - Adult: 100 mg twice daily for 14 days
Late latent syphilis
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 100 mg twice daily for 28 days
▶ Adult: 100 mg twice daily for 28 days

Neurosyphilis
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: 200 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 100 mg twice daily for 7 days
▶ Adult: 100 mg twice daily for 7 days

Pelvic inflammatory disease
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 100 mg twice daily for 14 days
▶ Adult: 100 mg twice daily for 14 days

Lyme disease
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)
▶ Adult: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 100 mg twice daily
▶ Adult: 100 mg twice daily

Prophylaxis of malaria
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
▶ Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving

Adjunct to quinine in treatment of Plasmodium falciparum malaria
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 200 mg daily for 7 days
▶ Adult: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12-17 years: 20 mg twice daily for 3 months
▶ Adult: 20 mg twice daily for 3 months

− CAUTIONS Alcohol dependence

− INTERACTIONS The metabolism of doxycycline may be influenced by antiepileptics.

− SIDE-EFFECTS Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus

− PREGNANCY When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation.

− RENAL IMPAIRMENT Use with caution (avoid excessive doses).

− MONITORING REQUIREMENTS When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

− DIRECTIONS FOR ADMINISTRATION Capsules and tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

− PATIENT AND CARER ADVICE Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

− PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

− MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Minocycline**

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 12-17 years: 100 mg twice daily
- Adult: 100 mg twice daily

**Acne vulgaris**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
- Adult: 100 mg once daily, alternatively 50 mg twice daily

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Child 12-17 years: 100 mg daily
- Adult: 100 mg daily

Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

**CAUTIONS** Systemic lupus erythematosus

**SIDE-EFFECTS**

- Rare Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
- Very rare Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus
- Frequency not known Dizziness (more common in women) · vertigo (more common in women)

**RENAI IMPAIRMENT** Use with caution (avoid excessive doses).

**MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

**DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

**PATIENT AND CAREER ADVICE** Counselling on administration advised (posture).

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Rosacea**

**BY MOUTH**

- Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)
2.2 Leprosy

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890). The World Health Organization has made recommendations to overcome the problem of dapson p. 500 resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapson, rifampicin p. 508, and clofazimine p. 500. Other drugs with significant activity against Mycobacterium leprae include ofloxacin p. 494, minocycline p. 496 and clarithromycin p. 495. However, none of these are as active as rifampicin; at present they should be reserved for second-line drugs for leprosy.

A three-drug regimen is recommended for multidrug leprosy (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for paucibacillary leprosy (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine p. 500 for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 585 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 798 [unlicensed] is also useful in patients who have become corticosteroid-dependent, but it should be used only under specialist supervision. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must not be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course. Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

2.1 Anthrax

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of B. anthracis is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.
ANTIMYCOBACTERIALS

Clofazimine

INDICATIONS AND DOSE
Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen)

BY MOUTH
Adult:
- Adult: 300 mg once a month, (supervised administration) and 50 mg daily, (self-administered), alternatively 100 mg once daily on alternate days, (self-administered)
Lepromatous lepra reactions

BY MOUTH
Adult: Increased to 300 mg daily for max. 3 months
Severe type II (erythema nodosum leprosum) reactions

BY MOUTH
Adult: Increased to 100 mg 3 times a day for the first month (with subsequent reductions), may take 4–6 weeks to attain full effect

CAUTIONS
Avoid if persistent abdominal pain and diarrhoea - may discolour soft contact lenses

SIDE-EFFECTS
Abdominal pain - acne-like eruptions - anorexia - bowel obstruction - brownish-black discoloration of lesions and skin including areas exposed to light - dimmed vision - dry eyes - dry skin - elevation of blood sugar - eosinophilic enteropathy - headache - lymphenadenopathy - macular corneal pigmentation - nausea - photosensitivity - pruritus - rash - red discoloration of body fluids - red discoloration of foaecees - red discoloration of urine - reversible hair discoloration - splenic infarction - subepithelial corneal pigmentation - tiredness - vomiting (hospitalise if persistent) - weight loss

PREGNANCY
Use with caution.

BREAST FEEDING
May alter colour of milk; skin discoloration of infant.

HEPATIC IMPAIRMENT
Use with caution.

RENAL IMPAIRMENT
Use with caution.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

2.3 Lyme disease

Lyme disease

Lyme disease should generally be treated by those experienced in its management. Doxycycline p. 496, amoxicillin p. 482 [unlicensed indication] or cefuroxime p. 460 (as cefuroxime axetil) are the antibiotics of choice for early Lyme disease or Lyme arthritis. If these antibacterials are contra-indicated, a macrolide (e.g. clarithromycin p. 470) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 459, cefotaxime p. 457, or benzylpenicillin sodium p. 480 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.
2.4 Methicillin-resistant staphylococcus aureus

MRSA

Infection from *Staphylococcus aureus* strains resistant to meticillin (now discontinued) (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 486 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 508 or fusidic acid p. 463 should not be used alone because resistance may develop rapidly. A tetracycline alone or a combination of rifampicin and fusidic acid can be used for skin and soft-tissue infections caused by MRSA; clindamycin p. 467 alone is an alternative. A glycopeptide (e.g. vancomycin p. 465) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 477 can be used on expert advice. As linezolid is not active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 466 and daptomycin p. 468 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A tetracycline or clindamycin can be used for bronchiectasis caused by MRSA. A glycopeptide can be used for pneumonia associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A tetracycline can be used for urinary-tract infections caused by MRSA; trimethoprim p. 462 or nitrofurantoin p. 512 are alternatives. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for septicaemia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin p. 465 or teicoplanin p. 464 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 980.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success.

**Initial phase**

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 506, rifampicin p. 508, pyrazinamide p. 506 and ethambutol hydrochloride p. 505. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 451 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

**Continuation phase**

After the initial phase, treatment is continued for a further 4 months with isoniazid with rifampicin p. 510 (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

**Unsupervised treatment**

The unsupervised treatment regimen should be used for patients who are likely to take antituberculous drugs reliably without supervision. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

**Pregnancy and breast-feeding**

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

**Supervised treatment**

Drug administration needs to be fully supervised (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

**Immunocompromised patients**

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if
### Recommended dosage for standard unsupervised 6-month treatment

#### 2-month initial phase

| Ethambutol hydrochloride (for 2-month initial phase only) | - Child: 30 mg/kg 3 times a week  
- Adult: 30 mg/kg 3 times a week |

Infection is caused by resistant organisms, and specialist advice is needed. Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

### Corticosteroids

In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

### Prevention of tuberculosis

Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months; longer chemoprophylaxis is not recommended.

See prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive. See advice on immunisation against tuberculosis.

#### Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

### Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.
Rifabutin, another rifamycin, is indicated for prophylaxis against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regime if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include aminosalicylic acid below, amikacin p. 450, capreomycin p. 504, cyclodexine p. 594, newer macrolides (e.g. azithromycin p. 469 and clarithromycin p. 470), moxifloxacin p. 492 and prothionamide (prothionamide; no longer on UK market).

Bedaquiline below and delamanid p. 504 are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.

Management of tuberculosis in children

Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride for the first 2 months followed by isoniazid and rifampicin during the next 4 months.

However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

**Drugs used for Tuberculosis not listed below; Streptomycin, p. 451**

---

**ANTIMYCOBACTERIALS**

**Aminosalicylic acid**

**INDICATIONS AND DOSE**

Multiple-drug resistant tuberculosis, in combination with other drugs

**BY MOUTH**

- Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

Desensitisation regimen

**BY MOUTH**

- Adult: (consult product literature)

- **CAUTIONS** Peptic ulcer
  - **SIDE-EFFECTS** Common or very common Abdominal pain - bloating - diarrhea - nausea - rash - vestibular syndrome - vomiting
  - **Uncommon** Anorexia
  - **Rare** Gastrointestinal bleeding - hypothyroidism - jaundice - malabsorption syndrome - metallic taste - peptic ulcer - urticaria
  - **Very rare** Agranulocytosis - anaemia - crystalluria - dizziness - headache - hypoglycaemia - leucopenia - methemoglobinemia - peripheral neuropathy - purpura - tendon pain - thrombocytopenia - visual abnormalities - weight loss
  - **Frequency not known** Hepatitis - hypersensitivity
information available. Avoid concomitant use of hepatotoxic drugs unless essential.

- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
  - Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
  - Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

- **PATIENT AND CARER ADVICE** Dizziness may affect performance of skilled tasks (e.g. driving)

- **Missed doses** If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  | CAUTIONARY AND ADVISORY LABELS 4, 8, 21 |
  | Sirturo (Janssen-Cilag Ltd) ▼ |
  | Bedaquiline (as Bedaquiline fumarate) 100 mg Sirturo 100mg tablets | 188 tablet (£0.07) £18,700.00

### Capreomycin

**INDICATIONS AND DOSE**

Tuberculosis resistant to first-line drugs in combination with other drugs

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

- **CAUTIONS** Auditory impairment

- **INTERACTIONS** → Appendix 1 (capreomycin).

- **SIDE-EFFECTS** Induration at injection site — changes in liver function tests — electrolyte disturbances — hearing loss with tinnitus and vertigo — hypersensitivity reactions — leucocytosis — leucopenia — nephrotoxicity — neuromuscular block after large doses — pain at injection site — rashes — thrombocytopenia — urticaria

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—teratogenic in animal studies.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Reduce dose—consult product literature. Nephrotoxic; otoxic.

- **MONITORING REQUIREMENTS** Monitor renal, hepatic, auditory, and vestibular function and electrolytes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for injection**

  | CAPREOMYCIN (Non-proprietary) |
  | Capreomycin (as Capreomycin sulfate) 1 gram Capreomycin 1g powder for solution for injection vials | 1 vial (£0.07) £28.61

### Cycloserine

**INDICATIONS AND DOSE**

Tuberculosis resistant to first-line drugs, in combination with other drugs

**BY MOUTH**

- Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

**PHARMACOKINETICS**

Cycloserine penetrates the CNS.

- **CONTRA-INDICATIONS** Alcohol dependence - depression - epilepsy - psychotic states - severe anxiety

- **INTERACTIONS** → Appendix 1 (cycloserine).

- **SIDE-EFFECTS** Allergic dermatitis — changes in liver function tests — confusion — convulsions — depression — dizziness — drowsiness — headache — heart failure at high doses — megaloblastic anaemia — psychosis — rashes — tremor — vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.

Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

**BREAST FEEDING** Present in milk—amount too small to be harmful.

**RENAL IMPAIRMENT** Increase interval between doses if creatinine clearance less than 50 mL/minute. Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.

**MONITORING REQUIREMENTS**

- Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/ litre.

- Monitor haematological, renal, and hepatic function.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**

  | CAUTIONARY AND ADVISORY LABELS 2, 8 |
  | CYCLOSERINE (Non-proprietary) |
  | Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule (£0.06) £402.63 DT price = £402.63

### Delamanid

**INDICATIONS AND DOSE**

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

**BY MOUTH**

- Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia’s formula) – serum albumin less than 28 g/litre

- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

- **INTERACTIONS** → Appendix 1 (delamanid).
Caution when concomitant use with other drugs known to prolong the QT interval. Contra-indicated with concomitant use of potent CYP3A4 inducers.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · acne · agitation · anxiety · chest pain · cough · decreased appetite · depression · dermatitis · dyspepsia · dyspnoea · earache · haemoptysis · headache · hyperhidrosis · hyperlipidaemia · hypertension · hypokalaemia · hypotension · insomnia · malaise · nausea · oropharyngeal pain · osteoarthritis · palpitation · peripheral neuropathy · photophobia · psychiatric disorder · QT interval prolongation · reticulocytosis · tinnitus · tremor · vomiting
  - **Uncommon** Arrhythmias · balance disorder · dehydration · dysphagia · herpes zoster · hypocalcaemia · leucopenia · nocturia · rash · thrombocytopenia · urinary retention

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
  - Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Friderica’s formula).

- **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 8, 21
  - Deltyba (Otsuka Novel Products GmbH) ▼ Delmaranid 50 mg Deltyba 50mg tablets | 48 tablet | £1,250.00

**Ethambutol hydrochloride**

### INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

**BY MOUTH**
- Child: 20 mg/kg once daily for 2 months (initial phase)
- Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

**BY MOUTH**
- Child: 30 mg/kg 3 times a week for 2 months (initial phase)
- Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

**CONTRA-INDICATIONS** Optic neuritis · poor vision

**CAUTIONS** Elderly · young children

**CAUTIONS, FURTHER INFORMATION**

**Understanding warnings** Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

- **INTERACTIONS** → Appendix 1 (ethambutol).

- **SIDE-EFFECTS**
  - **Rare** Pruritus · rash · thrombocytopenia · urticaria
  - **Frequency not known** Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Ocular toxicity** Ocular toxicity is more common where excessive dosage is used or if the patient’s renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.

- **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment.

  If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.

  - In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
  - In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.

- **MONITORING REQUIREMENTS**
  - 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
  - Renal function should be checked before treatment.
  - Visual acuity should be tested by Snellen chart before treatment with ethambutol.
  - In young children, routine ophthalmological monitoring recommended.

- **PATIENT AND CARER ADVICE**
  - Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 8
  - ETHAMBUTOL HYDROCHLORIDE (Non-proprietary)
    - Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets | 56 tablet | £11.52 DT price = £11.52
    - Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets | 56 tablet | £42.74 DT price = £42.74
  - Also available in combination with isoniazid, pyrazinamide and rifampicin, p. 509
Isoniazid

INDICATIONS AND DOSE
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION
- Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- Adult: 300 mg daily for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION
- Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION
- Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- Child 12–17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin
- Adult: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

CONTRA-INDICATIONS Drug-induced liver disease

CAUTIONS Acute porphyrias p. 864 - alcohol dependence - diabetes mellitus - epilepsy - history of psychosis - HIV infection - malnutrition - slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION
Peripheral neuropathy Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 882 should be given prophylactically from the start of treatment.

INTERACTIONS → Appendix 1 (isoniazid).
When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

SIDE-EFFECTS
- Common or very common Peripheral neuropathy
- Rare Hepatitis - psychotic episodes

SIDE-EFFECTS, FURTHER INFORMATION
Hepatitis Hepatitis more common in those aged over 35 years.

PREGNANCY Not known to be harmful; prophylactic pyridoxine recommended.

- BREAST FEEDING Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.
- HEPATIC IMPAIRMENT Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.
- RENAL IMPAIRMENT Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 882 recommended.
- MONITORING REQUIREMENTS
  - Renal function should be checked before treatment.
  - Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
  - Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.
- PRESCRIBING AND DISPENSING INFORMATION
  - In children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may need to be recalculated to allow for weight gain in younger children.
- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Isoniazid for latent tuberculosis www.medicinesforchildren.org.uk/isoniazid-for-latent-tuberculosis
  - Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Pyrazinamide

INDICATIONS AND DOSE
Tuberculosis in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH
- Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
- Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
- Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
- Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)
Tuberculosis in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH
- Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
- Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
- Adult (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
- Adult (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

RENAL IMPAIRMENT
- Reduce dose if eGFR less than 30 mL/minute/1.73 m².
- Use half normal dose if eGFR less than 20 mL/minute/1.73 m².
- Use alternative family planning advice should be offered.
- Discontinue if serious side-effects develop.

INTERACTIONS
- Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- No information available.
- No information available.

SIDE-EFFECTS
- Rare
- Frequency not known
- Chest pain
- Dyspnoea
- Hepatitis
- Influenza-like symptoms
- No information available.

CONTRA-INDICATIONS
- No information available.

PATIENT AND CARER ADVICE
- Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
- Pyrazinamide (Non-proprietary) Pyrazinamide 500 mg Pyrazinamide 500mg tablets | 30 tablet £38.34 | 50 tablet £52.25

Also available in combination with ethambutol with isoniazid and rifampicin, p. 509 · Isoniazid and rifampicin, p. 510

NITROIMIDAZO-OXAZOLE ANTIBACTERIALS

RIFAMYCINS

Rifabutin

INDICATIONS AND DOSE
- Prophylaxis of Mycobacterium avium complex infections in immuno-suppressed patients with low CD4 count

BY MOUTH
- Adult: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

BY MOUTH
- Adult: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

BY MOUTH
- Adult: 150–450 mg once daily for at least 6 months

CAUTIONS
- Acute porphyrias p. 864 · discolours soft contact lenses

INTERACTIONS
- Appendix 1 (rifamycins)

SIDE-EFFECTS
- Common or very common
- Anaemia, blood disorders, leucopenia, myalgia, nausea, pyrexia, rash, thrombocytopenia
- Uncommon
- Arthralgia, body secretions coloured orange-red, bronchospasm, corneal deposits, eosinophilia, hypersensitivity reactions, jaundice, raised liver enzymes, saliva coloured orange-red, skin coloured orange-red, urine coloured orange-red, uveitis (especially following high doses or concomitant use with drugs that increase plasma concentration), vomiting
- Rare
- Haemolysis
- Frequency not known
- Chest pain, dyspnoea, hepatitis, influenza-like symptoms

SIDE-EFFECTS, FURTHER INFORMATION
- Discontinue permanently if serious side-effects develop.

ALLERGY AND CROSS-SENSITIVITY
- Contra-indicated in patients with rifamycin hypersensitivity.

CONCEPTION AND CONTRACEPTION
- Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

PREGNANCY
- No information available.

BREAST FEEDING
- No information available.

HEPATIC IMPAIRMENT
- Reduce dose in severe impairment.
- In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

RENAL IMPAIRMENT
- Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
- Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months; blood counts should also be monitored in these patients.
Blood counts should be monitored on prolonged therapy.

Hepatic function should be checked before treatment. If increase gradually.

Adult (body-weight 50 kg and above):

\[ \text{Rifabutin 150 mg} \]

\[ \text{Capsule} \]

CAUTIONARY AND ADVISORY LABELS 8, 14

Mycobutin (Pfizer Ltd)

rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule £30.38

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

**BY MOUTH**

- Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- Adult (body-weight up to 50 kg): 450 mg daily for 3 months
- Adult (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

**BY MOUTH**

- Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, under 35 years

**BY MOUTH**

- Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of Haemophilus influenzae type b disease

**BY MOUTH**

- Child 1-2 months: 10 mg/kg once daily for 4 days
- Child 3 months-11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- Child 12-17 years: 600 mg once daily for 4 days
- Adult: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

**BY MOUTH**

- Child 1-11 months: 5 mg/kg every 12 hours for 2 days
- Child 1-11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- Child 12-17 years: 600 mg every 12 hours for 2 days

Multibacillary leprosy in combination with dapson and clofazimine (3-drug regimen) Paucibacillary leprosy in combination with dapson (2-drug regimen)

**BY MOUTH**

- Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
- Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

**CONTRA-INDICATIONS** Acute porphyrias p. 864 jaundice

**CAUTIONS** Discourages soft contact lenses

**INTERACTIONS** Appendix 1 (rifampicins).

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens,
corticosteroids, phenytoin, sulfonylureas, and anticoagulants.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Acute renal failure • adrenal insufficiency • alterations of liver function • anorexia • antibiotic-associated colitis • body secretions coloured orange-red • collapse and shock • diarrhoea • disseminated intravascular coagulation • drowsiness • eosinophilia • exfoliative dermatitis • flushing • gastro-intestinal symptoms • haemolytic anaemia • headache • influenza-like symptoms • shortness of breath • Stevens-Johnson syndrome • thrombocytopenic purpura • toxic epidermal necrolysis • urine coloured orange-red • urticaria • vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use
  Thrombophlebitis reported if infusion used for prolonged period

**SIDE-EFFECTS, FURTHER INFORMATION**

Discontinue permanently if serious side-effects develop.

**Intermittent therapy**

Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with rifampicin hypersensitivity.

**CONCEPTION AND CONTRACEPTION**

Important

Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

**PREGNANCY**

Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

**BREAST FEEDING**

Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Impaired elimination. Avoid or do not exceed 8 mg/kg daily. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

**RENAL IMPAIRMENT**

- In children Use with caution if doses above 10 mg/kg daily.
- In adults Use with caution if dose above 600 mg daily.

**MONITORING REQUIREMENTS**

- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- Blood counts should be monitored in patients on prolonged therapy.
- Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in adults
  For intravenous infusion (Rifadin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.

- With intravenous use in children
  Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

**PRESCRIBING AND DISPENSING INFORMATION**

If treatment interruption occurs, re-introduce with low dosage and increase gradually.

- With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/rifampicin-for-meningococcal-prophylaxis

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

- **RIFAMPICIN (Non-proprietary)**
  - Rifampicin 150 mg Rifampicin 150mg capsules | 100 capsule £47.10
  - Rifampicin 300 mg Rifampicin 300mg capsules | 100 capsule £47.33–£48.00

**Ethambutol with isoniazid, pyrazinamide and rifampicin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethambutol hydrochloride p. 505, isoniazid p. 506, pyrazinamide p. 508, rifampicin p. 506.

**INDICATIONS AND DOSE**

Initial treatment of tuberculosis

**BY MOUTH**

- Adult (body-weight 30–39 kg): 2 tablets daily for 2 months (initial phase)
## Isoniazid with rifampicin

The properties listed below are those particular to the combination only. For the properties of the components please consider, isoniazid p. 506, rifampicin p. 508.

### INICATIONS AND DOSE

**Treatment of tuberculosis (continuation phase)**

**BY MOUTH**

- Adult (body-weight up to 50 kg): 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifater® 150/100 Tablets, preferably taken before breakfast.
- Adult (body-weight above 50 kg): 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifater® 300/150 Tablets, preferably taken before breakfast.

### Dose equivalence and conversion

Tablet quantities refer to the number of Voractiv® Tablets which should be taken. Each Voractiv® Tablet contains ethambutol hydrochloride 275 mg, isoniazid 75 mg, pyrazinamide 400 mg and rifampicin 150 mg.

---

### 2.6 Urinary tract infections

**Urinary-tract infections**

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy:

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.
Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

**Antibacterial therapy for lower urinary-tract infections**

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 462 or nitrofurantoin p. 512, or alternatively, amoxicillin p. 482, ampicillin p. 483 or oral cephalosporin.

Suggested duration of treatment is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 484 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 486, or a quinolone.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 456 have been recommended for long-term therapy.

Methenamine hippurate below (hexamine hippurate) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

**Antibacterial therapy for upper urinary-tract infections**

Acute pyelonephritis can lead to septicemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 460) or a quinolone if the patient is severely ill; gentamicin p. 450 can also be used.

Suggested duration of treatment is 10–14 days (longer treatment may be necessary in complicated pyelonephritis).

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 490 or ofloxacin p. 494), or alternatively, trimethoprim.

Suggested duration of treatment is 28 days. Where infection is localised and associated with an indwelling catheter, a bladder instillation is often effective.

**Pregnancy**

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

**Renal impairment**

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

**Urinary-tract infections in children**

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. **Antibacterial prophylaxis** with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

**Methenamine hippurate**

(Hexamine hippurate)

**INDICATIONS AND DOSE**

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections**

**BY MOUTH**

- Adult: 1 g every 12 hours

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**

**BY MOUTH**

- Adult: 1 g every 8–12 hours

- CONTRA-INDICATIONS
  - Gout
  - Metabolic acidosis
  - Severe dehydration

- INTERACTIONS
  - → Appendix 1 (methenamine).
  - Caution—avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents.

- SIDE-EFFECTS
  - Bladder irritation
  - Gastro-intestinal disturbances
  - Rash

- PREGNANCY
  - Use with caution.

- BREAST FEEDING
  - Amount too small to be harmful.

- HEPATIC IMPAIRMENT
  - Avoid.

- RENAL IMPAIRMENT
  - Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.

- LESS SUITABLE FOR PRESCRIBING
  - Methenamine (hexamine) hippurate should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
Nitrofurantoin

**INDICATIONS AND DOSE**

**Acute uncomplicated urinary-tract infections**

- Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
- Child 12–17 years: 50 mg 4 times a day for 3–7 days
- Adult: 50 mg 4 times a day for 3–7 days

**Severe chronic recurrent urinary-tract infections**

- Child 12–17 years: 100 mg twice daily, dose to be taken with food
- Adult: 100 mg twice daily, dose to be taken with food

**Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**

- Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
- Child 12–17 years: 50–100 mg once daily, dose to be taken at night
- Adult: 50–100 mg once daily, dose to be taken at night

**Genito-urinary surgical prophylaxis**

- Adult: 100 mg twice daily on day of procedure and for 3 days after

**CONTRA-INDICATIONS**

Acute porphyrias (exclude if G6PD-deficient infants).

**CAUTIONS**

Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency

**INTERACTIONS**

Appendix 1 (nitrofurantoin).

**SIDE-EFFECTS**

- Rare: Agranulocytosis · aplastic anaemia · arthralgia · benign intracranial hypertension · blood disorders · cholestatic jaundice · erythema multiforme · exfoliative dermatitis · hepatitis · pancreatitis · thrombocytopenia · transient alopecia
- Frequency not known: Acute pulmonary reactions · anaphylaxis · angioedema · anorexia · chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) · diarrhoea · hypersensitivity reactions · nausea · peripheral neuropathy · pruritus · rash · sialadenitis · urticaria · vomiting

**PREGNANCY**

Avoid at term—may produce neonatal haemolysis.

**BREAST FEEDING**

Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.

**HEPATIC IMPAIRMENT**

Use with caution; cholestatic jaundice and chronic active hepatitis reported.

**RENAL IMPAIRMENT**

Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.

In adults: Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

In children: Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

**MONITORING REQUIREMENTS**

On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).

**EFFECT ON LABORATORY TESTS**

False positive urinary glucose (if tested for reducing substances).

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Nitrofurantoin 100 mg Macrodantin 100mg modified-release capsules | 14 capsule | £9.90 DT price = £9.50

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 9, 14, 21

- NITROFURANTOIN (Non-proprietary)

Nitrofurantoin 3 mg per 1 ml Nitrofurantoin 25mg/5ml oral suspension sugar free (sugar-free) | 300 ml | £260.46 DT price = £260.46

3 Fungal infection

**Antifungals, systemic use**

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

**Aspergillosis**

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 521 is the treatment of choice for aspergillosis; liposomal amphotericin p. 517 is an alternative first-line treatment.
when voriconazole cannot be used. Caspofungin p. 515, itraconazole p. 519, or posaconazole p. 521 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 518 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

Oral thrush (candidiasis) generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, an echinocandin can be used. Fluconazole is an alternative for Candida albicans infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin p. 517 is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 516 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 514 are used more frequently than griseofulvin p. 514 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission.

Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine is used for tinea capitis caused by T. tonsurans [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain.

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; terbinafine is considered to be the drug of choice.

Itraconazole can be administered as intermittent ‘pulse’ therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole p. 519, but fluconazole is not effective against Aspergillus spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole p. 521 can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin p. 516 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used. Amphotericin p. 517 by intravenous infusion or caspofungin p. 515 is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections. Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria. Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment. Voriconazole p. 521 is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 712, econazole nitrate p. 712, ketoconazole p. 713, and tioconazole p. 1012. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 997 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.
Polyene antifungals

The polyene antifungals include amphotericin p. 517 and nystatin p. 997; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include anidulafungin p. 515, caspofungin p. 515 and micafungin p. 516. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

Other antifungals

Flucytosine p. 516 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin below is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophytosis in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine below is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

**ANTIFUNGALS**

**Griseofulvin**

**INDICATIONS AND DOSE**

Dermatophyte infections where topical therapy has failed or is inappropriate

**BY MOUTH**

- **Child 1 month–11 years:** Usual dose 10 mg/kg daily (max. per dose 500 mg), alternatively 20 mg/kg daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- **Child 12–17 years:** 500 mg daily, alternatively 1 g daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- **Adult:** 500 mg daily, alternatively 1 g daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

**Tinea capitis caused by *Trichophyton tonsurans***

**BY MOUTH**

- Child 1 month–11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily in divided doses
- **Child 12–17 years:** 1 g once daily, alternatively 1 g daily in divided doses
- **Adult:** 1 g once daily, alternatively 1 g daily in divided doses

**SIDE-EFFECTS**

- **Rare** Erythema multiforme - toxic epidermal necrolysis
- **Very rare** Headache
- **Frequency not known** Abdominal pain - agitation - confusion - depression - diarrhoea - dizziness - dyspepsia - fatigue - glossitis - hepatotoxicity - impaired coordination - impaired hearing - leucopenia - menstrual disturbances - nausea - peripheral neuropathy - photosensitivity - rash - renal failure - sleep disturbances - systemic lupus erythematosus - taste disturbances - vomiting

**CONTRA-INDICATIONS**

- Acute porphyrias
- Systemic lupus erythematosus (risk of exacerbation)

**INTERACTIONS**

- **Effective** contraception required during and for at least 6 months after administration
- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in animals)
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.
- **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**MATERIAL HANDLING**

- Medicines for Children leaflet: Griseofulvin for fungal infections www.medicinesforchildren.org.uk/griseofulvin-for-fungal-infections

**TRENDS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**Terbinafine**

**INDICATIONS AND DOSE**

**Tinea pedis**

**BY MOUTH**

- **Adult:** 250 mg daily for 2–6 weeks

**Tinea corporis**

**BY MOUTH**

- **Adult:** 250 mg once daily for 4 weeks

**Tinea cruris**

**BY MOUTH**

- **Adult:** 250 mg once daily for 2–4 weeks
Dermatophyte infections of the nails

BY MOUTH
- Adult: 250 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)

- **CAUTIONS** Autoimmune disease (risk of lupus-erythematosus-like effect) • psoriasis (risk of exacerbation)
- **INTERACTIONS** → Appendix 1 (terbinafine).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort • anorexia • arthralgia • diarrhoea • dyspepsia • headache • myalgia • nausea • rash • urticaria
  - **Uncommon** Taste disturbance
  - **Rare** Cholestasis • dizziness • hepatitis • hypoaesthesia • jaundice • Liver toxicity • malaise • paraesthesia
  - **Very rare** Alopoeia • blood disorders • lupus erythematosus-like effect • neutropenia • photosensitivity • serious skin reactions • Stevens-Johnson syndrome • thrombocytopenia • toxic epidermal necrolysis

- **INTERACTIONS**
  - **Frequency not known** Disturbances in smell • exacerbation of psoriasis • hearing disturbances • influenza-like symptoms • pancreatitis • rhabdomyolysis • vasculitis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Liver toxicity** Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).
  - **Serious skin reactions** Discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—unless potential benefit outweighs risk—present in milk in animal studies.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ecalta®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.
- **MEDICINAL FORMS**
  - **Present in milk in animal**
  - **Contraindications** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Ecalta** (Pfizer Ltd)
  - **Anidulafungin 100 mg** Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial | £295.99

### Caspofungin

**INDICATIONS AND DOSE**
- Invasive aspergillosis • Invasive candidiasis • Empirical treatment of systemic fungal infections in patients with neutropenia

**BY INTRAVENOUS INFUSION**
- Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
- Adult (body-weight 81 kg and above): 70 mg once daily

- **INTERACTIONS** → Appendix 1 (caspofungin).
- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia • diarrhoea • dyspnoea • headache • hypokalaemia • injection-site reactions • nausea • pruritus • rash • sweating • vomiting
  - **Uncommon** Abdominal pain • anaemia • anorexia • anxiety • arthralgia • ascites • blurred vision • bronchospasm • chest pain • cholestasis • constipation • cough • disorientation • dizziness • dry mouth • dyspepsia • dysphagia • erythema multiforme • fatigue • flatulence • flushing • heart failure • hepatic dysfunction • hyperglycaemia • hypertension • hypoaesthesia • hypocalcaemia • hypomagnesaemia • hypotension • leukopenia • metabolic acidosis • muscular weakness • myalgia • palpitation • paraesthesia • renal failure • sleep disturbances • taste disturbances • thrombocytopenia • thrombopelititis • tremor
  - **Frequency not known**
    - **Adult** Respiratory distress syndrome • anaphylaxis

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** 70 mg on first day then 35 mg once daily in moderate impairment. No information available for severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cancidas®), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature, initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

### Echinocandin Antifungals

**Anidulafungin**

**INDICATIONS AND DOSE**
- Invasive candidiasis

**BY INTRAVENOUS INFUSION**
- Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

- **SIDE-EFFECTS**
  - **Common or very common** Coagulopathy • convulsion • diarrhoea • flushing • headache • hypokalaemia • nausea • pruritus • raised serum creatinine • rash • vomiting
  - **Uncommon** Abdominal pain • cholestasis • hyperglycaemia • hypertension • injection-site pain • urticaria

- **Frequency not known** Bronchospasm • dyspnoea • hepatitis • hypotension
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ecalta®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.
- **MEDICINAL FORMS**
  - **Present in milk in animal**
  - **Contraindications** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Ecalta** (Pfizer Ltd)
  - **Anidulafungin 100 mg** Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial | £295.99
Micafungin

INDICATIONS AND DOSE

- **Invasive candidiasis**
  - **Adult (body-weight up to 40 kg):** 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
  - **Adult (body-weight 40 kg and above):** 150 mg once daily

- **Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**
  - **Adult (body-weight up to 40 kg):** 1 mg/kg once daily continue for at least 7 days after neutrophil count is desirable range
  - **Adult (body-weight 40 kg and above):** 50 mg once daily continue for at least 7 days after neutrophil count is desirable range

- **Blood disorders**

INTERACTIONS

→ Appendix 1 (micafungin).

SIDE-EFFECTS

- **Common or very common**
  - Abdominal pain - anaemia - diarrhoea - fever - headache - hypocalcaemia - hypokalaemia - hypomagnesaemia - leucopenia - nausea - phlebitis - rash - vomiting

- **Uncommon**

- **Rare**
  - Haemolytic anaemia

- **Frequency not known**
  - Disseminated intravascular coagulation - hepatoxicity (potentially life-threatening) - renal failure - Stevens-Johnson syndrome - toxic epidermal necrolysis

PREGNANCY

Manufacturer advises avoid unless essential—toxicity in animal studies.

BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT

Use with caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT

Use with caution; renal function may deteriorate.

MONITORING REQUIREMENTS

- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Mycamine®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

FLUORONATED PYRIMIDINE ANTIFUNGALS

Flucytosine

INDICATIONS AND DOSE

- **Systemic yeast and fungal infections**
  - Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

BY INTRAVENOUS INFUSION

- **Adult:** Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for sensitive organisms

- **Cryptococcal meningitis (adjunct to amphotericin)**
  - **Adult:** 100 mg/kg daily in 4 divided doses for 2 weeks

UNLICENSED USE

Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

CAUTIONS

- Blood disorders - elderly

INTERACTIONS

→ Appendix 1 (flucytosine).

SIDE-EFFECTS

- **Common or very common**
  - Diarrhoea - nausea - rash - vomiting

- **Uncommon**
  - Alterations in liver function tests

- **Frequency not known**
  - Aplastic anaemia - blood disorders - hepatic necrosis - hepatitis - leucopenia - thrombocytopenia

PREGNANCY

Teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING

Manufacturer advises avoid.

RENAL IMPAIRMENT

Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

MONITORING REQUIREMENTS

- For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
- Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, give over 20–40 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.
Solution for infusion  
ELECTROLYTES: May contain Sodium  
- Ancotil (Medica Pharmaceuticals Ltd)  
- Fluocytosine 10 mg per 1 ml Ancotil 2.5g/250ml solution for infusion bottles | 5 bottle pack £151.67 (Hospital only)

POLYENE ANTIFUNGALS

Amphotericin (Amphotericin B)

**INDICATIONS AND DOSE**

**AMBISOME®**  
Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

**BY INTRAVENOUS INFUSION**
- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day
- Aspergillosis
  - Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day
- Visceral leishmaniasis (unresponsive to the antimonial alone)
  - Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNGIZONE®**  
Systemic fungal infections

**BY INTRAVENOUS INFUSION**
- Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

**ABELCET®**  
Severe invasive candidiasis  | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

**BY INTRAVENOUS INFUSION**
- Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

**UNLICENSED USE**

**AMBISOME®** Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

**CAUTIONS**  
Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

**CAUTIONS, FURTHER INFORMATION**

Anaphylaxis  
Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Phrophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

**INTERACTIONS**  
- Appendix 1 (amphotericin). Caution—corticosteroids (avoid except to control reactions).

**SIDE-EFFECTS**

- **Common or very common**  
  Abdominal pain  | abnormal liver function (discontinue treatment)  | anaemia  | arrhythmias  | blood disorders  | blood pressure changes  | cardiovascular effects  | chest pain  | diarrhoea  | disturbances in renal function  | dyspnoea  | electrolyte disturbances  | febrile reactions  | headache  | hypokalaemia  | hypomagnesaemia  | nausea  | rash  | renal tubular acidosis  | thrombocytopoenia  | vomiting

- **Uncommon**  
  Anaphylactoid reactions  | bronchospasm  | convulsions  | diplopia  | encephalopathy  | hearing loss  | neurological disorders  | peripheral neuropathy  | tremor

- **Frequency not known**  
  Anorexia  | arthralgia  | myalgia  | Stevens–Johnson syndrome  | toxic epidermal necrolysis

**PREGNANCY**  
Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

**BREAST FEEDING**  
No information available.

**RENAL IMPAIRMENT**  
Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

**MONITORING REQUIREMENTS**  
Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

**DIRECTIONS FOR ADMINISTRATION**

**AMBISOME®**

Amphotericin (liposomal)  
For intravenous infusion (Ambisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

**FUNGIZONE®**

Amphotericin (as sodium deoxycholate complex)  
For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

**ABELCET®**

Amphotericin (lipid complex)  
For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20–20 mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium
518 Fungal infection

Infection

chlordane or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral solution, lozenge

**Powder for solution for infusion**

- **Excipients**: May contain Sodium Chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

**Vulvovaginal candidiasis (recurrent)** Considered interchangeable. To avoid confusion, preparations of intravenous amphotericin vary in their licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral solution, lozenge

**INDICATIONS AND DOSE**

- **BY MOUTH**
  - Child 12–16 years: 150 mg for 1 dose
  - Adult: 150 mg for 1 dose

- **Vaginal candidiasis**
  - Child 12–16 years: 150 mg for 1 dose
  - Adult: 150 mg for 1 dose

- **Vulvovaginal candidiasis (recurrent)**
  - Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

**Mucosal candidiasis (except genital)**

- **BY MOUTH OR BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
  - Child 12–17 years: 50 mg for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

- **BY MOUTH**
  - Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

**Amphotericin**

- **Child 12–16 years**: 100 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
- **Adult**: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

**Prevention of fungal infections in immunocompromised patients** (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

- **BY MOUTH OR BY INTRAVENOUS INFUSION**
  - Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

**Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**

- **BY MOUTH OR BY INTRAVENOUS INFUSION**
  - Adult: 200 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Susceptibility to QT interval prolongation
- **INTERACTIONS** → Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment. Caution with concomitant use of hepatotoxic drugs.

- **SIDE-EFFECTS**
  - Common or very common Abdominal discomfort, diarrhoea, flatulence, headache, nausea, rash
  - Uncommon Alopecia, anaphylaxis, angioedema (in children), dizziness, dyspepsia, hepatic disorders, hyperlipidaemia, hypersensitivity reactions (in adults), pruritus, seizures, Stevens-Johnson syndrome, taste disturbance, toxic epidermal necrolysis, vomiting
  - Frequency not known Hypokalaemia, leucopenia, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Toxicity with related drugs.
**Itraconazole**

**INDICATIONS AND DOSE**

**Vulvovaginal candidiasis**
- **BY MOUTH**
  - Adult: 200 mg twice daily for 1 day

**Vulvovaginal candidiasis (recurrent)**
- **BY MOUTH**
  - Adult: 50–100 mg daily for 6 months

**Oral or oesophageal candidiasis that has not responded to fluconazole**
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

**Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients**
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

**Systemic candidiasis where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Adult: 100–200 mg once daily

**BY INTRAVENOUS INFUSION**
- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Pityriasis versicolor**
- **BY MOUTH**
  - Adult: 200 mg once daily for 7 days

**Tinea pedis | Tinea manuum**
- **BY MOUTH**
  - Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

**Tinea corporis | Tinea cruris**
- **BY MOUTH**
  - Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

**Onychomycosis**
- **BY MOUTH**
  - Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

**Aspergillosis**
- **BY MOUTH**
  - Adult: 200 mg twice daily

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**
- **BY INTRAVENOUS INFUSION**
  - Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Histoplasmosis**
- **BY MOUTH**
  - Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

**BY INTRAVENOUS INFUSION**
- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily continued**
Infection

520  Fungal infection

BY INTRAVENOUS INFUSION
• Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

BY MOUTH
• Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic
• Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

UNLICENSED USE Itraconazole doses in BNF may differ from those in product literature.

Important safety information

HEART FAILURE
Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:
• patients receiving high doses and longer treatment courses;
• older adults and those with cardiac disease;
• patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
• patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

CONTRA-INDICATIONS Acute porphyrias p. 864

CAUTIONS Active liver disease • history of hepatotoxicity with other drugs • susceptibility to congestive heart failure

INTERACTIONS → Appendix 1 (antifungals, triazole).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
• Common or very common Abdominal pain • diarrhoea • dyspnoea • headache • hepatitis • hyponatraemia • nausea • rash • taste disturbances • vomiting
• Uncommon Constipation • dizziness • dyspepsia • flatulence • menstrual disorder • myalgia • oedema • peripheral neuropathy (discontinue treatment)
• Rare Alopecia • deafness • erectile dysfunction • heart failure • hypertriglyceridaemia • leucopenia • pancreatitis • photosensitivity • Stevens-Johnson syndrome • tinnitus • toxic epidermal necrolysis • urinary frequency • visual disturbances
• Frequency not known Arthralgia • blood pressure changes • confusion • drowsiness • hepatotoxicity • renal impairment • thrombocytopenia • tremor

SPECIFIC SIDE-EFFECTS
• With intravenous use Hyperglycaemia

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

PREGNANCY Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

BREAST FEEDING Small amounts present in milk—may accumulate; manufacturer advises avoid.

HEPATIC IMPAIRMENT Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

RENAL IMPAIRMENT Risk of congestive heart failure.
• With oral use Bioavailability of oral formulations possibly reduced.
• With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusions if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
• Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
• Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

DIRECTIONS FOR ADMINISTRATION
• With intravenous use For intravenous infusion (Sporanox®), give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.
• With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry.

PATIENT AND CARER ADVICE Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop. Patients or carers should be given advice on how to administer itraconazole oral liquid.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25

Itraconazole 100 mg Itraconazole 100mg capsules | 4 capsule [POM] £3.75 | 15 capsule [POM] £21.50 DT price = £4.57 | 60 capsule [POM] £17.74/£56.21

Sporanox (Janssen-Cilag Ltd)
Itraconazole 100 mg Sporanox-Pulse 100mg capsules | 28 capsule [POM] £25.72
Sporanox 100mg capsules | 4 capsule [POM] £3.67 | 15 capsule [POM] £13.77 DT price = £4.57 | 60 capsule [POM] £55.10

Oral solution

CAUTIONARY AND ADVISORY LABELS 5, 9, 23

Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar free (sugar-free) | 150 ml [POM] £58.34 DT price = £58.34

Sporanox (Janssen-Cilag Ltd)
Itraconazole 10 mg per 1 ml Sporanox 50mg/5ml oral solution (sugar-free) | 150 ml [POM] £58.34 DT price = £58.34

Solution for infusion

EXCipients: May contain Propylene glycol

Sporanox (Janssen-Cilag Ltd)
Itraconazole 10 mg per 1 ml Sporanox IV 250mg/25ml solution for infusion ampoules and diluent | 1 ampoule [POM] £79.71
Posaconazole

**INDICATIONS AND DOSE**

Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin | Fusariosis either unresponsive to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole (occasionally unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole)

**BY MOUTH USING ORAL SUSPENSION**
- Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, dose if food not tolerated

**BY MOUTH USING TABLETS**
- Adult: 300 mg twice daily on first day, then 300 mg once daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)

**BY MOUTH USING ORAL SUSPENSION**
- Adult: 200 mg on first day, then 100 mg once daily for 13 days, dose if not tolerated

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole

**BY MOUTH USING ORAL SUSPENSION**
- Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food

**BY MOUTH USING TABLETS**
- Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain | anaemia | anorexia | blood disorders | constipation | diarrhea | dizziness | drowsiness | dry mouth | dyspepsia | electrolyte disturbances | fatigue | fever | flatulence | gastro-intestinal disturbances | headache | nausea | neutropenia | paraesthesia | pruritus | rash | thrombocytopaenia | vomiting
- **Uncommon** Alopecia | aphasia | arthralgia | bradycardia | cholestasis | convulsions | cough | gastroesophageal reflux | hepatic disorders | hiccups | hyperglycaemia | insomnia | menorrhagia | mouth ulcers | musculoskeletal pain | neuropathy | oedema | palpitation | pancreatitis | renal failure | tachycardia | tremor | vasculitis | visual disturbances
- **Rare** Adrenal insufficiency | breast pain | cardiac failure | depression | encephalopathy | hearing impairment | ileus | myocardial infarction | pneumonitis | psychosis | Stevens-Johnson syndrome | stroke | syncope | thrombosis

**CONTRA-INDICATIONS**

- Acute porphyrias

**PRECAUTIONS AND DISPENSING INFORMATION**

Where possible, Noxafil® tablets should be used in preference to the suspension because the tablets have a higher bioavailability; the suspension is not interchangeable with the tablets on a milligram-for-milligram basis. Flavours of oral liquid formulations may include cherry.

**CONCEPTION AND CONTRACEPTION**

Manufacturer recommends effective contraception during treatment.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Monitor liver function in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
- Monitor liver function before and during therapy.

**GASTRO-RESISTANT TABLET**

**CAUTIONARY AND ADVISORY LABELS** 3, 9, 25

Posaconazole 100 mg | Novofox 100mg gastro-resistant tablets | 24 tablet (PMS) £596.96 | 96 tablet (PMS) £2,387.85

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 3, 9, 21

Posaconazole 40 mg per 1 ml | Novofox 40mg/ml oral suspension | 105 ml (PMS) £491.20 (Hospital only)

Voriconazole

**INDICATIONS AND DOSE**

Invasive aspergillosis | Serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)

**BY MOUTH**
- Adult (body-weight up to 40 kg): 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, (by mouth) increased if necessary to 150 mg every 12 hours
- Adult (body-weight 40 kg and above): 400 mg every 12 hours, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

**BY INTRAVENOUS INFUSION**
- Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours for max. 6 months; reduced if not tolerated to 3 mg/kg every 12 hours

**CONTRA-INDICATIONS**

- Acute porphyrias

**CAUTIONS**

Avoid exposure to sunlight | bradycardia | cardiomyopathy | electrolyte disturbances | history of QT interval prolongation | patients at risk of pancreatitis | symptomatic arhythmias

**INTERACTIONS**

- Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs known to cause QT-interval prolongation.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain | acute renal failure | agitation | alopecia | altered perception | anaemia | anxiety | asthenia | blood disorders | blurred vision | chest pain | confusion | depression | diarrhoea | dizziness | encephalopathy | hallucinations | headache | hypertensive encephalopathy | hypokalaemia | hypoglycaemia | hypothyroidism | influenza-like symptoms | jaundice | leucopenia | nausea | oedema | pancytopenia | paraesthesia | photophobia | photosensitivity | pruritus | rash | respiratory distress

**GENERAL SIDE-EFFECTS**
syndrome · sinusitis · thrombocytopenia · tremor · visual disturbances · vomiting

- **Uncommon** Adrenocortical insufficiency · arrhythmias · arthritis · ataxia · blepharitis · cholecystitis · constipation · duodenitis · dyspepsia · flushing · fulminant hepatic failure · gingivitis · glossitis · hepatitis · hypersensitivity reactions · hypoglycaemia · hypotension · hypoxia · optic neuritis · pancreatitis · psoriasis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope

- **Rare** Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hyperthyroidism · hypertension · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis

- **Frequency not known** On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · periostitis (particularly in transplant patients)

### SPECIFIC SIDE-EFFECTS

- **Common or very common**
- **With intravenous use** Injection-site reactions

### SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

- **Phototoxicity** Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

### CONCEPTION AND CONTRACEPTION

Effective contraception required during treatment.

### PREGNANCY

Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

### BREAST FEEDING

Manufacturer advises avoid—no information available.

### HEPATIC IMPAIRMENT

In mild to moderate hepatic cirrhosis use usual initial dose then halve maintenance dose. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.

### RENAL IMPAIRMENT

Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

### MONITORING REQUIREMENTS

- Monitor renal function.
- Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

### DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give at a rate not exceeding 3 mg/kg/hour.

### PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include orange.

### PATIENT AND CARER ADVICE

Patients and their carers should be advised to keep the Alert Card with them at all times. Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAFÉTORY AND ADVISORY LABELS 9, 11, 23**
- **VFEND (Pfizer Ltd)**
  - **Voriconazole 50 mg** VFEND 50mg tablets | 28 tablet £27.68
  - **Voriconazole 200 mg** VFEND 200mg tablets | 28 tablet £110.74

**Oral suspension**

- **CAFÉTORY AND ADVISORY LABELS 9, 11, 23**
- **VFEND (Pfizer Ltd)**
  - Voriconazole 40 mg per 1 ml VFEND 40mg/ml oral suspension | 75 ml [Post] £51.37

**Powder for solution for infusion**

EXCIPIENTS: May contain Sulfobutylether beta cyclodextrin sodium

- **VFEND (Pfizer Ltd)**
  - Voriconazole 200 mg VFEND 200mg powder for solution for infusion vials | 1 vial [Post] £77.14

**Powder and solvent for solution for infusion**

EXCIPIENTS: May contain Sulfobutylether beta cyclodextrin sodium

- **VFEND (Pfizer Ltd)**
  - Voriconazole 200 mg VFEND 200mg powder and solvent for solution for infusion vials | 1 vial [Post] £77.14

---

### 3.1 Pneumocystis pneumonia

**Pneumocystis pneumonia**

Pneumonia caused by *Pneumocystis jirovecii (Pneumocystis carinii)* occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

**Treatment**

**Mild to moderate disease**

Co-trimoxazole p. 461 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 523 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 500 with trimethoprim p. 462 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 467 and primaquine p. 538 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

**Severe disease**

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 523 given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.
Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

**Adjunctive therapy**
In moderate to severe infections associated with HIV infection, prednisolone p. 585 is given by mouth for 5 days (alternatively, hydrocortisone p. 583 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**
Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers (alternatively, dapsone p. 500 can be used. Atovaquone below has also been used for prophylaxis [unlicensed indication].

**Pentamidine isetionate**

**INDICATIONS AND DOSE**
Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)
- **BY INTRAVENOUS INFUSION**
  - Adult: 4 mg/kg once daily for at least 14 days
- **Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)**
  - **BY INHALATION OF NEBULISED SOLUTION**
    - Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature
- **Visceral leishmaniasis**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary
- **Cutaneous leishmaniasis**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 3–4 mg/kg 1–2 times a week until condition resolves
- **Trypanosomiasis**
  - **BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION**
    - Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

**Atovaquone**

**INDICATIONS AND DOSE**
Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole
- **BY MOUTH**
  - Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food
- **Prophylaxis against pneumocystis pneumonia**
  - **BY MOUTH**
    - Adult: 750 mg twice daily

**UNLICENSED USE**
Not licensed for primary prevention of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia by inhalation of nebulised solution

**CAUTIONS**
Other causes of pulmonary disease should be sought and treated - elderly - initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)

**INTERACTIONS**
Appendix 1 (atovaquone).

**SIDE-EFFECTS**
**GENERAL SIDE-EFFECTS**
Abnormal liver-function tests - acute renal failure - anaemia - arrhythmias (can be severe and sometimes fatal) - azotaemia - dizziness - flushing - hyperglycaemia - hyperkalaemia - hypoglycaemia - hypokalaemia - hypomagnesaemia - hypotension - leucopenia - risk of severe hypotension following administration - thrombocytopenia

**SPECIFIC SIDE-EFFECTS**
- **When used by inhalation**
  - Bronchoconstriction (may be prevented by prior use of bronchodilators) - cough - shortness of breath
- **With intramuscular use**
  - Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **With intravenous use**
  - Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)

**PREGNANCY**
Manufacturer advises avoid unless essential.
524 Helminth infection

Helminth infections

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Drugs for threadworms

Anthelmintics are effective in threadworm (pinworms, Enterobius vermicularis) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment. Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 526 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against Ascaris lumbricoides and is generally considered to be the drug of choice.

Drugs for tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in Taenia solium infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 526 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by Echinococcus granulosus grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 525 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to E. multilocularis is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Drugs for hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole p. 526 has a useful broad-spectrum activity, and is effective against hookworms. Albendazole p. 525 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole p. 525 is also also effective in children.

Schistosomicides (bilharziasis)

Adult Schistosoma haematobium worms live in the genito-urinary veins and adult S. mansoni in those of the colon and mesentery. S. japonicum is more widely distributed in veins of the alimentary tract and portal system. Praziquantel p. 526 [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is
Diethylcarbamazine

**INDICATIONS AND DOSE**

- *Wuchereria bancrofti* infections | *Brugia malayi* infections

**BY MOUTH**

- Adult: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

- *Loa loa* infections

**BY MOUTH**

- Adult: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days; maximum 9 mg/kg per day

**INTERACTIONS** → Appendix 1 (diethylcarbamazine).

**MEDICINAL FORMS**

Medicines are available from importing manufacturers.

Ivermectin

**INDICATIONS AND DOSE**

- Chronic *Strongyloides* infection

**BY MOUTH**

- Adult: 200 micrograms/kg daily for 2 days

- *Onchocerciasis*

**BY MOUTH**

- Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months may be required depending on symptoms

- Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone

**BY MOUTH**

- Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

**UNLICENSED USE** Ivermectin is an unlicensed drug.

**INTERACTIONS** → Appendix 1 (ivermectin).

**SIDE-EFFECTS** Aggravation of itching - aggravation of rash

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Levamisole

**INDICATIONS AND DOSE**

- Roundworm infections

**BY MOUTH**

- Adult: 120–150 mg for 1 dose

**UNLICENSED USE** Not licensed.

**CONTRA-INDICATIONS** Blood disorders

**CAUTIONS** Epilepsy - Sjögren’s syndrome

**INTERACTIONS** → Appendix 1 (levamisole).

**SIDE-EFFECTS** Arthralgia (on prolonged treatment) - blood disorders (on prolonged treatment) - convulsions (on prolonged treatment) - diarrhoea - dizziness - headache - influenza-like syndrome (on prolonged treatment) - insomnia (on prolonged treatment) - myalgia (on prolonged treatment) - nausea - rash (on prolonged treatment) - taste disturbances (on prolonged treatment) - vasculitis (on prolonged treatment) - vomiting

**PREGNANCY** Embryotoxic in animal studies, avoid if possible.

**ANNEXES**

**MEDICATION**

- Albendazole
- Ivermectin
- Levamisole

---

effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

**Drugs for cutaneous larva migrans (creeping eruption)**

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical thiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or thiabendazole (thiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

**Drugs for strongyloidiasis**

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

**ANTHELMIINTICS**

**Albendazole**

**INDICATIONS AND DOSE**

- Chronic *Strongyloides* infection

**BY MOUTH**

- Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

- Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

**BY MOUTH**

- Adult: (consult product literature)

- Hookworm infections

**BY MOUTH**

- Adult: 400 mg for 1 dose

**UNLICENSED USE** Albendazole is an unlicensed drug.

**INTERACTIONS** → Appendix 1 (albendazole).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet
### Mebendazole

**INDICATIONS AND DOSE**

#### Threadworm infections

**BY MOUTH**
- Child 6 months-17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
- Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

#### Whipworm infections | Hookworm infections

**BY MOUTH**
- Child 1-17 years: 100 mg twice daily for 3 days
- Adult: 100 mg twice daily for 3 days

#### Roundworm infections

**BY MOUTH**
- Child 1 year: 100 mg twice daily for 3 days
- Child 2-17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
- Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

**SIDE-EFFECTS**
- Common or very common Abdominal pain
- Uncommon Diarrhoea; flatulence
- Rare Alopecia; convulsions; dizziness; neutropenia; rash; Stevens-Johnson syndrome; toxic epidermal necrolysis; urticaria

**PREGNANCY**
- Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**
- Amount present in milk too small to be harmful but manufacturer advises avoid.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include banana.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

**EXCEPTIONS TO LEGAL CATEGORY**
- Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

**UNLICENSED USE**
- Not licensed for use in children under 2 years. Treatment of roundworm infections with mebendazole 500 mg as a single dose is an unlicensed dose.

**INTERACTIONS** → Appendix 1 (mebendazole).

### Antiprotozoal drugs

#### Amoebicides

**Mebendazole**

- Brands may include: Ovex

- **Vermox** (Janssen-Cilag Ltd)
  - Mebendazole 100 mg
  - Mebendazole 20 mg per 1 ml
  - Vermox 100mg/5ml oral suspension | 30 ml (£0.53) £1.59 DT price = £1.59

**Praziquantel**

- **INDICATIONS AND DOSE**
  - **Tapeworm infections (Taenia solium)**
    - **BY MOUTH**
    - Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

- **Tapeworm infections (Hymenolepis nana)**
  - **BY MOUTH**
  - Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

- **Schistosoma haematobium** worm infections | **Schistosoma mansoni** worm infections
  - **BY MOUTH**
  - Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

- **Schistosoma japonicum** worm infections
  - **BY MOUTH**
  - Adult: 20 mg/kg 3 times a day for 1 day

**UNLICENSED USE**
- Praziquantel is an unlicensed drug.

**INTERACTIONS** → Appendix 1 (praziquantel).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

#### Metronidazole

- **INDICATIONS AND DOSE**
  - **Diloxanide furoate**
    - **Tapeworm infections (Taenia solium)**
      - **BY MOUTH**
      - Adult: 36–59 mg/kg 20 times daily for 20–30 days, alternatively 20 mg/kg 36 times a day for 10 days

- **Amoebicides**
  - **Entamoeba histolytica**
    - Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include banana.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Unlicensed use**
- Praziquantel is an unlicensed drug.

**INTERACTIONS** → Appendix 1 (praziquantel).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**5 Protozoal infection**
Trichomonacides
Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs
Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 438.

Leishmaniacides
Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate below under specialist supervision.

Amphotericin p. 517 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (AmBisome®). Abelcet® is also likely to be effective but less information is available.

Pentamidine isetionate p. 523 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Trypanocides
The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis
Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 539 and sulfadiazine p. 495, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine p. 539 with clindamycin p. 467 or clarithromycin p. 470 or azithromycin p. 469. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Sodium stibogluconate

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) · mucocutaneous disease · predisposition to QT interval prolongation · treat intercurrent infection (e.g. pneumonia)
- **CAUTIONS, FURTHER INFORMATION**
  - Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.
- **INTERACTIONS** > Appendix 1 (sodium stibogluconate). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - Rare Bleeding from gums · bleeding from nose · fever · flushing · jaundice · rash · substernal pain · sweating · vertigo
  - Frequency not known Abdominal pain · anaphylaxis · anorexia · arthralgia · coughing · diarrhoea · ECG changes · headache · lethargy · myalgia · nausea · pain on intramuscular injection · pain on intravenous administration · pancreatitis · thrombosis on intravenous administration · vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Avoid in significant impairment.
- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

---

5.2 Malaria

Antimalarials

*Artemether with lumefantrine*

*Artemether with lumefantrine* p. 534 is licensed for the treatment of acute non-complicated *falciparum* malaria.
Chloroquine
Chloroquine p. 536 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant *falciparum* malaria is still low. It is also used with proguanil hydrochloride p. 539 when chloroquine-resistant *falciparum* malaria is present but this regimen may not give optimal protection (see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Chloroquine is no longer recommended for the treatment of *falciparum* malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 540, Malarone®, or Riamet®. It is still recommended for the treatment of non-*falciparum* malaria.

Mefloquine
Mefloquine p. 537 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant *falciparum* malaria (for details, see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Mefloquine is now rarely used for the treatment of *falciparum* malaria because of increased resistance. It is rarely used for the treatment of non-*falciparum* malaria because better tolerated alternatives are available.

Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with artenimol
Arténimol with piperaquine phosphate p. 535 is not recommended for the first-line treatment of acute uncomplicated *falciparum* malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primamaquine
Primamaquine p. 538 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil
Proguanil hydrochloride p. 539 is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 530).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 536) is licensed for the treatment of acute uncomplicated *falciparum* malaria. Malarone® is also used for the prophylaxis of *falciparum* malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 496. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine
Pyrimethamine p. 539 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but can be used in the treatment of *falciparum* malaria with (or following) quinine.

Quinine
Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of *falciparum* malaria or if the infective species is not known or if the infection is mixed (for details see Malaria, treatment p. 529).

Tetracyclines
Doxycycline p. 496 is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 530).

Malaria, prophylaxis

Prophylaxis
The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 1015 provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 537) before travel into an endemic area; Malarone® or doxycycline p. 496 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone® prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine p. 536 and proguanil hydrochloride p. 539 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. Malarone® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine p. 536 and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered.
Asplenia
Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment
Avoidance (or dosage reduction) of proguanil hydrochloride p. 539 is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine p. 536 is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy
Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 836 (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline p. 496 is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding
Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants
Travellers taking warfarin sodium p. 121 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment
Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible. In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also Recommended regimens for prophylaxis against malaria p. 530

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Malaria, treatment
A number of specialist centres are able to provide advice on specific problems.

Treatment of malaria
Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is not known, or if the infection is mixed, initial treatment should be for falciparum malaria with quinine p. 540, Malarone® (atovaquone with proguanil hydrochloride p. 536), or Riamet® (artemether with lumefantrine p. 534). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)
Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine p. 536 which should not therefore be given for treatment.

Quinine, Malarone® (atovaquone with proguanil hydrochloride p. 536), or Riamet® (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the patient is seriously ill or unable to take tablets. Mefloquine p. 537 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 496 for 7 days or

</tbody>
</table>
clindamycin p. 467 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 540 as a single dose [unlicensed] may be given (instead of either clindamycin p. 467 or doxycycline p. 496) together with, or after, a course of quinine. Alternatively, Malarone® or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline p. 496 or clindamycin p. 467).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine p. 540, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

Pregnancy
Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clindamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided without more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named patient’ use.

Non-falciparum malaria (treatment)
Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region. Chloroquine p. 536 is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine p. 536, primaquine p. 538 should be given for radical cure. Chloroquine p. 536 alone is adequate for P. malariae and P. knowlesi infections but in the case of P. vivax and P. ovale, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine p. 538 [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

Parenteral
Parenteral If the patient is unable to take oral therapy, quinine p. 540 can be given by intravenous infusion [unlicensed], changed to oral chloroquine p. 536 as soon as the patient’s condition permits.

Pregnancy
The adult treatment doses of chloroquine p. 536 can be given for non-falciparum malaria. In the case of P. vivax or P. ovale, however, the radical cure with primaquine p. 538 should be postponed until the pregnancy is over; instead chloroquine p. 536 should be continued, given weekly during the pregnancy.

Artemether with lumefantrine

INDICATIONS AND DOSE
Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

BY MOUTH

Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)
UNLICENSED USE Use in treatment of non-falciparum malaria is an unlicensed indication.

CONTRA-INDICATIONS Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction

CAUTIONS Avoid in Acute porphyrias p. 864 · electrolyte disturbances

INTERACTIONS → Appendix 1 (artemether with lumefantrine). Caution if concomitant use with other drugs known to cause QT-interval prolongation.

SIDE-EFFECTS

Common or very common Abdominal pain · anorexia · arthralgia · asthma · cough · diarrhoea · dizziness · headache · malaise · palpitation · paraesthesia · prolonged QT interval · pruritus · rash · sleep disturbances · vomiting

Uncommon Ataxia · clonus · hypoaesthesia

PREGNANCY Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

BRIOSEEDING Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.

RENAL IMPAIRMENT Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.

MONITORING REQUIREMENTS Monitor patients unable to take food (greater risk of recrudescence).

DIRECTIONS FOR ADMINISTRATION Tablets may be crushed just before administration.

PATIENT AND CARER ADVICE Dizziness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Riamet (Nouartis Pharmaceuticals UK Ltd)

Artemether 20 mg, Lumefantrine 120 mg

Riamet tablets £22.50

Artemol with piperaquine phosphate (Piperaquine tetraphosphate with dihydroartemisinin)

INDICATIONS AND DOSE Treatment of uncomplicated falciparum malaria

BY MOUTH

→ Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

→ Child 6 months-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

→ Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

→ Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months;

second course given at least 2 months after first course

→ Adult (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

→ Adult (body-weight 75 kg and over): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

CONTRA-INDICATIONS Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension

INTERACTIONS → Appendix 1 (artemol with piperaquine).

Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped. Concomitant use with other drugs known to prolong the QT interval contra-indicated.

SIDE-EFFECTS

Common or very common Abdominal pain (in children) · anaemia · blood disorders (in children) · conjunctivitis (in children) · cough (in children) · diarrhoea (in children) · headache (in adults) · irregular heart rate (in children) · leucopenia (in children) · malaise · QT interval prolonged · rash (in children) · tachycardia (in adults) · thrombocytopenia (in children) · vomiting (in children)

Uncommon Abdominal pain (in adults) · acanthosis (in children) · anaemia (in adults) · arthralgia · arthralgia · bradycardia (in adults) · convulsions · cough (in adults) · diarrhoea (in adults) · dizziness (in adults) · headache (in children) · heart murmur (in children) · hepatitis · hepatomegaly · influenza-like symptoms · jaundice (in children) · malathy (in adults) · nausea · pruritus (in adults) · stomatitis (in children) · vomiting (in adults)

PREGNANCY Teratogenic in animal studies—manufacturer advises use only if other antimalarials cannot be used.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

RENAL IMPAIRMENT No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

MONITORING REQUIREMENTS Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in children who are vomiting, in females, or in the elderly.

Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose.

If QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.

DIRECTIONS FOR ADMINISTRATION Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer tablets containing piperaquine phosphate with artemol.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
Atovaquone with proguanil hydrochloride

INDICATIONS AND DOSE
MALARONE®

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

BY MOUTH
- Adult (body-weight 11-20 kg): 1 tablet once daily for 3 days
- Adult (body-weight 21-30 kg): 2 tablets once daily for 3 days
- Adult (body-weight 31-40 kg): 3 tablets once daily for 3 days
- Adult (body-weight 41 kg and above): 4 tablets once daily for 3 days

Common or very common
- Headache
- Nausea
- Vomiting
- Abdominal pain
- Diarrhoea
- Rash
- Anosmia
- Dizziness
- Fever
- Tachycardia
- Hallucinations
- Hypersensitivity reactions
- Seizures
- Stevens-Johnson syndrome
- Toxic epidermal necrolysis

Other
- Anemia
- Blood disorders
- Alopecia
- Anaphylaxis
- Anaphylactoid reactions
- Anorexia
- Anuria
- Arthralgia
- Arthritis
- Blood disorders
- Bone marrow depression
- Bronchitis
- Cough
- Dysuria
- Dyspepsia
- Erythematous rash
- Fever
- Headache
- Hypersensitivity reactions
- Itching
- Pruritus
- Tachycardia
- Vomiting

INTERACTIONS
- Avoid for malaria prophylaxis (and if eGFR less than 30 mL/minute/1.73m²).
- Treatment of non-falciparum malaria
- Initialy by mouth using syrup
- Child 6-11 months (body-weight 8-11 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1-2 years (body-weight 11-15 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3-4 years (body-weight 15-16.5 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 4-7 years (body-weight 16.5-25 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8-12 years (body-weight 25-45 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 13-17 years (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Doses at extremes of body-weight
- Initialy by mouth using syrup
- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

R. vivax or P. ovale infection during pregnancy while radical cure is postponed

Tablet
- Aspirin 325 mg
- Paracetamol 125 mg

Chloroquine

INDICATIONS AND DOSE

Active rheumatoid arthritis (administered on expert advice)
- Systemic and discoid lupus erythematosus (administered on expert advice)

BY MOUTH
- Adult: 150 mg daily; maximum 2.5 mg/kg per day

Prophylaxis of malaria

INITIALLY BY MOUTH USING SYRUP
- Child 6 weeks–5 months (body-weight 4.5-8 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6-11 months (body-weight 8-11 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1-2 years (body-weight 11-15 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3-4 years (body-weight 15-16.5 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 4-7 years (body-weight 16.5-25 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8-12 years (body-weight 25-45 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 13-17 years (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

TREATMENT OF NON-FALCIPARUM MALARIA

BY MOUTH
- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

Doses at extremes of body-weight

In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

Dose equivalence and conversion
- Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).
UNLICENSED USE Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

**Important safety information**
Ocular toxicity is unlikely if the adult dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

**CAUTIONS** Acute porphyrias p. 864 - elderly · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) - may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) · severe gastro-intestinal disorders

**CAUTIONS, FURTHER INFORMATION**
Screening for ocular toxicity A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening adults to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009*).

Chloroquine should be considered (for treating chronic inflammatory conditions) only if other drugs have failed. All patients taking chloroquine should receive ophthalmic examination according to a protocol arranged locally between the prescriber and the ophthalmologist.

**INTERACTIONS → Appendix 1 (chloroquine, hydroxychloroquine).**
Avoid concurrent therapy with hepatotoxic drugs.

**SIDE-EFFECTS**
- **Common or very common** Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- **Uncommon** Convulsions · discoloration of mucous membranes · discoloration of nails · discoloration of skin · ECG changes · hair depigmentation · hair loss · keratopathy · otoxicity · retinal damage · visual changes
- **Rare** Acute generalised exanthematous pustulosis · agranulocytosis · angioedema · aplastic anaemia · blood disorders · bone marrow suppression · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · hypersensitivity reactions · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia · urticaria
- **Frequency not known** Diffuse parenchymal lung disease · drug rash with eosinophilia and systemic symptoms · extrapyramidal symptoms (associated with use in malaria) · hypotension · visual disturbances · bronchospasm (in children)

**SIDE-EFFECTS, FURTHER INFORMATION**
**Malaria prophylaxis and treatment** Serious skin reactions, ECG changes, visual effects, otoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

**Overdose** Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

**BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

**HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.

**RENAL IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.

**MONITORING REQUIREMENTS**
- in adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
- in children Ophthalmic examination with long-term therapy.

**PATIENT AND CARER ADVICE** Warn travellers going to malaria-prone areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
CAUTIONARY AND ADVISORY LABELS 5
- **Avloclor** (Alliance Pharmaceuticals Ltd) Chloroquine phosphate 250 mg Avloclor 250mg tablets | 20 tablet [Pack] £4.90 DT price = £4.90

**Oral solution**
CAUTIONARY AND ADVISORY LABELS 5
- **Malarivon** (Wallace Manufacturing Chemists Ltd) Chloroquine phosphate 16 mg per 1 ml Malarivon 80mg/5ml syrup | 75 ml [Pack] £10.85

**Chloroquine with proguanil**
The properties listed below are those particular to the combination only. For the properties of the components please consider, proguanil hydrochloride p. 539, chloroquine p. 536.

**INDICATIONS AND DOSE**
Prophylaxis of malaria
BY MOUTH
- Adult: (consult product literature)

**EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablets**
CAUTIONARY AND ADVISORY LABELS 5, 21
- **CHLOROQUINE WITH PROGUANIL** (Non-proprietary) Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet [Pack] £11.75

**Mefloquine**

**INDICATIONS AND DOSE**
Treatment of malaria
BY MOUTH
- Adult: (consult product literature)
## Prophylaxis of malaria

### BY MOUTH
- **Child (body-weight 5-15 kg):** 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- **Child (body-weight 16-24 kg):** 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- **Child (body-weight 25-44 kg):** 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- **Child 1-17 years (body-weight 45 kg and above):** 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- **Adult (body-weight 45 kg and above):** 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.

### UNLICENSED USE
Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.

### CONTRA-INDICATIONS
Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions - avoid for standby treatment if history of convulsions - history of blackwater fever.

### CAUTIONS
Cardiac conduction disorders - epilepsy (avoid for prophylaxis) - not recommended in infants under 3 months (5 kg) - traumatic brain injury.

### CAUTIONS, FURTHER INFORMATION

#### Neuropsychiatric reactions
Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodomal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contraindicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions.

### INTERACTIONS
- Appendix 1 (mefloquine).

### SIDE-EFFECTS
- **Common or very common**
  - Abdominal pain
  - Diarrhoea
  - Dizziness
  - Headache
  - Nausea
  - Neuropsychiatric reactions
  - Pruritus
  - Visual disturbances
  - Vomiting
- **Very rare**
  - Optic neuropathy
  - Frequency not known
  - Alopecia
  - Anemia
  - Anorexia
  - Arthralgia
  - Ataxia
  - Blood disorders
  - Bradycardia
  - Cataract
  - Chest pain
  - Confusion
  - Drowsiness
  - Dyspepsia
  - Dysphonia
  - Encephalopathy
  - Fever
  - Flushing
  - Hepatic failure
  - Hyperhidrosis
  - Hypertension
  - Hypotension
  - Leucocytosis
  - Malaria
  - Motor neuropathies
  - Muscle weakness
  - Myalgia
  - Oedema
  - Palpitation
  - Panic attacks
  - Pneumonitis
  - Rash
  - Seizures
  - Sensory neuropathies
  - Speech disturbances
  - Stevens-Johnson syndrome
  - Syncpe
  - Tachycardia
  - Thrombocytopenia
  - Tremor
  - Vestibular disorders

### ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with hypersensitivity to quinine.

### CONCEPTION AND CONTRACEPTION
Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).

### PREGNANCY
Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

### BREAST FEEDING
Present in milk but risk to infant minimal.

### HEPATIC IMPAIRMENT
Elimination may be prolonged; avoid in severe impairment.

### RENAL IMPAIRMENT
Manufacturer advises caution.

### DIRECTIONS FOR ADMINISTRATION
Tablet may be crushed and mixed with food such as jam or honey just before administration.

### PATIENT AND CARER ADVICE
Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due. Also warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

### NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions
- Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Tablet
- **CAUTIONARY AND ADVISORY LABELS** 21, 27
- **Lariam (Roche Products Ltd)**
  - **Mefloquine** (as Mefloquine hydrochloride) 250 mg
  - Lariam 250mg tablets | 8 tablet [Pack] £14.53

## Primquine

### INDICATIONS AND DOSE
Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection

#### BY MOUTH
- **Adult:** 30 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection

#### BY MOUTH
- **Adult:** 15 mg daily for 14 days

### CONTRA-INDICATIONS
Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection in patients with mild 6GPD deficiency (administered on expert advice)

### BY MOUTH
- **Adult:** 45 mg once weekly for 8 weeks

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

#### BY MOUTH
- **Adult:** 30 mg daily, this combination is associated with considerable toxicity

### UNLICENSED USE
Not licensed.

### CAUTIONS
- 6GPD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

### INTERACTIONS
- Appendix 1 (primquine).
Proguanil hydrochloride

INDICATIONS AND DOSE
Prophylaxis of malaria

BY MOUTH
- Child up to 11 weeks (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3-11 months (body-weight 6-9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1-3 years (body-weight 10-16 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 4-7 years (body-weight 16-25 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8-12 years (body-weight 25-45 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 13-17 years (body-weight 46 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

UNLICENSED USE
Proguanil doses in BNF Publications may differ from those in product literature.

INTERACTIONS
- Appendix 1 (proguanil).

SIDE-EFFECTS
- Common or very common Abdominal pain, nausea, vomiting
- Uncommon Haemolytic anaemia especially in G6PD deficiency, leucopenia, thrombocytopenia
- PREGNANCY Risk of neonatal haemolysis and methaemoglobinaemia
- BREAST FEEDING Risk of haemolysis in G6PD-deficient infants
- PRE-TREATMENT SCREENING Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

INTERACTIONS
- Primaquine (as Primaquine phosphate) 7.5 mg tablets | 100 tablet no price available

Pyrimethamine

INDICATIONS AND DOSE
Toxoplasmosis in pregnancy (in combination with sulfadiazine and folic acid)

BY MOUTH
- Adult: 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folic acid)

BY MOUTH
- Adult 18-28 years: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 5 months, then 1 mg/kg 3 times a week for 6 months
- Malaria
- Adult: No dose stated because not recommended alone

CAUTIONS
- History of seizures—avoid large loading doses · predisposition to folate deficiency

INTERACTIONS
- Appendix 1 (pyrimethamine).

SIDE-EFFECTS
- Common or very common Anaemia (with high doses) · blood disorders (with high doses) · diarrhea · dizziness · headache · leucopenia · nausea · rash · thrombocytopenia · vomiting
- Uncommon Abnormal skin pigmentation · fever · Very rare Buccal ulceration · colic · convulsions
- PREGNANCY Theoretical teratogenic risk in first trimester (folate antagonist). Adequate folate supplements should be given to the mother.

BREAST FEEDING
- Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

HEPATIC IMPAIRMENT
- Manufacturer advises caution.

RENAL IMPAIRMENT
- Manufacturer advises caution.
**Pyrimethamine with sulfadoxine**

**INDICATIONS AND DOSE**

Adjunct to quinine in treatment of Plasmodium falciparum

**Adults**

- Oral: 500 mg daily for 3 days (max. 1500 mg total).
- Intravenous: 75 mg/m² body surface area per day (max. 3000 mg total).

**Children**

- Oral: 40 mg/m² body surface area per day (max. 1000 mg total).
- Intravenous: 60 mg/m² body surface area per day (max. 1500 mg total).

**SIDE-EFFECTS**

- Acute agranulocytosis, aplastic anaemia, aplastic crisis, aplastic crisis on long-term use.
- Convulsions (severe side-effects on long-term use).
- Photosensitivity.
- Interstitial nephritis.
- Pulmonary infiltrates.
- Aseptic meningitis.

6 Viral infection

6.1 Hepatitis

Hepatitis

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa p. 794 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Hepatitis B, chronic

Peginterferon alfa p. 542 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), caution of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 543 or tenofovir disoproxil p. 564 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 544, lamivudine p. 563, or telbivudine p. 544.

Entecavir p. 543 alone, tenofovir disoproxil p. 564 alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine p. 544 or entecavir p. 543 should not be used because cross-resistance can occur.

If there is no toxicity or loss of efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 563 or lamivudine may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa p. 542 or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

Hepatitis C, chronic

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load...
measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 545 and peginterferon alpha below is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alpha is less effective than the combination of peginterferon alpha and ribavirin. Peginterferon alpha alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Boceprevir p. 547 and telaprevir p. 548 are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alpha for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alpha. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

Daclatasvir p. 544 is licensed for use in combination with sofosbuvir p. 546 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alpha and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir p. 544 must not be given as monotherapy.

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alpha, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Simeprevir p. 548 is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 or 4; regimens containing peginterferon alfa-2b are less effective than those containing peginterferon alfa-2a. Simeprevir may also be used in combination with sofosbuvir, with or without ribavirin p. 545, for the urgent treatment of chronic hepatitis C infection of genotypes 1 or 4 only when peginterferon alfa cannot be used because of intolerance or contra-indications. Simeprevir monotherapy is not recommended.

6.2 **Hepatitis B, chronic**

**INTERFERONS**

**Peginterferon alfa**

- **Drug action** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

---

**INDICATIONS AND DOSE**

**PEGASYS®**

Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B

**BY SUBCUTANEOUS INJECTION**

- Adults: (consult product literature)

**VIRAFERONPEG®**

Combined with ribavirin for chronic hepatitis C | Combined with ribavirin and boceprevir for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated

**BY SUBCUTANEOUS INJECTION**

- Adults: (consult product literature)
● treated previously with interferon alfa alone or in combination with ribavirin;
● whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
● co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ Peginterferon alfa-2a 180 microgram per 1 ml Pegasis 90micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PO) £66.46
Peginterferon alfa-2a 270 microgram per 1 ml Pegasis 135micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PO) £107.76
Pegasis 135micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PO) £107.76
Peginterferon alfa-2a 360 microgram per 1 ml Pegasis 180micrograms/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection (PO) £497.60
Pegasis 180micrograms/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection (PO) £497.60

Powder and solvent for solution for injection

▶ ViraferonPeg (Mercer Sharp & Dohme Ltd)
Peginterferon alfa-2b 50 microgram ViraferonPeg 50microgram powder and solvent for solution for injection pre-filled disposable devices | 1 pre-filled disposable injection (PO) £66.46
ViraferonPeg 50microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection (PO) £66.46

Peginterferon alfa-2b 150 microgram ViraferonPeg 150microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection (PO) £199.38

NUCLEOSIDE ANALOGUES

Entecavir

INDICATIONS AND DOSE

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) is not previously treated with nucleoside analogues

BY MOUTH

▶ Adult: 500 micrograms once daily

Chronic hepatitis B in patients with decompensated liver disease

BY MOUTH

▶ Adult: 1 mg once daily

● CAUTIONS

HIV infection—risk of HIV resistance in patients not receiving ‘highly active antiretroviral therapy’ - lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

CAUTIONS, FURTHER INFORMATION
Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

SIDE-EFFECTS

▶ Common or very common Diarrhoea - dizziness - dyspepsia - fatigue - headache - nausea - raised serum amylase - raised serum lipase - sleep disturbances - vomiting

▶ Uncommon Alopecia - rash - thrombocytopenia

CONCEPTION AND CONTRACEPTION
Effective contraception required during treatment.

PREGNANCY

Toxicty in animal studies—manufacturer advises use only if potential benefit outweighs risks.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

RENAL IMPAIRMENT

Reduce dose if eGFR less than 50 mL/minute/1.73 m². Consult product literature.

MONITORING REQUIREMENTS

Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurgent hepatitis may occur on discontinuation).

DIRECTIONS FOR ADMINISTRATION

To be taken at least 2 hours before or 2 hours after food.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include orange.

PATIENT AND CARER ADVICE

Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Entecavir for chronic hepatitis B (August 2008) NICE TA153
Entecavir is an option for the treatment of chronic hepatitis B. www.nice.org.uk/TA153

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Baraclude (Bristol-Myers Squibb Pharmaceuticals Ltd)
Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets | 30 tablet (PO) £363.26
Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 tablet (PO) £363.26

Oral solution

▶ Baraclude (Bristol-Myers Squibb Pharmaceuticals Ltd)
Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml Baraclude 0.05mg/ml oral solution (sugar-free) | 210 ml (PO) £423.80
Telbivudine

INDICATIONS AND DOSE
Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

BY MOUTH
- Adult: 600 mg once daily

- CAUTIONS Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance
- CAUTIONS, FURTHER INFORMATION Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.
- INTERACTIONS → Appendix 1 (telbivudine).
- SIDE-EFFECTS
  - Common or very common Abdominal pain - cough - diarrhea - dizziness - fatigue - headache - nausea - raised serum amylase - raised serum lipase - rash
  - Uncommon Arthralgia - myalgia - myopathy (discontinue treatment) - peripheral neuropathy - taste disturbance
- Rare Lactic acidosis - rhabdomyolysis
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS Monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- PATIENT AND CARER ADVICE
  - Muscle effects and peripheral neuropathy Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations.
- NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Telbivudine for chronic hepatitis B (August 2008) NICE TA154
  - Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA154

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - Sebivo (Novartis Pharmaceuticals UK Ltd)
    - Telbivudine 600 mg Sebivo 600mg tablets | 28 tablet £290.33

NUCLEOTIDE ANALOGUES

Adefovir dipivoxil

INDICATIONS AND DOSE
Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

BY MOUTH
- Adult: 10 mg once daily

- CAUTIONS Elderly
- CAUTIONS, FURTHER INFORMATION Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.
- SIDE-EFFECTS Abdominal pain - asthenia - diarrhea - dyspepsia - flatulence - headache - hypophosphataemia - nausea - pancreatitis - pruritus - rash - renal failure - vomiting
- CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.
- PREGNANCY Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m².
  - No information available if eGFR less than 10 mL/minute/1.73 m². Monitor renal function more frequently in patients with renal impairment.
- MONITORING REQUIREMENTS
  - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
  - Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.
- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - Hepsera (Gilead Sciences International Ltd)
    - Adefovir dipivoxil 10 mg Hepsera 10mg tablets | 30 tablet £252.22

6.3 Hepatitis C, chronic

NON-STRUCTURAL PROTEIN 5A INHIBITORS

Daclatasvir

- DRUG ACTION Daclatasvir is an inhibitor of the multifunctional protein NS5A, which is an essential component of the hepatitis C virus replication process.

INDICATIONS AND DOSE
In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis | In combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis | In combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4

BY MOUTH
- Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature)

Dose adjustments due to interactions
Reduce dose to 30 mg once daily with concomitant use of potent CYP3A4 inhibitors (e.g. atazanavir boosted with ritonavir, boceprevir, clarithromycin, cobicistat, itraconazole, ketoconazole, posaconazole, telaprevir, telithromycin, and voriconazole). Increase dose to 90 mg once daily with concomitant use of moderate CYP3A4 inducers (e.g. efavirenz).
Chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)

**BY MOUTH**
- Adult: Usual dose 400 mg twice daily

**REBETOL® CAPSULES**

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)
- Adult (body-weight up to 64 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
- Adult (body-weight 81-104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

**REBETOL® ORAL SOLUTION**

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa)
- Adult (body-weight up to 64 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
- Adult (body-weight 81-104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

**CONTRA-INDICATIONS** Consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products - haemoglobinopathies - severe cardiac disease - severe debilitating medical conditions - unstable or uncontrolled cardiac disease in previous 6 months

**CAUTIONS** Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) - cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) - consult product literature for specific cautions when ribavirin used in combination with other medicinal products - gout - haemolyisis (haemoglobin concentration should be monitored during the treatment and corrective action taken) - patients with a transplant—risk of rejection - severe dental disorders - severe ocular disorders - severe periodontal disorders - severe psychiatric effects

**INTERACTIONS** → Appendix 1 (ribavirin).

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa

**CONCEPTION AND CONTRACEPTION** Highly effective contraception required during and for 5 weeks after treatment.

**PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**PATIENT AND CARER ADVICE**

- **Missed doses** If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. May affect performance of skilled tasks (e.g. driving)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

  - Daclatasvir (as Daclatasvir dihydrochloride) 60 mg Daklinza 60mg tablets | 28 tablet (PO) £8.172.61

**NUCLEOSIDE ANALOGUES**

Ribavirin (Tribavirin)

**INDICATIONS AND DOSE COPEGUS® TABLETS**

Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)

**BY MOUTH**
- Adult (body-weight up to 74 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- Adult (body-weight 75 kg and above): 600 mg twice daily

Chronic hepatitis C (in combination with peginterferon alfa 2b with or without direct acting antivirals)

**BY MOUTH**
- Adult (body-weight up to 64 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, to be taken in the morning and 600 mg, to be taken in the evening
- Adult (body-weight 81-105 kg): 600 mg twice daily
- Adult (body-weight 106 kg and above): 600 mg, to be taken in the morning and 800 mg, to be taken in the evening
Infection
paraesthesia · peptic ulcer · pericarditis · peripheral neuropathy · peripheral oedema · photosensitivity · prostatitis · pruritus · psoriasis · psychotic disorders · pulmonary embolism · rash · renal failure · respiratory infections · retinal detachment · retinal haemorrhage · rhabdomyolysis · rheumatoid arthritis · sarcoidosis · seizures · sexual dysfunction · sinus congestion · skin discoloration · sleep disturbances · sore throat · Stevens-Johnson syndrome · stomatitis · suicidal ideation (more frequent in children) · syncope · systemic lupus erythematosus · tachycardia · taste disturbance · thrombocytopenia · thrombocytopenia purpura · thyroid disorders · tinnitus · tongue pigmentation · toxic epidermal necrolysis; tremor · urinary tract infections · vertigo · visual disturbances · vomiting · weight loss · wheezing

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excrated in semen).

**PREGNANCY** Avoid; teratogenicity in animal studies.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.

**RENAL IMPAIRMENT** Plasma-ribavirin concentration increased.

Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.

**MONITORING REQUIREMENTS** Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200
  
  The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). www.nice.org.uk/TA200

- Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
  
  The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

  - not previously treated with interferon alfa or peginterferon alfa;
  - treated previously with interferon alfa alone or in combination with ribavirin;
  - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
  - co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**NUCLEOTIDE ANALOGUES**

**Sofosbuvir**

**INDICATIONS AND DOSE**

In combination with ribavirin (Copegus®), with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6 in patients with compensated liver disease | In combination with ribavirin (Copegus®) for chronic hepatitis C infection of genotype 2 in patients with compensated liver disease | In combination with daclatasvir for chronic hepatitis C infection of genotype 1, 3, or 4

**BY MOUTH**

- Adult: 400 mg once daily, for duration of treatment consult product literature

**CAUTIONS, FURTHER INFORMATION**

In chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

- INTERACTIONS → Appendix 1 (sofosbuvir).

- SIDE-EFFECTS Abdominal discomfort · agitation · alopecia · anaemia · anxiety · arthralgia · asthenia · blurred vision · chest pain · constipation · cough · decreased appetite · depression · diarrhoea · disturbance in attention · dizziness · dry mouth · dyspnoea · gastro-oesophageal reflux · headache · influenza-like symptoms · insomnia · irritability · memory impairment · migraine · myalgia · nausea · neutropenia · rash · vomiting · weight loss

- SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa

- PREGNANCY Manufacturer advises avoid.

- BREAST FEEDING Manufacturer advises avoid—metabolites present in milk in animal studies.
CONTRA-INDICATIONS

PROTEASE INHIBITORS (HEPATITIS)

**Sofosbuvir**

**INDICATIONS AND DOSE**

Chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

**BY MOUTH**

- Adult: 800 mg 3 times a day, for duration of treatment consult product literature

**CONTRA-INDICATIONS**

- Autoimmune hepatitis
- CAUTIONS Coagulopathy - hypoalbuminaemia - low platelets - predisposition to QT interval prolongation

**CAUTIONS, FURTHER INFORMATION**

Low platelets, hypoalbuminaemia, or coagulopathy Not recommended in patients with low platelets, hypoalbuminaemia, or coagulopathy—if initiated in these patients monitor closely for signs of infection, worsening liver impairment and anaemia (increased risk of severe morbidity and mortality).

**INTERACTIONS** → Appendix 1 (boceprevir). Caution with concomitant use of other drugs known to prolong QT interval.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · agitation · alopecia · amnesia · anaemia · anxiety · arthralgia · asthenia · blood pressure changes · changes in libido · constipation · cough · decreased appetite · depression · diarrhoea · disturbances in smell · disturbances in taste · dizziness · dry eyes · dry mouth · dysphonia · erectile dysfunction · flatulence · gastro-oesophageal reflux · haemorrhoids · headache · hyperglycaemia · hyperhidrosis · hyperglyceridaemia · hyperuricaemia · hypoaesthesia · hypothyroidism · influenza-like symptoms · insomnia · leucopenia · mouth ulcers · muscle spasm · myalgia · nausea · palpitation · pancytopenia · paraesthesia · peripheral oedema · polyuria · pruritus · psoriasis · rash · stomatitis · syncope · thrombocytopaenia · tinnitus · tooth disorder · tremor · visual disturbances · vomiting · weight loss

- **Uncommon** Aneurorrhoea · arrhythmias · colitis · conjunctival haemorrhage · dysphagia · dysphonia · dysuria · eye pain · flushing · gingivitis · gut · hearing impairment · homicidal ideation · hypoaesthesia · hyperbilirubinaemia · hypercalcaemia · hypercalciuria · hypergammaglobulinaemia · hyperkalaemia · hyperlipidaemia · hyperparathyroidism · hypokalaemia · increased laceration · pancreatitis · photophobia · polymyalgia · photophobia · sensitivity · retinal ischaemia · retinopathy · skin ulceration · suicidal ideation · tongue discoloration · venous thromboembolism

- **Rare** Acute myocardial infarction · asthma · bipolar disorder · cholestatic jaundice · coronary artery disease · encephalopathy · hallucinations · pericarditis · pleural fibrosis · respiratory failure · sarcoidosis · thyroid neoplasms

- **Frequency not known** Rash with eosinophilia and systemic symptoms · Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects listed are reported when boceprevir is used in combination with ribavirin and peginterferon alfa.

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

Manufacturer advises avoid; present in milk in animal studies.

**MONITORING REQUIREMENTS**

Monitor full blood count before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.

**PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012) NICE TA253

Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:

- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA253

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2014) that sofosbuvir (Sovaldi)® is accepted for use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21, 25

- **Sofosbuvir 400 mg** Sovaldi 400mg tablets | 28 tablet pack £11.660.98

**PROTEASE INHIBITORS (HEPATITIS)**

**Boceprevir**

- **RENA L IMPAIRMENT** Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Boceprevir for treating chronic hepatitis C (February 2015) NICE TA330

Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
- of genotype 3 with cirrhosis (treatment naive patients)
- of genotype 3 that has not adequately responded to interferon-based treatment
- of genotype 4, 5, or 6 with cirrhosis

Sofosbuvir in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
- of genotype 2 that has not adequately responded to interferon-based treatment
- of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
- of genotype 3 that has not adequately responded to interferon-based treatment

NICE technology appraisals (TAs)

- Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330

Sofosbuvir in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6.

www.nice.org.uk/TA330

NICE technology appraisals (TAs)

- Sovaldi (Gilead Sciences International Ltd) ▼

Sofosbuvir 400 mg Sovaldi 400mg tablets | 28 tablet pack £11.660.98
Simeprevir

INDICATIONS AND DOSE
In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4. In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications.

BY MOUTH
Adult: 150 mg once daily (for duration of treatment consult product literature).

CAUTIONS
Consider alternative treatment in presence of NS3 Q80K polymorphism—efficacy of simeprevir is reduced—patients of East Asian origin.

INTERACTIONS
Appendix 1 (simeprevir).

SIDE-EFFECTS
Constipation; dyspepsia; fatigue (in combination with sofosbuvir); headache (in combination with sofosbuvir); insomnia (in combination with sofosbuvir); nausea; photoanisotropia; pruritus; raised bilirubin concentration—rash.

SIDE-EFFECTS, FURTHER INFORMATION
Rash Monitor for deterioration if mild or moderate; discontinue if severe.

CONCEPTION AND CONTRACEPTION
Effective contraception essential during treatment.

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid—present in plasma of breast-fed animals.

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate to severe impairment—elimination reduced in severe impairment. Manufacturer advises caution in decompensated cirrhosis—elimination reduced in severe impairment.

RENAL IMPAIRMENT
Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m—elimination may be reduced.

PRE-TREATMENT SCREENING
Test for NS3 Q80K polymorphism before combination treatment with ribavirin and peginterferon alfa in patients with chronic hepatitis C infection of genotype 1a. Consider testing for NS3 Q80K polymorphism before combination treatment with sofosbuvir (with or without ribavirin) in patients with chronic hepatitis C infection of genotype 1a.

PATIENT AND CARER ADVICE
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Simeprevir in combination with peginterferon alfa and ribavirin for treating genotypes 1 and 4 chronic hepatitis C (February 2015) NICE TA331 Simeprevir in combination with peginterferon alfa and ribavirin is recommended within its marketing authorisation, as an option for the treatment of chronic hepatitis C infection of genotype 1 and 4 in adults. www.nice.org.uk/TA331

Telaprevir

INDICATIONS AND DOSE
In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease.

BY MOUTH
Adult: 1.125 g every 12 hours, alternatively 750 mg every 8 hours, for duration of treatment consult product literature.

CAUTIONS
Bradycardia—congenital or family history of QT interval prolongation—electrolyte disturbances—family history of sudden death—heart failure with reduced left ventricular ejection fraction—hypoaalbuminaemia—low platelets—prolongation of QT interval

INTERACTIONS
Appendix 1 (telaprevir). Caution in concomitant use with other drugs known to prolong QT interval.

SIDE-EFFECTS
Common or very common Anaemia—anal fissure—diarrhoea—eczema—haemorrhoids—hyperuricaemia—hyperuricaemia—hypokalaemia—hyperthyroidism—lymphopenia—nausea—peripheral oedema—pruritus—rash—syncope—taste disturbances—thrombocytopenia—vomiting
Uncommon Gout—proctitis—retinopathy—urticaria
Rare Stevens-Johnson syndrome—toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects listed are reported when telaprevir is used in combination with ribavirin and peginterferon alfa.
Varicella–zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella–zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir p. 550 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster. Famiciclovir p. 552, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 552 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famiciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 553 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex p. 550 has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection

Ganciclovir p. 554 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 566; the
Infection

Acyclovir (Aciclovir)

MEDICINAL FORMS

- Not suitable for prescribing

RENAL IMPAIRMENT

PREGNANCY

- Manufacturer advises caution

SIDE-EFFECTS

- Common or very common: Reversible increase in serum uric acid; reversible increase in urinary uric acid

- Uncommon: Arthralgia, epigastric discomfort, fatigue, headache, itching, nausea, rash, vertigo, vomiting

- Rare: Anxiety, constipation, diarrhoea, polyuria, sleep disturbances

PREGNANCY

- Manufacturer advises caution

RESEARCH IMPAIRED

LESS SUITABLE FOR PRESCRIBING

- Inosine pranobex is less suitable for prescribing

CAUTIONS

History of gout; history of hyperuricaemia

INDICATIONS AND DOSE

Mucocutaneous herpes simplex

- Adult: 1 g 4 times a day for 7–14 days

Adjuvant treatment of genital warts

- Adult: 1 g 3 times a day for 14–28 days

Subacute sclerosing panencephalitis

- Adult: 50–100 mg/kg daily in 6 divided doses

CAUTIONARY AND ADVISORY LABELS

- Manufacturer advises caution; metabolised to uric acid

INOSINE COMPLEXES

Inosine pranobex (inosine acedoben dimepranol)

NUCLEOSIDE ANALOGUES

Aciclovir (Acyclovir)

INDICATIONS AND DOSE

Herpes simplex, suppression

- Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day. Dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

- Adult: 200–400 mg 4 times a day

- Adult: 5 mg/kg every 8 hours

Herpes simplex, treatment (non-genital)

- Adult: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of severe, initial infection

- Adult: Initially 5 mg/kg every 8 hours usually for 5 days; increased to 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stop-ping treatment, to be increased only if resistant organisms suspected or in simplex encephalitis

- Adult: 400 mg 5 times a day for 7–10 days

Herpes simplex, treatment of recurrent infection

- Adult: 400 mg 5 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3–5 days

- Adult: 400 mg 3 times a day for 5–10 days

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 400 mg 3 times a day for 5–10 days

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours

Children

- Adult: 200 mg 3 times per day for 2 weeks; increased to 400 mg 3 times per day for 2 weeks (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 5 mg/kg every 8 hours
Varicella zoster (chickenpox), treatment | Herpes zoster, treatment

**BY MOUTH**
- Child 1 month—1 year: 200 mg 4 times a day for 5 days
- Child 2—5 years: 400 mg 4 times a day for 5 days
- Child 6—11 years: 800 mg 4 times a day for 5 days
- Child 12—17 years: 800 mg 5 times a day for 7 days
- Adult: 800 mg 5 times a day for 7 days

**BY INTRAVENOUS INFUSION**
- Adult: 5 mg/kg every 8 hours usually for 5 days

Herpes zoster, treatment in immunocompromised

**BY MOUTH**
- Child 1 month—1 year: 200 mg 4 times a day continue for 2 days after crusting of lesions
- Child 2—5 years: 400 mg 4 times a day continue for 2 days after crusting of lesions
- Child 6—12 years: 800 mg 4 times a day continue for 2 days after crusting of lesions
- Child 12—17 years: 800 mg 5 times a day continue for 2 days after crusting of lesions
- Adult: 800 mg 5 times a day continue for 2 days after crusting of lesions

**BY INTRAVENOUS INFUSION**
- Adult: 10 mg/kg every 8 hours given for 10—14 days in encephalitis, possibly longer if also immunocompromised

Varicella zoster (chickenpox) attenuation of infection if varicella-zoster immunoglobulin not indicated

**BY MOUTH**
- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
- Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

**Doses at extremes of body-weight**
To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

- **UNLICENSED USE** Attenuation of chickenpox is an unlicensed indication. Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer)

- **CAUTIONS** Elderly (risk of neurological reactions) (in adults) • maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1 (aciclovir).

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Abdominal pain • diarrhoea • fatigue • headache • nausea • photosensitivity • pruritus • rash • urticaria • vomiting
  - **Very rare** Acute renal failure • anaemia • ataxia • confusion • convulsions • dizziness • drowsiness • dysarthria • dyspnoea • hallucinations • hepatitis • jaundice • leucopenia • neurological reactions • thrombocytopenia
  - **SPECIFIC SIDE-EFFECTS**
    - **Very rare**
      - With intravenous use • agitation • fever • psychosis • severe local inflammation (sometimes leading to ulceration) • tremors
    - **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
    - **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
    - **Renal Impairment** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

- With intravenous use in adults Use normal intravenous dose every 12 hours if eGFR 25—50 mL/minute/1.73 m² (every 24 hours if eGFR 10—25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².

- With oral use in adults For herpes zoster, use normal oral dose every 8 hours if eGFR 10—25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²).

- For herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².

- With oral use in children For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10—25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

- For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - **For intravenous infusion** Zovirax IV®; Aciclovir IV (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; For Aciclovir IV ( Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulation: Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed. Aciclovir Cream may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 9
    - **ACICLOVIR (Non-proprietary)**
      - Aciclovir 200 mg Aciclovir 200mg tablets | 25 tablet (£0.50) DT price = £1.77
      - Aciclovir 400 mg Aciclovir 400mg tablets | 56 tablet (£0.75) DT price = £4.05
      - Aciclovir 800 mg Aciclovir 800mg tablets | 35 tablet (£0.75) DT price = £4.24

  **Dispersible tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 9
    - **ACICLOVIR (Non-proprietary)**
      - Aciclovir 200 mg Aciclovir 200mg dispersible tablets | 25 tablet (£0.75) DT price = £1.88
      - Aciclovir 400 mg Aciclovir 400mg dispersible tablets | 56 tablet (£0.75) DT price = £2.75
      - Aciclovir 800 mg Aciclovir 800mg dispersible tablets | 35 tablet (£0.75) DT price = £6.00
    - Zovirax (GlaxoSmithKline UK Ltd)
      - Aciclovir 200 mg Zovirax 200mg dispersible tablets | 25 tablet (£0.85) DT price = £1.88
      - Aciclovir 800 mg Zovirax 800mg dispersible tablets | 35 tablet (£0.85) DT price = £6.75

  **Oral suspension**
  - **CAUTIONARY AND ADVISORY LABELS** 9
    - **ACICLOVIR (Non-proprietary)**
      - Aciclovir 40 mg per 1 ml Aciclovir 200mg/5ml oral suspension sugar free (sugar-free) | 125 ml (£0.50) DT price = £3.75
      - Aciclovir 80 mg per 1 ml Aciclovir 400mg/5ml oral suspension sugar free (sugar-free) | 100 ml (£0.50) DT price = £3.97
Famciclovir

**INDICATIONS AND DOSE**

**Herpes zoster infection, treatment**

**BY MOUTH**

- Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1–2 times a day for 7 days

**Herpes zoster infection, treatment in immunocompromised patients**

**BY MOUTH**

- Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions

**Genital herpes, suppression**

**BY MOUTH**

- Adult: 250 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Genital herpes, suppression in immunocompromised or HIV-positive patients**

**BY MOUTH**

- Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Valaciclovir**

**INDICATIONS AND DOSE**

**Herpes zoster infection, treatment**

**BY MOUTH**

- Adult: 1 g 3 times a day for 7 days

**Herpes zoster infection, treatment in immunocompromised patients**

**BY MOUTH**

- Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

**Herpes simplex, treatment of first infective episode**

**BY MOUTH**

- Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or if healing incomplete)

**Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients**

**BY MOUTH**

- Adult: 1 g twice daily for 5–10 days

**Herpes simplex infection (non-genital), treatment in immunocompromised patients**

**BY MOUTH**

- Adult: 500 mg twice daily for 5–10 days

**INTERACTIONS**

→ Appendix 1 (famciclovir).

**SIDE-EFFECTS**

- Common or very common: Headache, nausea, vomiting

- Rare: Confusion

- Very rare: Dizziness, drowsiness, hallucinations, jaundice, rash, Stevens-Johnson syndrome, thrombocytopenia

- Frequency not known: Constipation, abdominal pain, diarrhoea, fatigue, fever, pruritus, sweating

- Pregnancy: Manufacturers advise avoid unless potential benefit outweighs risk.

- Breast feeding: No information available—present in milk in animal studies.

- Hepatic impairment: Usual dose in well compensated liver disease (information not available on decompensated).

- Renal impairment: Reduce dose; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**

Famciclovir is a pro-drug of penciclovir.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: table.
Herpes virus infections, cytomegalovirus

6.5 Herpesvirus infections, cytomegalovirus

NON-NUCLEOSIDE PYROPHOSPHATE ANALOGUES

Foscarnet sodium

INDICATIONS AND DOSE

Cytomegalovirus disease

BY INTRAVENOUS INFUSION

Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections

unresponsive to aciclovir in immunocompromised patients

BY INTRAVENOUS INFUSION

Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal
NUCLEOSIDE ANALOGUES

Ganciclovir

**INDICATIONS AND DOSE**
Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

**BY INTRAVENOUS INFUSION**
- Adult: 5 mg/kg every 12 hours for 7–14 days

Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only

**BY INTRAVENOUS INFUSION**
- Adult: 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

**SIDE-EFFECTS**
- Common or very common Abdominal pain - acute renal failure - aggravation - agitation - anaemia - arthralgia - asthenia - changes in blood pressure - changes in ECG - confusion - constipation - convulsions - depression - diarrhoea - dizziness - dyspepsia - dysuria - electrolyte disturbances - genitourinary irritation and ulceration (due to high concentrations excreted in urine) - granulocytopenia - headache - hepatic dysfunction - hypocalcaemia - hypokalaemia - hypomagnesaemia - leucopenia - malaise - myalgia - nausea (reduce infusion rate) - neurological disorders - oedema - palpititation - pancreatitis - paraesthesia (reduce infusion rate) - polyuria - pruritus - rash - renal impairment - thrombocytopenia - thrombophlebitis if given undiluted by peripheral vein - tremor - vomiting

- Uncommon Acidosis

- Frequency not known Diabetes insipidus - myasthenia - myositis - oesophageal ulceration - rhabdomyolysis - ventricular arrhythmias

**CONCEPTION AND CONTRACEPTION**
Men should avoid fathering a child during and for 6 months after treatment.

**PREGNANCY**
Manufacturer advises avoid.

**BREAST FEEDING**
Avoid — present in milk in animal studies.

**RENAI IMPAIRMENT**
Reduce dose; consult product literature.

**MONITORING REQUIREMENTS**
- Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.

**DIRECTIONS FOR ADMINISTRATION**
- Avoid rapid infusion.
- For intravenous infusion (Foscavir®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**SOLUION FOR INFUSION**
**ELECTROLYTES:** May contain Sodium
- *Foscavir* (Cipligen Healthcare Ltd)
  - Foscarnet sodium 24 mg per 1 ml
  - Foscovir 6g/250ml solution for infusion bottles | 1 bottle £30 £119.85 (Hospital only)

**CONTRA-INDICATIONS**
- Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)

**CAUTIONS**
Children (possible risk of long-term carcinogenic or reproductive toxicity) - ensure adequate hydration - history of cytopenia - potential carcinogen - potential teratogen - radiotherapy - vesicant

**INTERACTIONS**
- Appendix 1 (foscarnet).
- Increased risk of myelosuppression with other myelosuppressive drugs - consult product literature.

**SIDE-EFFECTS**

- Uncommon Alopecia - anaphylactic reactions - arrhythmias - disturbances in hearing and vision - haematuria - hypotension - male infertility - mouth ulcers - pancreatitis - psychosis - tremor

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

**PREGNANCY**
Avoid — teratogenic risk.

**BREAST FEEDING**
Avoid — no information available.

**RENAI IMPAIRMENT**
Reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS**
Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

**DIRECTIONS FOR ADMINISTRATION**
Infuse into vein with adequate flow preferably using plastic cannula. For intravenous infusion (Cyveine®) give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially in water for injections (500 mg/10 mL then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour.

**HANDLING AND STORAGE**
Caution in handling. Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **ELECTROLYTES:** May contain Sodium
  - *Cyveine* (Roche Products Ltd)
  - Ganciclovir (as Ganciclovir sodium) 500 mg
  - Cyveine 500mg powder for solution for infusion vials | 5 vial £30 £148.83
Valganciclovir

**INDICATIONS AND DOSE**

**Cytomegalovirus retinitis, induction**

**BY MOUTH**

- Adult: Initially 900 mg twice daily for 21 days, then 900 mg daily, induction regimen may be repeated if retinitis progresses

**Prevention of cytomegalovirus disease following solid organ transplantation**

**BY MOUTH**

- Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

**Dose equivalence and conversion**

Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) • abnormally low neutrophil count (consult product literature) • abnormally low platelet count (consult product literature)

- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) • history of cytopenia • potential carcinogen • potential teratogen • radiotherapy

- **INTERACTIONS** → Appendix 1 (valganciclovir).

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain • abnormal thinking • anaemia • anorexia • anxiety • arthralgia • chest pain • confusion • constipation • convulsions • cough • depression • dermatitis • diarrhoea • dizziness • dyspepsia • dysphagia • dyspepsia • ear pain • eye pain • fatigue • flatulence • headache • hepatic dysfunction • infection • insomnia • leucopenia • macular oedema • myalgia • nausea • night sweats • pancytopenia • peripheral neuropathy • pruritus • pyrexia • renal impairment • retinal detachment • taste disturbance • thrombocytopenia • vitreous floaters • vomiting • weight loss
  - Uncommon Alopecia • anaphylactic reactions • arrhythmias • disturbances in hearing • disturbances in vision • haematuria • hypotension • male infertility • mouth ulcers • pancreatitis • psychosis • tremor

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

- **PREGNANCY** Avoid—teratogenic risk.

- **BREAST FEEDING** Avoid—no information available.

- **RENAL IMPAIRMENT** Reduce dose, consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

- **PRESCRIBING AND DISPENSING INFORMATION**

  Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.

- **HANDLING AND STORAGE**

  Caution in handling Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

### 6.6 HIV infection

**HIV infection**

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

**Principles of treatment**

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

**Initiation of treatment**

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as "highly active antiretroviral therapy". Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimens of choice contain tenofovir disoproxil and emtricitabine with either efavirenz or ritonavir-boosted atazanavir, or ritonavir-boosted darunavir, or raltegravir. Alternative regimens contain abacavir and lamivudine with either lopinavir with ritonavir, or ritonavir-boosted fosamprenavir, or nevirapine, or rilpivirine. Patients who require treatment for both HIV
and chronic hepatitis B should be treated with antivirals active against both diseases.

Switching therapy
Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy
Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/ bbhp/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding
Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis
Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

Drugs for HIV infection
Zidovudine p. 566, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir p. 561, didanosine p. 562, emtricitabine p. 563, lamivudine p. 563, stavudine p. 564, and tenofovir disoproxil p. 564.

The protease inhibitors include atazanavir p. 567, darunavir p. 568, fosamprenavir p. 568 (a pro-drug of amprenavir), indinavir p. 569, lopinavir (available as lopinavir with ritonavir), ritonavir p. 570, saquinavir p. 570, and tipranavir p. 571. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz p. 558, etravirine p. 559, nevirapine p. 560, and rilpivirine p. 561 are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide p. 557, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 557 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 557 and raltegravir p. 558 are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Elvitegravir is also an inhibitor of HIV integrase that is only available as a component of a fixed-dose combination product (cobicistat with elvitegravir, emtricitabine and tenofovir). Cobicistat p. 567 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

Immune reconstitution syndrome
Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

Lipodystrophy syndrome
Metabolic effects associated with antiretroviral treatment include fat redistribution, insulin resistance, and dyslipidaemia; collectively these have been termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, ‘buffalo hump’ and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

Osteonecrosis
Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.
HIV infection in children
HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

CCRS CHEMOKINE RECEPTOR ANTAGONISTS

Maraviroc
- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

**INDICATIONS AND DOSE**
CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

- **BY MOUTH**
  - Adult: 300 mg twice daily

- **CAUTIONS** Cardiovascular disease
- **INTERACTIONS** → Appendix 1 (maraviroc).
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain, anaemia, anorexia, depression, diarrhoea, flattulence, headache, insomnia, malaise, nausea, rash
  - Uncommon Myositis, proteinuria, renal failure, seizures
  - Rare Angina, granulocytopenia, hepatitis, pancytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis
  - Frequency not known Eosinophilia, fever, hepatic reactions, hypersensitivity reactions, osteonecrosis, rash

**SIDE-EFFECTS, FURTHER INFORMATION**
Osteonecrosis
For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Celsentri (ViiV Healthcare UK Ltd)
  - Maraviroc 150 mg Celsentri 150mg tablets | 60 tablet pack £441.27
  - Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet pack £441.27

HIV-FUSION INHIBITORS

Enfuvirtide
- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

**INDICATIONS AND DOSE**
HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 90 mg twice daily

**INTERACTIONS** → Appendix 1 (enfuvirtide).

**SIDE-EFFECTS**
- Common or very common Acne, anorexia, anxiety, asthenia, conjunctivitis, diabetes mellitus, dry skin, erythema, gastrointestinal reflux disease, haematuria, hypertriglyceridaemia, impaired concentration, influenza-like illness, injection-site reactions, irritability, lymphaedema, myalgia, nightmares, pancreatitis, peripheral neuropathy, pneumonia, renal calculi, sinusitis, skin papilloma, tremor, vertigo, weight loss
- Uncommon Hypersensitivity reactions
- Frequency not known Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**
Hypersensitivity reactions
Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

**Osteonecrosis**
For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**ELECTROLYTES:** May contain Sodium

- Fuzeon (Roche Products Ltd)
  - Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial pack £1,081.57

HIV-INTEGRASE INHIBITORS

Dolutegravir
- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**
HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

- **BY MOUTH**
  - Adult: 50 mg once daily

HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs

- **BY MOUTH**
  - Adult: 50 mg twice daily, dose to be taken with food

HIV infection in combination with other antiretroviral drugs (with concomitant efavirezin, nevirapine, tipranavir, or rifampicin)

- **BY MOUTH**
  - Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

**INTERACTIONS** → Appendix 1 (dolutegravir).
Caution—avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting
- **Uncommon** Hepatitis · hypersensitivity reactions
- **Frequency not known** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity reactions
- Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis
- For further information see HIV infection p. 555

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**DIRECTIONS FOR ADMINISTRATION** Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

**PATIENT AND CARER ADVICE**
- **Missed doses** If a dose is more than 2 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer dolutegravir tablets.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Tivicay** (ViiV Healthcare UK Ltd) ▼
  - Dolutegravir (as Dolutegravir sodium) 50 mg Tivicay 50mg tablets | 30 tablet | £49.87

Also available in combination with abacavir and lamivudine, p. 562

**Draltegravir**

**DRUG ACTION** Draltegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

**BY MOUTH USING TABLETS**
- **Adult:** 400 mg twice daily

**Dose equivalence and conversion**

The bioavailability of Isentress® chewable tablets is higher than that of the ’standard’ 400 mg tablets; the chewable tablets are not interchangeable with the ’standard’ tablets on a milligram-for-milligram basis.

**CAUTIONS**

Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

**INTERACTIONS** → Appendix 1 (raltegravir).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · abnormal dreams · anaemia · anxiety · appetite changes · arthralgia · bradycardia · carpal tunnel syndrome · chest pain · chills · confusion · constipation · drowsiness · dry mouth · dry skin · dysphonia · epistaxis · erectile dysfunction · flushing · gastritis · gingivitis · glossitis · gynaecomastia · hepatitis · hyperhidrosis · hypertension · impaired memory and attention · lipodystrophy · Lipodystrophy Syndrome · menopausal symptoms · myalgia · nasal congestion · neutropenia · nocturia · oedema · osteopenia · pain on swallowing · palpitation · pancreatitis · peptic ulcer · peripheral neuropathy · polydipsia · pruritus · pyrexia · rash with eosinophilia and systemic symptoms · rectal bleeding · renal failure · rhabdomyolysis · skin papilloma · Stevens-Johnson syndrome · suicidal ideation · taste disturbances · thrombocytopenia · tinnitus · tremor · ventricular extrasystoles · visual disturbances
- **Uncommon** Angina · angioedema · hepatitis · or eosinophilia.

**Frequency not known** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

Rash
- Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

Lipodystrophy syndrome
- For further information see HIV infection p. 555

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

**PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium has advised (April 2010) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 25
  - **Isentress** (Merck Sharp & Dohme Ltd)
    - **Raltegravir 400 mg** Isentress 400mg tablets | 60 tablet | £471.41

**Chewable tablet**
- CAUTIONARY AND ADVISORY LABELS 24
  - EXCIPIENTS: May contain Aspartame
  - **Isentress** (Merck Sharp & Dohme Ltd)
    - **Raltegravir 25 mg** Isentress 25mg chewable tablets | 60 tablet | £29.46 | DT price = £29.46
    - **Raltegravir 100 mg** Isentress 100mg chewable tablets | 60 tablet | £117.85 | DT price = £117.85

**Granules**
- **RALTEGRAVIR (Non-proprietary)**
  - **Raltegravir 100 mg** Isentress 100mg granules sachets | 60 sachet | £213.02

**NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS**

**Efavirenz**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

**BY MOUTH USING CAPSULES**
- **Adult:** 600 mg once daily
Etravirine

**INDICATIONS AND DOSE**
HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

**BY MOUTH**

- Adult: 200 mg twice daily, to be taken after food

**SIDE-EFFECTS**

- Common or very common Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · diziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting
- Uncommon Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor
- Rare Hepatic failure · photosensitivity · suicide
- Frequency not known Lipodystrophy Syndrome · osteonecrosis · raised serum cholesterol

**SIDE-EFFECTS, FURTHER INFORMATION**

**Common** Rash
Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

**CNS effects** Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

**Lipodystrophy Syndrome** For further information see HIV infection, p. 555.

**Osteonecrosis** For further information see HIV infection, p. 555.

**Pregnancy** Reports of neural tube defects when used in first trimester.

**Hepatic impairment** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment. In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.

**Renal impairment** Manufacturer advises caution in severe renal failure—no information available.

**Monitoring requirements** Monitor liver function if receiving other hepatotoxic drugs.

**Directions for administration** Capsules may be opened and contents added to food (contents have a peppery taste).

**Prescribing and dispensing information** Flavours of oral liquid formulations may include strawberry and mint.

**Patient and carer advice** Psychiatric disorders. Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 23
- Efavirenz (Non-proprietary) Efavirenz 600 mg Efavirenz 600 mg tablets | 30 tablet (£102.79) (Hospital only)
PATIENT AND CARER ADVICE

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 21

Intolerance (Janssen-Cilag Ltd) Etravirine 25 mg Intolerance 25mg tablets | 120 tablet £75.32
Etravirine 100 mg Intolerance 100mg tablets | 120 tablet £130.27
Etravirine 200 mg Intolerance 200mg tablets | 60 tablet £203.27

Nevirapine

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 400 mg once daily

CONTRA-INDICATIONS Acute porphyrias p. 864 • post-exposure prophylaxis

CAUTIONS Females (at greater risk of hepatic side effects) • high CD4 cell count (at greater risk of hepatic side effects)

CAUTIONS, FURTHER INFORMATION

Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects— if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.

INTERACTIONS → Appendix 1 (nevirapine).

SIDE-EFFECTS

Common or very common Abdominal pain • diarrhoea • fatigue • fever • granulocytopenia • headache • hepatitis • hypersensitivity reactions (may involve hepatic reactions and rash) • nausea • rash • Stevens-Johnson syndrome • toxic epidermal necrolysis • vomiting

Uncommon Anaemia • arthralgia • myalgia

Frequency not known Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 5 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 5 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis For more information see HIV infection p. 555.

HEPATIC IMPAIRMENT Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

RENAL IMPAIRMENT Manufacturer advises avoid modified-release preparation—no information available.

MONITORING REQUIREMENTS

Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.

Rash Monitor closely for skin reactions during first 18 weeks.

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 8 hours late with the 'immediate-release' preparation or more than 12 hours late with the modified-release preparation, the missed dose should not be taken and the next dose should be taken at the usual time.

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

NEVIRAPINE (Non-proprietary)

Nevirapine 100 mg Viramune 100mg modified-release tablets | 90 tablet £127.50 (Hospital only)

Nevirapine 400 mg Viramune 400mg modified-release tablets | 30 tablet £170.00 (Hospital only)

Oral suspension

VIRAMUNE (Boehringer Ingelheim Ltd)

Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml £50.40
Rilpivirine

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than 100 000 copies/mL

**BY MOUTH**
- Adult: 25 mg once daily

**INTERACTIONS** → Appendix 1 (rilpivirine).

Caution if concomitant use with drugs that prolong QT interval.

**SIDE-EFFECTS** Abdominal pain - abnormal dreams - anorexia - depression - dizziness - dry mouth - headache - hyperlipidaemia - Lipodystrophy Syndrome - malaise - nausea - osteonecrosis - raised serum amylase - raised serum lipase - rash - sleep disturbances - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Lipodystrophy For further information see HIV infection p. 555.

Osteonecrosis For further information see HIV infection p. 555.

**PREGNANCY**

Manufacturer advises avoid unless essential — no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment; avoid in severe impairment — no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

**RENAL IMPAIRMENT**

Manufacturer advises caution in severe impairment.

**DIRECTIONS FOR ADMINISTRATION** Avoid antacids 2 hours before or 4 hours after taking rilpivirine.

**PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer rilpivirine tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21, 25
- Edurant (Janssen-Cilag Ltd) ▼
- Rilpivirine (as Rilpivirine hydrochloride) 25 mg Edurant 25 mg tablets | 30 tablet | £20.27

Also available in combination with emtricitabine and tenofovir, p. 565

**NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS**

Nucleoside reverse transcriptase inhibitors

**CAUTIONS**

- Alcohol abuse (increased risk of lactic acidosis)
- Obese women (increased risk of lactic acidosis) - patients at risk of lactic acidosis

**CAUTIONS, FURTHER INFORMATION**

Lactic acidosis Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis. Treatment with the nucleoside reverse transcriptase inhibitor should be discontinued in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function.

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Lipodystrophy syndrome For further information see HIV infection p. 555.

Osteonecrosis For further information see HIV infection p. 555.

**PREGNANCY** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

**HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

Abacavir

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

**BY MOUTH**
- Adult: 600 mg daily in 1–2 divided doses

**CAUTIONS**

- HIV load greater than 100 000 copies/mL in patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

**INTERACTIONS** → Appendix 1 (abacavir).

**SIDE-EFFECTS**

- Very rare Stevens-Johnson syndrome - toxic epidermal necrolysis
- Frequency not known Hypersensitivity reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity reactions Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible — if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

**Gastro-intestinal disturbances** More common in children.

**Rash** More common in children.
Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, zidovudine p. 566.

INDICATIONS AND DOSE
HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)
BY MOUTH
» Adult: 1 tablet twice daily

RENAL IMPAIRMENT Avoid Trizivir® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m². (consult product literature).
MEDIcular FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
» Trizivir® (ViiV Healthcare UK Ltd)
Abacavir (as Abacavir sulfate) 300 mg, Lamivudine 150 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet £432.70

Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, dolutegravir p. 557.

INDICATIONS AND DOSE
HIV infection
BY MOUTH
» Adult (body-weight 40 kg and above): 1 tablet once daily

RENAL IMPAIRMENT Avoid Triumeq® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).
PATIENT AND CARER ADVICE
Missed doses If a dose is more than 24 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDIcular FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
» Triumeq® (ViiV Healthcare UK Ltd)
Abacavir (as Abacavir sulfate) 600 mg, Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg Triumeq 50mg/600mg/300mg tablets | 30 tablet £798.16

Didanosine
(ddi; DDI)

INDICATIONS AND DOSE
HIV infection in combination with other antiretrovirals
BY MOUTH
» Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
» Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

CAUTIONS History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · peripheral neuropathy
INTERACTIONS → Appendix 1 (didanosine).
Antacids in tablet formulation may affect absorption of other drugs—give at least 2 hours apart.
SIDE-EFFECTS Acute renal failure · alopecia · anaphylactic reactions · diabetes mellitus · dry eyes · dry mouth · hyperuricaemia (suspend if raised significantly) · hypoglycaemia · liver failure · non-cirrhotic portal hypertension · optic nerve changes · pancreatitis (less
common in children) - parotid gland enlargement - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - retinal changes - rhombomylolysis - siadadenitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Pancreatitis** Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Insufficient information. In hepatic impairment, monitor for toxicity. **RENAL IMPAIRMENT** Reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

**DIRECTIONS FOR ADMINISTRATION** With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after food. With chewable dispersible tablets (sugar-free) /oral liquid formulations may include candy.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Abnormal dreams** - hyperpigmentation - pruritus

**INTERACTIONS** → Appendix 1 (emtricitabine).

**SIDE-EFFECTS** Abnormal dreams - hyperpigmentation - pruritus

**HEPATIC IMPAIRMENT** On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include candy.

**PATIENT AND CARER ADVICE** Missed doses. If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Also available in combination with cobicistat with elvitegravir, tenofovir, p. 565 · efavirenz with tenofovir, p. 565 · rilpivirine and tenofovir, p. 565 · tenofovir, p. 566

**Lamivudine (3TC)**

**INDICATIONS AND DOSE**

**ZEFFIX**

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

**BY MOUTH**

- Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

**EPIVIR® TABLETS**

HIV infection in combination with other antiretroviral drugs

**BY MOUTH**

- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

**EPIVIR® ORAL SOLUTION**

HIV infection in combination with other antiretroviral drugs

**BY MOUTH**

- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

**CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

**INTERACTIONS** → Appendix 1 (lamivudine).

**SIDE-EFFECTS** Alopecia - muscle disorders - nasal symptoms - peripheral neuropathy - rhombomylolysis

**BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.
Infection

564 Viral infection

• MONITORING REQUIREMENTS When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

• PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include banana and strawberry.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
- **LAMIVUDINE (Non-proprietary)**
  - Lamivudine 100 mg: Lamivudine 100mg tablets | 28 tablet [POM] £74.19–£78.09 DT price = £74.55
  - Lamivudine 150 mg: Lamivudine 150mg tablets | 60 tablet [POM] £85.80–£136.15
  - Lamivudine 300 mg: Lamivudine 300mg tablets | 30 tablet [POM] £54.98–£149.63
- **Epivir** (ViiV Healthcare UK Ltd)
  - Lamivudine 150 mg: Epivir 150mg tablets | 60 tablet [POM] £121.82
  - Lamivudine 300 mg: Epivir 300mg tablets | 30 tablet [POM] £133.89
- **Zefix** (GlaxoSmithKline UK Ltd)
  - Lamivudine 100 mg: Zefix 100mg tablets | 28 tablet [POM] £78.09 DT price = £74.55

Oral solution
- **EXCIPIENTS:** May contain Sucrose
- **Epivir** (ViiV Healthcare UK Ltd)
  - Lamivudine 10 mg per 1 ml: Epivir 50mg/5ml oral solution | 240 ml [POM] £33.16

Also available in combination with abacavir and dolutegravir, p. 562.

Stavudine (d4T)

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs
when no suitable alternative available and when prescribed for shortest period possible BY MOUTH
- Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
- Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

- CAUTIONS Excessive alcohol intake - higher risk of lactic acidosis than other nucleoside reverse transcriptase inhibitors (especially when used in combination with didanosine)—use only if alternative regimens are not suitable - history of pancreatitis - history of peripheral neuropathy

- INTERACTIONS → Appendix 1 (stavudine). Caution with concomitant use of isoniazid—risk of peripheral neuropathy. Caution with concomitant use with other drugs associated with pancreatitis.

- SIDE-EFFECTS
  - Common or very common Abnormal dreams - cognitive dysfunction - depression - drowsiness - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - pruritus
  - Uncommon Anxiety - gynaecomastia
  - PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

- RENAL IMPAIRMENT Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m². Risk of peripheral neuropathy.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry.

- LESS SUITABLE FOR PRESCRIBING Stavudine (especially in combination with didanosine) is associated with a higher risk of lipatrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule
- **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Stavudine 20 mg: Zerit 20mg capsules | 56 capsule [POM] £139.46 (Hospital only)
  - Stavudine 30 mg: Zerit 30mg capsules | 56 capsule [POM] £146.25 (Hospital only)
  - Stavudine 40 mg: Zerit 40mg capsules | 56 capsule [POM] £150.66 (Hospital only)

Oral solution
- **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Stavudine 1 mg per 1 ml: Zerit 1mg/ml oral solution | 200 ml [POM] £22.94 (Hospital only)

Tenofovir disoproxil

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs
| Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease |
| BY MOUTH |
- Adult: 245 mg once daily

Dose equivalence and conversion
7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

INTERACTIONS → Appendix 1 (tenofovir). Use with caution if concomitant or recent use of nephrotoxic drugs.

- SIDE-EFFECTS
  - Rare Nephrogenic diabetes insipidus - proximal renal tubulopathy - renal failure
  - Frequency not known Hypophosphataemia - reduced bone density

- RENAL IMPAIRMENT Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m². Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m². Monitor renal function—interrupt treatment if further deterioration.

MONITORING REQUIREMENTS
- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

DIRECTIONS FOR ADMINISTRATION Granules: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.
Cobicistat with elvitegravir, emtricitabine and tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 563, tenofovir disoproxil p. 564, cobicistat p. 567.

INDICATIONS AND DOSE

HIV infection
BY MOUTH
- Adult: 1 tablet once daily

INTERACTIONS
- Appendix 1 (cobicistat, elvitegravir, emtricitabine, tenofovir).

SIDE-EFFECTS
- Uncommon Depression and suicidal ideation (in patients with a history of psychiatric illness)
- CONCEPTION AND CONCEPTION Women of childbearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- HEPATIC IMPAIRMENT Avoid Strild ® in severe impairment.
- RENAL IMPAIRMENT If eGFR less than 90 mL/minute/1.73 m², only initiate Strild ® if other treatments cannot be used (avoid initiating Strild ® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only continue Strild ® if potential benefit outweighs risk (discontinue Strild ® if eGFR less than 50 mL/minute/1.73 m²).
- MONITORING REQUIREMENTS Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.

INDICATIONS AND DOSE

HIV infection stabilised on antiretroviral therapy for more than 3 months
BY MOUTH
- Adult: 1 tablet once daily

HEPATIC IMPAIRMENT Manufacturer of Atripla ® advises caution in mild impairment; avoid Atripla ® in moderate to severe impairment.

RENAL IMPAIRMENT Avoid Atripla ® if eGFR less than 50 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Efavirenz with emtricitabine and tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, efavirenz p. 558, emtricitabine p. 563, tenofovir disoproxil p. 564.

INDICATIONS AND DOSE

HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL
BY MOUTH
- Adult: 1 tablet once daily

Emtricitabine with rilpivirine and tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 563, rilpivirine p. 561, tenofovir disoproxil p. 564.

INDICATIONS AND DOSE

HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL
BY MOUTH
- Adult: 1 tablet once daily

@drmyothethan
Emtricitabine with tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 563, tenofovir disoproxil p. 564.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

► Adult: 1 tablet once daily

RENAL IMPAIRMENT

Use normal dose of Truvada® every 2 days if eGFR 30–50 mL/minute/1.73 m².

Avoid Truvada® if eGFR less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).

PATIENT AND CARER ADVICE

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer Eviplera®.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

► Eviplera (Gilead Sciences International Ltd) ▼

Emtricitabine 200 mg, Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg Eviplera 200mg/25mg/245mg tablets | 30 tablet £525.95

Zidovudine

(Azidothymidine; AZT)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

► Adult: 250–300 mg twice daily

Prevention of maternal-fetal HIV transmission

BY MOUTH OR BY INTRAVENOUS INFUSION

► Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

CONTRA-INDICATIONS

Acute porphyrias p. 864 • abnormally low haemoglobin concentration (consult product literature) • abnormally low neutrophil counts (consult product literature)

CAUTIONS

Elderly • risk of haematological toxicity particularly with high dose and advanced disease • vitamin B₁₂ deficiency (increased risk of neutropenia)

INTERACTIONS

Appendix 1 (zidovudine).

SIDE-EFFECTS

Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment

Lipoatrophy Zidovudine is associated with a higher risk of lipoatrophy than other antiretrovirals and should be used only if alternative regimens are not suitable.

HEPATIC IMPAIRMENT

Accumulation may occur.

RENAL IMPAIRMENT

Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Monitor full blood count after 4 weeks of treatment, then every 3 months.

DIRECTIONS FOR ADMINISTRATION

Avoid antacids

BY INTRAVENOUS INFUSION

► Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

CONTRA-INDICATIONS

Acute porphyrias p. 864 • abnormally low haemoglobin concentration (consult product literature) • abnormally low neutrophil counts (consult product literature)

CAUTIONS

Elderly • risk of haematological toxicity particularly with high dose and advanced disease • vitamin B₁₂ deficiency (increased risk of neutropenia)

INTERACTIONS

Appendix 1 (zidovudine).

SIDE-EFFECTS

Anaemia and myelosuppressive drugs—for further details consult product literature.

SIDE-EFFECTS, FURTHER INFORMATION

Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment

Lipoatrophy Zidovudine is associated with a higher risk of lipoatrophy than other antiretrovirals and should be used only if alternative regimens are not suitable.

HEPATIC IMPAIRMENT

Accumulation may occur.

RENAL IMPAIRMENT

Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Monitor full blood count after 4 weeks of treatment, then every 3 months.

DIRECTIONS FOR ADMINISTRATION

For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

PRESCRIBING AND DISPENSING INFORMATION

The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► ZIDOVUDINE (Non-proprietary)

Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule £40.41

Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule £96.36

Zidovudine 10 mg per 1 ml Retrovir 50mg/5ml oral solution (sugar-free) | 200 ml (PO) £17.78

Solution for infusion

► Retrovir (ViiV Healthcare UK Ltd)

Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial (PO) £44.61

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

BY INTRAVENOUS INFUSION

► Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth
Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, zidovudine p. 566.

**INDICATIONS AND DOSE**

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

**BY MOUTH**

- Adult: 1 tablet twice daily

- **RENAL IMPAIRMENT** Avoid Trizivir® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).
- Avoid Trizivir® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - Trizivir (ViiV Healthcare UK Ltd)
    - Abacavir (as Abacavir sulfate) 300 mg, Lamivudine 150 mg, Zidovudine 300 mg

Lamivudine with zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lamivudine p. 563, zidovudine p. 566.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals

**BY MOUTH**

- Adult: 1 tablet twice daily

- **RENAL IMPAIRMENT** Avoid if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

- **DIRECTIONS FOR ADMINISTRATION**
  - **COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - Tablet
    - Lamivudine with zidovudine (Non-proprietary)

      - Tybost (Gilead Sciences International Ltd)
        - Cobicistat 150 mg
      - Tybost 150mg tablets | 30 tablet (Po) £21.38

Also available in combination with elvitegravir, emtricitabine and tenofovir, p. 565

**PROTEASE INHIBITORS (HIV)**

**Protease inhibitors**

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Diabetes - haemophilia (increased risk of bleeding)
- **SIDE-EFFECTS, FURTHER INFORMATION** Lipodystrophy Syndrome For further information see HIV infection p. 555. Osteonecrosis For further information see HIV infection p. 555.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Atazanavir**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

**BY MOUTH**

- Adult: 300 mg once daily

- HIV infection in combination with other antiretroviral drugs—with cobicistat

- **BY MOUTH**
  - Adult: 300 mg daily

- **CAUTIONS** Cardiac conduction disorders - electrolyte disturbances - predisposition to QT interval prolongation

- **INTERACTIONS** → Appendix 1 (atazanavir).
  - Caution if concomitant use with drugs that prolong PR interval. Caution with concomitant use of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - **Uncommon** Abnormal dreams - alopecia - amnesia - anxiety - arthralgia - chest pain - cholelithiasis - depression - disorientation - dry mouth - dyspnoea - gynaecomastia - haematuria - hypertension - increased appetite - mouth
ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · tarsode de pointes · urinary frequency · weight changes

- Rare Abnormal gait · cholecystitis · hepatosplenomegaly · oedema · palpitation

SIDE-EFFECTS, FURTHER INFORMATION

Rash Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- PREGNANCY Theoretical risk of hyperbilirubinaemia in neonate if used at term. In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 21

- Reyataz (Bristol-Myers Squibb Pharmaceuticals Ltd)

  Atazanavir (as Atazanavir sulfate) 300 mg Reyataz 300mg capsules | 30 capsule £303.38 (Hospital only)

Darunavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—

with low-dose ritonavir

BY MOUTH

- Adult: 600 mg twice daily, alternatively 800 mg once daily if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/ml, and if CD4 cell count greater than 100 cells × 10⁹/litre

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—

with cobicistat

BY MOUTH

- Adult: 800 mg once daily, if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁹/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—

with low-dose ritonavir

BY MOUTH

- Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—

with cobicistat

BY MOUTH

- Adult: 800 mg once daily

INTERACTIONS → Appendix 1 (darunavir).

SIDE-EFFECTS

- Common or very common Peripheral neuropathy · rash
- Uncommon Abnormal dreams · acne · alopecia · angina · anxiety · arthralgia · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

- Rare Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhea · seborrhoeic dermatitis · syncope · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

ALLERGY AND CROSS-SENSITIVITY Use with caution in patients with sulphonamide sensitivity.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

- MONITORING REQUIREMENTS Monitor liver function before and during treatment.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.

- PATIENT AND CARER ADVICE

Missed doses

If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

  Darunavir (as Darunavir ethanolate) 600 mg Prezista 600mg tablets | 60 tablet £446.70
  Darunavir (as Darunavir ethanolate) 800 mg Prezista 800mg tablets | 30 tablet £297.80

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

- Prezista (Janssen-Cilag Ltd)
  Darunavir (as Darunavir ethanolate) 100 mg per 1 ml Prezista 100mg/ml oral suspension (sugar-free) | 200 ml £248.17

Fosamprenavir

- DRUG ACTION Fosamprenavir is a pro-drug of ampranavir.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—

with low-dose ritonavir

BY MOUTH

- Adult: 700 mg twice daily

Dose equivalence and conversion

700 mg fosamprenavir is equivalent to approximately 600 mg ampranavir.

- INTERACTIONS → Appendix 1 (fosamprenavir).
INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs
INITIALLY BY MOUTH USING TABLETS
- Adult: 400/100 mg twice daily, alternatively (by mouth) 800/200 mg once daily in adults with a HIV strain that has less than 3 mutations to protease inhibitors
-成人：每日2次，每次400/100mg，或800/200mg一次，用于成人对HIV的株，该株对蛋白酶抑制剂有3个或3个以下的突变。

Dose equivalence and conversion
The proportions are expressed in the form x/y where x and y are the strengths in milligrams of lopinavir and ritonavir respectively.

CAUTIONS
Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · structural heart disease

INTERACTIONS → Appendix 1 (lopinavir, ritonavir).
Caution if concomitant use with drugs that prolong QT or PR interval.

SIDE-EFFECTS
- Common or very common Amenorrhea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight changes
- Uncommon Abnormal dreams · alopecia · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastro-intestinal ulcer · haematuria · myocardial infarction · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION
Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

PREGNANCY
Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies)
Ritonavir

INDICATIONS AND DOSE
HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—with low-dose ritonavir
BY MOUTH
> Adult: 1 g every 12 hours
HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—with low-dose ritonavir
BY MOUTH
> Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

CAUTIONS
Cardiac conduction disorders · pancreatitis · structural heart disease

INTERACTIONS → Appendix 1 (ritonavir).
Caution if concomitant use with drugs that prolong PR interval.

SIDE-EFFECTS
> Common or very common Acne · anxiety · arthralgia · blood pressure changes · blurred vision · confusion · cough · decreased blood thyroxine concentration · fever · flushing · gastro-intestinal haemorrhage · menorrhagia · mouth ulcers · oedema · peripheral neuropathy · pharyngitis · renal impairment · seizures · syncope
> Uncommon Electrolyte disturbances · myocardial infarction
> Rare Toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

PREGNANCY
Only use low-dose booster to increase the effect of other protease inhibitors.

HEPATIC IMPAIRMENT
Avoid in decompensated liver disease; in severe impairment without decompensation, use “booster” doses with caution (avoid treatment doses).

DIRECTIONS FOR ADMINISTRATION
Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer ritonavir oral solution.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21
EXCIPIENTS: May contain Alcohol, propylene glycol
> Norvir (AbbVie Ltd)
Ritonavir 80 mg per 1 ml Norvir 80mg/ml oral solution (sugar-free) | 450 ml [Fest] £403.20

Saqinavir

INDICATIONS AND DOSE
HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—
with low-dose saquinavir
BY MOUTH
> Adult: 1 g every 12 hours
HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—
with low-dose saquinavir
BY MOUTH
> Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

CONTRA-INDICATIONS
Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias

INTERACTIONS → Appendix 1 (saquinavir).
Caution with concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration). Contra-indicated if concomitant use of drugs that prolong QT or PR interval. Contra-indicated if concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available).

SIDE-EFFECTS
> Common or very common Alopecia · changes in libido · dry mouth · dyspnoea · increased appetite · peripheral neuropathy
> Uncommon Convulsions · mucosal ulceration · renal impairment · visual impairment

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate impairment; avoid in decompensated liver disease.

RENAL IMPAIRMENT
Use with caution if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds); if baseline QT interval less than 450 milliseconds, monitor ECG during treatment (particularly 10 days after starting treatment in patients not previously treated with antiretroviral therapy)—discontinue if QT interval increases over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, if prolongation of PR interval, or if arrhythmias occur.

PATIENT AND CARER ADVICE
Arrhythmias Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
6.7 Influenza

Oxeltevivir below and zanamivir p. 573 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oxeltevivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oxeltevivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oxeltevivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oxeltevivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to osextamivir, but may retain susceptibility to zanamivir. Resistance to osextamivir may be greater in severely immunocompromised patients.

Osextamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Osextamivir in children under 1 year of age

Data on the use of osextamivir in children under 1 year of age is limited. Furthermore, osextamivir may be ineffective in neonates because they may not be able to metabolise osextamivir to its active form. However, osextamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with osextamivir can be overseen by healthcare professionals experienced in assessing children.

NEUROMINIDASE INHIBITORS

Oseltamivir

Caution

PRECAUTIONS

Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

Dehydration

FREQUENCY NOT KNOWN

Anorexia, dyspnoea, influenza-like symptoms, peripheral neuropathy, photosensitivity, renal impairment.

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity. Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.

MONITORING REQUIREMENTS

Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include toffee and mint.

PATIENT AND CARER ADVICE

Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capable

CAUTIONARY AND ADVISORY LABELS 5, 21

More than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

DIFFERENCE AND CONVERSION

Tipranavir

INDICATIONS AND DOSE

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals (with low-dose ritonavir).

BY MOUTH USING CAPSULES

Adult: 500 mg twice daily

Dose equivalence and conversion

The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

CAUTIONARY AND ADVISORY LABELS

5, 21

CAUTIONARY AND ADVISORY LABELS 5, 21

Capsule containing the same drug.

There can be variation in the licensing of different medicines containing the same drug.
Infection

- Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1-12 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

BY MOUTH
- Child 1-2 months: 2.5 mg/kg twice daily for 5 days
- Child 3-11 months: 3 mg/kg twice daily for 5 days
- Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days
- Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days
- Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days
- Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- Child 13-17 years: 75 mg twice daily for 5 days
- Adult: 75 mg twice daily for 5 days

UNLICENSED USE
- Not licensed for use in children under 1 year of age unless there is a pandemic.

SIDE-EFFECTS
- Common or very common: Abdominal pain; dyspepsia; headache; nausea; vomiting
- Uncommon: Altered consciousness (usually in children and adolescents); arrhythmias; convulsions; eczema; rash
- Rare: Gastro-intestinal bleeding; hepatitis; neuropsychiatric disorders (usually in children and adolescents); Stevens-Johnson syndrome; thrombocytopenia; toxic epidermal necrolysis; visual disturbances

PREGNANCY
- Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

BREAST FEEDING
- Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

RENAL IMPAIRMENT
- In adults For treatment, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For prevention, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m².
- In children For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
- If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid formulations may include tutti-frutti.

PATIENT AND CARER ADVICE
- Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

NATIONAL FUNDING/ACCESS DECISIONS
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) [NICE TA158]
- The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Amantadine is not recommended for prophylaxis of influenza.
- Oseltamivir is not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes. At risk patients include those aged over 65 years or those who have one or more of the following conditions:
  - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
  - chronic heart disease;
  - chronic renal disease;
  - chronic liver disease;
  - chronic neurological disease;
  - immunosuppression;
  - diabetes mellitus.
- The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant. This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community. www.nice.org.uk/TA158
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (February 2009) [NICE TA168]
- The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Amantadine is not recommended for prophylaxis of influenza.
When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for treatment at-risk patients living in long-term residential or nursing homes. At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant. This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community. www.nice.org.uk/TA168

NHS restrictions Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

Capsule
- Tamiflu (Roche Products Ltd)
  - Oseltamivir (as Oseltamivir phosphate) 30 mg Tamiflu 30mg capsules | 10 capsule (PO) £7.71
  - Oseltamivir (as Oseltamivir phosphate) 45 mg Tamiflu 45mg capsules | 10 capsule (PO) £15.41
  - Oseltamivir (as Oseltamivir phosphate) 75 mg Tamiflu 75mg capsules | 10 capsule (PO) £15.41

Oral suspension
- Tamiflu (Roche Products Ltd)
  - Oseltamivir (as Oseltamivir phosphate) 6 mg per 1 ml Tamiflu 6mg/ml oral suspension (sugar-free) | 65 ml (PO) £10.27

Oral solution
- Tamiflu (Roche Products Ltd)
  - Oseltamivir (as Oseltamivir phosphate) 15 mg per 1 ml Oseltamivir 15mg/ml oral solution sugar free (sugar-free) | 20 ml (PO) £10.00

Zanamivir
- DRUG ACTION Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

INDICATIONS AND DOSE
Post-exposure prophylaxis of influenza
- Child 5-17 years: 10 mg once daily for up to 10 days
- Adult: 10 mg once daily for up to 10 days

Prevention of influenza during an epidemic
- Child 5-17 years: 10 mg once daily for up to 28 days
- Adult: 10 mg once daily for up to 28 days

TREATMENT OF INFLUENZA
- Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
- Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

UNLICENSED USE Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

CAUTIONS
- Asthma, chronic pulmonary disease
- Uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION
- Asthma and chronic pulmonary disease Risk of bronchospasm - short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

SIDE-EFFECTS
- Common or very common Rash
- Uncommon Angioedema, bronchospasm, dyspnoea, urticaria

RARE Neupyschiatric disorders (in children). Neupyschiatric disorders (especially in children and adolescents) (in adults) - Stevens-Johnson syndrome - toxic epidermal necrolysis

PREGNANCY Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic). Breastfeeding Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

DIRECTIONS FOR ADMINISTRATION Other inhaled drugs should be administered before zanamivir.

PRESCRIBING AND DISPENSING INFORMATION Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

NATIONAL FUNDING/ACCESS DECISIONS

Chapter 6
Endocrine system

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 576 (antidiuretic hormone, ADH) is used in the treatment of pituitary ('cranial') diabetes insipidus as is its analogue desmopressin. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 387 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate p. 77, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 705, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 496 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 577 is a vasopressin V2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment. Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Drugs used for Diabetes insipidus not listed below; Chlortalidone, p. 204

VASOPRESSIN AND ANALOGUES

Desmopressin

Drug action

Desmopressin is an analogue of vasopressin.
**INDICATIONS AND DOSE**

**Diabetes insipidus, diagnosis (water deprivation test)**

BY INTRANASAL ADMINISTRATION
- Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION
- Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

**Diabetes insipidus, treatment**

BY MOUTH
- Child 1 month-1 year: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
- Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
- Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
- Adult: Initially 60 micrograms 3 times a day, maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily

BY SUBLINGUAL ADMINISTRATION
- Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

BY INTRANASAL ADMINISTRATION
- Child 1 month-1 year: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
- Child 2-11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
- Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
- Adult: 10–40 micrograms daily in 1–2 divided doses

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: 1–4 micrograms daily

**Primary nocturnal enuresis**

BY MOUTH
- Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

BY SUBLINGUAL ADMINISTRATION
- Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
- Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

**Postoperative polyuria or polydipsia**

BY MOUTH
- Adult: Dose to be adjusted according to urine osmolality

Polyuria or polydipsia after hypophysectomy

BY SUBLINGUAL ADMINISTRATION
- Adult: Dose to be adjusted according to urine osmolality

**Nocturia associated with multiple sclerosis (when other treatments have failed)**

BY INTRANASAL ADMINISTRATION
- Adult 18-65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

Renal function testing

BY INTRANASAL ADMINISTRATION
- Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Mild to moderate haemophilia and von Willebrand’s disease**

BY INTRANASAL ADMINISTRATION
- Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION
- Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

**Fibrinolytic response testing**

BY INTRANASAL ADMINISTRATION
- Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION
- Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

**Lumbar-puncture-associated headache**

BY INTRANASAL ADMINISTRATION OR BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Cardiac insufficiency - conditions treated with diuretics - polydipsia in alcohol dependence - psychogenic polydipsia

- **CAUTIONS**

**GENERAL CAUTIONS**
- Asthma - avoid fluid overload - cardiovascular disease (not indicated for nocturnal enuresis or nocturia) - conditions which might be aggravated by water retention - cystic fibrosis - elderly (avoid for nocturnal enuresis and nocturia in those over 65 years) epilepsy - heart failure - hypertension (not indicated for nocturnal enuresis or nocturia) - migraine - nocturia — limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards - nocturnal enuresis — limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

**SPECIFIC CAUTIONS**
- With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects
### Desmopressin

**Endocrine system**

#### PRESCRIBING AND DISPENSING INFORMATION

**DIRECTIONS FOR ADMINISTRATION**

- **With intranasal use**
- **Rhinitis**
- **SIDE-EFFECTS, FURTHER INFORMATION**
- **Hypotensive convulsions**
  - The risk of hypotensive convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).
- **PREGNANCY**
  - Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING**
  - Amount too small to be harmful.
- **RENAL IMPAIRMENT**
  - Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS**
  - In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION**
  - BDVAP® and Desmotabs® tablets may be crushed. BDVAP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
  - In adults For intravenous infusion (BDVAP®, Octim®), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
- **CHILDREN**
  - Children requiring an intranasal dose of less than 10 micrograms should be given BDVAP® intranasal solution.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/ desmopressin-bedwetting-0
- **Hypotensive convulsions**
  - Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, spray, oral solution, capsule, nasal drops.

- **Tablet**
  - DESMOPRESSIN (Non-proprietary)
    - Desmopressin acetate 100 microgram BDVAP 100 microgram tablets | 90 tablet (BDP) £61.43 DT price = £61.43
    - Desmopressin acetate 200 microgram BDVAP 0.2mg tablets | 90 tablet (BDP) £88.23
    - Desmotabs Ferring Pharmaceuticals Ltd
    - Desmopressin acetate 200 microgram Desmotabs 0.2mg tablets | 30 tablet (BDP) £35.23 DT price = £35.23
  - **Desmotabs**
    - Desmopressin acetate 200 microgram Desmotabs 0.2mg tablets | 30 tablet (BDP) £35.23 DT price = £35.23
  - **Oral solution**
    - DESMOPRESSIN (Non-proprietary)
      - Desmopressin (as Desmopressin acetate) 360 microgram per 1 ml Desmopressin 360micrograms/ml oral solution | 15 ml (BDP) £30.00

### Oral lyophilisate

#### CAUTIONARY AND ADVISORY LABELS

- **DESMPRESSIN (Non-proprietary)**
  - Desmopressin (as Desmopressin acetate) 60 microgram (BDVAP Melt oral lyophilisates sugar-free) | 100 tablet (BDP) £50.53
  - Desmopressin (as Desmopressin acetate) 120 microgram Desmopressin 120microgram oral lyophilisates sugar-free (sugar-free) | 30 tablet (BDP) no price available
  - Desmopressin (as Desmopressin acetate) 240 microgram Desmopressin 240microgram oral lyophilisates sugar-free | 100 tablet (BDP) £101.07
  - Desmopressin (as Desmopressin acetate) 240 microgram Desmopressin 240 microgram oral lyophilisates sugar-free | 30 tablet (BDP) £30.34
  - Desmopressin (as Desmopressin acetate) 240 microgram Desmopressin 240 microgram oral lyophilisates sugar-free | 100 tablet (BDP) £101.07

#### Solution for Injection

- **DESMPRESSIN (Non-proprietary)**
  - Desmopressin acetate 4 microgram per 1 mL BDVAP 4micrograms/mL solution for injection ampoules | 10 ampoule (BDP) £13.16
  - Octim (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 15 microgram per 1 mL Octim 15 micrograms/mL solution for injection ampoules | 10 ampoule (BDP) £192.20
  - **Spray**
    - DESMOPRESSIN (Non-proprietary)
      - Desmopressin acetate 10 microgram per 1 dose Desmopressin 10 micrograms/dose nasal spray | 60 dose (BDP) £23.04 DT price = £8.18
      - Desmopressin acetate 2.5 microgram per 1 dose Desmopressin 2.5 micrograms/dose nasal spray | 50 dose no price available
  - **Desmospray**
    - Desmospray (Ferring Pharmaceuticals Ltd)
    - Desmopressin acetate 150 microgram per 1 dose Octim 150 micrograms/dose nasal spray | 25 dose (BDP) £576.60

### Vasopressin

#### INDICATIONS AND DOSE

- **Pituitary diabetes insipidus**
  - BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION
    - Adult: 5–20 units every 4 hours
  - **Initial control of oesophageal variceal bleeding**
    - BY INTRAVENOUS INFUSION
      - Adult: 20 units, dose to be administered over 15 minutes

- **CONTRA-INDICATIONS**
  - Chronic nephritis (until reasonable blood nitrogen concentrations attained) - vascular disease (especially disease of coronary arteries) unless extreme caution
- **CAUTIONS**
  - Asthma - avoid fluid overload - conditions which might be aggravated by water retention - epilepsy - heart failure - hypertension - migraine
- **SIDE-EFFECTS**
  - Rare Gangrene
  - Frequency not known Abdominal cramps - anaphylaxis - anginal attacks - belching - constriction of coronary arteries - desire to defaecate - fluid retention - headache - hypersensitivity reactions - myocardial ischaemia - nausea - pallor - peripheral ischaemia - sweating - tremor - vertigo - vomiting
- **PREGNANCY**
  - Oxytocic effect in third trimester.
1.2 Syndrome of inappropriate antidiuretic hormone secretion

Drugs used for Syndrome of inappropriate antidiuretic hormone secretion not listed below; Demeclocycline hydrochloride, p. 496

SELECTIVE VASOPRESSIN V2-RECEPTOR ANTAGONISTS

Tolvaptan

- **DRUG ACTION** Tolvaptan is a vasopressin V2-receptor antagonist.

**INDICATIONS AND DOSE**

Treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion

BY MOUTH

- Adult: 15 mg once daily, increased if necessary up to 60 mg daily treatment duration is determined by the underlying disease and its treatment

**CONTRA-INDICATIONS** Anuria · hypernatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion

**CAUTIONS** Alcoholism (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · diabetes mellitus · ensure adequate fluid intake · hypoxia (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · malnutrition (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · pseudohyponatraemia associated with diabetes mellitus (exclude before treatment)

**INTERACTIONS** → Appendix 1 (tolvaptan). Avoid concomitant drugs that increase serum-sodium concentration.

**SIDE-EFFECTS**

- Common or very common Constipation · decreased appetite · dehydration · dry mouth · ecchymosis · fever · hyperglycaemia · hyperkalaemia · increased blood creatinine · malaise · nausea · neurological disturbance (following rapid correction of hyponatraemia) · postural hypotension · pruritus · thirst · urinary frequency

- Uncommon Renal impairment · taste disturbance

- Frequency not known Dizziness · hepatic impairment (discontinue) · hypernatraemia · hyperuricaemia · hypoglycaemia · syncope

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hepatic impairment** Discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus).

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT** Use with caution in severe impairment—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **MONITORING REQUIREMENTS**

  - Monitor for dehydration in patients who are fluid-restricted.
  - Monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised. Discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

2 Corticosteroid responsive conditions

Corticosteroids, general use

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 582 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 583 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 581 and betamethasone p. 581 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and
by measurement of adrenal androgens and
17-hydroxyprogesterone. In common with all
glucocorticoids their suppressive action on the
hypothalamic-pituitary-adrenal axis is greatest and most
prolonged when they are given at night. In most individuals
a single dose of dexamethasone at night, is sufficient to
inhibit corticotropin secretion for 24 hours. This is the basis of
the ‘overnight dexamethasone suppression test’ for
diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate
for conditions where water retention would be a
disadvantage.

A corticosteroid may be used in the management of raised
intracranial pressure or cerebral oedema that occurs as a
result of malignancy (see Prescribing in palliative care
p. 20); high doses of betamethasone or dexamethasone
are generally used. However, a corticosteroid should not be
used for the management of head injury or stroke because it
is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of
the upper respiratory tract and anaphylaxis, corticosteroids
are indicated as an adjunct to emergency treatment with
adrenaline/epinephrine p. 196. In such cases hydrocortisone
(as sodium succinate) by intravenous injection may be
required.

Corticosteroids are preferably used by inhalation in
the management of asthma but systemic therapy in association
with bronchodilators is required for the emergency
treatment of severe acute asthma.

Corticosteroids may also be useful in conditions such as
autoimmune hepatitis, rheumatoid arthritis and sarcoidosis;
they may also lead to remissions of acquired haemolytic
anaemia, and some cases of the nephrotic syndrome
(particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious
conditions such as systemic lupus erythematosus, temporal
arteritis, and polyarteritis nodosa; the effects of the disease
process may be suppressed and symptoms relieved, but the
underlying condition is not cured, although it may
ultimately remit. It is usual to begin therapy in these
conditions at fairly high dose, and then to reduce the dose
to the lowest commensurate with disease control.

For other references to the use of corticosteroids see:
Prescribing in Palliative Care, immunosuppression,
rheumatic diseases, eye, otitis externa allergic rhinitis, and
aphthous ulcers.

Side-effects

Overdosage or prolonged use can exaggerate some of the
normal physiological actions of corticosteroids leading to
mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- Hypertension
- Sodium retention
- Water retention
- Potassium loss
- Calcium loss

Mineralocorticoid side effects are most marked with
fludrocortisone, but are significant with hydrocortisone,
corticosterone, and tetracortisone. Mineralocorticoid actions
are negligible with the high potency glucocorticoids,
betamethasone and dexamethasone, and occur only slightly
with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side effects

- Diabetes
- Osteoporosis, which is a danger, particularly in
  the elderly, as it can result in osteoporotic fractures for
  example of the hip or vertebrae;
- In addition high doses are associated with avascular
  necrosis of the femoral head;

Managing side-effects

Side-effects can be minimised by using lowest effective dose
for minimum period possible. The suppressive action of a
corticosteroid on cortisol secretion is least when it is given
as a single dose in the morning. In an attempt to reduce
pituitary-adrenal suppression further, the usual dose for two
days can sometimes be taken as a single dose on alternate
days; alternate-day administration has not been very
successful in the management of asthma. Pituitary-adrenal
suppression can also be reduced by means of intermittent
therapy with short courses. In some conditions it may be
possible to reduce the dose of corticosteroid by adding a
small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-
articular injections, inhalations, eye-drops, or enemas
should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic
effects than oral corticosteroids, but adverse effects
including adrenal suppression have been reported. Use of
other corticosteroid therapy (including topical) or
concurrent use of drugs which inhibit corticosteroid
metabolism should be taken into account when assessing
systemic risk. In children, growth restriction associated with
systemic corticosteroid therapy does not seem to occur with
recommended doses of inhaled therapy; although initial
growth velocity may be reduced, there appears to be no
effect on achieving normal adult height. Large-volume
spacer devices should be used for administering inhaled
corticosteroids in children under 15 years; they are also
useful in older children and adults, particularly if high doses
are required. Spacer devices increase airway deposition and
reduce oropharyngeal deposition.

Corticosteroids, replacement
therapy

The adrenal cortex normally secretes hydrocortisone p. 583
(cortisol) which has glucocorticoid activity and weak
mineralocorticoid activity. It also secretes the
mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best
achieved with a combination of hydrocortisone and the
mineralocorticoid fludrocortisone acetate p. 582;
hydrocortisone alone does not usually provide sufficient
mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy,
hydrocortisone by mouth is usually required. This is given
in 2 doses, the larger in the morning and the smaller in the
evening, mimicking the normal diurnal rhythm of cortisol
secretion. The optimum daily dose is determined on the
basis of clinical response. Glucocorticoid therapy is
supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is
given intravenously (preferably as sodium succinate) every 6
to 8 hours in sodium chloride p. 953 intravenous infusion
0.9%.

In hypopituitarism, glucocorticoids should be given as in
adrenocortical insufficiency, but since production of
aldosterone is also regulated by the renin-angiotensin
system a mineralocorticoid is not usually required.

Additional replacement therapy with levothyroxine sodium
p. 665 and sex hormones should be given as indicated by
the pattern of hormone deficiency.
Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of hydrocortisone acetate p. 582 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

The relatively high mineralocorticoid activity of hydrocortisone p. 583, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 585 and prednisone p. 586 have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 581 and dexamethasone p. 581 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclometasone dipropionate p. 38 (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 581 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

• CONTRA-INDICATIONS Avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) - systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

For further information on contra-indications associated with intra-articular, intradermal and intral esional preparations, consult product literature.

• CAUTIONS Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (post-menopausal women and the elderly at special risk) · peptic ulcer · psychiatric reactions · reactivation of dormant virus · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · should not be used long-term · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

For further information on cautions associated with intra-articular, intradermal and intral esional preparations, consult product literature.

• INTERACTIONS → Appendix 1 (corticosteroids).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Abdominal distension · acute pancreatitis · aggravation of epilepsy · aggravation of schizophrenia · amenorrhoea · bruising · candidiasis · congestive heart failure · corneal thinning · Cushing’s syndrome (with moon face, striae and acne) · dysepsia · ecchymoses · exacerbation of ophthalmic fungal disease · exacerbation of ophthalmic viral disease · exophthalmos · facial erythema · glaucoma · headache · hiccups · hirsutism · hypercholesterolaemia · hyperglycaemia · hypothyroidism · hyperlipidaemia · impaired healing · increased appetite · increased intraocular pressure · increased susceptibility to and severity of infection · insomnia · leucocytosis · long bone fractures · malaise · menstrual irregularities · muscle weakness · myocardial rupture following recent myocardial infarction · nausea · negative calcium balance · negative nitrogen balance · oesophageal ulceration · papilloedema · petechiae · posterior subcapsular cataracts · potassium loss · psychological dependence · reactivation of dormant tuberculosis · scleral thinning · skin atrophy · sodium retention · telangiectasia · tendon rupture · thromboembolism · urticaria · vertebral fractures · vertigo · weight gain

SPECIFIC SIDE-EFFECTS

• With intra-articular use Flushing · may affect the hyaline cartilage

SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects associated with intra-articular, intradermal and intral esional preparations, consult product literature.

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 577

Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A
Corticosteroid responsive conditions

580

suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.
- Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

**Infections** Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated. *Chickenpox* Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at *risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non–immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased. Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox. *Measles* Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed. *Psychiatric reactions* Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

**Pregnancy** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **Breast feeding** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **Hepatic impairment** The plasma–drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.
- **Renal impairment** Use by oral and injectable routes should be undertaken with caution.
- **Effect on laboratory tests** Suppression of skin test reactions.
- **Treatment cessation** Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
  - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
  - been given repeat doses in the evening;
  - received more than 3 weeks’ treatment;
  - recently received repeated courses (particularly if taken for longer than 3 weeks);
  - taken a short course within 1 year of stopping long-term therapy;
  - other possible causes of adrenal suppression. Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above. During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- **Patient and carer advice** Advice for patients. Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment. A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:
  - **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe *chickenpox* and should avoid close contact with people who have chickenpox or shingles. Similarly,
Betamethasone

**INDICATIONS AND DOSE**

**Suppression of inflammatory and allergic disorders**

- **Congenital adrenal hyperplasia**
  - Adult: Usual dose 0.5–5 mg daily
  - By intramuscular injection or by slow intravenous injection or by intravenous infusion
  - Adult: 4–20 mg, repeated up to 4 times in 24 hours

**PREGNANCY**

Readily crosses the placenta. Transient effect on fetal movements and heart rate.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (as sodium phosphate) (Betnesol®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

**PATIENT AND CARER ADVICE**

- With oral use: Patient counselling is advised for betamethasone soluble tablets (steroid card).

**MEDICINAL FORMS**

- Soluble tablet

  CAUTIONARY AND ADVISORY LABELS 10, 13, 21

CAUTIONARY AND ADVISORY LABELS 10

- **Dexamethasone (non-proprietary)**
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.3 mg per 1 ml
  - Dexamethasone 6.6mg/2ml solution for injection vials | 5 vial [P] £24.00
  - Dexamethasone 6.6mg/2ml solution for injection ampoules | 5 ampoule [P] £11.00
  - Dexamethasone 3.3mg/1ml solution for injection ampoules | 5 ampoule [P] £12.00
  - 10 ampoule [P] £16.00
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.8 mg per 1 ml
  - Dexamethasone 3.8mg/1ml solution for injection vials | 10 vial [P] £19.99

**Fludrocortisone acetate**

---

**Unlicensed use** Consult product literature; not licensed for use in bacterial meningitis.

**Side-effects**

- With intravenous use: Perineal irritation may follow intravenous administration of the phosphate ester

---

**Cerebral oedema associated with malignancy**

With intravenous use

- Adult: 8.3 mg every 6 hours for 4 days

Local inflammation of joints (with dexamethasone as sodium phosphate)

- Adult: Initially 8–16 mg, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually

Cerebral oedema associated with malignancy (with dexamethasone as sodium phosphate 3.3 mg/mL injection)

Initially by intravenous injection

- Adult: Initially 8.3 mg, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days

Local inflammation of joints (with dexamethasone as sodium phosphate 3.3 mg/mL injection)

- By intra-articular injection
  - Adult: 0.3–3 mg, dose given according to size, where appropriate may be repeated at intervals of 3–21 days

Local inflammation of soft tissues (with dexamethasone as sodium phosphate 3.3 mg/mL injection)

- By local infiltration
  - Adult: 1.7–5 mg, dose given according to size, where appropriate may be repeated at intervals of 3–21 days

Symptom control of anorexia (in palliative care)

- Adult: 2–4 mg daily

Obstruction due to tumour (dysphagia in palliative care)

- Adult: 8 mg daily

Bronchospasm or partial obstruction (dyspnoea in palliative care)

- Adult: 4–8 mg daily

Nausea and vomiting (adjunct in palliative care)

- By mouth
  - Adult: 8–16 mg daily

Headaches due to raised intracranial pressure (in palliative care)

- Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

Pain due to nerve compression (in palliative care)

- Adult: 8 mg daily

---

**Sodium Chloride**

Brands may include Dexsol, Martapan.
Hydrocortisone

**INDICATIONS AND DOSE**

**SPECIFIC SIDE-EFFECTS**

- Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline) followed by 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery
- Severe inflammatory bowel disease followed by 25–50 mg 3–4 times a day or when required
- Ulcerative colitis | PROCTISI PROCTOSIGMOIDITIS | BY RECTUM USING RECTAL FOAM | Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum |
- Acute hypersensitivity reactions | ANGIOEDEMA | BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION | Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response |
- Severe acute asthma | LIFE-THREATENING ACUTE ASTHMA | BY INTRAVENOUS INJECTION | Child 1–5 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate |
- Hydrocortisone acetate 100 microgram (SoluCortef®) or Efcortesol® lower than immediate release tablets—monitor clinical response.

**CONTRA-INDICATIONS**

- With rectal use: Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

**SAFETY AND ECONOMICS**

- With intravenous use in children: For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With intravenous use in adults: For intravenous infusion (SoluCortef® or Efcortesol®), give continuously or

- With rectal use: Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

**SAFETY AND ECONOMICS**

- With intravenous use in children: For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With intravenous use in adults: For intravenous infusion (SoluCortef® or Efcortesol®), give continuously or
intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

- **LESS SUITABLE FOR PRESCRIBING** Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection. Efcortesol® is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With intramuscular use or intravenous use. Prescription only medicine restriction does not apply where administration is for saving life in emergency.

### Methylprednisolone

#### INDICATIONS AND DOSE

- Suppression of inflammatory and allergic disorders
- Cerebral oedema associated with malignancy
  - **BY MOUTH**
    - Adult: Usual dose 2–40 mg daily
  - BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
    - Adult: Initially 10–500 mg

#### Treatment of graft rejection reactions

- **BY INTRAVENOUS INFUSION**
  - Adult: Up to 1 g daily for up to 3 days

- **DEPO-MEDRONE®**
  - Local inflammation of joints and soft tissues
  - **BY INTRA-ARTICULAR INJECTION**
    - Adult: 4–80 mg, select dose according to size; where appropriate dose may be repeated at intervals of 7–35 days, for details consult product literature

- Suppression of inflammatory and allergic disorders
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

#### CAUTIONS

- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

#### DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (as sodium succinate) (Solu-Medrone®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**Prednisolone**

**INDICATIONS AND DOSE**

Exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)

**BY MOUTH**
- Adult: 30 mg daily for 7–14 days

Severe cough (before transfer to hospital) | Mild cough that might cause complications (before transfer to hospital)

**BY MOUTH**
- Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

**BY MOUTH**
- Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

**BY MOUTH**
- Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary

- Child 12–17 years: 40–50 mg daily for at least 5 days

- Adults: 40–50 mg daily for at least 5 days

Suppression of inflammatory and allergic disorders

**BY MOUTH**
- Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

**BY INTRAMUSCULAR INJECTION**
- Adult: 25–100 mg 1–2 times a week, as prednisolone acetate

Suppression of inflammatory and allergic disorders (initial dose in severe disease)

**BY MOUTH**
- Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

Idiopathic thrombocytopenic purpura

**BY MOUTH**
- Adult: 1 mg/kg daily, gradually reduce dose over several weeks

Ulcerative colitis | Crohn's disease

**BY MOUTH**
- Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

**Distal ulcerative colitis**

**BY RECTUM USING RECTAL FOAM**
- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Rectal complications of Crohn's disease**

**BY RECTUM USING SUPPOSITORIES**
- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

**Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease**

**BY RECTUM USING ENEMA**
- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

**Proctitis**

**BY RECTUM USING RECTAL FOAM**
- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Rectal and proctitis using suppositories**
- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

**Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)**

**BY MOUTH**
- Adult: Initially 40–60 mg daily, dose to be instituted at once

**Generalised myasthenia gravis (when given on alternate days)**

**INITIALLY BY MOUTH**
- Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis in ventilated patients (when given on alternate days)**

**BY MOUTH**
- Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis (when giving daily)**

**BY MOUTH**
- Adult: Initially 5 mg daily, increased in steps of 5 mg daily. maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

**Ocular myasthenia**

**BY MOUTH**
- Adult: Usual dose 10–40 mg daily on alternate days, reduce to minimum effective dose

**Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration**

**BY MOUTH**
- Adult: 7.5 mg daily

**Polymyalgia rheumatica**

**BY MOUTH**
- Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

**Giant cell (temporal) arteritis**

**BY MOUTH**
- Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in continued →
Corticosteroid responsive conditions

Endocrine system

PATIENT AND CARER ADVICE
With systemic use
▶ BREAST FEEDING
With systemic use
▶ PREGNANCY
With rectal use
CAUTIONS
▶ CONTRA-INDICATIONS
With rectal use
Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses
▶ CAUTIONS
With rectal use
Systemic absorption may occur with rectal preparations
With systemic use
Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)
▶ PREGNANCY
As it crosses the placenta 88% of prednisolone is inactivated.
With systemic use
Pregnant women with fluid retention should be monitored closely.
▶ BREAST FEEDING
Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
With systemic use
Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.
▶ PATIENT AND CARER ADVICE
Medicines for Children leaflet: Prednisolone for asthma www. medicinesforchildren.org.uk/prednisolone-for-asthma and Prednisolone (oral) for nephrotic syndrome www. medicinesforchildren.org.uk/prednisolone-oral-for-nephrotic-syndrome
Patient counselling is advised for prednisolone tablets (steroid card).

Triamcinolone acetonide

**INDICATIONS AND DOSE**

Suppression of inflammatory and allergic disorders

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient’s response

**KENALOG® VIALS**

Local inflammation of joints and soft tissues

**BY INTRA-ARTICULAR INJECTION**

- Adult: 5–40 mg (max. per dose 80 mg), for further details consult product literature, select dose according to size. For doses below 5 mg use Adcortyl® Intra-articular/Intradermal injection, where appropriate dose may be repeated when relapse occurs.

**ADCORTYL® INTRA-ARTICULAR/INTRADERMAL**

Local inflammation of joints and soft tissues

**BY INTRA-ARTICULAR INJECTION**

- Adult: 2.5–15 mg, adjusted according to size (for larger doses use Kenalog®). Where appropriate dose may be repeated when relapse occurs, for details consult product literature.

**BY INTRADERMAL INJECTION**

- Adult: 2–3 mg, max. 5 mg at any one site (total max. 30 mg). Where appropriate may be repeated at intervals of 1–2 weeks, for details consult product literature.

**CAUTIONS**

- With intramuscular use High dosage (may cause proximal myopathy), avoid in chronic therapy

**PATIENT AND CARER ADVICE**

Patient counselling is advised for triamcinolone acetonide injection (steroid card).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

CAUTIONARY AND ADVISORY LABELS 10 EXCipients: May contain Benzyl alcohol

- Adcortyl Intra-articular / Intradermal (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Triamcinolone acetonide 10 mg per 1 ml Adcortyl Intra-articular / Intradermal 50mg/5ml suspension for injection vials | 1 vial £3.63
- Adcortyl Intra-articular / Intradermal 10mg/1ml suspension for injection ampoules | 5 ampoule £4.47 DT price = £4.47
- Kenalog (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Triamcinolone acetonide 40 mg per 1 ml Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial £7.45 DT price = £7.45

2.1 Cushing’s syndrome and disease

**Cushing’s Syndrome**

Most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 588 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery.
Endocrine system

Metyrapone

**DRUG ACTION** Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

**INDICATIONS AND DOSE**

**Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)**

**BY MOUTH**

- Adult: 750 mg every 4 hours for 6 doses

**MONITORING REQUIREMENTS**

**HEPATIC IMPAIRMENT**

Consult product literature; if liver enzymes are raised to 2 times the normal upper limit, discontinue dose if liver enzymes increase less than 3 times the normal upper limit.

**PREGNANCY**

Manufacturer advises avoid—teratogenic in animal studies.

**CONCEPTION AND CONTRACEPTION**

Effective contraception must be used in women of child-bearing potential.

**BREAST FEEDING**

Manufacturer advises avoid—present in breast milk.

**MONITORING REQUIREMENTS**

Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.

Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

**PATIENT AND CARER ADVICE** Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving). Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

**SIDE-EFFECTS**

- Headache
- Hypotension
- Nausea
- Sedation
- Vomiting
- Hypothyroidism (delayed response)
- Hypopituitarism (risk of precipitating acute adrenal failure) (with glucocorticoid replacement therapy)
- Hypertension (long-term administration)
- Hypothyroidism (delayed response)

**INTERACTIONS**

- **Frequency not known**
  - Dizziness
  - Headache
  - Hypotension
  - Nausea
  - Sedation
  - Vomiting

**CONTRA-INDICATIONS**

- **Adrenocortical insufficiency**
- **Hypothyroidism**
- **Hypopituitarism**
- **Hypertension**
- **Hepatic failure**
- **Hepatic failure (with glucocorticoid replacement therapy)**
- **Hepatic impairment**
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).
- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS. 21**
  - **Ketoconazole**
    - **Non-proprietary**
    - **Ketoconazole**
    - **200 mg**
    - **60 tablet**
    - **£480.00**

**11ß-HYDROXYLASE INHIBITORS**

Metyrapone

**DRUG ACTION** Metyrapone is a competitive inhibitor of 11ß-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

**INDICATIONS AND DOSE**

**Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)**

**BY MOUTH**

- Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosterone replacement therapy is also needed

**Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy)**

**Specialist supervision in hospital**

**BY MOUTH**

- Adult: 3g daily in divided doses

**CONTRA-INDICATIONS**

- **Adrenocortical insufficiency**
- **Hypothyroidism**
- **Hypopituitarism**
- **Hypertension**
- **Hepatic failure**
- **Hepatic failure (with glucocorticoid replacement therapy)**

**CAUTIONS**

- **Avoid in Acute porphyrias**
- **Non-proprietary**
- **Ketoconazole 200 mg**
- **£363.66**

3 **Diabetes mellitus and hypoglycaemia**

3.1 **Diabetes mellitus**

**Diabetes**

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

**Type 1 diabetes**, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

**Type 2 diabetes**, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic
drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat p. 78 may be considered in obese patients.

Treatment of diabetes

Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications; tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 104 and a lipid-regulating drug.

Prevention of diabetic complications

Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy.

A measure of the total glycosylated (or glycated) haemoglobin (HbA₁c) or a specific fraction (HbA₁cₙ) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA₁c (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA₁c concentration at 48 mmol/mol or less. HbA₁c should be measured every 3–6 months.

Measurement of HbA₁c

HbA₁c values are expressed in mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA₁c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA₁c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

<table>

</tbody>
</table>

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA₁c, and can be used to assess control over short periods of time, particularly when HbA₁c monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA (www.gov.uk/government/publications/at-a-glance).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 607, repaglinide p. 608). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using Albustix®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (Microtest II® or Microbunimeter®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment. See also treatment of hypertension in diabetes.

Diabetic neuropathy

Optimal diabetic control is beneficial for the management of painful neuropathy in patients with type 1 diabetes. Paracetamol p. 354 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 927 may relieve mild to moderate pain.

Duloxetine p. 288 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 292 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 298 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 400 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms. Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 373, morphine p. 367, and oxycodone hydrochloride p. 369; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.
Diabetic ketoacidosis, management

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 ml sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, sodium chloride 0.5% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.5% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.
- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

Insulins and anti-diabetic drugs

Insulins

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, pbh) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. Antidiabetic drugs have a role in the management of diabetes in pregnancy.

Safe and Effective Use of Insulin in Hospitalised Patients (March 2010)

Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-
acting insulin analogues, insulin aspart p. 604, insulin glulisine p. 605, and insulin lispro p. 606;
• those with an intermediate action, e.g. isophane insulin p. 607; and
• those whose action is slower in onset and lasts for long periods, e.g. protamine zinc insulin p. 607, insulin detemir p. 605, and insulin glargine p. 605.

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid-acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is increased gradually according to the patient’s individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison’s disease, hyperpituitarism), or in coeliac disease.

Examples of recommended insulin regimens
• Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
• Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
• Intermediate-acting or long-acting insulin, once or twice daily. With or without short-acting insulin or rapid-acting insulin before meals;
• Continuous subcutaneous insulin infusion.

Hypoglycaemia
Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

Diabetes and surgery
Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:
• give an injection of the patient’s usual insulin on the night before the operation;
• early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient’s fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
• the rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient’s volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 20–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hypoglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:
• additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
• temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
• complete reversion to the intravenous regimen (especially if the patient is unwell).

Short-acting insulins
Soluble insulin is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals. Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (see Diabetic ketoacidosis, management p. 590) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours. When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.
The rapid-acting human insulin analogues, insulin aspart, insulin glulisine, and insulin lispro have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion. Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

**Intermediate- and long-acting insulins**

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir, insulin glargine, and insulin degludec) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin).

Isophane insulin is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin, biphasic insulin aspart, or biphasic insulin lispro).

Insulin zinc suspension (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin glargine and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin or
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or
- who would otherwise need twice–daily basal insulin injections in combination with oral antidiabetic drugs or
- who cannot use the device needed to inject isophane insulin.

Insulin detemir is also licensed as add-on therapy in patients receiving treatment with lixisenatide.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

**Hypodermic equipment**

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

**Lancets, syringes, and accessories** are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/pfa/edt_intro.htm](http://www.ppa.org.uk/pfa/edt_intro.htm)

**Antidiabetic drugs**

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months’ restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

**Pregnancy and breast-feeding**

During pregnancy, women with *pre-existing diabetes* can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin. Metformin hydrochloride can be continued, or glibenclamide p. 611 resumed, during breast-feeding for those with pre-existing diabetes. Women with *gestational diabetes* may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

**Sulfonylureas**

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin hydrochloride is contraindicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as gliclazide p. 611 or tolbutamide p. 613, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin;
- combining with pioglitazone;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, lixisenatide, or liraglutide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;

- Empagliflozin, dapagliflozin, and empagliflozin are not recommended for use in pregnancy.

- For patients with type 1 diabetes who are not using a pump, insulin replacement regimens are being evaluated (one of which is a 3 1/2-hour basal bolus regimen).

- For patients who are not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

- For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

- For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

- For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

- For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

- combining with bedtime isophane insulin but weight gain and hypoglycaemia can occur.
- Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

**Biguanides**

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.

Metformin hydrochloride is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin hydrochloride treatment fails, other options include:

- combining with a sulfonylurea;
- combining with pioglitazone;
- combining with repaglinide or nateglinide;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, liraglutide, or lixisenatide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin hydrochloride on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin hydrochloride; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Metformin hydrochloride is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin hydrochloride improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

**Other antidiabetic drugs**

Use of acarbose p. 594 is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide p. 607 and repaglinide p. 608 stimulate insulin secretion. Both drugs have a rapid onset of action and short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin hydrochloride is contra-indicated or not tolerated, or it may be given in combination with metformin hydrochloride. Nateglinide is licensed only for use with metformin hydrochloride.

Pioglitazone p. 613 can be used alone or in combination with metformin hydrochloride or with a sulfonylurea (if metformin hydrochloride inappropriate), or with both; the combination of pioglitazone plus metformin hydrochloride is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin hydrochloride and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin hydrochloride is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin hydrochloride is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contraindicated or not tolerated;
- a combination of metformin hydrochloride and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Linagliptin p. 596 is licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride (when treatment with metformin hydrochloride alone fails to achieve adequate glycaemic control), or both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin hydrochloride p. 594) when a stable dose of insulin has not provided adequate glycaemic control.

Saxagliptin p. 597 and vildagliptin p. 598 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride or a sulfonylurea (if metformin hydrochloride inappropriate), or pioglitazone (when treatment with either metformin hydrochloride or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin or vildagliptin, and insulin (with or without metformin hydrochloride) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control.

Alogliptin p. 596 is also licensed for use as triple therapy in combination with metformin hydrochloride and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contraindicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Treatment with exenatide p. 599, liraglutide p. 600, and lixisenatide p. 601 is associated with the prevention of
weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin hydrochloride or a sulfonylurea, or both, or with either metformin hydrochloride and pioglitazone, or both, with metformin hydrochloride and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin hydrochloride or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin hydrochloride and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:
- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard release exenatide is continued only if HbA1c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin hydrochloride or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with basal insulin or both metformin hydrochloride and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control. Lixisenatide is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin hydrochloride, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs; lixisenatide should not be used in combination with both basal insulin and a sulfonylurea because of an increased risk of hypoglycaemia. Canagliflozin p. 608 and dapagliflozin p. 609, and empagliflozin p. 610 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.

ALPHA GLUCOSIDASE INHIBITORS

Acarbose

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

**INDICATIONS AND DOSE**

Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

**BY MOUTH**

- Adult: Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- CONTRA-INDICATIONS Hernia · inflammatory bowel disease · predisposition to partial intestinal obstruction · previous abdominal surgery
- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
  - Common or very common Abdominal distention and pain · diarrhoea (may need to reduce dose or withdraw) · flatulence · soft stools
  - Rare Abnormal liver function tests · nausea · skin reactions
  - Very rare Hepatitis · ileus · jaundice · oedema

**SIDE-EFFECTS, FURTHER INFORMATION**

Antacids Antacids unlikely to be beneficial for treating side effects.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 ml/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

**PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose — acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **ACARBOSE (Non-proprietary)**
  - Acarbose 50 mg Acarbose 50 mg tablets | 90 tablet [POD] £9.65 DT price = £9.65
  - Acarbose 100 mg Acarbose 100 mg tablets | 90 tablet [POD] £16.42 DT price = £16.42
- **Glucobay (Bayer Plc)**
  - Acarbose 50 mg Glucobay 50 mg tablets | 90 tablet [POD] £7.35 DT price = £7.35
  - Acarbose 100 mg Glucobay 100 mg tablets | 90 tablet [POD] £13.50 DT price = £13.50

**BIGUANIDES**

Metformin hydrochloride

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

**INDICATIONS AND DOSE**

Diabetes mellitus

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased
RENAL IMPAIRMENT

NATIONAL FUNDING/ACCESS DECISIONS

Frequency not known
Common or very common

CAUTIONS

CONTRA-INDICATIONS
Ketoacidosis - use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

Also available in combination with alogliptin, p. 596; canagliflozin, p. 609; dapagliflozin, p. 610; linagliptin, p. 597; pioglitazone, p. 614; saxagliptin, p. 597; sitagliptin, p. 598; vildagliptin, p. 599

Gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

Polycystic ovary syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

UNLICENSED USE
Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.

CONTRA-INDICATIONS
Ketoacidosis - use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

CONTRA-INDICATIONS, FURTHER INFORMATION

Iodine-containing X-ray contrast media

Intravenous administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

CAUTIONS
Can provoke lactic acidosis

INTERACTIONS
Appendix 1 (antidiabetics).

SIDE-EFFECTS
Common or very common
Abdominal pain - anorexia - diarrhoea (usually transient) - nausea - taste disturbance - vomiting

Rare
Decreased vitamin-B₁₂ absorption - erythema - lactic acidosis (withdraw treatment) - pruritus - urticaria

FREQUENCY NOT KNOWN
Hepatitis

GASTRO-INTESTINAL EFFECTS
Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

PREGNANCY
Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

BREAST FEEDING
May be used during breast-feeding in women with pre-existing diabetes.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

HEPATIC IMPAIRMENT
Withdraw if tissue hypoxia likely.

RENAL IMPAIRMENT
Use with caution in renal impairment - increased risk of lactic acidosis.

Lactic acidosis
Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

NICE (clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes) recommends that the dose should be reviewed if eGFR less than

BNF 70
Dipeptidylpeptidase-4 inhibitors (glitins)

Alogliptin

**Drug action** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**Indications and dose**
Type 2 diabetes as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin.

**By mouth**
- Adult: 25 mg once daily

Dose adjustments due to interactions
Dose of concomitant sulfonylurea or insulin may need to be reduced. Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

**Contra-indications** Ketoacidosis

**CAUTIONS** History of pancreatitis—not recommended in moderate to severe heart failure (limited experience).

**Interactions** → Appendix 1 (antidiabetics).

**Side-effects**
- Common or very common Abdominal pain, gastro-oesophageal reflux, headache, nasopharyngitis, pruritis, rash, upper respiratory tract infection
- Frequency not known Angioedema, hepatic impairment, pancreatitis, Stevens-Johnson syndrome, urticaria

**Side-effects, further information**
Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**Allergy and cross-sensitivity** Contraindicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**Pregnancy** Manufacturer advises avoid—no information available.

**Breastfeeding** Avoid—present in milk in animal studies.

**Hepatic impairment** Manufacturer advises avoid in severe impairment—no information available.

**Renal impairment** Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m². Use with caution if eGFR less than 30 mL/minute/1.73 m².

**Monitoring requirements** Determine renal function before treatment and periodically thereafter.

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug.

Linagliptin

**Drug action** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**Indications and dose**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control.

**By mouth**
- Adult: 5 mg once daily

Dose adjustments due to interactions
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**Interactions** → Appendix 1 (antidiabetics).

**Side-effects**
- Uncommon Cough, nasopharyngitis
- Frequency not known Pancreatitis

**Side-effects, further information**
Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**Pregnancy** Avoid—no information available.

**Breastfeeding** Avoid—present in milk in animal studies.

**National funding/access decisions**
Scottish medicines consortium (SMC) decisions
The Scottish medicines consortium has advised that linagliptin (Trajenta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug.

Diabetes mellitus 597

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Use with caution in moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT Reduce dose to 2.5 mg once daily in moderate to severe impairment. Use with caution in severe impairment.

MONITORING REQUIREMENTS Determine renal function before treatment and periodically thereafter.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised that Komboglyze® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate.
Sitagliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with both metformin and a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control, and may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control

**BY MOUTH**
- **Adult:** 100 mg once daily
- **Dose adjustments due to interactions**
  - Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CONTRA-INDICATIONS** KETOACIDOSIS

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**
- **Common or very common** Gastro-intestinal disturbances - nasopharyngitis - pain - peripheral oedema - upper respiratory tract infection
- **Uncommon** Anorexia - dizziness - drowsiness - dry mouth - headache - hypoglycaemia - osteoarthritis
- **Frequency not known** Cutaneous vasculitis - pancreatitis - rash - Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**
Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**PREGNANCY** Avoid — toxicity in animal studies.

**BREAST FEEDING** Avoid — present in milk in animal studies.

**RENAI IMPAIRMENT** Reduce dose to 50 mg once daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 25 mg once daily if eGFR less than 30 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2008) that Janumet® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Januvia** (Merck Sharp & Dohme Ltd) 25 mg Januvia 25mg tablets | 28 tablet | £3.26 07 price = £3.26
- **Sitagliptin (as Sitagliptin phosphate) 50 mg** Januvia 50mg tablets | 28 tablet | £3.26 07 price = £3.26
- **Sitagliptin (as Sitagliptin phosphate) 100 mg** Januvia 100mg tablets | 28 tablet | £3.26 07 price = £3.26

Vildagliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin

**BY MOUTH**
- **Adult:** 1 tablet twice daily

**INTERACTIONS** Dose of concomitant sulfonylurea or insulin may need to be reduced.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2008) that Janumet® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

Exenatide

DRUG ACTION
Binds to, and activates, the GLP-1 (glucagon-like-peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE
Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES
Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart) by subcutaneous injection using modified-release medicines
Adult: 2 mg once weekly

BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES
Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)
Dose adjustments due to interactions
Dose of concomitant sulfonylurea may need to be reduced.

PHARMACOKINETICS
Effect of modified-release exenatide injection (Bydureon®) may persist for 10 weeks after discontinuation.

CONTRA-INDICATIONS
Ketoacidosis · severe gastrointestinal disease

CAUTIONS
Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis

INTERACTIONS
Appendix 1 (antidiabetics), Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption.

SIDE-EFFECTS
Common or very common · Abdominal pain and distension · agitation · antibody formation · asthma · decreased appetite · diarrhoea · dizziness · dyspepsia · gastro-intestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · increased sweating · injection-site reactions · nausea · vomiting · weight loss
Uncommon · Pancreatitis
Rare · Alopecia
Very rare · Anaphylactic reactions
Frequency not known · Angioedema · constipation · dehydration · drowsiness · eructation · flatulence · pruritus · rash · renal impairment · taste disturbance · urticaria
Endocrine system

Exenatide modified-release for the treatment of type 2 diabetes mellitus (February 2012) NICE TA248

Modified-release exenatide in triple therapy regimens (in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione) is recommended for treatment of type 2 diabetes mellitus in combination with metformin or pioglitazone as a third-line pre-insulin treatment option. Some oral medications should be taken at least 30 minutes before or 2 hours after exenatide injection—consult product literature for details.

NICE technology appraisals (TAs)

Exenatide modified-release for the treatment of type 2 diabetes mellitus (February 2012) NICE TA248

Modified-release exenatide in triple therapy regimens (in combination with metformin or a sulfonylurea, or metformin and a thiazolidinedione) is recommended for treatment of type 2 diabetes mellitus with these drugs alone or in combination with metformin and a thiazolidinedione when basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control. Treatment with modified-release exenatide in a triple therapy regimen should be continued only if HbA1c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Modified-release exenatide in dual therapy regimens (in combination with metformin or a sulfonylurea) is recommended only if:
- treatment with metformin or a sulphonylurea is contraindicated or not tolerated, and
- treatment with a thiazolidinedione and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Modified-release exenatide in a dual therapy regimen should be continued only if HbA1c concentration is reduced by at least 1 percentage point within 6 months of starting treatment. www.nice.org.uk/TA248

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2007) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

Byetta (AstraZeneca UK Ltd) Exenatide 250 microgram per 1 ml Byetta 10micrograms/0.04ml solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection (P) £68.24 DT price = £68.24

Byetta 5micrograms/0.2ml solution for injection 1.2ml pre-filled disposable devices | 1 pre-filled disposable injection (P) £68.24 DT price = £68.24

Bydureon (AstraZeneca UK Ltd) Exenatide 2 mg Bydureon 2mg powder and solvent for suspension for injection vials | 4 vial (P) £73.36

Bydureon 2mg powder and solvent for suspension for injection pre-filled pen | 4 pre-filled disposable injection (P) £73.36

Liraglutide

Drug action

Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

Indications and dose

Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination | Type 2 diabetes mellitus in combination with basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

By subcutaneous injection

Adult: Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary up to 1.8 mg once daily.

Dose adjustments due to interactions

Dose of concomitant insulin or sulfonylurea may need to be reduced.

Contra-indications

Diabetic gastroparesis - inflammatory bowel disease - ketoacidosis - moderate to severe congestive heart failure—no information available

Caution

Asymptomatic left ventricular dysfunction - history of pancreatitis - mild congestive heart failure—limited experience - thyroid disease

Interactions

Appendix 1 (antidiabetics).

Side-effects

Common or very common Abdominal pain and distension - bronchitis - constipation - decreased appetite - diarrhoea - dizziness - dyspepsia - flatulence - gastritis - gastrointestinal disturbances - gastro-oesophageal reflux disease - headache - hypoglycaemia - injection site reactions - malaise - nasopharyngitis - nausea - tachycardia - vomiting

Uncommon Acute renal failure - dehydration - renal impairment
Lixisenatide

**DRUG ACTION**  Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Lixisenatide**

**DRUG ACTION**  Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs by subcutaneous injection.

- Adult: Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal.

**Dose adjustments due to interactions**

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CONTRA-INDICATIONS**  Ketoacidosis · severe gastro-intestinal disease

**INTERACTIONS**  Appendix (antidiabetics).

Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption.

**SIDE-EFFECTS**

- Diarrhoea · dizziness · drowsiness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · palpitation · vomiting

- Tachycardia · urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

**RENAL IMPAIRMENT**  Use with caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.

**PATIENT AND CARER ADVICE**

Missed doses If a dose is missed, inject within 1 hour before the next meal—do not administer after a meal. Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2013) that lixisenatide (*Lyxumia®*) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or lixisenatide).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**LIRAGLUTIDE (Non-proprietary)**

- Liraglutide 6 mg per 1 ml Liraglutide 6mg/ml solution for injection 3ml pre-filled disposable devices | 2 pre-filled disposable injection | no price available | 3 pre-filled disposable injection | no price available |
- Victoza (Novo Nordisk Ltd) Liraglutide 6 mg per 1 ml Victoza 6mg/ml solution for injection 3ml pre-filled pen | 2 pre-filled disposable injection | £78.48 | 3 pre-filled disposable injection | £117.72 |

**Frequency not known** Goitre · increased blood calcitonin · thyroid neoplasm
INSULINS

**Insulins**

- **SIDE-EFFECTS**
  - **Common or very common** Fat hypertrophy at injection site · local reactions at injection site · transient oedema
  - **Rare** Hypersensitivity reactions · rash · urticaria
  - **Overdose** Overdose causes hypoglycaemia.

- **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

- **BREAST FEEDING** During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

- **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

- **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

- **MONITORING REQUIREMENTS**
  - Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
  - Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
  - It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
  - While accepting that occasionally, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The injection site should
  - **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Units The word ‘unit’ should not be abbreviated. Show container to patient or carer and confirm the expected version is dispensed.

- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

- 3M Security Print and Systems Limited
- Gorse Street, Chadderton
- Oldham OL9 9QH
- 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

- NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Biphasic insulin aspart

(Intermediate-acting insulin)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- **BY SUBCUTANEOUS INJECTION**
  - **Child**: Administer dose up to 10 minutes before or soon after a meal, according to requirements
  - **Adult**: Administer dose up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **SIDE-EFFECTS** Protamine may cause allergic reactions.

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- NovoMix 30 FlexPen (Novo Nordisk Ltd) Insulin aspart 30 unit per 1 ml, Insulin aspart (as insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£59) £29.89

- **BY INTRAVENOUS INJECTION**

- **Adult:** According to requirements

  **Diabetic ketoacidosis | Diabetes during surgery**

- **Adult:** (consult local protocol)

**INTERACTIONS**

- Appendix 1 (antidiabetics).

**DIRECTIONS FOR ADMINISTRATION**

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

For intravenous infusion give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into ‘dead space’ of injection port of the infusion bag.

- **PRESCRIBING AND DISPENSING INFORMATION**

  A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or

- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of

**Solution for injection**

- **NovoRapid (Novo Nordisk Ltd)**
  - Insulin aspart 100 unit per 1 ml
  - Insulin aspart 100 unit per 1 ml
  - Insulin aspart 100 unit per 1 ml
  - Insulin aspart 100 unit per 1 ml
  - Insulin aspart 100 unit per 1 ml

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY SUBCUTANEOUS INJECTION**

- Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements

**BY SUBCUTANEOUS INFUSION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**

- Child 2-17 years: According to requirements
- Adult: According to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** Not known to be harmful—may be used during pregnancy.

**BREAST FEEDING** Not known to be harmful—may be used during lactation.

**DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- In adults For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to 0.05-1 unit/ml with infusion fluid; adsorbed to some extent by plastics of infusion set.
- In children For intravenous infusion, dilute to a concentration of 0.05–1 unit/ml with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

**Prescribing and dispensing information** Insulin degludec (Tresiba®) is available in strengths of 100 units/ml (allows 1-unit dose adjustment) and 200 units/ml (allows 2-unit dose adjustment)—ensure correct strength prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Tresiba FlexTouch (Novo Nordisk Ltd)**
  - Insulin human (as Insulin degludec) 100 unit per 1 ml
  - Insulin human (as Insulin degludec) 100 unit per 1 ml
  - Insulin human (as Insulin degludec) 100 unit per 1 ml

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY SUBCUTANEOUS INJECTION**

- Adult: Dose to be given according to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

**Prescribing and dispensing information** Insulin degludec (Tresiba®) is available in strengths of 100 units/ml (allows 1-unit dose adjustment) and 200 units/ml (allows 2-unit dose adjustment)—ensure correct strength prescribed.
Insulin degludec with liraglutide

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec p. 604, liraglutide p. 600.

INDICATIONS AND DOSE
As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone or by oral antidiabetics in combination with basal insulin

BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics alone or by oral antidiabetics in combination with basal insulin

BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

INTERACTIONS
- Dose of concomitant sulfonylurea may need to be reduced.

PATIENT AND CARER ADVICE
- Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Xultophy (Novo Nordisk Ltd)

Insulin human (as insulin degludec) 100 unit per 1 ml, liraglutide 3.6 mg per 1 ml Xultophy 100units/ml / 3.6mg/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection | £159.22

Insulin degludec with liraglutide

(Recombinant human insulin analogue—long acting)

INDICATIONS AND DOSE
Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- **Child 2-17 years:** According to requirements
- **Adult:** According to requirements

INTERACTIONS
- Appendix 1 (antidiabetics).

PREGNANCY
- Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Levemir FlexPen (Novo Nordisk Ltd)

Insulin human (as insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection | £42.00

Insulin detemir

(Recombinant human insulin analogue—long acting)

INDICATIONS AND DOSE
Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- **Child 6-17 years:** Administrator immediately before meals or when necessary shortly after meals, according to requirements
- **Adult:** Administrator immediately before meals or when necessary shortly after meals, according to requirements

INTERACTIONS
- Appendix 1 (antidiabetics).

DIRECTIONS FOR ADMINISTRATION
- Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device
Endocrine system

Diabetes mellitus and hypoglycaemia

Delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

In adults For intravenous infusion (Apidra®), give continuously in Sodium chloride 0.9%; dilute to 1 unit/mL with infusion fluid; use a co-extruded polyelefin/polyamide plastic infusion bag with a dedicated infusion line.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TAI51

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens,
- whose glycaemic control remains inadequate (HbA1c over 8.5% [65 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate.

In adults For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by plastics of infusion set.

In children For intravenous infusion, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2008) that Apidra® is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Apidra (Sanofi)
  - Insulin lispro 100 unit per 1 mL Apidra 100units/mL solution for injection 10ml vials | vial | £16.00
  - Apidra 100units/mL solution for injection 3ml cartridges | 5 cartridge | £28.30
- Apidra SoloStar (Sanofi)
  - Insulin lispro 100 unit per 1 mL Apidra 100units/mL solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection | £28.30

Insulin lispro

(Recombinant human insulin analogue)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION
- Child 2-17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements
- Adult: Administer shortly before meals or when necessary shortly after meals, according to requirements

BY SUBCUTANEOUS INFUSION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
- Child 2-17 years: According to requirements

NATIONAL FUNDING/ACCESS DECISIONS

  - Insulin lispro 100 unit per 1 mL Humalog 100units/mL solution for injection 10ml vials | vial | £16.01
  - Humalog 100units/mL solution for injection 3ml cartridges | 5 cartridge | £28.31
- Humalog KwikPen (Eli Lilly and Company Ltd)
  - Insulin lispro 100 unit per 1 mL Humalog KwikPen 100units/mL solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection | £58.92
### Insulin zinc suspension

**Indications and Dose**

**Diabetes mellitus**

- **By subcutaneous injection**
  - Child: According to requirements
  - Adult: According to requirements

**Interactions** → Appendix 1 (antidiabetics).

**Pregnancy**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin below is recommended where longer-acting insulins are needed; insulin detemir p. 605 may also be considered.

**Prescribing and Dispensing Information**

A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Humulin Bovine Lente (Wockhardt UK Ltd)**
  - Insulin bovine (as insulin zinc suspension mixed bovine) 100 unit per 1 ml
  - **Hypurin Bovine Lente 100 units/ml suspension for injection 10 ml vials** | 1 vial £27.72

### Isophane insulin

**Indications and Dose**

**Diabetes mellitus**

- **By subcutaneous injection**
  - Child: According to requirements
  - Adult: According to requirements

**Interactions** → Appendix 1 (antidiabetics).

**Side-effects**

Protamine may cause allergic reactions

**Pregnancy**

Recommended where longer-acting insulins are needed.

**Prescribing and Dispensing Information**

A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulphate or another suitable protamine.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Humulin I (Eli Lilly and Company Ltd)**
  - Insulin human (as insulin isophane human) 100 unit per 1 ml
  - **Humulin I 100 units/ml suspension for injection 10 ml vials** | 1 vial £15.68
  - **Humulin I 100 units/ml suspension for injection 3 ml cartridges** | 5 cartridge £19.08
- **Humulin I KwikPen (Eli Lilly and Company Ltd)**
  - **Humulin I 100 units/ml suspension for injection 3 ml pre-filled pen** | 5 pre-filled disposable injection £21.70
- **Humyrion Bovine Isophane (Wockhardt UK Ltd)**
  - Insulin bovine (as insulin isophane bovine) 100 unit per 1 ml
  - **Humyrion Bovine Isophane 100 units/ml suspension for injection 10 ml vials** | 1 vial £27.72
  - **Humyrion Bovine Isophane 100 units/ml suspension for injection 3 ml cartridges** | 5 cartridge £41.58

### Protamine zinc insulin

**Indications and Dose**

**Diabetes mellitus**

- **By subcutaneous injection**
  - Child: According to requirements
  - Adult: According to requirements

**Interactions** → Appendix 1 (antidiabetics).

**Side-effects**

Protamine may cause allergic reactions

**Pregnancy**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin above is recommended where longer-acting insulins are needed; insulin detemir p. 605 may also be considered.

**Prescribing and Dispensing Information**

A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Hypurin Bovine Protamine Zinc (Wockhardt UK Ltd)**
  - Insulin bovine (as insulin protamine zinc bovine) 100 unit per 1 ml
  - **Hypurin Bovine Protamine Zinc 100 units/ml suspension for injection 10 ml vials** | 1 vial £27.72

### Meglitinides

Nateglinide

**Drug Action**

Nateglinide stimulates insulin secretion.

**Indications and Dose**

**Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate**

**By mouth**

- **Adult:** Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

**Contra-indications**

Ketoacidosis
CAUTIONS Debilitated patients - elderly - malnourished patients

CAUTIONS, FURTHER INFORMATION
Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally).

INTERACTIONS → Appendix 1 (antidiabetics).

SIDE-EFFECTS Hypersensitivity reactions - hypoglycaemia - pruritus - rashes - urticaria

PREGNANCY Avoid - toxicity in animal studies.

BREAST FEEDING Avoid - present in milk in animal studies.

HEPATIC IMPAIRMENT Caution in moderate hepatic impairment. Avoid in severe impairment - no information available.

PATIENT AND CARER ADVICE Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- **Starlix** (Novartis Pharmaceuticals UK Ltd)
  - Nateglinide 60 mg Starlix 60mg tablets | 84 tablet £22.71 DT price = £22.71
  - Nateglinide 120 mg Starlix 120mg tablets | 84 tablet £25.88 DT price = £25.88
  - Nateglinide 180 mg Starlix 180mg tablets | 84 tablet £25.88 DT price = £25.88

Repaglinide

DRUG ACTION Repaglinide stimulates insulin secretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

BY MOUTH
- Adult 18-74 years: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
- Adult 75 years and over: Not recommended

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral hypoglycaemic drug

BY MOUTH
- Adult 18-74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
- Adult 75 years and over: Not recommended

CONTRA-INDICATIONS Ketoacidosis

CAUTIONS Debilitated patients - malnourished patients

CAUTIONS, FURTHER INFORMATION
Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally).

INTERACTIONS → Appendix 1 (antidiabetics).

SIDE-EFFECTS
- Common or very common Abdominal pain - constipation - diarrhoea - nausea - vomiting
- Rare Hypersensitivity reactions - hypoglycaemia - pruritus - rashes - urticaria - vasculitis - visual disturbances

PREGNANCY Avoid.

MEDICINE FORMS

Tablet
- **REPAGLINIDE (Non-proprietary)**
  - Repaglinide 500 microgram tablet | 30 tablet £3.92 | 90 tablet £11.76 DT price = £9.03
  - Repaglinide 1 mg tablet | 30 tablet £3.92 | 90 tablet £11.76 DT price = £10.69
  - Repaglinide 2 mg tablet | 30 tablet £5.89
  - Prandin (Novo Nordisk Ltd)
    - Repaglinide 500 microgram Prandin 0.5mg tablet | 30 tablet £3.92 | 90 tablet £11.76 DT price = £9.03
    - Repaglinide 1 mg Prandin 1mg tablet | 30 tablet £3.92 | 90 tablet £11.76 DT price = £10.69

  - Brands may include Englyd

SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

Canagliflozin

DRUG ACTION Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus as monotherapy if metformin inappropriate | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

BY MOUTH
- Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

Dose adjustments due to interactions
Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

CONTRA-INDICATIONS Ketoacidosis

CAUTIONS Cardiovascular disease (risk of hypotension) - elderly (risk of hypotension) - elevated haematocrit - history of hypotension

FURTHER INFORMATION
Volume depletion Correct hypovolaemia before starting treatment.

INTERACTIONS → Appendix 1 (antidiabetics).

SIDE-EFFECTS
- Common or very common Constipation - dyslipidaemia - genital infection - hypoglycaemia (in combination with insulin or sulfonylurea) - nausea - polyuria - raised haematocrit - thirst - urinary frequency - urinary-tract infection
- Uncommon Dehydration - dizziness - hypovolaemia - postural hypotension - raised serum creatinine - raised serum urea - rash - syncope

VOLUME DEPLETION
Volume depletion Consider interrupting treatment if volume depletion occurs.

PREGNANCY Avoid — toxicity in animal studies.
**Diabetes mellitus 609**

**Indications and dose**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs

**By mouth**

- Adult: 1 tablet twice daily, dose based on patient’s current metformin dose, daily dose of metformin should not exceed 2 g

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**Renal impairment** Avoid if eGFR less than 60 mL/minute/1.73 m².

**National funding/access decisions**

**Scottish medicines consortium (SMC) decisions**

The Scottish Medicines Consortium (SMC) has advised (December 2014) that Vokanamet® is accepted for restricted use within NHS Scotland in patients with type 2 diabetes mellitus for whom a combination of canagliflozin and metformin is an appropriate choice of therapy.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
  - **Vokanamet** (Janssen-Cilag Ltd) ▼
    - Canagliflozin (as Canagliflozin hemihydrate) 50 mg, Metformin hydrochloride 850 mg Vokanamet 50mg/850mg tablets | 60 tablet | £39.20 DT price = £39.20
    - Canagliflozin (as Canagliflozin hemihydrate) 50 mg, Metformin hydrochloride 1 gram Vokanamet 50mg/1000mg tablets | 60 tablet | £39.20 DT price = £39.20

**Dapagliflozin**

**Drug action** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**Indications and dose**

Type 2 diabetes mellitus as monotherapy if metformin inappropriate

**Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

**By mouth**

- Adult 18-74 years: 10 mg once daily
- Adult 75 years and over: Initiation not recommended

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**Contra-indications**

Ketoacidosis

**Caution** Cardiovascular disease (risk of hypotension) - elderly (risk of hypotension) - electrolyte disturbances - hypotension - raised haematocrit

**Caution, further information**

Volume depletion Correct hypovolaemia before starting treatment.

**Interactions**

- Appendix 1 (antidiabetics).

**Side-effects**

- **Common or very common** Back pain - constipation - dyslipidaemia - dysuria - genital infection - hypoglycaemia (in combination with insulin or sulphonylurea) - polyuria - sweating - thirst - urinary-tract infection
- **Uncommon** Dehydration - dizziness - hypotension - hypovolaemia - nausea - nocturia - raised serum creatinine - raised serum urea - rash

---

**Canagliflozin with metformin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, canagliflozin p. 608, metformin hydrochloride p. 594.

---

**Breast feeding** Avoid—present in milk in animal studies.

**Hepatic impairment** Manufacturer advises avoid in severe impairment—no information available.

**Renal impairment** Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated. Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m². Monitor renal function at least twice a year in moderate impairment.

**Monitoring requirements** Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.

**Patient and carer advice** Patients or carers should be advised to report symptoms of volume depletion including postural hypotension and dizziness.

**National funding/access decisions**

**NICE technology appraisals (TAs)**

- Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315
  - Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated or the patient has a significant risk of hypoglycaemia.
  - Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulfonylurea or metformin and a thiazolidinedione.
  - Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.
  - Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA315

**Scottish medicines consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (May 2014) that canagliflozin (Invokana®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin as dual therapy, or in combination with metformin and standard of care as triple therapy, or in combination with insulin and standard of care.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Dapagliflozin 5 mg, Metformin hydrochloride 850 mg Tablet £36.59 DT price = £36.59
- Dapagliflozin 5 mg, Metformin hydrochloride 1 gram Tablet £36.59 DT price = £36.59

**Empagliflozin**

**DRUG ACTION**

Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

Type II diabetes as monotherapy (if metformin inappropriate) | Type II diabetes in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

**BY MOUTH**
- **Adult 18-84 years:** 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
- **Adult 85 years and over:** Initiation not recommended

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**CONTRA-INDICATIONS**

Diabetic ketoacidosis

**CAUTIONS**

Cardiovascular disease (increased risk of volume depletion) - complicated urinary tract infections—consider temporarily interrupting treatment - concomitant antihypertensive therapy (increased risk of volume depletion) - elderly patients aged over 75 years (increased risk of volume depletion) - heart failure - history of hypotension (increased risk of volume depletion) - patients at increased risk of volume depletion - predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

**CAUTIONS, FURTHER INFORMATION**

**Volume depletion** Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.

**INTERACTIONS**

Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- **Common or very common** Genital infection - hypoglycaemia (in combination with insulin or sulfonylurea) - polyuria - pruritus - urinary tract infection
- **Uncommon** Dysuria - volume depletion

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.
SULFONYLUREAS

**Sulfonylureas**

**DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

**CONTRA-INDICATIONS** Presence of ketoacidosis

**CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) • elderly • G6PD deficiency

**SIDE-EFFECTS**

- **Uncommon** Hypoglycaemia
- **Rare** Agranulocytosis • aplastic anaemia • Blood disorders • cholestatic jaundice • haemolytic anaemia • hepatic failure • hepatitis • leucopenia • pancytopenia • thrombocytopenia
- **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) • constipation • diarrhoea • disturbance in liver function • erythema multiforme (usually in the first 6–8 weeks of therapy) • exfoliative dermatitis (usually in the first 6–8 weeks of therapy) • fever (usually in the first 6–8 weeks of therapy) • gastro-intestinal disturbances • Hypersensitivity reactions (usually in the first 6–8 weeks of therapy) • jaundice (usually in the first 6–8 weeks of therapy) • leucopenia –8 weeks of therapy)

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hypoglycaemia** This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

- **RENAL IMPAIRMENT** Sulfonylures should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

**PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

**Glibenclamide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

**BY MOUTH**

- **Adult** Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

**CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

**BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Glibenclamide 2.5 mg** Glibenclamide 2.5 mg tablets | 28 tablet (POS) £19.99 09 DT price = £11.09
- **Glibenclamide 5 mg** Glibenclamide 5 mg tablets | 28 tablet (POS) £36.59 09 DT price = £22.22

**BNF 70**

**Diabetes mellitus 611**

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m². Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**

  - **Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336**
  - **Jardiance in dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:**
    - a sulfonylurea is contraindicated or not tolerated, or
    - the patient is at significant risk of hypoglycaemia or its consequences.
  - **Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:**
    - metformin and a sulfonylurea or
    - metformin and a thiazolidinedione.
  - **Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes. Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA336**

**SULFONYLUREAS**

**GLIBENCLAMIDE (Non-proprietary)**

- **Tablet**
  - **Glibenclamide 2.5 mg** Glibenclamide 2.5 mg tablets | 28 tablet (POS) £15.48 09 DT price = £9.22
  - **Glibenclamide 5 mg** Glibenclamide 5 mg tablets | 28 tablet (POS) £19.99 09 DT price = £11.09

**Gliclazide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- **INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Adult**
    - Initially 40–80 mg daily, adjusted according to response, by mouth increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

**Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.**
PREGNANCY

Avoid where possible in Acute porphyrias p. 864
INTERACTIONS

Avoid if the patient has both renal and hepatic impairment.

RENAL IMPAIRMENT

If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Gliclazide 40 mg Glacepak 40 capsule [30 tablet ] £3.36 DT price = £3.30
Gliclazide 80 mg Glacepak 80 capsule [30 tablet ] £7.74 DT price = £7.70
Diamicron (Servier Laboratories Ltd) Gliclazide 80 mg Diamicron 800mg tablets [60 tablet ] £4.38
Brands may include Zicron

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25
Gliclazide 30 mg Glacepak 30 capsule [28 tablet ] £4.00 DT price = £3.96 | 56 tablet [POS] £8.00
Diamicron MR (Servier Laboratories Ltd) Gliclazide 30 mg Diamicron 30mg MR tablets [28 tablet ] £2.81 DT price = £2.76 | 56 tablet [POS] £5.62
Brands may include Dacardis MR; Laaglyda MR; Nazdoor MR; Vanju; Ziclaseg

Glimepiride

INDICATIONS AND DOSE

Type 2 diabetes mellitus

BY MOUTH

Adult: Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day

CAUTIONS

CAUTIONS, FURTHER INFORMATION

Porphyria Sulfonylureas should be avoided where possible in Acute porphyrias p. 864 but glimepiride is thought to be safe.

INTERACTIONS

Hyponatraemia

PREGNANCY

The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

BREAST FEEDING

Avoid—theoretical possibility of hypoglycaemia in the infant.
Tolbutamide

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

**BY MOUTH**

- Adult: 0.5–1.5 g daily in divided doses (max. per dose 2 g), dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily (max. per dose 2 g), dose to be taken with or immediately after breakfast

**MEDICINAL FORMS**

- CONTRA-INDICATIONS Avoid where possible in Acute porphyrias p. 864
- INTERACTIONS Appendix 1 (antidiabetics).
- SIDE-EFFECTS Headache • tinnitus
- PREGNANCY The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- BREAST FEEDING The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- RENAL IMPAIRMENT If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

**THIAZOLIDINEDIONES**

Pioglitazone

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus, (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)**

**BY MOUTH**

- Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

Dose adjustments due to interactions

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**Important safety information**

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks. Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

**CONTRA-INDICATIONS** History of heart failure • previous or active bladder cancer • uninvestigated macroscopic haematuria

**CAUTIONS** Avoid in Acute porphyrias p. 864 • cardiovascular disease or in combination with insulin (risk of heart failure) • elderly (increased risk of heart failure, fractures, and bladder cancer) • increased risk of bone fractures, particularly in women • risk factors for bladder cancer

CAUTIONS, FURTHER INFORMATION

Substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally).

**INTERACTIONS Appendix 1 (antidiabetics).**

**SIDE-EFFECTS**

- Common or very common Anaemia • arthralgia • dizziness • gastro-intestinal disturbances • haematuria • headache • hypoaesthesia • impotence • oedema • vertigo • visual disturbances • weight gain

- Uncommon Altered blood lipids • bladder cancer • fatigue • hypoglycaemia • insomnia • proteinuria • sweating

- Rare Liver dysfunction

SIDE-EFFECTS, FURTHER INFORMATION

Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice occurs.

PREGNANCY Avoid—toxicity in animal studies.

BREAST FEEDING Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid.

**MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.

**PATIENT AND CARER ADVICE**

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.
614 Diabetes mellitus and hypoglycaemia

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **Pioglitazone (Non-proprietary)**
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg Diabiam 15mg tablets | 28 tablet (PO) £26.00 DT price = £1.23
  - Pioglitazone 15mg tablets | 28 tablet (PO) £25.83 DT price = £1.23
  - Pioglitazone (as Pioglitazone hydrochloride) 30 mg Diabiam 30mg tablets | 28 tablet (PO) £36.00 DT price = £1.46
  - Pioglitazone 30mg tablets | 28 tablet (PO) £35.89 DT price = £1.46
  - Pioglitazone (as Pioglitazone hydrochloride) 45 mg Diabiam 45mg tablets | 28 tablet (PO) £40.00 DT price = £1.68
  - Pioglitazone 45mg tablets | 28 tablet (PO) £39.55 DT price = £1.68
  - Actos (Takeda UK Ltd) Pioglitazone (as Pioglitazone hydrochloride) 15 mg Actos 15mg tablets | 28 tablet (PO) £25.83 DT price = £1.23
  - Pioglitazone (as Pioglitazone hydrochloride) 30 mg Actos 30mg tablets | 28 tablet (PO) £35.89 DT price = £1.46
  - Pioglitazone (as Pioglitazone hydrochloride) 45 mg Actos 45mg tablets | 28 tablet (PO) £35.57 DT price = £1.68
  - Brands may include Glijpion

**Metformin with pioglitazone**
The properties listed below are those particular to the combination only. For the properties of the components please consider, metformin hydrochloride p. 594, pioglitazone p. 613.

**INDICATIONS AND DOSE**
Type 2 diabetes not controlled by metformin alone

BY MOUTH
- Adult: 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Competact** (Takeda UK Ltd)
  - Metformin hydrochloride 850 mg, Pioglitazone (as Pioglitazone hydrochloride) 15 mg Competact 15mg tablets | 56 tablet (PO) £35.89 DT price = £0.68

3.2 Diabetes mellitus, diagnosis and monitoring

**Diabetes mellitus, diagnostic and monitoring devices**

**Urilalysis**
Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring. Microalbuminuria can be detected with *Micral-Test II®* but this should be followed by confirmation in the laboratory, since false positive results are common.

**Blood monitoring**
Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:
- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

**Oral glucose tolerance test**
The oral glucose p. 852 tolerance test is used mainly for diagnosis of impaired glucose p. 852 tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose p. 852 tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose p. 852 tolerance test generally involves giving anhydrous glucose p. 852 by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose p. 852 should be given with 200–300 mL fluid. Anhydrous glucose p. 852 may alternatively be given as 113 mL Polycal® with extra fluid to administer a total volume of 200–300 mL, or as Rapilose® OGTT oral solution.

**Blood monitoring test strips**

**BLOOD GLUCOSE TESTING STRIPS**
- **Diastix testing strips (Bayer Diagnostics Manufacturing Ltd)**
  - 50 strip | NHS indicative price = £2.89 | Drug Tariff (Part IXr)
- **Element testing strips (Neon Diagnostics Ltd)**
  - 36 strip | NHS indicative price = £3.69 | Drug Tariff (Part IXr)
- **FreeStyle Lite testing strips (Abbott Laboratories Ltd)**
  - 50 strip | NHS indicative price = £15.73 | Drug Tariff (Part IXr)
- **FreeStyle Optium testing strips (Abbott Laboratories Ltd)**
  - 50 strip | NHS indicative price = £15.64 | Drug Tariff (Part IXr)

### Hypodermic insulin injection pens

#### HYPODERMIC INSULIN INJECTION PENS

- **AUTOOPEN®**
  - **AUTOOPEN® 24**
    - For use with Sanofi: Aventis 3-mL insulin cartridges, allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).
    - **AUTOOPEN® CLASSIC**
      - For use with Lilly and Wockhardt 3-mL insulin cartridges, allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

- **CLIKSTAR®**
  - For use with Lantus®, Apidra®, and InsuLan® 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 143 units.

#### NEEDLE FREE INSULIN DELIVERY SYSTEMS

- **INSUJET®**
  - For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max. 40 units. Available as **starter set** (Insulet® device, nozzle cap, nozzle and piston, 1 x 10-mL adaptor, 1 x 3-mL adaptor, 1 cartridge cap removal key), **needle pack** (15 nozzles), **cartridge adaptor pack** (15 adaptors), or **vial adaptor pack** (15 adaptors).
    - Insulet 10mL vial adaptor pack (Spirit Healthcare Ltd)
    - 1 pack · NHS indicative price = £13.50 · Drug Tariff (Part IXa)
    - Insulet 3mL cartridge adaptor pack (Spirit Healthcare Ltd)
    - 1 pack · NHS indicative price = £21.70 · Drug Tariff (Part IXa)
    - Insulet needle pack (Spirit Healthcare Ltd)
    - 1 pack · NHS indicative price = £28.40 · Drug Tariff (Part IXa)
    - **Insulet starter set** (Spirit Healthcare Ltd)
    - 1 pack · NHS indicative price = £14.00 · Drug Tariff (Part IXa)
3.3 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Initially glucose p. 852 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection.

Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 20% may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also emergency management of hypoglycaemia in dental practice for further advice.

Chronic hypoglycaemia

Diazboxide p. 619, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

GLYCOGENOLYTIC HORMONES

Glucagon

INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

Child 1 month–1 year: 500 micrograms

Child 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given.

Child 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given.

Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given.

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

INITIALLY BY INTRAVENOUS INJECTION

Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour.

Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour.

Dose equivalence and conversion

1 unit of glucagon = 1 mg of glucagon.

UNLICENSED USE

Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

In children Unlicensed for growth hormone test and hyperinsulinism.

CONTRA-INDICATIONS

Phaeochromocytoma

CAUTIONS

Glucagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency - insulinoma - when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result — deaths reported (ensure a meal is eaten before discharge).

SIDE-EFFECTS

Rare Hypersensitivity reactions.
3.4 Hypoglycaemia, chronic

**THIAZIDES AND RELATED DIURETICS**

**Diazoxide**

**INDICATIONS AND DOSE**

**Chronic intractable hypoglycaemia**

**BY MOUTH**

- Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

**CAUTIONS**

- Aortic coarctation • aortic stenosis • arteriovenous shunt • heart failure • hyperuricaemia • impaired cardiac circulation • impaired cerebral circulation

**INTERACTIONS**

- Appendix 1 (diazoxide).

**SIDE-EFFECTS**

- abdominal pain • anaemia • anorexia (prolonged use) • bleeding • constipation • decreased libido • dermatitis • diarrhoea • diziness • dyspnoea • eosinophilia • extrapyramidal effects • galactorrhoea • headache • heart failure • hyperglycaemia • hyperosmolar non-ketotic coma • hypertrichosis • hyperuricaemia • (prolonged use) • hypotension • ileus • lacrimation • leucopenia • lichenoid eruption • musculoskeletal pain • nausea • pancreatitis • pruritus • pulmonary hypertension • raised serum creatinine • raised serum urea • reversible nephritic syndrome • sodium and fluid retention • taste disturbance • thrombocytopenia • tinnitus • transient catacacts • visual disturbances • vomiting

**PREGNANCY**

- Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

- Dose reduction may be required.

**MONITORING REQUIREMENTS**

- Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children

**Tablet**

- **Eudemine** (Focus Pharmaceuticals Ltd)
  - Diazoxide 50 mg  Eudemine 50mg tablets | 100 tablet £46.45

### 4 Disorders of bone metabolism

**Bone metabolism**

**Osteoporosis**

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements. Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

**Postmenopausal osteoporosis**

The bisphosphonates (alendronate and risedronate) are effective for preventing postmenopausal osteoporosis.

**Hormone replacement therapy** (HRT) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a bisphosphonate. The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol p. 885 or strontium ranelate may be considered. Calcitonin (salmon)/salcatonin is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin (salmon)/salcatonin (unlicensed indication) has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks.

**Parathyroid hormone, and teriparatide** have been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene hydrochloride p. 659 is licensed for the prophylaxis and treatment of vertebral fractures in postmenopausal women.

**Corticosteroid-induced osteoporosis**

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even
intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis. Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low trauma fracture should receive treatment for osteoporosis. The therapeutic options for prophylaxis and treatment of corticosteroid-induced osteoporosis are the same:
- a bisphosphonate;
- calcitriol [unlicensed indication];
- hormone replacement (HRT in women, testosterone in men [unlicensed indication]).

Calcitonin and parathyroid hormone
Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homoeostasis. Calcitonin (salmon)/salcatonin (synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy.

Calcitonin (salmon)/salcatonin is also licensed for treatment of Paget’s disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin (salmon)/salcatonin is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Recombinant parathyroid hormone is used for the treatment of postmenopausal osteoporosis. Teriparatide p. 629 (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis.

Cinacalcet p. 855 is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

Bisphosphonates
Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronate p. 621 or risedronate sodium p. 624 are considered the drugs of choice for these conditions. Bisphosphonates are also used in the treatment of Paget’s disease, hypercalcaemia of malignancy, and in bone metastases in breast cancer.

Strontium ranelate
Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

See also calcium, phosphorus, vitamin D and oestrogens in postmenopausal osteoporosis.

Drugs used for Disorders of bone metabolism not listed below; Calcitriol, p. 885

ANABOLIC STEROIDS

**Nandrolone**

**INDICATIONS AND DOSE**

Osteoporosis in postmenopausal women (but not recommended)

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 50 mg every 3 weeks.

**CONTRA-INDICATIONS**

Acute porphyrias p. 864 - male breast cancer - prostate cancer

**CAUTIONS**

Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - skeletal metastases (risk of hypercalcaemia)

**INTERACTIONS**

→ Appendix 1 (anabolic steroids).

**SIDE-EFFECTS**

Abnormal liver-function tests (with high doses) - acne - amenorrhoea - inhibition of spermatogenesis - liver tumours (with prolonged treatment with anabolic steroids) - premature epiphyseal closure - sodium retention with oedema - virilisation (with high doses including voice changes—sometimes irreversible)

**HEPATIC IMPAIRMENT**

Use in severe hepatic impairment only if benefit outweighs risk.

**RENAL IMPAIRMENT**

Use with caution—may cause sodium and water retention.

**MONITORING REQUIREMENTS**

Monitor skeletal maturation in young patients.

**LESS SUITABLE FOR PRESCRIBING**

Nandrolone injection is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Arachis (peanut) oil, benzyl alcohol

- Deca-Durabolin (Aspen Pharma Trading Ltd)

  Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule £3.17 Schedule 4 (CD Anab)

**BISPHOSPHONATES**

**Bisphosphonates**

**DRUG ACTION**

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

**Important safety information**

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis. The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate. Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

BISPHOSPHONATES: OSTEONECROSIS OF THE JAW

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous
Alendronic acid (Alendronate)

INDICATIONS AND DOSE
Treatment of postmenopausal osteoporosis
BY MOUTH
Adult: 10 mg daily, alternatively 70 mg once weekly.

Treatment of osteoporosis in men
BY MOUTH
Adult: 10 mg daily.
Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy
BY MOUTH
Adult: 10 mg daily.

CONTRA-INDICATIONS
Abnormalities of oesophagus - hypocalcaemia - other factors which delay emptying (e.g. stricture or achalasia)

CAUTIONS
Active gastro-intestinal bleeding - atypical femoral fractures - duodenitis - dysphagia - exclude other causes of osteoporosis - gastritis - history (within 1 year) of ulcers - surgery of the upper gastro-intestinal tract - symptomatic oesophageal disease - ulcers - upper gastrointestinal disorders

INTERACTIONS
Appendix 1 (bisphosphonates).

SIDE-EFFECTS
Common or very common Abdominal distension - abdominal pain - alopecia - asthenia - constipation - diarrhoea - dizziness - dyspepsia - flatulence - headache - joint swelling - musculoskeletal pain - oesophageal reactions - peripheral oedema - pruritus - regurgitation - vertigo
Uncommon Dysgeusia - episceratitis - erythema - gastritis - malaise (on initiation) - melena - myalgia (on initiation) - nausea - rash - scleritis - uveitis - vomiting
Rare Atypical femoral fractures with long-term use - fever (on initiation) - hypocalcaemia - osteonecrosis of the jaw - photosensitivity - severe skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

PREGNANCY
Avoid.

BREAST FEEDING
Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT
Avoid if eGFR less than 35 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment.

DIRECTIONS FOR ADMINISTRATION
Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

PATIENT AND CARER ADVICE
Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution.

Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:
- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis. www.nice.org.uk/TA160
- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Alendronate is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women. www.nice.org.uk/TA161
Alendronic acid with calcitriol

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 621, calcitriol p. 886.

INDICATIONS AND DOSE
Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency
BY MOUTH
Adult: 1 tablet once weekly.

DIRECTIONS FOR ADMINISTRATION
Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer alendronic acid with calcitriol tablets.

Ibandronic acid

INDICATIONS AND DOSE
Reduction in bone damage in bone metastases in breast cancer
INITIALLY BY MOUTH
Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

Hypercalcaemia of malignancy
BY INTRAVENOUS INFUSION
Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

Treatment of postmenopausal osteoporosis
INITIALLY BY MOUTH
Adult: 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS:
Hypocalcaemia

SPECIFIC CONTRA-INDICATIONS:
With oral use Abnormalities of the oesophagus - other factors which delay emptying (e.g. stricture or achalasia)

CAUTIONS
Atypical femoral fractures - cardiac disease (avoid fluid overload)

INTERACTIONS
 Appendix 1 (bisphosphonates).

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Common or very common
Abdominal pain, asthenia, bone pain, chill, diarrhoea, dyspepsia, fever, gastritis, headache, hypocalcaemia, hypophosphataemia, influenza-like symptoms, muscle pain, nausea, pharyngitis, rash, vomiting

Rare Anaemia, angioedema, atypical femoral fractures, bronchospasm, hypersensitivity reactions, injection-site reactions, pruritus, urticaria

Very rare Osteonecrosis of the jaw

SPECIFIC SIDE-EFFECTS
Common or very common
With oral use Severe oesophageal reactions (discontinue)

PREGNANCY
Avoid.

BRST FEEDING
Avoid—present in milk in animal studies.

RENO IMPAIRMENT
With intravenous use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.

With oral use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly. When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor renal function and serum calcium, phosphate and magnesium.

DIRECTIONS FOR ADMINISTRATION
Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer ibandronic acid tablets.

MEDIINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Table

Pamidronate disodium
(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

**INDICATIONS AND DOSE**

**Hypercalcaemia of malignancy**
- Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

**Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma**
- Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

**Paget’s disease of bone**
- Adult: 30 mg every 1 week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

**SIDE-EFFECTS**

**Rare**

**Frequency not known**
- Atrial fibrillation - injection-site reactions - reactivation of herpes simplex - reactivation of herpes zoster

**SIDE-EFFECTS, FURTHER INFORMATION**

**Calcium and vitamin D supplements**
Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

**RENAL IMPAIRMENT** Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk. If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

**MONITORING REQUIREMENTS**
- Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- Assess renal function before each dose.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For slow intravenous infusion (Aredia®, Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia® reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL or for Pamidronate disodium (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

**PATIENT AND CARER ADVICE** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial (Roche) £27.50 (Hospital only) | 5 vial (Roche) £149.15 Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial (Roche) £35.00 (Hospital only) | 1 vial (Roche) £59.66 Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial (Roche) £110.00 (Hospital only) Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial (Roche) £165.00 (Hospital only)

- Pamidronate disodium 6 mg per 1 ml Pamidronate disodium 60mg/10ml solution for infusion vials | 1 vial (Roche) £115.25

- Pamidronate disodium 9 mg per 1 ml Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial (Roche) £170.45

- Pamidronate disodium 15 mg per 1 ml Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule (Roche) £113.32

- Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule (Roche) £113.32

- Pamidronate disodium 90mg/6ml solution
**INDICATIONS AND DOSE**

Paget’s disease of bone

**BY MOUTH**

- **Adult:** 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

**Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**

**BY MOUTH**

- **Adult:** 5 mg daily, alternatively 35 mg once weekly.

**Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women**

**BY MOUTH**

- **Adult:** 5 mg daily.

**Treatment of osteoporosis in men at high risk of fractures**

**BY MOUTH**

- **Adult:** 35 mg once weekly.

---

**CONTRA-INDICATIONS**

- Hypocalcaemia

**CAUTIONS**

- Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia)

**INTERACTIONS**

- **Common or very common** · Abdominal pain · constipation · diarrhoea · dyspepsia · headache · musculoskeletal pain · nausea

- **Uncommon** · Duodenitis · dysphagia · gastritis · oesophageal ulcer · oesophagitis · uveitis

- **Rare** · Atypical femoral fractures · glossoitis · oesophageal stricture

- **Frequency not known** · Cutaneous vasculitis · gastro-duodenal ulceration · hair loss · hepatic disorders · osteonecrosis of the jaw · Stevens-Johnson syndrome · toxic epidermal necrolysis

**PREGNANCY**

- Avoid.

**BREAST FEEDING**

- Avoid.

**RENAL IMPAIRMENT**

- Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Correct hypocalcaemia before starting.

- Correct other disturbances of bone and mineral metabolism (e.g. vitamin D deficiency) at onset of treatment.

**DIRECTIONS FOR ADMINISTRATION**

- Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

**PATIENT AND CARER ADVICE**

- Patients or carers should be given advice on how to administer risedronate sodium tablets.

- Oesophageal reactions. Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Risedronate is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated and

- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. www.nice.org.uk/TA160

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Risedronate is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated and

- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance. www.nice.org.uk/TA161

**MEDICINAL FORMS**

There may be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **RISEDRONATE SODIUM (Non-proprietary)**

  - Risedronate sodium 5 mg
  - Risedronate sodium 30 mg
  - Risedronate sodium 35 mg

- **Actonel** (Warner Chilcott UK Ltd)

  - Risedronate sodium 5 mg

**Risedronate with calcium carbonate and colecalciferol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate p. 856, colecalciferol p. 886, risedronate sodium above.
## Sodium clodronate

### INDICATIONS AND DOSE

**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

**BY MOUTH**
- **Adult:** 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

**LORON 520®**

**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

**BY MOUTH**
- **Adult:** Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

### DIRECTIONS FOR ADMINISTRATION

- Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

### PATIENT AND CARER ADVICE

- Patients or carers should be given advice on how to administer sodium clodronate with colecalciferol and risedronate tablets and granules.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Granules
- **Actonel Combi** (Warner Chilcott UK Ltd)
- Actonel Combi 35 mg tablets and 1000 mg/880 unit effervescent granules sachets | 4 week supply (DST) £19.12

### SIDE-EFFECTS

- Common or very common: Bronchospasm, diarrhoea, nausea, skin reactions, vomiting
- Rare: Atypical femoral fractures
- Very rare: Osteonecrosis of the jaw
- Frequency not known: Renal impairment, uveitis

### CONTRA-INDICATIONS

- Acute gastro-intestinal inflammatory conditions

### CAUTIONS

- Atypical femoral fractures: maintain adequate fluid intake during treatment

### INTERACTIONS

- Appendix 1 (bisphosphonates).

### PRECAUTIONS

- **PREGNANCY**: Avoid.
- **BREAST FEEDING**: Manufacturer advises avoid — no information available.

### RENAL IMPAIRMENT

- Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73 m². Use half normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

### MONITORING REQUIREMENTS

- Monitor renal function, serum calcium and serum phosphate before and during treatment.

### DIRECTIONS FOR ADMINISTRATION

- Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.

### PATIENT AND CARER ADVICE

- Patients or carers should be given advice on how to administered sodium clodronate with coleccalciferol and risedronate tablets and granules.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

### Disorders of bone metabolism 625

---

## Zoledronic acid

### INDICATIONS AND DOSE

**ZOMETA® INFUSION**

**Reduction of bone damage in advanced malignancies involving bone**

**BY INTRAVENOUS INFUSION**
- **Adult:** 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

**Hypercalcaemia of malignancy**

**BY INTRAVENOUS INFUSION**
- **Adult:** 4 mg for 1 dose, to be administered over at least 15 minutes

**ACLASTA®**

**Treatment of Paget’s disease of bone**

**BY INTRAVENOUS INFUSION**
- **Adult:** 5 mg 1 times yearly, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

**Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)**

**BY INTRAVENOUS INFUSION**
- **Adult:** 5 mg 1 times yearly, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50000–125000 units of vitamin D

### CAUTIONS

- Atypical femoral fractures, cardiac disease (avoid fluid overload) concomitant medicines that affect renal function

### INTERACTIONS

- Appendix 1 (bisphosphonates).

### SIDE-EFFECTS

- Common or very common: Anaemia, arthralgia, atrial fibrillation, bone pain, conjunctivitis, dizziness, fever, gastro-intestinal disturbances, headache.
Disorders of bone metabolism

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Infusion**
  - **Zoledronic Acid (Non-proprietary)**
    - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml
    - Zoledronic acid 4mg/100ml infusion bags [1 bag PMP £174.14 (Hospital only)]
    - Zoledronic acid 4mg/100ml infusion bottles [1 bottle PMP £150.00]
    - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml
    - Zoledronic acid 5mg/100ml infusion bags [1 bag PMP £217.68]
    - Aclasta (Novartis Pharmaceuticals UK Ltd)
      - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml
      - Aclasta 5mg/100ml infusion bottles [1 bottle PMP £253.38]
    - Zometa (Novartis Pharmaceuticals UK Ltd)
      - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml
      - Zometa 4mg/100ml infusion bottles [1 bottle PMP £174.14]
    - Brands may include Zerlinda

- **Solution for infusion**
  - **Zoledronic Acid (Non-proprietary)**
    - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml
    - Zoledronic acid 4mg/100ml solution for infusion vials [1 vial PMP £147.30–£174.14]
    - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml
    - Zoledronic acid 5mg/100ml solution for infusion vials [1 vial PMP £215.37–£266.72]
    - Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 ml
      - Zoledronic acid 4mg/ml concentrate for solution for infusion vials [1 vial PMP £174.14 (Hospital only)]
      - Zoledronic acid 4mg/ml solution for infusion vials [1 vial PMP £150.00]
    - Zometa (Novartis Pharmaceuticals UK Ltd)
      - Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 ml
      - Zometa 4mg/ml solution for infusion vials [1 vial PMP £174.14]

- **Bone Formation Stimulants**

  - **Strontium Ranelate**
    - **Drug Action**
      - Stimulates bone formation and reduces bone resorption.
    - **Indications and Dose**
      - Treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated (initiated under specialist supervision)
    - **POM**
    - - Adult: 2 g once daily, dose to be taken in water, preferably at bedtime
    - **Contra-Indications**
      - Cerebrovascular disease - current or previous venous thromboembolic event - ischaemic heart disease - peripheral arterial disease - temporary or prolonged immobilisation - uncontrolled hypertension
    - **Caution**
      - Predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment
    - **Interactions**
      - Appendix 1 (strontium ranelate).
    - **Side-Effects**
      - Common or very common: Dermatitis - diarrhoea - eczema - headache - myocardial infarction - nausea - venous thromboembolism
      - Very rare: Angioedema - hypersensitivity reactions - urticaria - urticarial rash
      - Frequency not known: Abdominal pain - alopeedia - bone marrow suppression - constipation - dyspepsia - flatulence - gastro-oesophageal reflux - peripheral oedema - stomatitis - vomiting
SIDE-EFFECTS, FURTHER INFORMATION
Severe allergic reactions Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Treatment with strontium ranelate should not be restarted.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** Interferes with colorimetric measurements of calcium in blood and urine.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules.
- **PATIENT AND CARER ADVICE** Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops. Patients or carers should be given advice on how to administer strontium ranelate granules.
- **NATIONAL FUNDING/ACCESS DECISIONS**

### NICE technology appraisals (TAs)

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

**Strontium ranelate** is recommended as an alternative for women:
- in whom alendronate and risedronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. [www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Strontium ranelate** is recommended as an alternative for women:
- in whom alendronate and risedronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. [www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

### MEDICINAL FORMS

**Granules**

| CAUTIONARY AND ADVISORY LABELS 5, 13 |
| EXCipients: May contain Aspartame |

- **Protelos** (Servier Laboratories Ltd)
- **Strontium ranelate 2 gram** Protelos 2g granules sachets (sugar-free) | 28 sachet pack £27.08 DT price = £27.08

---

**CALCITONINS**

### Calcitonin salmon

**Calcitonin (salmon)** (Salcaltonin)

#### INDICATIONS AND DOSE

**Hypercalcaemia of malignancy**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: 100 units per day, adjusted according to response

- **BY INTRAVENOUS INFUSION**
  - Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

**Paget’s disease of bone**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

#### CONTRA-INDICATIONS

- Hypocalcaemia

#### CAUTIONS

- Heart failure - history of allergy (skin test advised) - risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

#### SIDE-EFFECTS

- Common or very common Abdominal pain - diarrhoea - dizziness - fatigue - flushing - headache - malignancy (with long-term use) - muscularkeletal pain - nausea - taste disturbances - vomiting
- Uncommon Cough - hypersensitivity reactions - hypertension - injection-site reactions - oedema - polyuria - pruritus - rash - visual disturbances
- Frequency not known Tremor

#### PREGNANCY

- Avoid unless potential benefit outweighs risk (toxicity in animal studies).

#### BREAST FEEDING

- Avoid; inhibits lactation in animals.

#### RENAL IMPAIRMENT

- Use with caution.

#### DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Miacalcic®), give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Miacalcic** (Novartis Pharmaceuticals UK Ltd)
  - Calcitonin (salmon) 50 unit per 1 mL Miacalcic 50units/1ml solution for injection ampoules | 5 ampoule pack £11.10
  - Calcitonin (salmon) 100 unit per 1 mL Miacalcic 100units/1ml solution for injection ampoules | 5 ampoule pack £34.21
  - Calcitonin (salmon) 200 unit per 1 mL Miacalcic 400units/2ml multidose solution for injection vials | 1 vial pack £24.60
DENOSUMAB

**Drug action** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

**Indications and dose**

**XGEVA®**

Prevention of skeletal related events in patients with bone metastases from solid tumours

**By subcutaneous injection**

- **Adult:** 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescent

**By subcutaneous injection**

- **Adult:** 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

**PROLIA®**

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures

**By subcutaneous injection**

- **Adult:** 60 mg every 6 months, supplement with calcium and vitamin D

**Important safety information**

**MHRA/CHM advice: Denosumab: atypical femoral fractures (February 2013)**

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis. Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab. Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**MHRA/CHM advice: Denosumab: minimising the risk of osteonecrosis of the jaw; monitoring for hypocalcaemia—updated recommendations (September 2014)**

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

**Osteonecrosis of the jaw**

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients

**Contra-indications** Hypocalcaemia

**Caution** Atypical femoral fractures • hypocalcaemia • osteonecrosis of the jaw—consider temporary interruption of treatment if occurs

**Side-effects**

- **Common or very common** Abdominal discomfort • cataracts • constipation • diarrhoea • dysphonia • eczema • hypocalcaemia (fatal cases reported) • hypophosphataemia • musculoskeletal pain • osteonecrosis of the jaw • pain in extremity • rash • sciatica • sweating • upper respiratory tract infection • urinary tract infection

- **Uncommon** Cellulitis (seek prompt medical attention) • diverticulitis • ear infection • skin infections (seek prompt medical attention)

- **Rare** Atypical femoral fractures • osteonecrosis of the jaw

**Conception and contraception** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.

**Pregnancy** Avoid—toxicity in animal studies; risk of toxicity increases with each trimester—advise women who become pregnant during treatment to enrol in the manufacturer’s Pregnancy Surveillance Programme (consult product literature).

**Breast feeding** Avoid (if women do decide to breast-feed during treatment, they should enrol in the manufacturer’s Lactation Surveillance Programme—consult product literature.)

- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have not recovered following oral surgery

Denosumab 60 mg (osteoporosis indication)

- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.

**Hypocalcaemia**

Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
- if suspected symptoms of hypocalcaemia occur

All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

- Avoid (if women do decide to breast-feed during treatment)

- Pregnancy surveillance programme

- Lactation surveillance programme
PATIENT AND CARER ADVICE

RENAL IMPAIRMENT
Increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.

PATIENT AND CARER ADVICE
Atypical femoral fractures. Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Osteonecrosis of the jaw. All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor. Hypocalcaemia. All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g., muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
• Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204

Denosumab is recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:
- who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Denosumab is recommended as a treatment option for the secondary prevention of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments. www.nice.org.uk/TA204

• Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265

Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:
- bisphosphonates would otherwise be prescribed, and
- the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is not recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA265

PROLIA®

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2010) that denosumab (Prolia®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score <-2.5 and ≥-4.0 and for whom bisphosphonates are unsuitable.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
• Prolia (Amgen Ltd) Denosumab 60 mg per 1 ml Prolia 60mg/1ml solution for injection pre-filled disposable injection pen £183.00
• Xgeva (Amgen Ltd) Denosumab 70 mg per 1 ml Xgeva 120mg/1.7ml solution for injection £109.86

PARATHYROID HORMONES AND ANALOGUES

Parathyroid hormone
(Human recombinant parathyroid hormone)

INDICATIONS AND DOSE
Treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures)

BY SUBCUTANEOUS INJECTION
• Adult: 100 micrograms daily for maximum duration of treatment 24 months

CONTRA-INDICATIONS
Hyperparathyroidism - metabolic bone disease - Paget’s disease - pre-existing hyperparathyroidism - previous radiation therapy to skeleton - unexplained raised levels of alkaline phosphatase

CAUTIONS
Active urolithiasis - previous urolithiasis

INTERACTIONS
Use with caution with concomitant cardiac glycosides.

SIDE-EFFECTS
• Common or very common Asthenia - back pain - constipation - diarrhoea - dizziness - dyspepsia - fatigue - headache - hypercalcaemia - injection-site reactions - muscle cramp - nausea - pain in extremities - palpitation - transient hypercalcaemia - vomiting

• Uncommon Abdominal pain - altered sense of smell - anorexia - hyperuricaemia - influenza - taste disturbance

PREGNANCY
Avoid.

BREAST FEEDING
Avoid.

HEPATIC IMPAIRMENT
Avoid.

RENAL IMPAIRMENT
Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised).

PRESCRIBING AND DISPENSING INFORMATION
Preotact® cartriges are for use with Preotact® pen device.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (February 2007) that parathyroid hormone (Preotact®) should be initiated by specialists experienced in the treatment of osteoporosis.

MEDICINAL FORMS
Medicines not identified.

Teriparatide

INDICATIONS AND DOSE
Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

BY SUBCUTANEOUS INJECTION
• Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

CONTRA-INDICATIONS
Bone metastases - hyperparathyroidism - metabolic bone diseases - Paget’s disease - hyperparathyroidism - previous radiation therapy to skeleton - unexplained raised levels of alkaline phosphatase

CAUTIONS
Active urolithiasis - previous urolithiasis

INTERACTIONS
Use with caution with concomitant cardiac glycosides.

SIDE-EFFECTS
• Common or very common Asthenia - back pain - constipation - diarrhoea - dizziness - dyspepsia - fatigue - headache - hypercalcaemia - injection-site reactions - muscle cramp - nausea - pain in extremities - palpitation - transient hypercalcaemia - vomiting

• Uncommon Abdominal pain - altered sense of smell - anorexia - hyperuricaemia - influenza - taste disturbance

PREGNANCY
Avoid.

BREAST FEEDING
Avoid.

HEPATIC IMPAIRMENT
Avoid.

RENAL IMPAIRMENT
Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised).

PRESCRIBING AND DISPENSING INFORMATION
Preotact® cartriges are for use with Preotact® pen device.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (February 2007) that parathyroid hormone (Preotact®) should be initiated by specialists experienced in the treatment of osteoporosis.
Dopamine-responsive conditions

DOPAMINE RECEPTOR AGONISTS

**Bromocriptine**

Bromocriptine is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 789) are more effective.

Cabergoline p. 334 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).

Quinagolide has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

**Suppression of lactation**

Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

---

**Quinagolide**

**INDICATIONS AND DOSE**

Hyperprolactinaemia

**BY MOUTH**

- Adult: Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

**SIDE-EFFECTS, FURTHER INFORMATION**

Hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS**  ➔ Appendix 1 (quinagolide).
- **SIDE-EFFECTS**
  - **Unlicensed Use** Not licensed for the suppression of lactation.
  - **CAUTIONS** Acute porphyrias p. 864 · history of psychotic illness · history of serious mental disorders

Hyperprolactinaemic patients. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS**  ➔ Appendix 1 (quinagolide).
- **SIDE-EFFECTS**
  - **Unlicensed Use** Not licensed for the suppression of lactation.
  - **CAUTIONS** Acute porphyrias p. 864 · history of psychotic illness · history of serious mental disorders

**CONCEPTION AND CONTRACEPTION**

Advise non-hormonal contraception if pregnancy not desired.

**PREGNANCY**

Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).

**BREAST FEEDING**

Suppresses lactation.

**HEPATIC IMPAIRMENT**

Avoid—no information available.

Bromocriptine p. 333 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of...
6 Gonadotrophin responsive conditions

Gonadotrophins

Drugs affecting gonadotrophins

Danazol p. 636 is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix p. 636 and ganirelix p. 636 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hyposexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate p. 633 and triptorelin p. 635 for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 791 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

GONADOTROPHIN-RELEASING HORMONE ANALOGUES

Buserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

**Endometriosis**

**BY INTRanasAL ADMINISTRATION**

- **Adult:** 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**

**BY SUBCUTaneous INJECTION**

- **Adult:** 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**BY INTRanasAL ADMINISTRATION**

- **Adult:** 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping continued →
gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development

- **Advanced prostate cancer**
  - *Initially by subcutaneous injection*
    - Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

- **Contra-indications**
  - When used for endometriosis
  - Hormone dependent tumours - undiagnosed vaginal bleeding - use longer than 6 months (do not repeat)

- **Caution**
  - Depression - diabetes - hypertension - patients with metabolic bone disease (decrease in bone mineral density can occur) - polycystic ovarian disease

- **Side-effects**
  - General side-effects

  - Specific side-effects
    - With intranasal use
      - Altered sense of taste and smell - nasal irritation - nose bleeds

- **Drug action**
  - Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

### Goserelin

- **Indications and dose**
  - ZOLADEX®
    - Locally advanced prostate cancer as an alternative to surgical castration / Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer / Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer / Metastatic prostate cancer / Advanced breast cancer / Oestrogen-receptor-positive early breast cancer
    - **By subcutaneous injection**
      - Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

  - Endometriosis
    - **By subcutaneous injection**
      - Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

  - Endometrial thinning before intra-uterine surgery
    - **By subcutaneous injection**
      - Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

  - Before surgery in women who have anaemia due to uterine fibroids
    - **By subcutaneous injection**
      - Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

  - Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)
    - **By subcutaneous injection**
      - Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on
administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall.

Zoladex LA®
Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

BY SUBCUTANEOUS INJECTION
Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

Contra-Indications
Undiagnosed vaginal bleeding - use longer than 6 months in endometriosis (do not repeat)

Caution
Depression, diabetes, hypertension - patients with metabolic bone disease (decrease in bone mineral density can occur) - polycystic ovarian disease - risk of spinal cord compression in men - risk of ureteric obstruction in men

Side-effects
Rare
Hypercalcaemia (in women)
Frequency not known
Anaphylaxis, arthralgia, asthma, breast tenderness - changes in blood pressure - changes in breast size - changes in scalp and body hair - decrease in trabecular bone density - depression - dizziness - dyspareunia (when used for gynaecological conditions) - gastro-intestinal disturbances - gynaecomastia - headache - heart failure (when used for prostate or breast cancer) - hot flushes - hypersensitivity reactions - increased sweating - local reactions at injection site - loss of libido - menopausal-like symptoms - migraine - mood changes - musculoskeletal pain (when used for gynaecological conditions) - musculoskeletal weakness (when used for gynaecological conditions) - myalgia - myocardial infarction (when used for prostate or breast cancer) - oedema of the face and extremities (when used for gynaecological conditions) - oedema of the lower extremity (when used for gynaecological conditions) - oedema of the upper extremity (when used for gynaecological conditions) - palpitation (when used for gynaecological conditions) - paraesthesia - paraesthesia - pruritus - rash - sexual dysfunction - sleep disorders - urticaria - vaginal bleeding - vaginal dryness - visual disturbances - weight change - withdrawal bleeding

Tumour flare
During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.

Conception and Contraception
Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

Pregnancy
Avoid.

Breast Feeding
Avoid.

Monitoring Requirements
Men at risk of tumour 'flare' should be monitored closely during the first month of therapy for prostate cancer.

Directions for Administration
Rotate injection site to prevent atrophy and nodule formation.

Leuprolrel acetate

Drug action
Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Indications and Dose

Prostap 3 DCS®
Endometriosis
By Intramuscular Injection
Adult: Initially 11.25 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

By Subcutaneous Injection
Adult: 11.25 mg every 3 months

Prostap SR DCS®
Endometriosis
By Subcutaneous Injection or by Intramuscular Injection
Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every 1 month for maximum 6 months (course not to be repeated)

Endometrial thickening before intra-uterine surgery
By Subcutaneous Injection or by Intramuscular Injection
Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle, 5–6 weeks before surgery

Reduction of size of uterine fibroids and of associated bleeding before surgery
By Subcutaneous Injection or by Intramuscular Injection
Adult: Initially 3.75 mg every 1 month usually for 3–4 months (maximum 6 months)

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

By Subcutaneous Injection or by Intramuscular Injection
Adult: 3.75 mg every 1 month
Endocrine system

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding - use longer than 6 months in the treatment of endometriosis (do not repeat)

- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **When used for prostate cancer**
    - **Tumour flare** In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.
  - **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
  - **PREGNANCY** Avoid—teratogenic in animal studies.
  - **BREAST FEEDING** Avoid.
  - **MONITORING REQUIREMENTS**
    - Monitor liver function.
    - Men at risk of tumour 'flare' should be monitored closely during the first month of therapy.
  - **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for suspension for injection**
    - **Prostop 3 DCS (Takeda UK Ltd)**
      - Leuprorelin acetate 11.25 mg
      - Prostop 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £225.72 DT price = £225.72
    - **Prostop SR DCS (Takeda UK Ltd)**
      - Leuprorelin acetate 3.75 mg
      - Prostop SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £75.24 DT price = £75.24

Nafarelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**Endometriosis**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of choric gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

**SIDE-EFFECTS, FURTHER INFORMATION**

**Menopausal-like symptoms** These effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone).

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **DIRECTIONS FOR ADMINISTRATION** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Spray**

**CAUTIONARY AND ADVISORY LABELS**

10. **Synarel (Pfizer Ltd)**

- Nafarelin (as Nafarelin acetate) 200 microgram per 1 dose
  - Synarel 200micrograms/dose nasal spray | 60 dose (PFS) £52.43
Triptorelin

**DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**DECAPEPTYL<sup>®</sup> SR 3MG**

**Endometriosis**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Reduction in size of fibroids**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration**

- **Metastatic prostate cancer**
  - **Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer**
  - **Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer**
  - **Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 3 mg every 4 weeks

**DECAPEPTYL<sup>®</sup> SR 11.25MG**

**Endometriosis**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 11.25 mg every 3 months for maximum 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration**

- **Metastatic prostate cancer**
  - **Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer**
  - **Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer**
  - **Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 11.25 mg every 3 months

**DECAPEPTYL<sup>®</sup> SR 22.5MG**

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration**

- **Metastatic prostate cancer**
  - **Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer**
  - **Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer**
  - **Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 22.5 mg every 6 months

**SALVACYL<sup>®</sup>**

**Male hypersexuality with severe sexual deviation**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 11.25 mg every 12 weeks

**GONAPETYL DEPOT<sup>®</sup>**

**Endometriosis | Reduction in size of fibroids**

- **BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**
  - **Adult:** 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Advanced prostate cancer**

- **BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 3.75 mg every 4 weeks

**CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) - undiagnosed vaginal bleeding

**SALVACYL<sup>®</sup>** Severe osteoporosis

**CAUTIONS**

**GENERAL CAUTIONS**

Patients with metabolic bone disease (decrease in bone mineral density can occur)

**SPECIFIC CAUTIONS**

- **When used for prostate cancer** risk factors for osteoporosis - risk of spinal cord compression in men - risk of ureteric obstruction in men

**SALVACYL<sup>®</sup>** Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment - transient increase in serum testosterone occurs on initiation—consider administration of an antiandrogen

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Anaphylaxis - arthralgia - asthenia - asthma - breast tenderness (males and females) - changes in blood pressure - changes in breast size - changes in scalp and body hair - depression - gastro-intestinal disturbances - headache - hot flushes - hypersensitivity reactions - increased sweating - local reactions at injection site - mood changes - ovarian cysts (may require withdrawal) - paraesthesia - pruritus - rash - urticaria - visual disturbances - weight changes

**SPECIFIC SIDE-EFFECTS**

- **When used for prostate cancer** Dizziness - dry mouth - hair loss - increased dysuria - myalgia - peripheral oedema - sexual dysfunction - sleep disorders

- **When used for reduction in size of uterine fibroids** Bleeding associated with fibroid degeneration - decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

- **When used for endometriosis** Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

- **When used for endometriosis** Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

- **When used for gonadotrophin-dependent precocious puberty** Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)
636 Gonadotrophin responsive conditions

Cetrorelix

ANTAGONISTS

GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS

Cetrorelix

INDICATIONS AND DOSE

Adjucent in the treatment of female infertility (initiated under specialist supervision)

BY SUBCUTANEOUS INJECTION

- Adult: 250 micrograms daily, dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy), dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction).

SIDE-EFFECTS

- Rare: Hypersensitivity reactions
- Pregnancy: Avoid in confirmed pregnancy.
- Breastfeeding: Avoid.
- Hepatic impairment: Avoid in moderate or severe hepatic impairment.
- Renal impairment: Avoid in moderate or severe renal impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ganirelix

INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (under expert supervision)

BY SUBCUTANEOUS INJECTION

- Adult: 250 micrograms daily, dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy), dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction).

SIDE-EFFECTS

- Common or very common: Headache, injection site reactions, nausea
- Rare: Hypersensitivity reactions
- Pregnancy: Avoid in confirmed pregnancy.
- Breastfeeding: Avoid.
- Hepatic impairment: Avoid in moderate or severe liver impairment.
- Renal impairment: Avoid in moderate or severe renal impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6.1 Hereditary angioedema

GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS

Danazol

- Drug action: Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogestogenic activity.
7 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Tetracosactide (tetracosacin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in follitropin), or chorionic gonadotrophin p. 639, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 659, or in superovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligosperma. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (hGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 642, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 639 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating

...
hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic pituitary lesions. 

**7.1 Adrenocortical function testing**

**CORTICOTROPHINS**

**Tetracosactide**

(Tetracosactrin)

**INDICATIONS AND DOSE**

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)
- By intravenous injection or by intramuscular injection
  - Adult: 250 micrograms for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)
- By intramuscular injection using depot injection
  - Adult: 1 mg for 1 dose

Alternative to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)

Initially by intramuscular injection using depot injection
  - Adult: Initially 1 mg daily, alternatively (by intramuscular injection) initially 1 mg every 12 hours, (in acute cases), then (by intramuscular injection) reduced to 1 mg every 2–3 days, followed by (by intramuscular injection) 1 mg once weekly, alternatively (by intramuscular injection) 500 micrograms every 2–3 days

**SIDE-EFFECTS**

**ALLERGY AND CROSS-SENSITIVITY**

Contraindicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.

**PREGNANCY**

Avoid (but may be used diagnostically if essential).

**BREAST FEEDING**

Avoid (but may be used diagnostically if essential).

**HEPATIC IMPAIRMENT**

An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.

**RENAL IMPAIRMENT**

Use with caution in patients with renal impairment.

**EFFECT ON LABORATORY TESTS**

May suppress skin test reactions. Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Synacthen (Questcor Operations Ltd)

  Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 5 ampoule | £190.00

**Suspension for injection**

- Synacthen Depot (Questcor Operations Ltd)

  Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 10 ampoule | £41.83
7.2 Assessment of pituitary function

GONADOTROPIN-RELEASING HORMONE ANALOGUES

Gonadorelin
(Gonadotrophin-releasing hormone; GnRH; LH-RH)

**INDICATIONS AND DOSE**
Assessment of pituitary function
BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION
▶ Adult: 100 micrograms for 1 dose

- **CAUTIONS** Pituitary adenoma
- **SIDE-EFFECTS** Abdominal pain, headache, hypersensitivity reaction on repeated administration of large doses, increased menstrual bleeding, irritation at injection site, nausea
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **EXCIPIENTS:** May contain Benzyl alcohol
  - **GONADORELIN (Non-proprietary)**
    Gonadorelin (as Gonadorelin hydrochloride) 100 microgram: Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial (PSt) £75.00 (Hospital only)

7.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Chorionic gonadotrophin alfa
(Human chorionic gonadotrophin; HCG)

**INDICATIONS AND DOSE**
Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Supovulation treatment for assisted conception (such as in vitro fertilisation)
BY SUBCUTANEOUS INJECTION
▶ Adult: Adjusted according to response.

- **CONTRA-INDICATIONS** Androgen-dependent tumours
- **CAUTIONS** Asthma, cardiac impairment, epilepsy, migraine, prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
- **SIDE-EFFECTS** Gynaecomastia, headache, local reactions, may aggravate ovarian hyperstimulation, mood changes, multiple pregnancy, oedema (particularly in males—reduce dose), tiredness
- **RENAL IMPAIRMENT** Use with caution.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder and solvent for solution for injection**
    Chorionic gonadotrophin human 5000 unit Choragon 5,000 unit powder and solvent for solution for injection ampoules | 3 ampoules (PSt) £3.77 Schedule 4 (CD Anab)
    Pregnyl (Merck Sharp & Dohme Ltd) Chorionic gonadotrophin human 1,500 unit Pregnyl 1,500 unit powder and solvent for solution for injection ampoules | 1 ampoule (PSt) £1.12 Schedule 4 (CD Anab)
    Chorionic gonadotrophin human 5000 unit Pregnyl 5,000 unit powder and solvent for solution for injection ampoules | 1 ampoule (PSt) £3.15 Schedule 4 (CD Anab)

Corifollitropin alfa

**INDICATIONS AND DOSE**
Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist
BY SUBCUTANEOUS INJECTION
▶ Adult (body-weight up to 60 kg): 100 micrograms
▶ Adult (body-weight 60 kg and above): 150 micrograms

- **CONTRA-INDICATIONS** History of ovarian hyperstimulation syndrome, ovarian enlargement or cyst, polycystic ovarian syndrome, tumours of breast, tumours of hypopituitarism, tumours of ovaries, tumours of pituitary, tumours of uterus, vaginal bleeding of unknown cause
- **CAUTIONS** Acute porphyrias p. 864, risk factors for thromboembolism, risk of ovarian hyperstimulation syndrome

- **SIDE-EFFECTS**
  - Common or very common Breast pain, fatigue, headache, nausea, ovarian hyperstimulation, pelvic pain
**Hypothalamic and anterior pituitary hormone related disorders**

*Uncommon*  Abdominal distension and pain • constipation • diarrhoea • dizziness • ovarian torsion • vomiting
*Frequency not known*  Ectopic pregnancy • miscarriage • multiple pregnancies

**BREAST FEEDING**  Avoid.

**RENAL IMPAIRMENT**  Avoid.

**SIDE-EFFECTS**

**CONTRA-INDICATIONS**  Ovarian cysts (not caused by polycystic ovarian syndrome) • tumours of breast • tumours of hypothalamus • tumours of ovaries • tumours of pituitary • tumours of prostate • tumours of testes • tumours of uterus • vaginal bleeding of unknown cause

**CAUTIONS**  Acute porphyrias p. 864

**SIDE-EFFECTS**

**Common or very common**  Fever • gastro-intestinal disturbances • headache • hypersensitivity reactions • injection site reactions • joint pain • ovarian hyperstimulation

**Very rare**  Thromboembolism

**Frequency not known**  Acne • gynaecomastia • increased risk of miscarriage • increased risk of multiple pregnancy • weight gain

**PREGNANCY**  Avoid.

**BREAST FEEDING**  Avoid.

**PATIENT AND CARER ADVICE**  Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Elonva (Merck Sharp & Dohme Ltd)
- Corifollitropin alfa 200 microgram per 1 ml  Elonva 100micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£94.00)
- Corifollitropin alfa 300 microgram per 1 ml  Elonva 150micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£141.00)

**Indications and dose**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

**BY SUBCUTANEOUS INJECTION**

- Adult: Adjusted according to response.

**Hypogonadotrophic hypogonadism**

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature).

**Contraindications**

Ovarian cysts (not caused by polycystic ovarian syndrome) • tumours of breast • tumours of hypothalamus • tumours of ovaries • tumours of pituitary • tumours of prostate • tumours of testes • tumours of uterus • vaginal bleeding of unknown cause

**Caution**

Acute porphyrias p. 864

**Side-effects**

**Common or very common**  Fever • gastro-intestinal disturbances • headache • hypersensitivity reactions • injection site reactions • joint pain • ovarian hyperstimulation

**Very rare**  Thromboembolism

**Frequency not known**  Acne • gynaecomastia • increased risk of miscarriage • increased risk of multiple pregnancy • weight gain

**Pregnancy**  Avoid.

**Breast feeding**  Avoid.

**Patient and carer advice**  Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**Medicinal forms**  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Follitropin alfa 600 unit per 1 ml  Bemfola 225units/0.375ml solution for injection pre-filled pen | 1 pre-filled disposable injection (£94.00)
- Bemfola 300units/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection (£141.00)
- Bemfola 450units/0.75ml solution for injection pre-filled pen | 1 pre-filled disposable injection (£194.00)

**Indications and dose**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

**By subcutaneous injection**

- Adult: Adjusted according to response.

**Contraindications**

Ovarian cysts (not caused by polycystic ovarian syndrome) • tumours of breast • tumours of hypothalamus • tumours of ovaries • tumours of pituitary • tumours of prostate • tumours of testes • tumours of uterus • vaginal bleeding of unknown cause

**Caution**

Acute porphyrias p. 864

**Side-effects**

**Common or very common**  Fever • gastro-intestinal disturbances • headache • hypersensitivity reactions • injection site reactions • joint pain • ovarian hyperstimulation

**Very rare**  Thromboembolism

**Frequency not known**  Acne • gynaecomastia • increased risk of miscarriage • increased risk of multiple pregnancy • weight gain

**Pregnancy**  Avoid.
Lutropin alfa
(Recombinant human luteinising hormone)

INDICATIONS AND DOSE
Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene (in conjunction with follicle-stimulating hormone) Superovulation treatment for assisted conception (such as in vitro fertilisation) (in conjunction with follicle-stimulating hormone)
BY SUBCUTANEOUS INJECTION
Adult: Adjusted according to response.

CONTRA-INDICATIONS Mammary carcinoma - ovarian carcinoma - ovarian enlargement or cyst (unless caused by polycystic ovarian disease) - tumours of hypothalamus - tumours of pituitary - undiagnosed vaginal bleeding - uterine carcinoma
CAUTIONS Acute porphyrias p. 864

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
- Luveris (Merck Serono Ltd)
- Lutropin alfa 75 unit Luveris 75unit powder and solvent for solution for injection vials | 1 vial £31.38

Also available in combination with follitropin alfa, p. 640

Menotrophin

INDICATIONS AND DOSE
Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)
BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION
Adult: Adjusted according to response.

CONTRA-INDICATIONS Ovarian cysts (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause
CAUTIONS Acute porphyrias p. 864
SIDE-EFFECTS Very rare Thromboembolism
Frequency not known Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - increased risk of miscarriage - increased risk of multiple

Urofollitropin

INDICATIONS AND DOSE
Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)
BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION
Adult: Adjusted according to response.
7.4 Growth hormone disorders

GROWTH HORMONE RECEPTOR ANTAGONISTS

Pegvisomant

- **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

- **INDICATIONS AND DOSE**
  - Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist) **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

- **CAUTIONS**
  - Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - liver disease

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Injection-site reactions: Rotate injection sites to avoid lipoatrophy.

- **CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder and solvent for solution for injection**
    - Somavert (Pfizer Ltd)
      - Pegvisomant 10 mg Somavert 10 mg powder and solvent for solution for injection vials | 30 vial PSH £1.500.00
      - Pegvisomant 15 mg Somavert 15 mg powder and solvent for solution for injection vials | 30 vial PSH £2.250.00
      - Pegvisomant 20 mg Somavert 20 mg powder and solvent for solution for injection vials | 1 vial PSH £100.00 | 30 vial PSH £3.000.00

**HUMAN GROWTH HORMONES**

Somatropin

*(Recombinant Human Growth Hormone)*

- **INDICATIONS AND DOSE**
  - Gonadal dysgenesis (Turner syndrome)
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily
  - Deficiency of growth hormone
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

- **Dose equivalence and conversion**
  - Dose formerly expressed in units; somatropin 1 mg equivalent to 3 units.

- **CONTRA-INDICATIONS** Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) - not to be used after renal transplantation - not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) - severe obesity in Prader-Willi syndrome - severe respiratory impairment in Prader-Willi syndrome

- **CAUTIONS**
  - Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - disorders of the epiphysis of the hip (monitor for limping) - history of malignant disease - hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value - initiation of treatment close to puberty not recommended in child born small for corrected gestational age - papilloma - relative deficiencies of other pituitary hormones - resolved intracranial hypertension (monitor closely) - Silver-Russell syndrome

- **INTERACTIONS**
  - Appendix 1 (somatropin).

- **SIDE-EFFECTS**
  - Antibody formation - arthralgia - benign intracranial hypertension - carpal tunnel syndrome - fluid retention (peripheral oedema) - headache - hyperglycaemia - hypoglycaemia - hypothyroidism - insulin resistance - leukaemia in children with growth hormone deficiency - myalgia - nausea - papilloedema - paraesthesia - reactions at injection site - visual problems - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Papilloma - Funduscopic for papilloma recommended if severe or recurrent headache, visual problems, nausea and vomiting occur — if papilloma confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs — no information available.

- **BREAST FEEDING** No information available. Absorption from milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipoatrophy.
Genotropin®, Humatrope cartridges, Norditropin®, NutropinAq®, Omnitrope®, Saizen® and Zomacton® preparations

For use by subcutaneous injection.

**HUMATROPE® POWDER FOR RECONSTITUTION**

For use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION** Medicinal products containing somatropin are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.

**GENOTROPIN® PREPARATIONS**

Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).

**NORDITROPIN® PREPARATIONS**

Cartridges are for use with appropriate NordiPen® device (non-NHS but available free of charge from clinics). Multidose disposable prefilled pens for use with Novofine® or NovoTwist® needles.

**NUTROPINaq®**

For use with NutropinAq® Pen device (non-NHS but available free of charge from clinics).

**OMNITROPE®**

For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices (non-NHS but available free of charge from clinics).

**SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION**

For use with one.click® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

**SAIZEN® SOLUTION FOR INJECTION**

For use with cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

**ZOMACTON®**

4mg vial for use with ZomaJet 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes. 10mg vial for use with ZomaJet Vision X® needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Somatropin for the treatment of growth failure in children (May 2010) NICE TA188

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency

- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment. [www.nice.org.uk/TA188](http://www.nice.org.uk/TA188)

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Benzyl alcohol

- **Norditropin NordiFlex** (Novo Nordisk Ltd)
  - Somatropin (epr) 10 mg per 1 ml Norditropin NordiFlex

8 Sex hormone responsive conditions

Sex hormones

Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia. In terms of oestrogenic activity natural oestrogens (estradiol p. 649 (estradiol)), estrone (estrone), and estriol p. 713 (estriol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol p. 655 (ethinylestradiol) and mestranol). Tibolone p. 646 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 137 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer

It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a
progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

**Risk of ovarian cancer**
Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

**Risk of venous thromboembolism**
Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

**Risk of stroke**
Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

**Risk of coronary heart disease**
HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Choice**
The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

**Surgery**
Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective
surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

**Reasons to stop HRT**
Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:
- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

**Ethinylestradiol**
Ethinylestradiol p. 655 (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders. Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

**Raloxifene**
Raloxifene hydrochloride p. 659 is licensed for the treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Raloxifene hydrochloride may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

**Progestogens and progesterone receptor modulators**
There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 695) and testosterone analogues (norethisterone p. 656 and norgestrel). The newer progestogens (desogestrel p. 691, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 692 is the active isomer of norgestrel and has twice its potency. Progestogen p. 658 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 626 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 95 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 932; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are **not** recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 104 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

**Hormone replacement therapy**
In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

**Oral contraception**
Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

**Cancer**
Progestogens also have a role in neoplastic disease.

**Progesterone receptor modulators**
Ulipristal acetate p. 691 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

---

**8.1 Female sex hormone responsive conditions**

**Drugs used for Female sex hormones responsive conditions not listed below:**
- Medroxyprogesterone acetate, p. 695; Clonidine hydrochloride, p. 137

**NORETYNODREL DERIVATIVES**

**Tibolone**

**INDICATIONS AND DOSE**
Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated
---

**By Mouth**
- Adult: 2.5 mg daily

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 864 | active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) | active thrombophilebitis | Dubin-Johnson and Rotor syndrome (or monitor closely) | history of breast cancer | history of cardiovascular disease | history of cerebrovascular disease | history of recurrent venous thromboembolism (unless already on anticoagulant treatment) | history of thromboembolism | history of thrombophilebitis, hormone-dependent tumours | liver disease (where liver function tests have failed to return to normal) | oestrogen-dependent cancer | thrombophilic disorder | uninvestigated or undiagnosed
vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 864 - diabetes (increased risk of heart disease) - epilepsy - factors predisposing to thromboembolism - history of breast nodules - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease - closely monitor breast status (risk of breast cancer) - history of liver disease - hyperglycaemia - hypophyseal tumours - migraine (or migraine-like headaches) - presence of antithrombin antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - risk of stroke

**CAUTIONS, FURTHER INFORMATION**

**Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, osteosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (tibolone).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - facial hair - leucorrhoea - vaginal bleeding - weight changes
  - **Rare** Amnesia
  - **Frequency not known** Arthralgia - breast cancer - depression - dizziness - gastro-intestinal disturbances - headache - increased risk of gall-bladder disease - migraine - myalgia - oedema - pruritus - rash - seborrhoeic dermatitis - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size - visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

**Vaginal bleeding** Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

**Reasons to withdraw treatment** Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- **PREGNANCY** Avoid; toxicity in animal studies.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.

- **RENAL IMPAIRMENT** Patients with renal impairment should be closely monitored (risk of fluid retention).

- **PRESCRIBING AND DISPENSING INFORMATION** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive. Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-compounded HRT, start at any time.

  - **BY MOUTH**
    - Adult: 0.3–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **Osteoporosis prophylaxis**
  - **BY MOUTH**
    - Adult: 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndromes (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - liver disease (where liver function tests have failed to return to normal) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndromes (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 864 - diabetes (increased risk of heart disease) - factors predisposing to thromboembolism - history of breast nodules (closely monitor breast status — risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease (closely monitor breast status — risk of breast cancer) - hypophyseal tumours - increased risk of gall-bladder disease reported - migraine - migraine-like headaches - presence of antithrombin antibodies (increased risk of thrombotic events) - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - risk of breast cancer

**CAUTIONS, FURTHER INFORMATION**

**Risk of breast cancer** It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

**Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

**Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

**Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is
Endocrine system

SIDE-EFFECTS

INTERACTIONS

l

Necessary preclude the possibility of becoming pregnant.

l

Pregnancy

INTERACTIONS

l

Risk of stroke

Risk of coronary heart disease

Hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY

l

Breast feeding

Avoid until weaning or for 6 months after birth (adverse effects on lactation).

SIDE-EFFECTS

Abdominal bloating - abdominal cramps - altered blood lipids (may lead to pancreatitis, rashes and chloasma) - breast enlargement - breast tenderness - changes in libido - cholestatic jaundice - contact lenses may irritate - depression - dizziness - fluid retention - glucose intolerance - headache - headache (on vigorous exercise) - leg cramps (rule out venous thrombosis) - migraine - mood changes - nausea - premenstrual-like syndrome - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - sodium retention - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size - vaginal candidiasis - vomiting - weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding

Cyclical HRT (where a progestogen is taken, usually in a single continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

CONCEPTION AND CONTRACEPTION

HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY

Not known to be harmful.

Breast feeding

Avoid until weaning or for 6 months after birth (adverse effects on lactation).

l

HEPATIC IMPAIRMENT

Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

l

Menopausal symptoms | Osteoporosis prophylaxis
BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), continued →
650  Sex hormone responsive conditions

FEMSEVEN®
Menopausal symptoms | Osteoporosis prophylaxis
BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch once weekly continuously, to be used with cyclical prostogesten for 12–14 days of each cycle in women with a uterus, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical prostogesten for at least 12 days of each cycle in women with a uterus

PROGYNOVA® TS
Menopausal symptoms | Osteoporosis prophylaxis
BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch once weekly continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical prostogesten for at least 12 days of each cycle in women with a uterus

OESTROGEL®
Menopausal symptoms | TO THE SKIN
- Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical prostogesten for at least 12 days of each cycle in women with a uterus

Dose equivalence and conversion
2 measures is equivalent to estradiol 1.5 mg

SANDRENA®
Menopausal symptoms | TO THE SKIN
- Adult: Apply 1 mg once daily, to be applied over area 1–2 times size of hand; with cyclical prostogesten for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

ESTRING®
Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)
BY VAGINA
- Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

VAGIFEM®
Improve the vaginal epithelium in menopausal atrophic vaginitis
BY VAGINA
- Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

CONTRA-INDICATIONS
Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndrome (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

CAUTIONS
GENERAL CAUTIONS
Acute porphyrias p. 864 - diabetes (increased risk of heart disease) - history of breast nodules - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia; factors predisposing to thromboembolism - history of fibrocystic disease - closely monitor breast status (risk of breast cancer) - hypophysial tumours - increased risk of gall-bladder disease - migraine (or migraine-like headaches) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

SPECIFIC CAUTIONS
- With vaginal use Interrupt treatment periodically to assess need for continued treatment

CAUTIONS, FURTHER INFORMATION
Risk of breast cancer
It is estimated that using all types of HRT increases the risk of breast cancer in women by about 3% after 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

Risk of endometrial cancer
The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer
Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism
Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke
Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen–only HRT slightly increases the risk of stroke.

Risk of coronary heart disease
HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little...

APPENDIX (oestrogens).

PATTER AND CARER ADVICE

SPECIFIC SIDE-EFFECTS

WITH transdermal use

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding

Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

CONCEPTION AND CONTRACEPTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

VAGIFEM® No evidence of damage to latex condoms and vaginal tracts.

information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

 Specialist advice is advised for estradiol gels (administration).

OESTROGEL® Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 1 minute. Wash hands after application. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

SANDRENA® Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

Drospirenone with estradiol

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

INDICATIONS AND DOSE

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously

- Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

BY MOUTH

- Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

- CAUTIONS
  Use with care if an increased concentration of potassium might be hazardous

- REPRODUCTIVE AND BREAST FUNCTION
  Avoid if eGFR less than 30 mL/minute/1.73 m²

- MEDICAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

**Estradiol with estriol and estrone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649, estriol p. 713.

**INDICATIONS AND DOSE**

Menopausal symptoms | Osteoporosis prophylaxis  
**BY MOUTH**
- Adult: 1–2 tablets daily continuously or cyclically (21 days out of 28), started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progesterogen for 12–14 days of each cycle in women with a uterus
### Indications and Dose

#### **CLIMASTE® 1-MG**

**Menopausal symptoms**

- **By mouth**
  - Adult: 1 grey tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 white tablet daily for 12 days, subsequent courses are repeated without interval.

#### **CLIMASTE® 2-MG**

**Menopausal symptoms (if symptoms not controlled with lower strength)**

- **By mouth**
  - Adult: 1 blue tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 white tablet daily for 12 days, subsequent courses are repeated without interval.

#### **CLIMAGEST®**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

- **By mouth**
  - Adult: 1 tablet daily continuously

#### **CLINORETTE®**

**Menopausal symptoms in women with a uterus**

- **By mouth**
  - Adult: 1 white tablet daily for 16 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days, subsequent courses repeated without interval.

#### **ELLESTE-DUET® CONTI**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

- **By mouth**
  - Adult: 1 tablet daily continuous basis, if changing from cyclical HRT begin treatment at the end of scheduled bleed.

#### **ELLESTE-DUET® 1-MG**

**Menopausal symptoms**

- **By mouth**
  - Adult: 1 white tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days, subsequent courses are repeated without interval.

#### **ELLESTE-DUET® 2-MG**

**Menopausal symptoms**

- **By mouth**
  - Adult: 1 orange tablet daily for 16 days, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 grey tablet daily for 12 days, subsequent courses are repeated without interval.

#### **EVOREL® CONTI**

**Menopausal symptoms in women with a uterus**

- **By Transdermal Application**
  - Adult: Apply 1 patch twice weekly continuously

#### **EVOREL® SEQUI**

**Menopausal symptoms in women with a uterus**

- **By Transdermal Application**
  - Adult: Apply 1 Evorel® 1-MG patch twice weekly for 2 weeks, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 Evorel® Conti patch twice weekly, subsequent courses are repeated without interval.

#### **KLOFEM®**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

- **By mouth**
  - Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT.

#### **KLOYVANCE®**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

- **By mouth**
  - Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT.

#### **NOVOFEM®**

**Menopausal symptoms in women with a uterus**

- **By mouth**
  - Adult: 1 red tablet daily for 16 days, then 1 white tablet daily for 12 days, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase.

#### **NUVELLE® CONTINUOUS**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

- **By mouth**
  - Adult: 1 tablet daily continuously, if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase.

#### **TRISEQUENS®**

**Menopausal symptoms in women with a uterus**

- **By mouth**
  - Adult: 1 blue tablet daily for 12 days, followed by 1 white tablet daily for 10 days, then 1 red tablet daily for 6 days, subsequent courses are repeated without interval.
**Estradiol with norgestrel**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

**INDICATIONS AND DOSE**

**CYCLO-PROGYNova® 2MG TABLETS**

Menopausal symptoms in women with a uterus; Osteoporosis prophylaxis in women with a uterus

**BY MOUTH**

- Adult: 1 white tablet daily for 11 days; started on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet free interval

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Cyclo-Progynova (Meda Pharmaceuticals Ltd)
  Cyclo-Progynova tablets 2 | 21 tablet [BNF] £3.11

---

**Ethinylestradiol (Ethinyleoestradiol)**

**INDICATIONS AND DOSE**

Short-term treatment of symptoms of oestrogen deficiency

**Osteoporosis prophylaxis if other drugs cannot be used**

**BY MOUTH**

- Adult: 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progesterogen for 12–14 days per cycle in women with intact uterus.

**Female hypogonadism**

**BY MOUTH**

- Adult: 10–50 micrograms daily on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progesterogen therapy.

**Menstrual disorders**

**BY MOUTH**

- Adult: 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progesterogen, added either throughout the cycle or from day 15 to 25.

**Palliative treatment of prostate cancer**

**BY MOUTH**

- Adult: 0.15–1.5 mg daily.

**CONTRA-INDICATIONS**

Acute porphyrias p. 864; active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson and Rotor syndromes (or monitor closely) · gallstones · heart disease associated with pulmonary hypertension · heart disease associated with risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pempigoid gestations · history during pregnancy of puritus · history of breast cancer · history of haemolytic uraemic syndrome · liver disease (where liver function tests have failed to return to normal) · migraine with aura · oestrogen-dependent cancer · sclerosing cholangitis · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · thrombophilic disorder · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism · or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)

**CAUTIONS**

Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) · seek specialist advice · cardiovascular disease (sodium retention with oedema, thromboembolism) · Crohn’s disease · diabetes (increased risk of heart disease) · gene mutations associated with breast cancer (e.g. BRCA1) · history of breast nodules or fibrocystic disease · colon cancer · endometrial hyperplasia · history of severe depression (especially if induced by hormonal contraceptive) · hyperprolactinaemia (seek specialist advice) · hypophyselial tumours · increased risk of gall-bladder disease · inflammatory bowel disease · migraine (migraine-like headaches) · personal or family history of hypertriglyceridaemia · presence of antiphospholipid antibodies · increased risk of thrombotic events · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for arterial disease · risk factors for migraine · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass
656  Sex hormone responsive conditions

Endocrine system

CAUTIONS, FURTHER INFORMATION

Other conditions  The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otochlosis, multiple sclerosis, and systemic lupus erythematous (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

Risk of venous thromboembolism  Use with caution if any of the following factors present but avoid if two or more factors present:

•  family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
•  obesity—body mass index $\geq 30$ kg/m$^2$ (avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
•  long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
•  history of superficial thrombophlebitis;
•  age over 35 years (avoid if over 50 years);
•  smoking.

Risk factors for arterial disease  Use with caution if any one of following factors present but avoid if two or more factors present:

•  family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
•  diabetes mellitus (avoid if diabetes complications present);
•  hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high);
•  smoking (avoid if smoking 40 or more cigarettes daily);
•  age over 35 years (avoid if over 50 years);
•  obesity (avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
•  migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine  Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

INTERACTIONS  $\rightarrow$ Appendix 1 (oestrogens).

SIDE-EFFECTS

•  Rare  Gallstones systemic lupus erythematous
•  Frequency not known  Abdominal bloating abdominal cramps absence of withdrawal bleeding altered blood lipids (may lead to pancreatitis) amenorrhea after discontinuation breast enlargement breast secretion breast tenderness cervical erosion changes in libido changes in lipid metabolism changes in vaginal discharge chloasma cholestatic jaundice chorea contact lenses may irritate depression dizziness feminising effects fluid retention glucose intolerance headache hepatic tumours hypertension irritability leg cramps (rule out venous thrombosis) liver impairment migraine mood changes nausea nervousness photosensitivity premenstrual-like syndrome rashes reduced menstrual loss skin reactions sodium retention symptoms of endometriosis may be exacerbated thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) uterine fibroids may increase in size vaginal candidiasis visual disturbances vomiting weight changes spotting in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding  Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

•  PREGNANCY  Not known to be harmful.
•  BREAST FEEDING  Avoid until weaning or for 6 months after birth (adverse effects on lactation).
•  HEPATIC IMPAIRMENT  Avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, capsule

PROGESTOGENS

Norethisterone

INDICATIONS AND DOSE

Endometriosis

BY MOUTH

$\rightarrow$ Adult 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

Dysfunctional uterine bleeding (to arrest bleeding) Menorrhagia (to arrest bleeding)

BY MOUTH

$\rightarrow$ Adult 5 mg 3 times a day for 10 days

Dysfunctional uterine bleeding (to prevent bleeding) Menorrhagia (to prevent bleeding)

BY MOUTH

$\rightarrow$ Adult 5 mg twice daily, to be taken from day 19 to day 26 of cycle

Dysmenorrhoea

BY MOUTH

$\rightarrow$ Adult 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

Premenstrual syndrome (but not recommended)

BY MOUTH

$\rightarrow$ Adult 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

Postponement of menstruation

BY MOUTH

$\rightarrow$ Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)
When used for contraception

- **CAUTIONS**
  - **With oral use**
  - **Females of childbearing potential**:
    - 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks), then 200 mg after 8 weeks if required
  
- **Contraception**
  - **BY MOUTH**
  - **Females of childbearing potential**:
    - 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

- **INTERACTIONS** → Appendix 1 (progestogens).
  - With intramuscular use
    - Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection is not affected by enzyme-inducing drugs and may be continued as normal during courses of these drugs.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - In use as a contraceptive indications.
    - Acne, alopecia, anaphylactoid reactions, breast tenderness, change in libido, depression, disturbance of appetite, dizziness, fluid retention, headache, hirsutism, insomnia, nausea, premenstrual-like syndrome, pruritus, rash, skin reactions, urticaria, vomiting, weight change
  
  **SPECIFIC SIDE-EFFECTS**
  - With intramuscular use
    - Injection-site reactions

  **SIDE-EFFECTS, FURTHER INFORMATION**

  **Cervical cancer** Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

  **PREGNANCY** Masculinisation of female fetuses and other defects reported with non-contraceptive use.

  **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

  **With intramuscular use**
  - Withhold breast-feeding for 3 days after recovery.
  - Use as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

  **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

  **PATIENT AND CARER ADVICE**
  - **Missed oral contraceptive pill** The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’
  
  The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

  - Diarrhoea and vomiting with oral contraceptives
  - Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives.
  - If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.
Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment. Changing from a combined oral contraceptive: start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth: oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Contraceptives by injection Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

UTROGESTAN® CAPSULES

Progestogenic opposition of oestrogen HRT

BY MOUTH
   Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

GESTONE® SOLUTION FOR INJECTION

Dysfunctional uterine bleeding

BY DEEP INTRAMUSCULAR INJECTION
   Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks

Recurrent miscarriage due to inadequate luteal phase (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer

BY DEEP INTRAMUSCULAR INJECTION
   Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy, to be administered into buttocks; maximum 200 mg per day

LUBION® SOLUTION FOR INJECTION

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
   Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

CYCLOGEST® PESSARIES

Premenstrual syndrome | Post-natal depression

BY VAGINA OR BY RECTUM
   Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

UTROGESTAN® VAGINAL CAPSULES

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

BY VAGINA
   Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

● CONTRA-INDICATIONS

Acute porphyrias p. 864 • avoid in patients with a history of liver tumours • breast cancer (unless progestogens are being used in the management of this condition) • genital cancer (unless progestogens are being used in the management of this condition) • history during pregnancy of idiopathic jaundice • history during pregnancy of pemphigoid gestationis • history during pregnancy of severe pruritus • incomplete miscarriage • missed miscarriage • severe arterial disease • undiagnosed vaginal bleeding

● CAUTIONS

Asthma • cardiac dysfunction • conditions that may worsen with fluid retention • diabetes (progestogens can decrease glucose tolerance—monitor patient closely) • epilepsy • history of depression • hypertension • migraine • susceptibility to thromboembolism (particular caution with high dose)

● INTERACTIONS → Appendix 1 (progestogens).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Acne • alopecia • anaphylactoid reactions • bloating • breast tenderness • change in libido • depression • dizziness • drowsiness • fluid retention • headache • hirsutism • insomnia • jaundice • menstrual disturbances • nausea • premenstrual-like syndrome • pruritus • rash • skin reactions • urticaria • weight change

SPECIFIC SIDE-EFFECTS

With intramuscular use or subcutaneous use Injection-site reactions
   With rectal use Diarrhoea • flatulence • pain
   With vaginal use Local irritation

● PREGNANCY

Not known to be harmful.

● BREAST FEEDING

Avoid—present in milk.

● HEPATIC IMPAIRMENT

Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

● RENAL IMPAIRMENT

Use with caution.

● DIRECTIONS FOR ADMINISTRATION

Capsules should be taken at bedtime on an empty stomach.

● PATIENT AND CARER ADVICE

Patient counselling is advised for progesterone capsules (administration).
Anti-oestrogens 659

SELECTIVE OESTROGEN RECEPTOR MODULATORS

Raloxifene hydrochloride

INDICATIONS AND DOSE
Treatment and prevention of postmenopausal osteoporosis

BY MOUTH

Adult: 60 mg once daily

CONTRA-INDICATIONS Cholestasis - endometrial cancer - history of venous thromboembolism - undiagnosed uterine bleeding

CAUTIONS Avoid in Acute porphyrias p. 864 - breast cancer (manufacturer advises avoid during treatment for breast cancer) - history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) - risk factors for stroke - risk factors for venous thromboembolism (discontinue if prolonged immobilisation)

INTERACTIONS → Appendix 1 (raloxifene).

SIDE-EFFECTS

Common or very common Hot flushes - influenza-like symptoms - leg cramps - peripheral oedema

Uncommon Thrombophlebitis - venous thromboembolism - leg pain

Rare Arterial thromboembolism - breast discomfort - gastro-intestinal disturbances - headache - hypertension - migraine - rashes - thrombocytopenia

HEPATIC IMPAIRMENT Avoid.

RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

RALOXIFENE HYDROCHLORIDE (Non-proprietary)

Raloxifene hydrochloride 60 mg Raloxifene 60 mg tablets | 28 tablet | £16.02

Raloxifene hydrochloride 60 mg Raloxifene 60 mg tablets | 84 tablet | £14.63

Raloxifene hydrochloride 60 mg Raloxifene 60 mg tablets | 14 tablet | £6.02

Raloxifene hydrochloride 60 mg Raloxifene 60 mg tablets | 28 tablet | £17.06

Brands may include Ostiral; Razylan

Raloxifene is recommended by the NICE guideline TA161 as a treatment option for postmenopausal women for prevention of osteoporotic fractures and osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

8.2 Anti-oestrogens

OVULATION STIMULANTS

Clomifene citrate

Clomiphene citrate

DRUG ACTION Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; choriionic gonadotrophin is sometimes used as an adjunct.

INDICATIONS AND DOSE

Treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease)

BY MOUTH

Adult: 50 mg daily for 5 days, to be started within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen induced withdrawal bleed) if cycles have ceased, followed by 100 mg daily if required for a further 5 days, this second course may be given in absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended.

Important safety information

The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).
8.3 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

Anti-androgens

Cyproterone acetate

Cyproterone acetate p. 662 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertillity (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

Dutasteride and finasteride

Dutasteride p. 676 and finasteride p. 676 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

Anabolic steroids

Anabolic steroids have some anabolic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anemia. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

ANDROGENS

Androgens

- CONTRA-INDICATIONS Breast cancer in males • history of liver tumours • hypercalcaemia • prostate cancer

- CAUTIONS Cardiac impairment • diabetes mellitus • elderly • epilepsy • hypertension • ischaemic heart disease • migraine • pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored • skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) • sleep apnoea • stop treatment or reduce dose if severe polycthymia occurs • tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

- INTERACTIONS Appendix 1 (testosterone).

- SIDE-EFFECTS
  - Common or very common Acne • androgenic effects (to be assessed regularly in women) • anxiety • arthralgia • asthenia • changes in libido • cholestatic jaundice • depression • electrolyte disturbances • excessive duration of penile erection • excessive frequency of penile erection • gastrointestinal bleeding • gynaecomastia • headache • hirsutism • hypercalcaemia • hypertension • increased bone growth • irritability • male-pattern baldness • muscle cramps • nausea • nervousness • oedema • paraesthesia • polycythaemia • precocious sexual development in pre-pubertal males • premature closure of epiphyses in pre-pubertal males • prostate abnormalities • prostate cancer • pruritus • seborrhoea • sodium retention • suppression of virilism in women • vomiting • weight gain
Testosterone enantate

INDICATIONS AND DOSE

Hypogonadism

BY SLOW INTRAMUSCULAR INJECTION

Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

Breast cancer

BY SLOW INTRAMUSCULAR INJECTION

Adult: 250 mg every 2–3 weeks

SIDE-EFFECTS

Suppression of spermatogenesis

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

TESTOSTERONE ENANTATE (Non-proprietary)

Testosterone enantate 250 mg per 1 ml Testosterone enantate 250mg/1ml solution for injection ampoules | 3 ampoule [POM] £68.00 DT price = £68.00 Schedule 4 (CD Anab)
## Testosterone propionate

### INDICATIONS AND DOSE

**Androgen deficiency**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 50 mg 2–3 times a week
- Delayed puberty in males
  - **BY INTRAMUSCULAR INJECTION**
  - Adult: 50 mg once weekly

**Breast cancer in women**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 100 mg 2–3 times a week

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream capsule containing the same drug. There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream.

### SIDE-EFFECTS

Suppression of spermatogenesis

## Testosterone decanoate, isocaproate, phenylpropionate and propionate

The properties listed below are those particular to the combination only. For the properties of the components please consider, testosterone propionate above.

### INDICATIONS AND DOSE

**Androgen deficiency**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 ml every 3 weeks

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Solution for injection EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol
- Testosterone decanoate 100 mg per 1 ml, Testosterone isocaproate 60 mg per 1 ml, Testosterone phenylpropionate 60 mg per 1 ml, Testosterone propionate 30 mg per 1 ml
- Sustanon 250mg/1ml solution for injection ampoules | 1 ampoule £2.45 Schedule 4 (CD Anab)
- Nebido 1000mg/4ml solution for injection vials | 1 vial £80.00 Schedule 4 (CD Anab)

### SIDE-EFFECTS

Suppression of spermatogenesis

## Testosterone undecanoate

### INDICATIONS AND DOSE

**Androgen deficiency**
- **BY MOUTH**
  - Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

**Hypogonadism**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Capsule

**CAUTIONARY AND ADVISORY LABELS** 21, 25
- Restandol (Merck Sharp & Dohme Ltd)
- Testosterone undecanoate 40 mg Restandol 40mg Testocaps | 30 capsule £8.55 Schedule 4 (CD Anab) | 60 capsule £17.10 DT price = £17.10 Schedule 4 (CD Anab)

### SIDE-EFFECTS

Suppression of spermatogenesis

## Cyproterone acetate

### INDICATIONS AND DOSE

**Hypersexuality | Sexual deviation**
- **BY MOUTH**
  - Adult: 50 mg twice daily, to be taken after food.

**Prevention of tumour flare with initial gonadorelin analogue therapy**
- **BY MOUTH**
  - Adult: 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

**Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred**
- **BY MOUTH**
  - Adult: 200–300 mg daily in 2–3 divided doses.

**Hot flushes with gonadorelin analogue therapy or after orchidectomy**
- **BY MOUTH**
  - Adult: Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

### CONTRA-INDICATIONS

In hypersexuality, Dubin-Johnson syndrome - in hypersexuality, history of thromboembolic disorders - in hypersexuality, liver disease - in hypersexuality, malignant diseases - in hypersexuality, previous or existing liver tumours - in hypersexuality, Rotor syndrome - in hypersexuality, severe depression - in hypersexuality, severe diabetes (with vascular changes) - in hypersexuality, sickle-cell anaemia - in hypersexuality, wasting diseases - meningioma or history of meningioma - youths under 18 years (may arrest bone maturation and testicular development)

### CAUTIONS

Diabetes mellitus - in prostate cancer, severe depression - in prostate cancer, sickle-cell anaemia - ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

### SIDE-EFFECTS

- Rare Hypersensitivity reactions - osteoporosis - rash
- **Frequency not known** Breathlessness - changes in hair pattern - fatigue - gynaecomastia (rarely leading to galactorrhoea and benign breast nodules) - hepatic failure - hepatitis - hepatotoxicity - inhibition of spermatogenesis - jaundice - lassitude - reduced sebum production (may clear acne) - risk of recurrence of thromboembolic disease - weight changes

### SIDE-EFFECTS, FURTHER INFORMATION

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as
9 Thyroid disorders

Thyrotropin alfa
(Recombinant human thyroid stimulating hormone; rhTSH)

**DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

**INDICATIONS AND DOSE**
Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radiolodine imaging) To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients

**BY INTRAMUSCULAR INJECTION**
- Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose

**CAUTIONS** Presence of thyroglobulin autoantibodies may give false negative results

**SIDE-EFFECTS**
- **Common or very common** Dizziness • fatigue • headache • nausea • vomiting
- **Uncommon** Asthenia • back pain • influenza-like symptoms • paraesthesia • rash • urticaria
- **Rare** Diarrhoea
- **Very rare** Arthralgia • dyspnoea • flushing • hyperhidrosis • injection-site pain • injection-site pruritus • injection-site rash • injection-site reactions • myalgia • pain at site of metastases • palpitation • tremor

**ALLERGY AND CROSS-SENSITIVITY** Contraindicated if previous hypersensitivity to bovine or human thyrotrophin.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Thyrogen (Genzyme Therapeutics Ltd) Thyrotropin alfa 900 microgram Thyrogen 900microgram powder for solution for injection vials 2 vial £158.04

9.1 Hyperthyroidism

**Antithyroid drugs**

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil p. 664 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium daily p. 665, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propanolol hydrochloride p. 146 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propanolol hydrochloride p. 146 has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propanolol hydrochloride but nadolol p. 145 is also used.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propanolol hydrochloride and hydrocortisone p. 583 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

**Pregnancy**
Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore...
propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

**Drugs used for Hyperthyroidism not listed below:**
Metoprolol tartrate, p. 144; Nadolol, p. 145; Propranolol hydrochloride, p. 146

### ANTITHYROIDORS

#### Carbimazole

**INDICATIONS AND DOSE**

**Hyperthyroidism**

**BY MOUTH**

- Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

**Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine**

**BY MOUTH**

- Adult: 40–60 mg daily, therapy usually given for 18 months

**Dose equivalence and conversion**

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

**Important safety information**

**NEUTROPENIA AND AGRANULOCYTOSIS**

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report any signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

**SIDE-EFFECTS**

| Common or very common | Arthralgia - fever - headache - jaundice - malaise - mild gastro-intestinal disturbances - nausea - pruritus - rash - taste disturbance |
| Rare | Agranulocytosis - alopecia - bone marrow suppression - jaundice - myopathy - pancytopenia |

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

**CONTRA-INDICATIONS**

Severe blood disorders

**SIDE-EFFECTS, FURTHER INFORMATION**

**HEPATIC IMPAIRMENT**

Avoid in severe impairment.

**BREAST FEEDING**

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

**Tablet**

- CARBIMAZOLE (Non-proprietary)
  - Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet POM
e\[11.08\] DT price = \[84.80\]
  - Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet POM
e\[72.93\] DT price = \[208.17\]

#### Propylthiouracil

**INDICATIONS AND DOSE**

**Hyperthyroidism**

**BY MOUTH**

- Adult: Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

**Dose equivalence and conversion**

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hepatotoxicity**

Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

**PREGNANCY**

Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

**BREAST FEEDING**

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. Monitor infant’s thyroid status.

**HEPATIC IMPAIRMENT**

Reduce dose.

**RENAL IMPAIRMENT**

Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m². Use half normal dose if eGFR less than 10 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Monitor for hepatotoxicity.
Liothyronine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 583, and treatment of infection; assisted ventilation is often required.

**THYROID HORMONES**

**Levothyroxine sodium**
*(Thyroxine sodium)*

**INDICATIONS AND DOSE**

**Hypothyroidism**

**BY MOUTH**

- **Adult**: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication.
- **Adult**: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication.

**Hypothyroidism in patients with cardiac disease**

**Severe hypothyroidism**

**BY MOUTH**

- **Adult**: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication.

**Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole**

**BY MOUTH**

- **Adult**: 50–150 micrograms daily therapy usually given for 18 months.

**CONTRA-INDICATIONS**

- Thyrotoxicosis

**CAUTIONS**

- Cardiovascular disorders • diabetes insipidus • diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) • elderly • hypertension • long-standing hypothyroidism • myocardial infarction • myoccardial insufficiency • panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) • predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine).

**CAUTIONS, FURTHER INFORMATION**

- Cardiovascular disorders: Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.
- **INTERACTIONS** → Appendix 1 (thyroid hormones).
- **SIDE-EFFECTS**
  - **Anginal pain (usually at excessive dosage)** • **arrhythmias (usually at excessive dosage)** • **diarrhoea (usually at excessive dosage)** • **excitability (usually at excessive dosage)** • **fever • flushing • headache • heat intolerance • hypersensitivity reactions • insomnia (usually at excessive dosage)** • **myocardial infarction • muscle cramp • muscular weakness • oedema • palpitation (usually at excessive dosage)** • **pruritus • rash • restlessness (usually at excessive dosage)** • **sweating • tachycardia (usually at excessive dosage)** • **transient hair loss in children • tremor (usually at excessive dosage)** • **weight-loss**
## 666 Thyroid disorders

**CONTRA-INDICATIONS**

- **PREGNANCY** Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection, oral suspension, oral solution, powder, capsule

**Tablet**

- **LEVOthyroxine SODIum (Non-proprietary)**
  - Levothyroxine sodium anhydrous 25 microgram tablet
  - Levothyroxine sodium 25microgram tablets | 28 tablet (PBM) £4.00 DT price = £2.95 | 500 tablet (PBM) £42.32-£52.68
  - Levothyroxine sodium anhydrous 50 microgram tablet
  - Levothyroxine sodium 50microgram tablets | 28 tablet (PBM) £3.00 DT price = £2.02 | 1000 tablet (PBM) £93.49
  - Levothyroxine sodium anhydrous 100 microgram tablet
  - Levothyroxine sodium 100microgram tablets | 28 tablet (PBM) £3.00 DT price = £2.02 | 1000 tablet (PBM) £92.51

**Oral solution**

- **LEVOthyroxine SODIum (Non-proprietary)**
  - Levothyroxine sodium anhydrous 5 microgram per 1 ml
  - Levothyroxine sodium 5microgram/5ml oral solution sugar free (sugar-free) | 100 ml (PBM) £90.92 DT price = £79.55
  - Levothyroxine sodium anhydrous 10 microgram per 1 ml
  - Levothyroxine sodium 10microgram/5ml oral solution sugar free (sugar-free) | 100 ml (PBM) £101.79 DT price = £96.16
  - Levothyroxine sodium anhydrous 20 microgram per 1 ml
  - Levothyroxine sodium 20microgram/5ml oral solution sugar free (sugar-free) | 100 ml (PBM) £142.94 DT price = £123.56

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Initial dosage in patients with cardiovascular disorders** If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**INDICATIONS AND DOSE**

**Hypothyroidism**

- **Adult**:
  - Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

**Hypothyroid coma**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**Dose equivalence and conversion**

20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.

Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

**CONTRA-INDICATIONS**

- **Cardiovascular disorders**
  - Diabetes mellitus (dose of anti diabetic drugs including insulin may need to be increased)
  - Elderly
  - Hypertension
  - Long-standing hypothyroidism
  - Myocardial infarction
  - Myocardial insufficiency

**CAUTIONS, FURTHER INFORMATION**

**Cardiovascular disorders** Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

**INTERACTIONS** Appendix 1 (thyroid hormones).

**SIDE-EFFECTS**

- Anginal pain (usually at excessive dosage)
- ARRHYNTHIAS (usually at excessive dosage)
- Nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Initial dosage in patients with cardiovascular disorders** If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

**PREGNANCY** Levothyroxine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

**BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, oral solution, capsule

**Tablet**

- **LIOTHYRONINE SODIUM (Non-proprietary)**
  - Liothyronine sodium 20 microgram tablet
  - Liothyronine sodium 20 microgram tablets | 28 tablet (PBM) £12.02 DT price = £10.00

**Powder for solution for injection**

- **LIOTHYRONINE SODIUM (Non-proprietary)**
  - Liothyronine sodium 20 microgram powder for solution for injection vials | 5 vial (PBM) £1.425.00
Chapter 7
Genito-urinary system

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence can be managed by non-drug methods. Duloxetine p. 288 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises. Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 669 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 671 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 669 has less marked side-effects but it is also less effective. Darifenacin p. 668, fesoterodine fumarate p. 668, propiverine hydrochloride p. 670, solifenacin succinate p. 670, and trosiptum chloride p. 671 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 74 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 296 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 671, a selective beta, agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome. Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An enuresis alarm should be first line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued.

Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin p. 574, or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin is given by oral or by sublingual administration. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for...
3 months if there are signs of response. Desmopressin should be withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with antimuscarinic specialist assessment and should be continued for 3 months; the course can be repeated if necessary. The tricyclic antidepressant imipramine hydrochloride p. 296 may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disorders can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdose with tricyclics is of particular concern.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - prostatic enlargement - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

- **CAUTIONS** Acute myocardial infarction - arrhythmias (may be worsened) - autonomic neuropathy - cardiac insufficiency (due to association with tachycardia) - cardiac surgery (due to association with tachycardia) - conditions characterised by tachycardia - congestive heart failure (may be worsened) - coronary artery disease (may be worsened) - diarrhoea - elderly (especially if frail) - gastro-oesophageal reflux disease - hiatus hernia with reflux oesophagitis - hypertension - hyperthyroidism (due to association with tachycardia) - individuals susceptible to angle-closure glaucoma - prostatic hyperplasia - pyrexia - ulcerative colitis

- **INTERACTIONS** Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

- **SIDE-EFFECTS**
  - **Common or very common** Constipation - dilution of pupils with loss of accommodation - dry mouth - photosphobia - reduced bronchial secretions - skin dryness - skin flushing - transient bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency
  - **Uncommon** Confusion (particularly in the elderly) - giddiness - nausea - vomiting
  - **Very rare** Angle-closure glaucoma
  - **Frequency not known** Angioedema - blurred vision - blurred vision - central nervous system stimulation - convulsion - diarrhoea - difficulty in micturition - disorientation - dizziness - drowsiness - dry eyes - euphoria - fatigue - flatulence - hallucinations - headache - impaired memory - palpitation - photosensitivity - rash - reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) - restless - taste disturbances

- **PATIENT AND CARER ADVICE** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

**Darifenacin**

**INDICATIONS AND DOSE**

**Urinary frequency | Urinary urgency | Incontinence**

**BY MOUTH**

- **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **SIDE-EFFECTS**
  - **Uncommon** Cough - dyspnoea - hypertension - impotence - insomnia - oedema - rhinitis - ulcerative stomatitis - vaginitis - weakness

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Max. 7.5 mg daily in moderate impairment. Avoid in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Modified-release tablet**
  
  **Emselex (Merus Labs Luxco S.A.R.L.)**
  
  **Darifenacin (as Darifenacin hydrobromide) 7.5 mg** Emselex 7.5mg modified-release tablets 28 tablet £25.48 DT price = £25.48
  
  **Darifenacin (as Darifenacin hydrobromide) 15 mg** Emselex 15mg modified-release tablets 28 tablet £25.48

**Fesoterodine fumarate**

**INDICATIONS AND DOSE**

**Urinary frequency | Urinary urgency | Urge incontinence**

**BY MOUTH**

- **Adult:** 4 mg once daily, increased if necessary up to 8 mg once daily

**Dose adjustments due to interactions**

Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, or telithromycin.

In patients with hepatic or renal impairment, consult product literature before concomitant use with amrrenavir, aperipitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

- **SIDE-EFFECTS**
  - **Common or very common** Insomnia
  - **Uncommon** Cough - nasal dryness - pharyngolaryngeal pain - vertigo

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises increase dose cautiously; max. 4 mg daily in moderate impairment. Avoid in severe impairment. Consult product literature before concomitant use of cytochrome P450 enzyme inhibitors.

- **RENAL IMPAIRMENT** Increase dose cautiously if eGFR 30–80 mL/minute/1.73m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73m². Consult product literature before concomitant use of cytochrome P450 enzyme inhibitors.
Flavoxate hydrochloride

INDICATIONS AND DOSE
Urinary frequency | Urinary incontinence | Dysuria | Urinary urgency | Bladder spasm due to catheterisation, cystoscopy, or surgery

BY MOUTH
- Adult: 200 mg 3 times a day

CONTRA-INDICATIONS
Gastro-intestinal haemorrhage

SIDE-EFFECTS
- Eosinophilia | erythema | leucopenia | pruritus | urticaria | vertigo

PREGNANCY
Manufacturer advises avoid unless no safer alternative.

BREAST FEEDING
Manufacturer advises caution—no information available.

PRESCRIBING AND DISPENSING INFORMATION
The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

MEDIcular FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 3, 25
- Toviaz (Pfizer Ltd)
  - Fesoterodine fumarate 4 mg: Toviaz 4 mg modified-release tablets | 28 tablet (PO) £25.78 DT price = £25.78
  - Fesoterodine fumarate 8 mg: Toviaz 8 mg modified-release tablets | 28 tablet (PO) £25.78 DT price = £25.78

Oxybutynin hydrochloride

INDICATIONS AND DOSE
Urinary frequency | Urinary incontinence | Neurogenic bladder instability

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

BY TRANSDERMAL APPLICATION USING PATCHES
- Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area.

Dose equivalence and conversion
Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lystinel™ XL.

UNLICENSED USE

CAUTIONS
Acute porphyrias p. 864

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
- Uncommon Anorexia | facial flushing
- Rare Night terrors
- Frequency not known Cognitive impairment

SPECIFIC SIDE-EFFECTS
- Rare
- With transdermal use Application site reactions with patches

PREGNANCY
Manufacturers advise avoid unless essential—toxicity in animal studies.

BREAST FEEDING
Manufacturers advise avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises caution.

RENAL IMPAIRMENT
Manufacturer advises caution.

DIRECTIONS FOR ADMINISTRATION
- With transdermal use Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).

PRESCRIBING AND DISPENSING INFORMATION
- In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then at regular intervals; a response usually occurs within 6 months but may take longer.
- In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms

Patients or carers should be given advice on how to administer oxybutynin transdermal patches.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2005) that Kentera® should be restricted for use in adults who...
benefit from oral oxybutynin but cannot tolerate its side-effects.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3

- OXYBUTYNIN HYDROCHLORIDE (Non-proprietary)
  - Oxybutynin hydrochloride 2.5 mg: Oxybutynin 2.5mg tablets | 56 tablet (£8.68 DT price = £1.75 | 84 tablet (£10.75

  - Ditropan (Sanofi)
    - Oxybutynin hydrochloride 500 microgram per 1 ml Ditropan 5mg/5ml elixir | 150 ml (£6.88 DT price = £6.88

**Transdermal patch**

CAUTIONARY AND ADVISORY LABELS 3

- Kentera (Orion Pharma (UK) Ltd)
  - Oxybutynin 3.9 mg per 24 hour Kentera 3.9mg/24hours patches | 8 patch (£27.20 DT price = £27.20

**Propiverine hydrochloride**

**INDICATIONS AND DOSE**

Urinary frequency, urgency and incontinence associated with overactive bladder

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 15 mg 1–2 times a day, increased if necessary up to 15 mg 3 times a day

BY MOUTH USING MODIFIED-RELEASE CAPSULES

- Adult: 30 mg once daily

Urinary frequency, urgency and incontinence associated with neurogenic bladder instability

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 15 mg 3 times a day

**PREGNANCY**

Manufacturer advises avoid (restriction of skeletal development in animals).

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Avoid in moderate to severe impairment.

**RENAL IMPAIRMENT**

Max. daily dose 30 mg if eGFR less than 30 ml/minute/1.73m². Manufacturer advises caution in mild or moderate impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3

- Detrunorm (AMCo)
  - Propiverine hydrochloride 15 mg Detrunorm 15mg tablets | 56 tablet (£18.00 DT price = £18.00

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 3, 25

- Detrunorm XL (AMCo)
  - Propiverine hydrochloride 30 mg Detrunorm XL 30mg capsules | 28 capsule (£24.45 DT price = £24.45
  - Propiverine hydrochloride 45 mg Detrunorm XL 45mg capsules | 28 capsule (£27.00 DT price = £27.00

**Solifenacin succinate**

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

BY MOUTH

- Adult: 5 mg once daily, increased if necessary to 10 mg once daily

Dose adjustments due to interactions

Max. 5 mg daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, or ritonavir).

**CAUTIONS**

Neurogenic bladder disorder • susceptibility to QT-interval prolongation

**SIDE-EFFECTS**

- Uncommon
  - Gastro-oesophageal reflux • oedema
- Frequency not known
  - Dysphonie • hepatic impairment • hyperkalaemia • muscle weakness • reduced appetite • torsade de pointes

**PREGNANCY**

Manufacturer advises caution—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Max. 5 mg daily in moderate impairment, avoid in moderate impairment in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir). Avoid in severe impairment.

**RENAL IMPAIRMENT**

Max. 5 mg daily if eGFR less than 30 ml/minute/1.73 m²; avoid if eGFR less than 30 ml/minute/1.73 m² in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).

**PRESCRIBING AND DISPENSING INFORMATION**

The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

- **TROSPNIUM CHLORIDE** (Non-proprietary)
  - Trospium chloride 60 mg: Trospium chloride 60mg modified-release capsules | 28 capsule [PMS] no price available
  - Regurin XL (Speciality European Pharma Ltd)
    - Trospium chloride 60 mg: Regurin XL 60mg capsules | 28 capsule [PMS] £23.05

**BETA₂-ADRENOCEPTOR AGONISTS**

**Mirabegron**

**INDICATIONS AND DOSE**

**Urinary frequency, urgency, and urge incontinence**

BY MOUTH

- Adult: 50 mg once daily

- **CONTRA-INDICATIONS** Severe hypertension
- **CAUTIONS** History of QT-interval prolongation
- **INTERACTIONS** → Appendix 1 (mirabegron).

  Caution with concomitant use with drugs that prolong the QT interval.

- **HEPATIC IMPAIRMENT** With concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ketoconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily in mild impairment, and avoid in moderate impairment.

- **RENAL IMPAIRMENT** With concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ketoconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily if eGFR less than 30–89 mL/minute/1.73 m², and avoid if eGFR less than 30 mL/minute/1.73 m².

- **SIDE-EFFECTS**
  - Common or very common: Atrial fibrillation · dyspepsia · gastritis · hypertension · joint swelling · palpitation · pruritus · rash · vulvovaginal infection · vulvovaginal pruritus
1.2 Urinary retention

**Drugs for urinary retention**

*Acute retention* is painful and is treated by catheterisation. *Chronic retention* is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

*Benign prostatic hyperplasia* is treated either surgically or medically with alpha-blockers. Dutasteride p. 676 and finasteride p. 676 are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil p. 700, a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

**Alpha-blockers**

The alpha-1-selective alpha blockers, alfuzosin hydrochloride below, doxazosin p. 673, prazosin p. 674, tamsulosin hydrochloride p. 674 and terazosin p. 675 relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

**Parasympathomimetics**

The parasympathomimetic bethanechol chloride p. 676 increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

**INDICATIONS AND DOSE**

Beanzosin hydrochloride

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 2.5 mg 3 times a day; maximum 10 mg per day
- Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia

**BY MOUTH USING MODIFIED-RELEASE TABLETS**

- Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

**SIDE-EFFECTS, FURTHER INFORMATION**

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

**HEPATIC IMPAIRMENT** Initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe.

**RENAL IMPAIRMENT** Initial dose 2.5 mg twice daily and adjust according to response. Manufacturers advise avoid use of modified-release preparations if eGFR less than 30 mL/minute/1.73 m² as limited experience.

**PATIENT AND CARER ADVICE** May affect performance of skilled tasks e.g. driving. Patient should be counselled on the first dose effect.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

- ALFUZOSIN HYDROCHLORIDE (Non-proprietary)
  - Alfuzosin hydrochloride 2.5 mg Alfuzosin 2.5mg tablets | 60 tablet £1.48 £1.39
  - Xatral (Sanofi)
  - Alfuzosin hydrochloride 2.5 mg Xatral 2.5mg tablets | 60 tablet £1.29 £1.21
Doxazosin

INDICATIONS AND DOSE

Hypertension

Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Benign prostatic hyperplasia

Administer the initial dose in the evening. If required, increase dose in 4 mg increments to a maximum of 16 mg daily

Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Dose adjustments due to interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

CONTRA-INDICATIONS

History of micturition syncope (in patients with benign prostatic hypertrophy) - history of postural hypotension - monotherapy in patients with overflow bladder or anuria

CAUTIONS

Care with initial dose (postural hypotension) - cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - heart failure - pulmonary oedema due to aortic or mitral stenosis

INTERACTIONS

Appendix 1 (alpha-blockers).

SIDE-EFFECTS

Common or very common

Anxiety - back pain - coughing - dyspnoea - fatigue - influenza-like symptoms - myalgia - paraesthesia - sleep disturbance - vertigo

Uncommon

Agitation - angina - arthralgia - epistaxis - gout - hypoesthesia - micturition disturbance - myocardial infarction - tinnitus - tremor - weight changes

Very rare

Abnormal ejaculation - alopecia - arrhythmias - bradycardia - bronchospasm - choreostasis - gynaecomastia - hepatitis - hot flashes - jaundice - leucopenia - thrombocytopenia

Frequency not known

Pregnancy

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

Breast feeding

Accumulates in milk in animal studies—manufacturer advises avoid.

Hepatic impairment

Use with caution. Manufacturer advises avoid in severe impairment—no information available.

PATIENT AND CARER ADVICE

May affect performance of skilled tasks e.g. driving. Patient counselling is advised for doxazosin tablets (initial dose).

MEDITICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

Tablet

DOXAZOSIN (Non-proprietary)

Doxazosin (as Doxazosin mesilate) 1 mg

Doxazosin 1 mg tablets | 28 tablet | £10.56 DT price = £0.92

Doxazosin (as Doxazosin mesilate) 2 mg

Doxazosin 2 mg tablets | 28 tablet | £14.08 DT price = £0.95

Doxazosin (as Doxazosin mesilate) 4 mg

Doxazosin 4 mg tablets | 28 tablet | £14.08 DT price = £1.12

Cardura (Pfizer Ltd)

Doxazosin (as Doxazosin mesilate) 1 mg

Cardura 1 mg tablets | 28 tablet | £10.56 DT price = £0.92

Doxazosin (as Doxazosin mesilate) 2 mg

Cardura 2 mg tablets | 28 tablet | £14.08 DT price = £0.95

Brands may include Doxadura

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS

Adult: 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

Benign prostate hyperplasia

BY MOUTH

Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses

Elderly: 20 mg daily, dose to be taken at night

Dose adjustments due to interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

CONTRA-INDICATIONS

Established heart failure - history micturition syncope (when used for benign prostatic hyperplasia) - history of postural hypotension (when used for benign prostatic hyperplasia)

CAUTIONS

Cataract surgery (risk of intra-operative floppy iris syndrome) - control incipient heart failure before initiating indoramin - elderly - epilepsy - convulsions in animal studies - history of depression - Parkinson’s disease (extrapyramidal disorders reported)

INTERACTIONS

Appendix 1 (alpha-blockers).

Avoid alcohol (enhances rate and extent of absorption).

SIDE-EFFECTS

Common or very common

Sedation

Uncommon

Failure of ejaculation - fatigue - weight gain

Frequency not known

Genito-urinary system

PREGNANCY No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

BREAST FEEDING No information available.

HEPATIC IMPAIRMENT Manufacturer advises caution.

RENAL IMPAIRMENT Manufacturer advises caution.

PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

■ ★ INDORAMIN (Non-proprietary)
  Indoramin hydrochloride 20 mg Indoramin 20mg tablets | 60 tablet | £33.30 DT price = 18.11
  Indoramin (as Indoramin hydrochloride) 25 mg Indoramin 25mg tablets | 84 tablet | £60.26 DT price = £60.26

■ ★ Doraile Tiltab (Chemidex Pharma Ltd)
  Indoramin hydrochloride 20 mg Doraile Tiltab 20mg tablets | 60 tablet | £11.44 DT price = £8.11

Prazosin

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

Congestive heart failure (rarely used)

BY MOUTH

Adult: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

Raynaud’s syndrome (but efficacy not established)

BY MOUTH

Adult: Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary up to 1–2 mg twice daily

Benign prostatic hyperplasia

BY MOUTH

Adult: Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

Dose adjustments due to interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

Tamsulosin hydrochloride

INDICATIONS AND DOSE

Benign prostatic hyperplasia

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 400 micrograms once daily

CONTRA-INDICATIONS History of micturition syncope - history of postural hypotension

CAUTIONS Cataract surgery (risk of intra-operative floppy iris syndrome) - comitant antihypertensives (reduced dosage and specialist supervision may be required) - elderly

INTERACTIONS → Appendix 1 (alpha-blockers).

Dutasteride with tamsulosin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dutasteride p. 676, tamsulosin hydrochloride p. 674.

INDICATIONS AND DOSE

Benign prostatic hyperplasia

BY MOUTH

Adult (male): 1 capsule daily.

PATIENT AND CARER ADVICE

May affect performance of skilled tasks e.g. driving.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, powder

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

TAMSULOSIN HYDROCHLORIDE (Non-proprietary)

Tamsulosin hydrochloride 400 microgram Tamsulosin 400micromgram modified-release tablets | 30 tablet (Pos) £10.47 DT price = £10.47

Flomaxtra XL (Astellas Pharma Ltd)

Tamsulosin hydrochloride 400 microgram | 30 tablet (Pos) £10.47 DT price = £10.47

Brands may include Costam XL; Faramisil; Flontone XL

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 25

TAMSULOSIN HYDROCHLORIDE (Non-proprietary)

Tamsulosin hydrochloride 400 microgram | 30 capsule (Pos) £6.15 DT price = £4.52

Brands may include Contiflo XL; Diffundox XL; Flomax MR; Galebon; Losinate MR; Pamsvax XL; Petyme MR; Pinexel PR; Prosurin XL; Talphyn MR; Tamfrex XL; Tamurex

Solifenacin with tamsulosin

The properties listed below are those particular to the combination only. For the properties of the components please consider, solifenacin succinate p. 670, tamsulosin hydrochloride p. 674.

INDICATIONS AND DOSE

Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective

BY MOUTH

Adult (male): 1 tablet daily.

Dose adjustments due to interactions

Max. 1 Vesomni® tablet daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).

HEPATIC IMPAIRMENT

Max. 1 Vesomni® tablet daily in moderate impairment.

RENAL IMPAIRMENT

Max. 1 Vesomni® tablet daily if eGFR less than 30 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

Vesomni® (Astellas Pharma Ltd)

Solifenacin succinate 6 mg, Tamsulosin hydrochloride 400 microgram Vesomni 6mg/0.4mg modified-release tablets | 30 tablet (Pos) £27.62

Terazosin

INDICATIONS AND DOSE

Mild to moderate hypertension

BY MOUTH

Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

Benign prostatic hyperplasia

BY MOUTH

Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

CONTRA-INDICATIONS

History of micturition syncope (in benign prostatic hyperplasia) - history of postural hypotension (in benign prostatic hyperplasia)

CAUTIONS

Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose

CAUTIONS, FURTHER INFORMATION

First dose First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.

INTERACTIONS

Appendix 1 (alpha-blockers).

SIDE-EFFECTS

PREGNANCY

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

BREAST FEEDING

No information available.

PATIENT AND CARER ADVICE

May affect performance of skilled tasks e.g. driving. Patient counselling is advised for terazosin tablets (initial dose).

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

TERAZOSIN (Non-proprietary)

Terazosin (as Terazosin hydrochloride) 2 mg Terazosin 2mg tablets | 28 tablet (Pos) £4.90 DT price = £2.45

Terazosin (as Terazosin hydrochloride) 5 mg Terazosin 5mg tablets | 28 tablet (Pos) £6.57 DT price = £2.80
Terazosin (as Terazosin hydrochloride) 10 mg Terazosin 10mg tablets | 28 tablet (P) £16.00 DT price = £8.09
▶ Hytrin (AMCo)
Terazosin (as Terazosin hydrochloride) 1 mg Hytrin 1mg tablets | 7 tablet (P) no price available
Terazosin (as Terazosin hydrochloride) 2 mg Hytrin 2mg tablets | 14 tablet (P) no price available | 21 tablet (P) no price available | 28 tablet (P) £2.20 DT price = £2.45
Terazosin (as Terazosin hydrochloride) 5 mg Hytrin 5mg tablets | 7 tablet (P) no price available | 28 tablet (P) £4.13 DT price = £2.80
Terazosin (as Terazosin hydrochloride) 10 mg Hytrin 10mg tablets | 28 tablet (P) £8.24 DT price = £8.09
▶ Hytrin (AMCo)
Hytrin BPH tablets starter pack | 28 tablet (P) £10.97
Hytrin tablets starter pack | 28 tablet (P) £13.00

PARASYMPATHOMIMETICS
Bethanechol chloride

INDICATIONS AND DOSE
Urinary retention
BY MOUTH
▶ Adult: 10–25 mg 3–4 times a day, to be taken 30 minutes before food

CONTRA-INDICATIONS Bradycardia - cardiovascular disorders - conditions where increased motility of the gastro-intestinal tract could be harmful - conditions where increased motility of the urinary tract could be harmful - epilepsy - heart block - hypothyroidism - hypotension - intestinal obstruction - obstructive airways disease - parkinsonism - peptic ulcer - recent myocardial infarction - urinary obstruction

CAUTIONS Autonomic neuropathy (use lower initial dose)

INTERACTIONS ▶ Appendix 1 (parasympathomimetics).

SIDE-EFFECTS Abdominal pain - bradycardia - bronchoconstriction - diarrhoea - eructation - flushing - headache - hypotension - increased lacrimation - increased salivation - increased sweating - nausea - rhinorrhoea - vomiting

PREGNANCY Manufacturer advises avoid—no information available.

BREAST FEEDING Manufacturer advises avoid; gastrointestinal disturbances in infant reported.

LESS SUITABLE FOR PRESCRIBING Less suitable for prescribing.

MEDICINAL FORMS
Tablet
CAUTIONARY AND ADVISORY LABELS 22
▶ Myotonine (Cheolapharm Arzneimittel GmbH)
Bethanechol chloride 10 mg Myotonine 10mg tablets | 100 tablet (P) £18.51
Bethanechol chloride 25 mg Myotonine 25mg tablets | 100 tablet (P) £27.26

5α-REDUCTASE INHIBITORS
Dutasteride

DRUG ACTION A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

INDICATIONS AND DOSE
Benign prostatic hyperplasia
BY MOUTH
▶ Adult: 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained).

INTERACTIONS ▶ Appendix 1 (dutasteride).

SIDE-EFFECTS Breast enlargement - breast tenderness - decreased libido - ejaculation disorders - impotence

CONCEPTION AND CONTRACEPTION Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

HEPATIC IMPAIRMENT Avoid in severe impairment—no information available.

EFFECT ON LABORATORY TESTS May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

HANDLING AND STORAGE Women of childbearing potential should avoid handling leaking capsules of dutasteride.

PATIENT AND CARER ADVICE Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
Capsule
CAUTIONARY AND ADVISORY LABELS 25
▶ Avarol (GlaxoSmithKline Ltd)
Dutasteride 500 microgram Avarol 500microgram capsules | 30 capsule (P) £14.60 DT price = £14.60
Also available in combination with tamsulosin, p. 675

Finasteride

DRUG ACTION A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

INDICATIONS AND DOSE
Benign prostatic hyperplasia
BY MOUTH
▶ Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained).

Androgenetic alopecia in men
BY MOUTH
▶ Adult: 1 mg daily.

CAUTIONS Obstructive uropathy

SIDE-EFFECTS Breast enlargement - breast tenderness - decreased libido - ejaculation disorders - face swelling - hypersensitivity reactions - impotence - lip swelling - male breast cancer - pruritus - rash - testicular pain

CONCEPTION AND CONTRACEPTION Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

EFFECT ON LABORATORY TESTS Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

HANDLING AND STORAGE Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.
1.3 Urological pain

**Urological pain**

The acute pain of ureteric colic may be relieved with pethidine hydrochloride p. 372. **Diclofenac** by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection. Lidocaine hydrochloride gel p. 1116 is a useful topical application in urethral pain or to relieve the discomfort of catheterisation.

**Alkalisation of urine**

*Alkalisation* of urine can be undertaken with potassium citrate. The alkalising action may relieve the discomfort of cystitis caused by lower urinary tract infections. Sodium bicarbonate p. 848 is used as a urinary alkalising agent in some metabolic and renal disorders.

| Drugs used for Urological pain not listed below: Sodium bicarbonate, p. 848 |

**ALKALINISING DRUGS**

**Citric acid with potassium citrate**

**INDICATIONS AND DOSE**

- Relief of discomfort in mild urinary-tract infections
- *Alkalisation of urine*

**BY MOUTH USING ORAL SOLUTION**

- Adult: 10 mL 3 times a day, diluted well with water

**CAUTIONS**

- Cardiac disease · elderly

**INTERACTIONS → Appendix 1 (potassium salts).**

**SIDE-EFFECTS**

- Hyperkalaemia on prolonged high dosage · mild diuresis

**RENAL IMPAIRMENT**

- Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Flavours of oral liquid formulations may include lemon.

**CONTRA-INDICATIONS**

- With rectal use: Acute gastro-intestinal conditions

**CAUTIONS**

- With oral use: Cardiac disease · elderly · hypertension · patients on a sodium-restricted diet

- With rectal use: Debilitated patients · sodium and water retention in susceptible individuals

**INTERACTIONS**

- With oral use: Appendix 1 (potassium citrate).

**SIDE-EFFECTS**

- With oral use: Mild diuresis

**PREGNANCY**

- With oral use: Use with caution.

**RENAL IMPAIRMENT**

- With oral use: In patients with fluid retention, avoid antacids containing large amounts of sodium.

**Sodium citrate**

**INDICATIONS AND DOSE**

- **Bladder washouts**
  - Adult: (consult product literature)
- **Relief of discomfort in mild urinary-tract infections**
  - **BY MOUTH**
    - Adult: (consult product literature)
- **MICRALAX®**
- **Constipation**
  - **BY RECTUM**
    - Child 3-17 years: 5 mL for 1 dose
    - Adult: 5 mL for 1 dose
- **MICOLETTE®**
- **Constipation**
  - **BY RECTUM**
    - Child 3-17 years: 5–10 mL for 1 dose
    - Adult: 5–10 mL for 1 dose
- **RELAXIT®**
- **Constipation**
  - **BY RECTUM**
    - Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
    - Child 3-17 years: 5 mL for 1 dose
    - Adult: 5 mL for 1 dose

## 7. Genito-urinary system
Bladder instillations and urological surgery

2 Bladder instillations and urological surgery

Bladder instillations and
urological surgery

Bladder infection
Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 1051 can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 851 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/ml p. 517 may be of value in mycotic infections in adults.

Dissolution of blood clots
Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Bladder cancer
Bladder instillations of doxorubicin hydrochloride p. 754 and mitomycin p. 767 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 756 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride p. 754 is also used for some papillary tumours.

Instillation of BCG (bacillus calmette-guérin p. 794), a live attenuated strain derived from Mycobacterium bovis is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

Urological surgery
Glycine irrigation solution 1.5% p. 679 is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

Maintenance of indwelling urinary catheters
The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Chlorhexidine with lidocaine
The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1051, lidocaine hydrochloride p. 1161.
Catheter maintenance solutions

- **OptiFlo R citric acid 6% catheter maintenance solution** (Bard Ltd)
  - 50 ml: NHS indicative price = £3.53 - Drug Tariff (Part IXa) 100 ml: NHS indicative price = £3.53 - Drug Tariff (Part IXa)
- **OptiFlo S saline 0.9% catheter maintenance solution** (Bard Ltd)
  - 50 ml: NHS indicative price = £3.33 - Drug Tariff (Part IXa)
- **Uro-Tainer M sodium chloride 0.9% catheter maintenance solution** (Braun Medical Ltd)
  - 50 ml: No NHS indicative price available - Drug Tariff (Part IXa)
  - 100 ml: No NHS indicative price available - Drug Tariff (Part IXa)
- **Uro-Tainer Twin Solution R citric acid 6% catheter maintenance solution** (Braun Medical Ltd)
  - 60 ml: NHS indicative price = £4.76 - Drug Tariff (Part IXa)
- **Uro-Tainer sodium chloride 0.9% catheter maintenance solution** (Braun Medical Ltd)
  - 50 ml: NHS indicative price = £3.48 - Drug Tariff (Part IXa)

3 Contraception

**Contraceptives, hormonal**

The Fraser Guidelines (Department of Health Guidance (July 2004)): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16 should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

**Hormonal contraception** is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

**Intra-uterine devices** are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

**Barrier methods** alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom ®) is also available; it is pre-lubricated but does not contain a spermicide.

**Combined hormonal contraceptives**

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

### Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 655 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.
Low strength preparations (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.

Standard strength preparations (containing ethinylestradiol 30 or 35 micrograms or in 30-40 microgram phased preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel with ethinylestradiol p. 685, drospirenone with ethinylestradiol p. 686, and ethinylestradiol with gestodene p. 687 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-depression, breast symptoms, and breakthrough bleeding) for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 685 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norgestrelomistin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped pending investigation and treatment, if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptive disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) p. 695 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

In adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;

- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems, Mirena® and Jaydess®, releases levonorgestrel p. 692 directly into the uterine cavity. Mirena® is licensed for use as a contraceptive, for the treatment of primary menorrhagia, and for the prevention of endometrial hyperplasia during

Genito-urinary system

BNF 70
oestrogen replacement therapy. Jaydess® is licensed for contraception. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogeneric activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel p. 692 and ulipristal acetate p. 691; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progestrone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel p. 692 for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibiotic prophylaxis (e.g. azithromycin p. 469). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

Combined hormonal contraceptives interactions

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 387, eslicarbazepine acetate p. 390, nevirapine p. 560, oxcarbazepine p. 397, phenytoin p. 398, phenobarbital p. 409, primidone p. 401, ritonavir p. 570, St John’s Wort, topiramate p. 406 and, above all, rifabutin p. 507 and rifampicin p. 508). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives, intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a short course (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a ‘tricycling’ regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin) is to follow the advice for long-term courses.

For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen; continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping. If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a long-term course (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

Latest recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 483, doxycline p. 496) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora...
responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

**Oral progestogen-only contraceptives interactions**

Effectiveness of oral progestogen-only preparations is not affected by antibiotics that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

**Parenteral progestogen-only contraceptives interactions**

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibiotics that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injections and medroxyprogesterone acetate intramuscular and subcutaneous injections p. 695 is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant p. 695 may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

**Hormonal emergency contraception interactions**

The effectiveness of levonorgestrel p. 692, and possibly ulipristal acetate p. 691, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

### Contraceptives, non-hormonal

**Spermicidal contraceptives**

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol 9" of 697 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

**Contraceptive devices**

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (Gyne Fix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

3.1 Contraception, combined

**OESTROGENS**

### Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 864; gallstones - heart disease associated with pulmonary hypertension or risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of chorea - history during pregnancy of pemphigoid gestationis - history during pregnancy of pruritus - history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) - history of haemolytic uraemic syndrome - migraine with aura - personal history of venous or arterial thrombosis - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease - severe or multiple risk factors for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - transient cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - Crohn’s disease - gene mutations associated with breast cancer (e.g. BRCA 1) - history of severe depression especially if induced by hormonal contraceptive - hyperprolactinaemia (seek specialist advice) - inflammatory bowel disease - migraine - personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) - risk factors for arterial disease - risk factors for venous thromboembolism - sickle cell disease - undiagnosed breast mass

**CAUTIONS, FURTHER INFORMATION**

Risk of venous thromboembolism. There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal
contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen. Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

**Risk factors for venous thromboembolism** Use with caution if any of following factors present but **avoid** if two or more factors present:

- **family history of venous thromboembolism** in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- **obesity**; body mass index \(\geq 30\) kg/m\(^2\) (avoid if body mass index \(\geq 35\) kg/m\(^2\) unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- **long-term immobilisation** e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- **history of superficial thrombophlebitis**;
- **age over 35 years** (avoid if over 50 years);
- **smoking**.

### Risk factors for arterial disease

Use with caution if any one of following factors present but **avoid** if two or more factors present:

- **family history of arterial disease** in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- **diabetes mellitus** (avoid if diabetes complications present);
- **hypertension**; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- **smoking** (avoid if smoking 40 or more cigarettes daily);
- **age over 35 years** (avoid if over 50 years);
- **obesity** (avoid if body mass index \(\geq 35\) kg/m\(^2\) unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- **migraine without aura** (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

**Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour). Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dizziness or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** → Appendix 1 (oestrogens, progestogens).

### SIDE-EFFECTS

- **Rare** Gallstones - systemic lupus erythematosus
- **Frequency not known** Abdominal cramps - absence of withdrawal bleeding - amenorrhoea after discontinuation - breast enlargement - breast secretion - breast tenderness - cervical erosion - changes in lihido - changes in lipid metabolism - changes in vaginal discharge - chloasma - chorea - contact lenses may irritate - depression - fluid retention - headache - hepatic tumours - hypertension - irritability - leg cramps - liver impairment - nausea - nervousness - photosensitivity - reduced menstrual loss - skin reactions - thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) - visual disturbances - vomiting - 'spotting' in early cycles.

### SIDE-EFFECTS, FURTHER INFORMATION

#### Breast cancer

There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

#### Cervical cancer

Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.
- **DIRECTIONS FOR ADMINISTRATION** With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day
interval (during which withdrawal bleeding occurs); if reasonably certain a woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Every day (ED) combined preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain a woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®).

After abortion or miscarriage Start same day.

PATIENT AND CARER ADVICE
Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet. Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).
**Genito-urinary system**

**DIRECTIONS FOR ADMINISTRATION**

**Estradiol with nomegestrol**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **Gedarel** (Consilient Health Ltd)
    - Desogestrel 150 microgram, Ethinylestradiol 20 microgram
      - 63 tablet (PFS) £5.98

**INSTRUCTIONS AND DOSE**

**Contraception with 21-day combined preparations**

- **BY MOUTH**
  - **Females of childbearing potential:** 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval

**PATIENT AND CARER ADVICE**

- **Missed dose**
  - A missed pill for a patient taking Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Zoely®, refer to product literature.
  - Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Zoely®, refer to product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **Zoely** (Merck Sharp & Dohme Ltd)
    - Estradiol (as Estradiol hemihydrate) 1.5 mg, Nomegestrol 2.5 mg
      - 80 tablet (PFS) £19.60 DT price £13.80

**Drospirenone with ethinylestradiol**

- **The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655.**

**INDICATIONS AND DOSE**

**Contraception with 21-day combined preparations**

**Menstrual symptoms with 21-day combined preparations**

**BY MOUTH**

| Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval |

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **Yasmin** (Bayer Plc)
    - Drospirenone 3 mg, Ethinylestradiol 30 microgram
      - 63 tablet (PFS) £14.70
    - **Brands may include Acondrin; Cleosensa; Dretrine; Lucette**

**Estradiol with nomegestrol**

- **The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.**

**INDICATIONS AND DOSE**

**Contraception**

**BY MOUTH**

- **Females of childbearing potential:** 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval

**DIRECTIONS FOR ADMINISTRATION**

- **Zoely® (every day (ED) combined (monophasic) preparation),** 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, starting on day 1 of cycle with first active tablet; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken). Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately.

- **Changing to Zoely®:** start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

- **PATIENT AND CARER ADVICE**
  - **Missed dose**
    - A missed pill for a patient taking Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Zoely®, refer to product literature.

**Ethinylestradiol with etonogestrel**

- **The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655, etonogestrel p. 695.**

**INDICATIONS AND DOSE**

**Contraception | Menstrual symptoms**

**BY VAGINA**

- **Females of childbearing potential:** 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

**DIRECTIONS FOR ADMINISTRATION**

- **Changing method of contraception to vaginal ring**
  - Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.
  - Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days. After first trimester abortion Start immediately. After childbirth (not breast-feeding) or second trimester abortion Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion, additional precautions (barrier methods) should be used for first 7 days.

**PATIENT AND CARER ADVICE**

- **Expulsion, delayed insertion or removal, or broken vaginal ring**
  - If the vaginal ring is expelled or removed, or broken vaginal ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days. If the ring remains outside the vagina for more than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed. If the ring remains outside the vagina for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed. If the ring remains outside the vagina for more than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

- **If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;**

- **If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; later option only available if ring was used continuously for at least 7 days before expulsion.**
If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered. No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring. If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly. Travel Women using the vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Vaginal delivery system

- **NuvaRing** (Merck Sharp & Dohme Ltd)
  - Ethinylestradiol 2.7 mg, Etonogestrel 11.7 mg NuvaRing
  - 0.12mg/0.015mg per day vaginal delivery system | 3 system [PoS] £29.70

### Ethinylestradiol with gestodene

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655, gestodene p. 692.

#### INDICATIONS AND DOSE

**Contraception with 21-day combined preparations**

**Menstrual symptoms with 21-day combined preparations**

**BY MOUTH**
- **Females of childbearing potential**: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

**Contraception with 28-day combined preparations**

**Menstrual symptoms with 28-day combined preparations**

**BY MOUTH**
- **Females of childbearing potential**: 1 active tablet once daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval, withdrawal bleeding occurs during the 7-day interval of inactive tablets being taken, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

  - Ethinylestradiol 35 microgram, Norethisterone 500 microgram
  - Ovysmen 500microgram/35microgram tablets | 63 tablet (PRT) £1.89

Ethinylestradiol with norgestimate

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655.

**INDICATIONS AND DOSE**

**Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations**

- **MOUTH**
  - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Cilest (Janssen-Cilag Ltd)**
  - Ethinylestradiol 35 microgram, Norgestimate 250 microgram
  - Cilest 250microgram/35microgram tablets | 63 tablet (PRT) £7.16
- **Brands may include Elevin; Erlibelle; Maexeni**

Ethinylestradiol with norelgestromin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655.

**INDICATIONS AND DOSE**

**Contraception | Menstrual symptoms**

**BY TRANSDERMAL APPLICATION**

- Females of childbearing potential. Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch-free interval (during which withdrawal bleeding occurs)

**DIRECTIONS FOR ADMINISTRATION**

- Adhesives or bandages should not be used to hold patch in place. If no longer sticky does not reapply but use a new patch.
- Changing to a transdermal combined hormonal contraceptive
- Changing from combined oral contraception

**Apply patch**

- on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch.
- Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

**Changing from progestogen-only method**

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

**After childbirth (not breast-feeding)**

- Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

**After abortion or miscarriage**

- Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days.

**After birth**

- If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

- If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch

- should be used as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the
new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required. Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

NATIONAL FUNDING/ACCESS DECISIONS Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

Mestranol with norethisterone The properties listed below are those particular to the combination only. For the properties of the components please consider, norethisterone p. 656.

INDICATIONS AND DOSE Contraception | Menstrual symptoms By Mouth

- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding can occur during the 7-day interval, if reasonably certain a woman is not pregnant, first course can be started on any day of cycle — if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at the same time each day.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Norinyl®-1 (Pfeizer Ltd)
- Mestranol 50 microgram, Norethisterone 1 mg Norinyl-1 tablets | 63 tablet (PBM) £2.19 DT price = £2.19

3.2 Contraception, devices Drugs used for Contraception, devices not listed below; Levonorgestrel, p. 692

CONTRACEPTIVE DEVICES Intra-uterine contraceptive devices (copper)

INDICATIONS AND DOSE Contraception By INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: (consult product literature)

- CONTRA-INDICATIONS Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) — distorted uterine cavity — established or marked immunosuppression — genital malignancy — medical diathery — pelvic inflammatory disease — recent sexually transmitted infection (if not fully investigated and treated) — severe anaemia — small uterine cavity — unexplained uterine bleeding — Wilson’s disease

CAUTIONS Anaemia — anticoagulant therapy (avoid if possible) — diabetes — disease-induced immunosuppression (risk of infection — avoid if marked immunosuppression) — drug-induced immunosuppression (risk of infection — avoid if marked immunosuppression) — endometritis — epilepsy (risk of seizure at time of insertion) — fertility problems — history of pelvic inflammatory disease — increased risk of expulsion if inserted before uterine involution — menorrhagia (progestogen intra-uterine system might be preferable) — nulliparity — severe cervical stenosis — severe primary dysmenorrhoea — severely scarred uterus (including after endometrial resection) — young age

CAUTIONS, FURTHER INFORMATION Risk of infection The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old or
- they are over 25 years old and have a new partner or
- have had more than one partner in the past year or their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days. An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

SIDE-EFFECTS Allergy — bleeding (on insertion) — cervical perforation — displacement — dysmenorrhoea — expulsion — menorrhagia — occasionally epileptic seizure (on insertion) — pain (on insertion, alleviated by NSAID such as ibuprofen 50 minutes before insertion) — pelvic infection may be exacerbated — uterine perforation — vasovagal attack (on insertion)

SIDE-EFFECTS, FURTHER INFORMATION Presence of significant symptoms (especially pain) Advise the patient to seek medical attention promptly in case of significant symptoms.

ALLERGY AND CROSS-SENSITIVITY Contraindicated if patient has a copper allergy.

PREGNANCY If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove
device; if pregnancy occurs, increased likelihood that it may be ectopic.

- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

### Prescribing and dispensing information

- **ANCORA – 375 CU PRODUCTS**
  - For uterine length over 6.5 cm; replacement every 5 years.
  - **COPPER – T380 PRODUCTS**
    - For uterine length 6.5–9 cm; replacement every 10 years.
    - **FLEXI-T – 300 PRODUCTS**
      - For uterine length over 5 cm; replacement every 5 years.
    - **FLEXI-T – 380 PRODUCTS**
      - For uterine length over 6 cm; replacement every 5 years.
    - **GYNEFLEX PRODUCTS**
      - Suitable for all uterine sizes; replacement every 5 years.
    - **LOAD PRODUCTS**
      - Suitable for uterine length over 7 cm; replacement every 5 years.
    - **MINI T380 PRODUCTS**
      - For minimum uterine length 5 cm; replacement every 5 years.
    - **MULTILOAD CU 375 PRODUCTS**
      - For uterine length 6–9 cm; replacement every 5 years.
    - **MULTI-SAFE 375 PRODUCTS**
      - For uterine length over 6–9 cm; replacement every 5 years.
    - **NEO-SAFE T380 PRODUCTS**
      - For uterine length 6.5–9 cm; replacement every 5 years.

3.3 Contraception, oral progestogen-only

### Ulipristal acetate

**DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

<table>
<thead>
<tr>
<th>INDICATIONS AND DOSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Emergency contraception</td>
</tr>
<tr>
<td>BY MOUTH</td>
</tr>
<tr>
<td>Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours</td>
</tr>
<tr>
<td>Pre-operative treatment of moderate to severe symptoms of uterine fibroids</td>
</tr>
<tr>
<td>BY MOUTH</td>
</tr>
<tr>
<td>Adults: 5 mg daily for up to 3 months starting during the first week of menstruation, course may be repeated once if necessary, starting during the second menstruation after the first course completed, maximum 2 courses of 3 months</td>
</tr>
</tbody>
</table>

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**
Repeated use as an emergency contraceptive within a menstrual cycle

**SPECIFIC CONTRA-INDICATIONS**
- When used for uterine fibroids
  - Breast cancer
  - Cervical cancer
  - Ovarian cancer
  - Undiagnosed vaginal bleeding
  - Uterine cancer
  - Vaginal bleeding not caused by uterine fibroids

**CAUTIONS**
- Uncontrolled severe asthma

**INTERACTIONS** 
- Appendix 1 (ulipristal).

The effectiveness of ulipristal as an emergency contraceptive is possibly reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

**SIDE-EFFECTS**
- Common or very common
  - Abdominal pain
  - Back pain
  - Diarrhoea
  - Dizziness
  - Fatigue
  - Gastro-intestinal disturbances
  - Headache
  - Menstrual irregularities
  - Muscle spasms
  - Nausea
  - Vomiting

**When used for uterine fibroids**
- Abdominal pain
- Acne
- Breast pain
- Dizziness
- Endometrial thickening
- Headache
- Hot flushes
- Hypertension
- Malaise
- Menstrual disturbances
- Myalgia
- Nausea
- Oedema
- Ovarian cyst (including rupture)
- Pelvic pain
- Uterine haemorrhage

**Uncommon**
- Abnormal bleeding
- Blurred vision
- Breast tenderness
- Dry mouth
- Hot flushes
- Pruritus
- Rash
- Tremor
- Uterine spasm

**When used for uterine fibroids**
- Anxiety
- Constipation
- Dyspepsia
- Epistaxis
- Flatulence
- Urinary incontinence

**CONCEPTION AND CONTRACEPTION**
- When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for Qlaira®) and 9 days for oral progestogen-only contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

**PREGNANCY**
- Manufacturer advises avoid for uterine fibroids—no information available. Limited information available when used as an emergency contraceptive.

**BREAST Feeding**
- When used for uterine fibroids, manufacturer advises avoid—no information available. In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.

**HEPATIC IMPAIRMENT**
- Caution with use in uterine fibroids in moderate to severe hepatic impairment—no information available. Manufacturer advises avoiding use as an emergency contraceptive in severe hepatic impairment—no information available.

**RENAL IMPAIRMENT**
- Caution in severe renal impairment when used for uterine fibroids—no information available.

**PATIENT AND CARER ADVICE**
- When ulipristal is given as an emergency contraceptive, if vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
  - that their next period may be early or late;
  - that a barrier method of contraception needs to be used until the next period;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
  - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

### Desogestrel

**INDICATIONS AND DOSE**

<table>
<thead>
<tr>
<th>Contraception</th>
</tr>
</thead>
<tbody>
<tr>
<td>BY MOUTH</td>
</tr>
<tr>
<td>Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle (if you have any delay then the pill must be taken as soon as possible)</td>
</tr>
</tbody>
</table>

**CONTRA-INDICATIONS**
- Acute porphyrias p. 864 • history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable • severe arterial disease • undiagnosed vaginal bleeding

**CAUTIONS**
- Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • arterial disease • functional ovarian cysts • history of jaundice in pregnancy • malabsorption syndromes • past ectopic pregnancy • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
Levonorgestrel

INDICATIONS AND DOSE

Emergency contraception

BY MOUTH

- Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception

BY MOUTH

- Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a "missed pill"

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

Contraception

BY VAGINA

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

CONTRA-INDICATIONS

- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration - acute cervicitis - acute vaginitis - distorted uterine cavity - established immunosuppression - genital
malignancy · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · infected abortion during the previous three months · marked immunosuppression · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · recent sexually transmitted infection (if not fully investigated and treated) · severe anemia · small uterine cavity · unexplained uterine bleeding

- With oral use Acute porphyrias p. 864
- With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

- CAUTIONS
  - With intra-uterine use Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · multiparity · severe cervical stenosis · severe primary dysmenorrhea · severely scarred uterus (including after endometrial resection) · young age
  - With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gondotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroi dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
  - With oral use for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gondotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old or
- they are over 25 years old and have a new partner or
- have had more than one partner in the past year or
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days. An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- With oral use

Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA® 50MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Advanced uterine atrophy

- INTERACTIONS → Appendix 1 (progestogens).

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers.

With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucosa and endometrium) and therefore prostogestinic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

- SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Depression (sometimes severe) · headache · nausea
- Frequency not known Vomiting

SPECIFIC SIDE-EFFECTS

- Common or very common
  - With intra-uterine use Abdominal pain · acne · alopecia · back pain · breast pain · changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) · expulsion · hirsutism · migraine · nervousness · pelvic pain · peripheral oedema · salpingitis
  - Uncommon
  - With intra-uterine use Abdominal distension · cervicitis · eczema · pelvic inflammatory disease · pruritus · skin hyperpigmentation
- Rare
  - With intra-uterine use Rash · uterine perforation
  - Frequency not known
  - With intra-uterine use Allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhea · epileptic seizures (on insertion) · functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) · menorrhagia · pain (on insertion, alleviated by NSAID such as ibuprofen 50 minutes before insertion) · pelvic infection may be exacerbated · vasovagal attack (on insertion)
- With oral use Breast discomfort · breast tenderness · changes in libido · disturbances of appetite · dizziness · fatigue · menstrual irregularities · skin disorders

SIDE-EFFECTS, FURTHER INFORMATION

Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in prostogestinic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent.

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic prostogestinic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a
woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

- **PREGNANCY**
  - With oral use Not known to be harmful.
  - With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- **BREAST FEEDING**
  - Progestogen-only contraceptives do not affect lactation.

- **HEPATIC DISEASE**
  - Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

- **MONITORING REQUIREMENTS**
  - Caution in recurrent cholestatic jaundice. Avoid in liver tumour.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

- **PRESCRIBING AND DISPENSING INFORMATION**

  - **JAYDESS 13.5MG INTRA-UTERINE DEVICE**
    When system is removed (and not replaced immediately) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

  - **MIRENA®20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**
    When system is removed (and not immediately replaced) and pregnancy is not desired, remove during first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

- **PATIENT AND CARER ADVICE**

  - **Missed doses**
    When used as an oral contraceptive, the following advice is recommended. If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days. The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken. Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

  - With oral use for Contraception
    Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

- **With oral use for Emergency contraception**
  - If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.

- **With vaginal use**
  - If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- **With oral use for Contraception**
  - If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.

- **When prescribing or supplying hormonal emergency contraception, women should be advised:**
  - that their next period may be early or late;
  - that a barrier method of contraception needs to be used until the next period;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
  - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

  - With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Levonelle® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- **MEDI CINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

3.4 Contraception, parenteral progestogen-only

**Drugs used for Contraception, parenteral progestogen-only not listed below; Norethisterone, p. 656**
**PROGESTOGENS**

**Etonogestrel**

**INDICATIONS AND DOSE**

Contraception (no hormonal contraceptive use in previous month)

* BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

* BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: 1 implant to be inserted after 28 days postpartum in breast-feeding mothers, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

* BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

* BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: 1 implant to be inserted within 5 days, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

* BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

**CONTRA-INDICATIONS**

- Acute porphyria - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

**CAUTIONS**

- Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - disturbances of lipid metabolism - history during pregnancy of deterioration of otosclerosis - history during pregnancy of pruritus - history of jaundice in pregnancy - malabsorption syndromes - possible risk of breast cancer - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

**INTERACTIONS**

- Appendix 1 (progestogens).
  - Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterial that do not induce liver enzymes. Effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

**SIDE-EFFECTS**

- Breast discomfort - changes in libido - depression - disturbance of appetite - dizziness - headache

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Implant**
  - ETONOGESTREL (Non-proprietary)
    - Etonogestrel 68 mg: Etonogestrel 68 mg implant | 1 device [commercial price not available]
    - Nexplanon (Merck Sharp & Dohme Ltd)
    - Etonogestrel 68 mg: Nexplanon 68 mg implant | 1 device [commercial price £83.43]

**Medroxyprogesterone acetate**

**INDICATIONS AND DOSE**

Dysfunctional uterine bleeding

* BY MOUTH
  - Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

Secondary amenorrhoea

* BY MOUTH
  - Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

Mild to moderate endometriosis

* BY MOUTH
  - Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

Progestogenic opposition of oestrogen HRT

* BY MOUTH
  - Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

Endometrial cancer | Renal cell cancer

* BY MOUTH
  - Adult: 200–600 mg daily

Breast cancer

* BY MOUTH
  - Adult: 0.4–1.5 g daily

SIDE-EFFECTS, FURTHER INFORMATION

Cervical cancer

- Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Breast cancer

- There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Pregnancy

- Not known to be harmful, remove implant if pregnancy occurs.

Breast feeding

- Progestogen-only contraceptives do not affect lactation.

DIRECTIONS FOR ADMINISTRATION

The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

PATIENT AND CARER ADVICE

- Full counselling backed by patient information leaflet required before administration.

continued →
Contraception

BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraception)
BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: (consult product literature)

• CONTRA-INDICATIONS
  • GENERAL CONTRA-INDICATIONS
    Acute porphyrias p. 864 · severe arterial disease · undiagnosed vaginal bleeding
  • SPECIFIC CONTRA-INDICATIONS
    - With intramuscular or subcutaneous use History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
    - With oral use Breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history of liver tumours
  • CAUTIONS
    • GENERAL CAUTIONS:
      Possible risk of breast cancer
    • SPECIFIC CAUTIONS:
      - With intramuscular or subcutaneous use History during pregnancy in disturbances of lipid metabolism · history during pregnancy of pruritus
      - With oral use Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)
  • INTERACTIONS → Appendix 1 (progestogens).
    Effectiveness of parental progestogen-only contraceptives is not affected by antibiotics that do not induce liver enzymes. The effectiveness of medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.
  • SIDE-EFFECTS
    • GENERAL SIDE-EFFECTS
      Breast discomfort · changes in libido · depression · dizziness · headache · indigestion · loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) · menstrual irregularities · nausea · pruritus · vomiting · weight gain
    • SPECIFIC SIDE-EFFECTS

        - With intramuscular or subcutaneous use Osteoporosis · osteoporotic fractures
      - Frequency not known
        - With intramuscular or subcutaneous use Disturbance of appetite · injection site-reactions · reduced bone mineral density · skin disorders
        - With oral use Acne · adrenergic-like effects (when used for malignant disease) · alopecia · anaphylactoid reactions · bloating · breast tenderness · cervical erosions (when used for malignant disease) · confusion (when used for malignant disease) · congestive heart failure (when used for malignant disease) · constipation (when used for malignant disease) · diarrhoea (when used for malignant disease) · drowsiness · dry mouth (when used for malignant disease) · euphoria (when used for malignant disease) · fluid retention · galactorrhoea (when used for malignant disease) · glucocorticoid effects may lead to a cushingoid syndrome (with high doses for malignant disease) · hirsutism · hypercalcaemia (when used for malignant disease) · hyperpyrexia (when used for malignant disease) · hypertension (when used for malignant disease) · insomnia · jaundice · loss of concentration (when used for malignant disease) · nervousness (when used for malignant disease) · palpitation (when used for malignant disease) · premenstrual-like syndrome · raised platelet count (when used for malignant disease) · raised white blood cell count (when used for malignant disease) · rash · retinal thrombosis (when used for malignant disease) · skin reactions · tachycardia (when used for malignant disease) · urticaria · vision disorders (when used for malignant disease)
    • SIDE-EFFECTS, FURTHER INFORMATION
      Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known. Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.
    • CONCEPTION AND CONTRACEPTION
      - With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
      - With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.
    • PREGNANCY
      - With oral use Avoid—genital malformations and cardiac defects reported.
      - With intramuscular use or subcutaneous use Not known to be harmful.
    • BREAST FEEDING
      Present in milk—no adverse effects reported. Progesterone-only contraceptives do not affect lactation.
      - With intramuscular use or subcutaneous use The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.
    • HEPATIC IMPAIRMENT
      - With oral use Avoid in hepatic impairment.
3.5 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

INDICATIONS AND DOSE
Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps by vagina

INTERNATIONAL PHARMACEUTICAL FORMULARY

Nonoxinol 9 20 mg per 1 ml Gygel 2% contraceptive jelly

30 gram (GSS) £4.25 | 81 gram (GSS) £11.00

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

Reasons for failure to produce a satisfactory erection include psychogenic, vascular, neurogenic, and endocrine abnormalities; impotence can also be drug-induced.

Intracavernosal, urethral or topical application of vasoactive drugs under careful medical supervision are used for the management of erectile dysfunction. Intracavernosal or intrathecal preparations can also be used in the diagnosis of erectile dysfunction.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie’s disease).

Priapism

If priapism occurs with alprostadil p. 701, treatment should not be delayed more than 6 hours and is as follows:

- Initial therapy by penile aspiration; using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 mL of blood aspirated; if necessary the procedure may be repeated on the opposite side.
- If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.
- If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (extreme caution: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) can be given.
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.
- If sympathomimetic unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIIIIB of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm

Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff

Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/
Alprostadil
Alprostadil p. 701 (prostaglandin E₃) is given by intracavernosal injection, intrarectal application, or topical application for the management of erectile dysfunction (after exclusion of treatable medical causes). Intracavernosal or intrarectal preparations can also be used in the diagnosis of erectile dysfunction.

Phosphodiesterase type-5 inhibitors
Avanafil below, sildenafil below, tadalafil p. 700 and vardenafil p. 701 are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadafalil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Papaverine and phentolamine
Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine mesilate p. 161 is added if the response is inadequate [unlicensed indication]. Persistence of the erection for longer than 4 hours is an emergency.

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

INDICATIONS AND DOSE
Erectile dysfunction
BY MOUTH
Adult: Initially 100 mg, to be taken approximately 30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Erectile dysfunction in patients on alpha-blocker therapy
BY MOUTH
Adult: Initially 50 mg, to be taken approximately 30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Dose adjustments due to interactions
Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil.

Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

CONTRA-INDICATIONS Avoid if systolic blood pressure below 90 mmHg (no information available) - blood pressure > 170/100 mmHg - hereditary degenerative retinal disorders - history of non-articent anterior ischaemic optic neuropathy - life-threatening arrhythmia in previous 6 months - mild to severe heart failure - patients in whom vasodilatation or sexual activity are inappropriate 

CAUTIONS Active peptic ulceration - anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

INTERACTIONS → Appendix 1 (avanafil).
Avoid concomitant use of nitrates.

SIDE-EFFECTS

Common or very common Back pain - dizziness - dyspepsia - flushing - headache - migraine - myalgia - nasal congestion - nausea - visual disturbances - vomiting

Uncommon Drowsiness - epistaxis - hypertension - hypotension - malaise - painful red eyes - palpitation - tachycardia

Rare Abdominal pain - diarrhoea - dry mouth - facial oedema - gastritis - genital irritation - gout - haematuria - hyperactivity - hyperbilirubinaemia - hyperosmolarity - increased serum creatinine - insomnia - muscle spasms - peripheral oedema - pollakiuria - priapism - rash - Stevens-Johnson syndrome - syncope - weight gain

Frequency not known Arrhythmia - myocardial infarction - non-articent anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - seizures - serious cardiovascular events - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina

HEPATIC IMPAIRMENT Use lowest effective initial dose in mild to moderate impairment, adjusted according to response. Manufacturer advises avoid in severe impairment—no information available.

RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE Onset of effect may be delayed if taken with food.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Spedra ™ is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’.

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm; Health and Personal Social Services for Northern Ireland Drug Tariff; www.dhsspsni.gov.uk/pas-tariff; Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Sildenafil

INDICATIONS AND DOSE
Pulmonary arterial hypertension
BY MOUTH
Adult: 20 mg 3 times a day

BY INTRAVENOUS INJECTION
Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate
Erectile dysfunction

**BY MOUTH**
- Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**
Hereditary degenerative retinal disorders · history of non-articentric anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke

**SPECIFIC CONTRA-INDICATIONS**
- When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) · patients in whom vasodilation or sexual activity are inadvisable · recent unstable angina
- When used for pulmonary arterial hypertension Sickle-cell anaemia

**CAUTIONS**

**GENERAL CAUTIONS**
Active peptic ulceration · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction

**SPECIFIC CAUTIONS**
- When used for erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernous fibrosis, Peyronie’s disease) · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- When used for pulmonary arterial hypertension Anatomical deformation of the penis · autonomic dysfunction · hypotension (avoid if systolic blood pressure below 90 mmHg) · intravascular volume depletion · predisposition to priapism · pulmonary veno-occlusive disease

**INTERACTIONS** → Appendix 1 (sildenafil).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
Back pain · dyspepsia · flushing · migraine · myalgia · nasal congestion · visual disturbances

**Frequency not known** Non-articentric anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) · sudden hearing loss · myalgia · vertigo · flushing · syncope

**SPECIFIC SIDE-EFFECTS**
- Common or very common
  - When used for erectile dysfunction Nausea · dizziness · vomiting
  - When used for pulmonary arterial hypertension Abdominal distension · alopecia · anemia · anxiety · bronchitis · cellulitis · cough · diarrhoea · dry mouth · epistaxis · fever · gastritis · gastro-oesophageal reflux · haemorrhoids · headache · influenza-like symptoms · insomnia · limb pain · night sweats · oedema · painful red eyes · paraesthesia · photophobia · retinal haemorrhage · tremor · vertigo
- Uncommon
  - When used for erectile dysfunction Chest pain · drowsiness · dry mouth · epistaxis · fatigue · hypertension · hypoaesthesia · hypotension · painful red eyes · palpitation · tachycardia · tinnitus · vertigo
  - When used for pulmonary arterial hypertension Gynaecomastia · haematuria · penile haemorrhage · priapism
- Rare
  - When used for erectile dysfunction Atrial fibrillation · cerebrovascular accident · facial oedema · hypersensitivity reactions · priapism · rash · Stevens-Johnson syndrome · syncope
- Frequency not known
  - When used for erectile dysfunction Arrhythmia · myocardial infarction · seizures · unstable angina
  - When used for pulmonary arterial hypertension Rash · retinal vascular occlusion
- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** In pulmonary arterial hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily. For erectile dysfunction, use initial dose of 25 mg. Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m².

In pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily.

**TREATMENT CESSATION**
- When used for Pulmonary arterial hypertension Consider gradual withdrawal.

**PATIENT AND CARER ADVICE**
- When used for Erectile dysfunction Onset of effect may be delayed if taken with food.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (January 2010 and February 2011) that sildenafil tablets (Revatio®) should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (Revatio®) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

**NHS restrictions** Viagra® is not prescribable under NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF publications p. xi.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: pessary, oral suspension, oral solution

Tadalafil

INDICATIONS AND DOSE
Pulmonary arterial hypertension
BY MOUTH
Adult: 40 mg once daily
Erectile dysfunction
BY MOUTH
Adult: Initially 10 mg once daily (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, daily dose of 10–20 mg not recommended; maximum 1 dose per day
Erectile dysfunction; for patients who anticipate sexual activity at least twice a week
BY MOUTH
Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours
Benign prostatic hyperplasia
BY MOUTH
Adult: 5 mg once daily

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
History of non-arteritic anterior ischaemic optic neuropathy
SPECIFIC CONTRA-INDICATIONS
When used for benign prostatic hyperplasia or erectile dysfunction Hypotension (avoid if systolic blood pressure below 90 mmHg) - left ventricular dysfunction - life-threatening arrhythmias - pericardial constriction - predisposition to priapism - pulmonary veno-occlusive disease - uncontrolled hypertension
INTERACTIONS → Appendix 1 (tadalafil).
SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Common or very common Back pain - dyspepsia - flushing - headache - myalgia - nausea - vomiting
Uncommon Hypertension - tachycardia
Frequency not known Arrhythmia - myocardial infarction - non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina
SPECIFIC SIDE-EFFECTS
Common or very common
When used for benign prostatic hyperplasia or erectile dysfunction Dizziness - migraine - nasal congestion - visual disturbances
When used for pulmonary arterial hypertension Blurred vision - chest pain - epistaxis - facial oedema - gastrointestinal reflux - hypotension - increased uterine bleeding - limb pain - nasopharyngitis - palpitation - rash
Uncommon
When used for benign prostatic hyperplasia or erectile dysfunction Epistaxis - hypotension - painful red eyes - palpitation
When used for pulmonary arterial hypertension or erectile dysfunction Amnesia - hyperhidrosis - priapism - seizures
Rare
When used for benign prostatic hyperplasia or erectile dysfunction Facial oedema - hypersensitivity reactions - priapism - rash - Stevens-Johnson syndrome - syncope
Frequency not known
When used for benign prostatic hyperplasia or erectile dysfunction Abdominal pain - increased sweating - seizures - serious cardiovascular events - transient amnesia
When used for pulmonary arterial hypertension Stevens-Johnson syndrome - stroke - visual field defect
PREGNANCY Manufacturer advises avoid.
BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
HEPATIC IMPAIRMENT When used for pulmonary arterial hypertension use initial dose of 20 mg once daily in mild to moderate impairment and avoid in severe impairment. Use maximum dose of 10 mg in erectile dysfunction and benign prostatic hyperplasia. Manufacturer advises caution in severe impairment and for regular once-daily dosing in erectile dysfunction and benign prostatic hyperplasia—no information available.
RENAL IMPAIRMENT In pulmonary arterial hypertension for patients with mild to moderate impairment, initially use 20 mg once daily, increased to 40 mg once daily if tolerated; avoid in severe impairment. For erectile dysfunction and benign prostatic hyperplasia, maximum dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing).
NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2012) that tadalafil (Adcirca®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.
NHS restrictions Cialis® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of

Vardenafil

INDICATIONS AND DOSE

Erectile dysfunction

BY MOUTH USING TABLETS
• Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

BY MOUTH USING ORODISPERSIBLE TABLET
• Adult: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

Erectile dysfunction (patients on alpha-blocker therapy)

BY MOUTH USING TABLETS
• Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

Dose adjustments due to interactions
Concomitant treatment with phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

Dose equivalence and conversion
Levitra® 10 mg orodispersible tablets and Levitra® 10 mg film coated tablets are not bioequivalent.

CONTRA-INDICATIONS
Avoid if systolic blood pressure below 90 mmHg • hereditary degenerative retinal disorders • myocardial infarction • patients in whom vasodilatation or sexual activity are inadvisable • previous history of non-arteritic anterior ischaemic optic neuropathy • recent stroke • unstable angina

CAUTIONS
Active peptic ulceration • anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) • bleeding disorders • cardiovascular disease • elderly • left ventricular outflow obstruction • predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) • susceptibility to prolongation of QT interval

INTERACTIONS
• Appendix 1 (vardenafil)
Caution with concomitant use of drugs which prolong QT interval. Avoid concomitant use of nitrates.

SIDE-EFFECTS
• Common or very common Back pain • dizziness • dyspepsia • flushing • headache • migraine • myalgia • nasal congestion • nausea • visual disturbances • vomiting

• Uncommon Drowsiness • dyspnoea • epistaxis • hypertension • hypotension • increased lacrimation • painful red eyes • palpitation • photosensitivity • tachycardia

• Rare Anxiety • facial oedema • hypersensitivity reactions • hypotonia • priapism • raised intraocular pressure • rash • Stevens-Johnson syndrome • syncope • transient amnesia

• Frequency not known Arrhythmia • myocardial infarction • non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) • retinal vascular occlusion • seizures • serious cardiovascular events • sudden hearing loss (discontinue drug and seek medical advice) • unstable angina

• HEPATIC IMPAIRMENT
Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m². Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².

• PRESCRIBING AND DISPENSING INFORMATION
Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

• NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

NHS restrictions Levitra® is not prescribable under the NHS for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF publications p. xi.

• MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

PROSTAGLANDINS (ERECTILE DYSFUNCTION)

Alprostadil

INDICATIONS AND DOSE
Erectile dysfunction (initiated under specialist supervision)
BY URETHRAL APPLICATION
• Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week continued
**Erectile and ejaculatory conditions**

**CAVERJECT®**

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Erectile dysfunction associated with neurological dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), then 2.5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**BY URETHRAL APPLICATION**

- Adult: 500 micrograms for 1 dose

**TO THE SKIN**

- Adult: 300 micrograms, to the tip of the penis, 30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

**VIRIDAL® DUO STARTER PACK**

Neurogenic erectile dysfunction

**BY INTRACAVERNOSAL INJECTION**

- Adult: 40 micrograms, increased in steps of 5–10 micrograms, maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**C A V E R J E C T ® D U A L C H A M B E R**

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection not lasting more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Erectile dysfunction associated with neurological dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**BY URETHRAL APPLICATION**

- Adult: 300 micrograms, to the tip of the penis, 30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

**TO THE SKIN**

- Adult: 300 micrograms, to the tip of the penis, 30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

**VIRIDAL® DUO CONTINUATION PACK**

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Neurogenic erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope); not for use with other agents for erectile dysfunction - predisposition to prolonged erection (as in thrombocytopenia, polycythemia, sickle cell anaemia,
multiple myeloma or leukaemia) - urethral application contra-indicated in balanitis - urethral application contra-indicated in severe curvature - urethral application contra-indicated in severe hypospadia - urethral application contra-indicated in urethral stricture - urethral application contra-indicated in urethritis

**SPECIFIC CONTRA-INDICATIONS**

- With topical use: Balanitis - severe curvature - severe hypospadia - urethral stricture - urethritis

**CAUTIONS**

- Anatomical deformations of penis (painful erection more likely) — follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop) — priapism (patients should be instructed to report any erection lasting 4 hours or longer)

**INTERACTIONS**

- Appendix 1 (alprostadil).

**SIDE-EFFECTS**

- Common or very common: Dizziness - haematoma - haemosiderin deposits - headache - hypertension - hypotension - influenza-like syndrome - injection site reactions - other localised pain (buttocks, leg, testicular, abdominal) - penile fibrosis - penile oedema - penile pain - penile rash - urethral bleeding - urethral burning

- Rare: Anaphylaxis - erythema - hypersensitivity reactions - rash - urinary-tract injection - urticaria - vertigo

**CONCEPTION AND CONTRACEPTION**

- With urethral use: If partner is pregnant, barrier contraception should be used. No evidence of harm to latent condoms and diaphragms.

- With topical use: Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latent condoms.

**DIRECTIONS FOR ADMINISTRATION**

- With intraurethral use: The first dose of the intraurethral injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.

- With urethral use: During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

**PATIENT AND CARER ADVICE**

- Patients should be instructed to report any erection lasting 4 hours or longer.

- With topical use: Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.

**NATIONAL FUNDING/ACCESS DECISIONS**

- NHS restrictions: Caverject®, Viridal®, Duo, Vitaros® and MUSE® are not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIb of the Drug Tariff (Part XIIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed “SLS” for more information see Prices in the BNF, under How to use BNF publications p. xi.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

---

**Premature ejaculation**

**SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS**

- **Dapoxetine**

  **DRUG ACTION**

  Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

  **INDICATIONS AND DOSE**

  Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes

  **BY MOUTH**

  - Adult: Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

  **continued**

---
Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes (with concomitant apreparit, clarihormycin, ditiazem, erythromycin, flucinazone, fosamprenavir, and verapamil).

BY MOUTH
- Adult: Up to 30 mg, to be taken approximately 1–3 hours before sexual activity; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day.

Dose adjustments due to interactions
Max. single dose 30 mg with concomitant apreparit, clarihormycin, ditiazem, erythromycin, flucinazone, fosamprenavir, and verapamil. Use 60-mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP2D6.

• CONTRA-INDICATIONS History of bipolar disorder • history of mania • history of severe depression • history of syncope • significant cardiac disease • uncontrolled epilepsy

• CAUTIONS Bleeding disorders • epilepsy (discontinue if convulsions develop) • susceptibility to angle-closure glaucoma

• INTERACTIONS → Appendix 1 (dapoxetine).
Caution with concomitant use of drugs that increase risk of bleeding.

• SIDE-EFFECTS
- Common or very common Abdominal distension • abdominal pain • abnormal dreams • agitation • anxiety • constipation • diarrhea • dizziness • drowsiness • dry mouth • dyspepsia • flushing • headache • hypertension • impaired attention • irritability • malaise • nausea • paraesthesia • sexual dysfunction • sleep disturbances • sweating • tinnitus • tremor • visual disturbances • vomiting
- Uncommon Abnormal thoughts • bradycardia • bruxism • confusion • depression • eye pain • hypotension • mood disturbances • mydriasis • postural hypotension • pruritus • restlessness • sinus arrest • syncope • tachycardia • taste disturbances • vertigo
- Rare Defaecation urgency • sudden onset of sleep

SIDE-EFFECTS, FURTHER INFORMATION
Discontinue if psychiatric disorder develops. Avoid if postural hypotension occurs during test dose.

• HEPATIC IMPAIRMENT
Avoid in moderate to severe impairment.

• RENAL IMPAIRMENT
Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

• PRE-TREATMENT SCREENING
Test for postural hypotension before starting treatment.

• PATIENT AND CARER ADVICE
Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

• MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

5 Obstetrics

Obstetrics

Prostaglandins and oxytocics
Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 705, carbocetin p. 706, ergometrine maleate p. 707, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion
Gemeprost p. 709, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol p. 709 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication].

Intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-anniotic dinoprostone p. 706 is rarely used nowadays.

Pre-treatment with mifepristone p. 708 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour
Dinoprostone p. 706 is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin p. 705 (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy.

Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol p. 709 is given orally or vaginally for the induction of labour [unlicensed indication].

Prevention and treatment of haemorrhage
Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (Syntometrine®) given intramuscularly, the dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (Syntometrine®) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate p. 707.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony or
- ergometrine by intramuscular injection or
contracts not established after a total of 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

Caesarean section
BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units immediately after delivery

Prevention of postpartum haemorrhage after delivery of placenta
BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours
BY INTRAMUSCULAR INJECTION
- Adult: 10 units, can be used instead of oxytocin with ergometrine (Symptometrine®)

Treatment of postpartum haemorrhage
BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units, repeated if necessary

Treatment of severe cases of postpartum haemorrhage
(following intravenous injection)
BY INTRAVENOUS INFUSION
- Adult: 40 units in 500 mL infusion fluid given at a rate sufficient to control uterine atony

Incomplete, inevitable, or missed miscarriage
INITIALLY BY SLOW INTRAVENOUS INJECTION
- Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 units/minute if required, the rate of infusion can be faster if necessary

UNLICENSED USE Oxytocin doses in the BNF may differ from those in the product literature.

Important safety information
Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

CONTRA-INDICATIONS Any condition where spontaneous labour inadvisable • any condition where vaginal delivery inadvisable • avoid intravenous injection during labour • avoid prolonged administration in oxytocin-resistant uterine inertia • avoid rapid intravenous injection (may transiently reduce blood pressure) • fetal distress (discontinue immediately if this occurs) • hypertonic uterine contractions (discontinue immediately if this occurs) • severe cardiovascular disease • severe pre-eclamptic toxaemia

CAUTIONS Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) • enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) • history of lower-uterine segment caesarean section • induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) • mild pregnancy-induced cardiac disease • mild pregnancy-induced hypertension • moderate pregnancy-induced cardiac disease • moderate pregnancy-induced hypertension • risk factors for disseminated intravascular coagulation • secondary uterine inertia • women over 35 years

INTERACTIONS → Appendix 1 (oxytocin).
Effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity). Caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors).
706 Obstetrics

SIDE-EFFECTS

- Common or very common: Arrhythmia · headache · nausea · vomiting
- Rare: Anaphylactoid reactions (with dyspnoea, hypotension, or shock) · disseminated intravascular coagulation · hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid · rash · uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture) · uterine spasm (may occur at low doses) · water intoxication associated with high doses with large infusion volumes of electrolyte-free fluid

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Pabal (Ferring Pharmaceuticals Ltd)

Carbetocin 100 microgram per 1 ml

Pabal 100micrograms/1ml solution for injection ampoules | 5 ampoule £88.20 (Hospital only)

CARBOPROSTOP

INDICATIONS AND DOSE

Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

BY DEEP INTRAMUSCULAR INJECTION

- Adult: 250 micrograms at least every 15 minutes, repeated if necessary, total dose should not exceed 2 mg (8 doses)

CONTRA-INDICATIONS

- Cardiac disease · pulmonary disease
- Untreated pelvic infection

CAUTIONS

- Excessive dosage may cause uterine rupture · history of anaemia · history of asthma · history of diabetes · history of epilepsy · history of glaucoma · history of hypertension · history of hypotension · history of jaundice · history of raised intra-ocular pressure · uterine scars

INTERACTIONS

- Appendix 1 (prostaglandins)

SIDE-EFFECTS

- Bronchospasm · cardiovascular collapse · chills · diaphoresis · diarrhoea · dizziness · dyspnoea · erythema at injection site · flushing · headache · hyperthermia · nausea · pain at injection site · pulmonary oedema · raised blood pressure · vomiting

HEPATIC IMPAIRMENT

Manufacturer advises avoid.

RENAL IMPAIRMENT

Manufacturer advises avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Hemabate (Pfizer Ltd)

Carboprost (as Carboprost trometamol) 250 microgram per 1 ml

Hemabate 250micrograms/1ml solution for injection ampoules | 5 ampoule £182.01 (Hospital only)

DINO PROSTOPNE

INDICATIONS AND DOSE

PROSTIN E2® VAGINAL GEL

Induction of labour

BY VAGINA

- Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; max. dose 3 mg

Induction of labour (unfavourable primigravida)

BY VAGINA

- Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required; max. dose 4 mg

5.2 Postpartum haemorrhage

PROSTAGLANDINS AND OXYTOCICS

Carbetocin

INDICATIONS AND DOSE

Prevention of uterine atony after caesarean section

BY SLOW INTRAVENOUS INJECTION

- Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

CONTRA-INDICATIONS

- Eclampsia · epilepsy · pre-eclampsia

CAUTIONS

- Asthma · cardiovascular disease (avoid if severe) · hyponatraemia · migraine
**PROSTIN E2® VAGINAL TABLETS**

Induction of labour

**BY VAGINA**

- Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours (max. per dose 6 mg), to be given if labour not established

**Dose equivalence and conversion**

Prostin E2 Vaginal tablets and Vaginal Gel are not bioequivalent.

**PROPESES®**

Cervical ripening and induction of labour at term

**BY VAGINA**

- Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated).

**CONTRA-INDICATIONS**

- Active cardiac disease
- Active pulmonary disease
- Avoid extra-anniotic route in cervicitis or vaginitis
- Fetal distress
- Fetal malpresentation
- Grand multiparas
- History of caesarean section
- History of difficult or traumatic delivery
- Major cephalopelvic disproportion
- Myocardial infarction
- Neurological disease
- Severe bradycardia
- Severe cardiac disease
- Severe uterine contractions
- Stillbirth or neonatal death
- Uterine hypercontractility with or without fetal bradycardia
- Uterine hypertonus
- Uterine scarring
- Untreated pelvic infection

**CAUTIONS**

- Effect of oxytocin enhanced
- History of asthma
- History of epilepsy
- History of glaucoma and raised intraocular pressure
- Hypertension
- Risk factors for disseminated intravascular coagulation
- Uterine rupture
- Uterine scarring

**INTERACTIONS**

- Appendix 1 (prostaglandins).

**SIDE-EFFECTS**

- Abruptio placenta
- Amniotic fluid embolism
- Backache
- Bronchospasm
- Cardiac arrest
- Diarrhoea
- Disseminated intravascular coagulation
- Fetal distress
- Fever
- Low Apgar scores
- Maternal hypertension
- Nausea
- Pulmonary embolism
- Rapid cervical dilation
- Severe uterine contractions
- Stillbirth or neonatal death
- Uterine hypercontractility with or without fetal bradycardia
- Uterine hypertonus
- Uterine rupture
- Vaginal symptoms (warmth, irritation, pain)
- Vomiting

**HEPATIC IMPAIRMENT**

Manufacturers advise avoid.

**RENAL IMPAIRMENT**

Manufacturers advise avoid.

**MONITORING REQUIREMENTS**

- Monitor for disseminated intravascular coagulation after parturition.
- Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
- Care needed in monitoring uterine activity when used in sequence following oxytocin.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Prostin E2®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Important: Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—not bioequivalent.

**LESS SUITABLE FOR PRESCRIBING**

Intravenous solution rarely used and is considered less suitable for prescribing. Extra-anniotic solution less commonly used and is considered less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

---

**Ergometrine maleate**

**INDICATIONS AND DOSE**

Postpartum haemorrhage caused by uterine atony

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**

- Adult: 250–500 micrograms

**CONTRA-INDICATIONS**

- Eclampsia - first stage of labour - induction of labour - second stage of labour - sepsis - severe cardiac disease - severe hypertension - vascular disease

**CAUTIONS**

- Acute porphyrias
- Cardiac disease
- Hypertension
- Multiple pregnancy
- Risk of hypertension associated with intravenous administration

**INTERACTIONS**

- Appendix 1 (ergot alkaloids).

**SIDE-EFFECTS**

- Common or very common
  - Abdominal pain
  - Arrhythmias
  - Brachycardia
  - Chest pain
  - Dizziness
  - Dyspnoea
  - Headache
  - Hypertension
  - Nausea
  - Palpitations
  - Pulmonary oedema
  - Rash
  - Tinnitus
  - Vasoconstriction
  - Vomiting

**VERY RARE**

- Myocardial infarction

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **ERGOMETRINE MALEATE** (Non-proprietary)
  - Ergometrine maleate 500 microgram per 1 ml Ergometrine 500 micrograms/2ml solution for injection ampoules | 10 ampoule (POM) £13.00
Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 707, oxytocin p. 705.

**INDICATIONS AND DOSE**
Active management of the third stage of labour
Postpartum haemorrhage caused by uterine atony

**BY INTRAMUSCULAR INJECTION**
- Adult: 1 ml for one dose.

**BLEEDING DUE TO INCOMPLETE MISCARRIAGE OR ABORTION**
**BY INTRAMUSCULAR INJECTION**
- Adult: Adjusted according to response to, the patient’s condition and blood loss.

**SIDE-EFFECTS**
Common or very common
- Dizziness · headache · hot flushes · hyperglycaemia · hypotension · injection-site reaction · nausea · tachycardia · vomiting

**CONTRA-INDICATIONS**
Abruptio placentae · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · intra-uterine growth restriction with abnormal fetal heart rate · placenta praevia · premature rupture of membranes after 30 weeks’ gestation · severe pre-eclampsia

**CAUTIONS**
Abnormal placental site · intra-uterine growth restriction

**HEPATIC IMPAIRMENT**
No information available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- [ATOSIBAN](https://www.alliancepharma.co.uk/) (Non-proprietary)
  - Atosiban (as Atosiban acetate) 7.5 mg per 1 ml
    - Atosiban 6.75 mg/0.9 ml solution for injection vials | 1 vial (£52.82) (Hospital only)
  - Tractocile (Ferring Pharmaceuticals Ltd)
    - Atosiban (as Atosiban acetate) 7.5 mg per 1 ml
      - Tractocile 6.75 mg/0.9 ml solution for injection vials | 1 vial (£52.82) (Hospital only)

**Solution for infusion**
- [ATOSIBAN](https://www.alliancepharma.co.uk/) (Non-proprietary)
  - Atosiban (as Atosiban acetate) 7.5 mg per 1 ml
    - Atosiban 37.5 mg/ml for solution for infusion vials | 1 vial (£52.82) (Hospital only)
  - Tractocile (Ferring Pharmaceuticals Ltd)
    - Atosiban (as Atosiban acetate) 7.5 mg per 1 ml
      - Tractocile 37.5 mg/ml for solution for infusion vials | 1 vial (£52.82) (Hospital only)

5.3 Premature labour

**OXYTOCIN RECEPTOR ANTAGONISTS**

**Atosiban**

**INDICATIONS AND DOSE**
Uncomplicated premature labour between 24 and 33 weeks of gestation

**INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

**CONTRA-INDICATIONS**
Abruptio placentae · antepartum haemorrhage · eclampsia · intra-uterine fetal death · intra-uterine infection · intra-uterine growth restriction with abnormal fetal heart rate · placenta praevia · premature rupture of membranes after 30 weeks’ gestation · severe pre-eclampsia

**SIDE-EFFECTS**
Common or very common
- Dizziness · headache · hot flushes · hyperglycaemia · hypotension · injection-site reaction · nausea · tachycardia · vomiting

**UNCOMMON**
- Fever · insomnia · pruritus · rash

**HEPATIC IMPAIRMENT**
No information available.

**RENAL IMPAIRMENT**
No information available.

**MONITORING REQUIREMENTS**
Monitor blood loss after delivery.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 ml infusion fluid from 100-ml bag and replace with 10 ml atosiban concentrate (7.5 mg/ml) to produce a final concentration of 750 micrograms/ml.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

5.4 Termination of pregnancy

**PROGESTERONE RECEPTOR MODULATORS**

**Mifepristone**

**DRUG ACTION**
Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

**INDICATIONS AND DOSE**
Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 64 days gestation (under close medical supervision)

**BY MOUTH**
- Adult: 200 mg for 1 dose, to be taken 36–48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

**BY MOUTH**
- Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

**BY MOUTH**
- Adult: 600 mg for 1 dose, dose followed 24–36 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

**BY MOUTH**
- Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
Gemeprost

**INDICATIONS AND DOSE**

Cervical ripening prior to first trimester surgical abortion
- **BY VAGINA**
  - Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

Second trimester abortion
- **BY VAGINA**
  - Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix

Second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

**Second trimester intra-uterine death**

- **BY VAGINA**
  - Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

**Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone**

- **BY VAGINA**
  - Adult: 1 mg

**Termination of pregnancy of 13-24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)**

**By Mouth**
- Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 864 - chronic adrenal failure - suspected ectopic pregnancy (use other specific means of termination) - uncontrolled severe asthma

- **CAUTIONS**
  - Adrenal suppression (may require corticosteroid) - anticoagulant therapy - asthma (avoid if severe and uncontrolled) - existing cardiovascular disease - haemorrhagic disorders - history of endocarditis - prosthetic heart valve - risk factors for cardiovascular disease

- **INTERACTIONS** → Appendix 1 (mifepristone).

- **SIDE-EFFECTS**
  - **Common or very common** Gastro-intestinal cramps - uterine contractions - vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery)
  - **Uncommon** Hypersensitivity reactions - rash - urticaria
  - **Rare** Chills - dizziness - fever - headache - hot flushes - hypotension - malaise

- **Frequency not known** Infections - toxic shock syndrome

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).

- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.

- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 10**
  - **MIFEPRISTONE (Non-proprietary)**
    - Mifepristone 200 mg Mifepristone 200mg tablets | 1 tablet £25.50 no price available (Hospital only)
  - **Mifegyne (Nordic Pharma Ltd)**
    - Mifepristone 200 mg Mifegyne 200mg tablets | 3 tablet £52.66 (Hospital only)

**PROSTAGLANDINS AND OXYTOCICS**

**Gemeprost**

**INDICATIONS AND DOSE**

Cervical ripening prior to first trimester surgical abortion
- **BY VAGINA**
  - Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

Second trimester abortion
- **BY VAGINA**
  - Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix

- **CONTRA-INDICATIONS**
  - Placenta praevia - unexplained vaginal bleeding - uterine scarring

- **CAUTIONS**
  - Cardiovascular insufficiency - cervicitis - obstructive airways disease - raised intra-ocular pressure - vaginitis

- **INTERACTIONS** → Appendix 1 (prostaglandins).

- **SIDE-EFFECTS**
  - Backache - chest pain - chills - coronary artery spasm - diarrhoea - dizziness - dyspnoea - flushing - headache - mild pyrexia - muscle weakness - myocardial infarction - nausea - palpitation - severe hypotension - uterine pain - uterine rupture (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics) - vaginal bleeding - vomiting

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS**
  - If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
  - When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Pessary**
  - **GEMEPROST (Non-proprietary)**
    - Gemeprost 1mg Gemeprost 1mg pessaries | 5 pessary £25.50 no price available

**PROSTAGLANDINS**

**Misoprostol**

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It also acts as a potent uterine stimulant.

**INDICATIONS AND DOSE**

Termination of pregnancy following mifepristone (gestation up to 49 days)
- **BY MOUTH**
  - Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone
Termination of pregnancy following mifepristone (gestation 50 to 63 days)
INITIALLY BY VAGINA OR BY BUCCAL ADMINISTRATION OR BY SUBLINGUAL ADMINISTRATION
- Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina)
- 400 micrograms for 1 dose

Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)
INITIALLY BY VAGINA
- Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)
INITIALLY BY VAGINA
- Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

Benign gastric ulceration | Benign duodenal ulceration | NSAID-associated ulceration
BY MOUTH
- Adult: 800 micrograms daily in 2–4 divided doses continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

Prophylaxis of NSAID-induced gastric ulcer | Prophylaxis of duodenal ulcer
BY MOUTH
- Adult: 200 micrograms 4 times a day, reduced if not tolerated to 200 micrograms 2–3 times a day, use lower dose is less effective

- UNLICENSED USE Use of misoprostol for termination of pregnancy is an unlicensed use.
- CAUTIONS Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) - inflammatory bowel disease
- SIDE-EFFECTS
  - Common or very common Diarrhoea
  - Postmenopausal bleeding - rashes - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Diarrhoea May occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

- CONCEPTION AND CONTRACEPTION Manufacturer advises that misoprostol should not be used in women of childbearing age unless pregnancy has been excluded. In such patients it is advised that misoprostol should only be used if the patient takes effective contraceptive measures and has been advised of the risks of taking misoprostol if pregnant.
- PREGNANCY Avoid—potent uterine stimulant (has been used to induce abortion). Teratogenic risk in first trimester.
- BREAST FEEDING Present in milk, but amount probably too small to be harmful.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
- Tablet
  CAUTIONARY AND ADVISORY LABELS 21
  - MISOPROSTOL (Non-proprietary)
    - Misoprostol 200 microgram Misoprostol 200microgram vaginal tablets | 4 tablet | no price available (Hospital only)
    - Cytotec (Pfizer Ltd)
      - Misoprostol 200 microgram Cytotec 200microgram tablets | 56 tablet | no price available | 60 tablet | £10.03 DT price = £10.03
      - Topogyn (Nordic Pharma Ltd)
        - Misoprostol 400 microgram Topogyn 400microgram tablets | 16 tablet | £128.00 (Hospital only)

Vaginal delivery system
- Mysodelle (Ferring Pharmaceuticals Ltd)
  - Misoprostol 7 microgram per 1 hour Mysodelle 200micrograms vaginal delivery system | 5 unit | £465.00

6 Vaginal and vulval conditions

Vaginal and vulval conditions
Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis.

Preparations for vaginal and vulval changes
A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in menopausal atrophic vaginitis. It is important to bear in mind that topical oestrogens should be used in the smallest effective amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when systemic oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

Non-hormonal preparations for vaginal atrophy
Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

Vaginal and vulval infections
Effective specific treatments are available for the common vaginal infections.

Fungal infections
Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. Vaginal candidiasis is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-
Vaginal and vulval infections, bacterial **711**

6.1 **Vaginal and vulval infections, bacterial**

**CARBOXYLIC ACIDS**

### Lactic acid

**INDICATIONS AND DOSE**

**BALANCE ACTIV RX® GEL**

**Prevention of bacterial vaginosis**

BY VAGINA

- Adult: 5 mL 1–2 times a week, insert the content of 1 tube

**RELACTAGEL® GEL**

**Prevention of bacterial vaginosis**

BY VAGINA

- Adult: 5 mL daily for 2–3 nights after menstruation, insert the contents of one tube

- **SIDE-EFFECTS**

  RELACTAGEL® GEL

  Mild irritation

- **CONCEPTION AND CONTRACEPTION**

  RELACTAGEL® GEL

  Not recommended if trying to conceive.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Vaginal gel**

  EXCIPIENTS: May contain Propylene glycol

  - Balance Activ (BBI Healthcare Ltd)
    Balance Activ BV vaginal pH correction gel | 7 device £5.25
    Balance Activ pessaries | 7 pessary £5.25
  - Relactagel (KoRa Healthcare)
    Relactagel vaginal pH correction gel | 7 device £5.25

#### Clindamycin

**INDICATIONS AND DOSE**

**DALACIN® 2% CREAM**

**Bacterial vaginosis**

BY VAGINA

- Adult: 1 applicatorful daily for 3–7 nights, dose to be administered at night

**Dose equivalence and conversion**

1 applicatorful delivers a 5 g dose of clindamycin 2%.

- **SIDE-EFFECTS**

  Cervicitis - irritation - vaginitis

  SIDE-EFFECTS, FURTHER INFORMATION

  Systemic side-effects Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

- **CONCEPTION AND CONTRACEPTION**

  DALACIN® 2% CREAM

  Damages latex condoms and diaphragms.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Cream**

  EXCIPIENTS: May contain Benzyl alcohol, cetosteareth alcohol (including cetyl and stearyl alcohol), polyborates, propylene glycol

  - Dalacin (Pfizer Ltd)
    Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram | £10.86
    Dalacin 2% cream | 40 gram | £10.86
Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

### INDICATIONS AND DOSE

**Bacterial vaginosis**

- **BY VAGINA USING VAGINAL GEL**
  - Adult: 1 applicatorful daily for 5 days, dose to be administered at night

- **CAUTIONS** Not recommended during menstruation - some systemic absorption may occur with vaginal gel

- **SIDE-EFFECTS** Abnormal vaginal discharge - local irritation - pelvic discomfort - vaginal candidiasis

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Vaginal gel

- **EXCEPTIONS TO LEGAL CATEGORY** Brands for sale to the public include Canesten® Internal Cream.

#### Medicinal forms

- **CLOTRIMAZOLE (Non-proprietary)**
  - Clotrimazole 500 mg. Clotrimazole 500mg pessaries | 1 pessary [P] £4.00 DT price = £3.47
  - Canesten (clotrimazole) (Bayer Plc) Clotrimazole 100 mg. Canesten 100mg pessaries | 6 pessary [P] £3.50 DT price = £3.50
  - Clotrimazole 200 mg. Canesten 200mg pessaries | 3 pessary [P] £3.10 DT price = £3.10
  - Clotrimazole 500 mg. Canesten 500mg Soft Gel pessaries | 1 pessary [P] £6.41 DT price = £3.47

- **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates.

### INDICATIONS AND DOSE

- **Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)**
  - **BY VAGINA USING CREAM**
    - Adult: Apply 2–3 times a day, to be applied to anogenital area

- **Vaginal candidiasis (dose for 10% intravaginal cream)**
  - **BY VAGINA USING CREAM**
    - Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

- **Vaginal candidiasis**
  - **BY VAGINA USING PESSARIES**
    - Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

- **Recurrent vulvovaginal candidiasis**
  - **BY VAGINA USING PESSARIES**
    - Adult: 500 mg every 1 week for 6 months, dose to be administered following topical imidazole for 10–14 days

### UNLICENSED USE

- Consult product literature for individual preparations.

### SIDE-EFFECTS

- Local irritation

### CONCEPTION AND CONTRACEPTION

- Cream and pessaries may damage latex condoms and diaphragms.

### PREGNANCY

- Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

### ECONAZOLE NITRATE (Non-proprietary)

#### INDICATIONS AND DOSE

- **GYNO-PEVARYL® CREAM**
  - **BY VAGINA**
    - Adult: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

- **GYNO-PEVARYL® ONCE**
  - **BY VAGINA**
    - Adult: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary

- **GYNO-PEVARYL® PESSARY**
  - **BY VAGINA**
    - Adult: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

### SIDE-EFFECTS

- Occasional local irritation

### CONCEPTION AND CONTRACEPTION

- Cream and pessaries damage latex condoms and diaphragms.

### PREGNANCY

- Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Pessary

- **GYNO-PEVARYL® ONCE**
  - Econazole nitrate 150 mg. Gyno-Pevaryl Once 150mg vaginal pessary | 1 pessary [P] £3.69
  - Econazole Nitrate 150mg vaginal pessaries | 3 pessary [P] £4.17
### Fenticonazole nitrate

**INDICATIONS AND DOSE**

**Vaginal and vulva candidiasis**
- **Adult:** 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
- **By Vagina Using Cream**
- **Adult:** 5 g twice daily for 3 days

**SIDE-EFFECTS**
- Local irritation

**CONCEPTION AND CONTRACEPTION**
- Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **Excipients:** May contain Hydroxybenzoates (parabens)
- **Fenticonazole nitrate 200 mg** Gynoxin 200mg vaginal capsules | 3 capsule [PAX] £2.42
- **Fenticonazole nitrate 600 mg** Gynoxin 600mg vaginal capsules | 1 capsule [PAX] £2.62

**Cream**
- **Excipients:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol, wool fat and related substances including lanolin
- **Gynoxin** Capsule
- **Fenticonazole nitrate 20 mg per 1 gram** Gynoxin 2% vaginal cream | 30 gram [PAX] £3.74

### Ketoconazole

**INDICATIONS AND DOSE**

**Vaginal and vulva candidiasis**
- **By Vagina Using Cream**
- **Adult:** Apply 1–2 times a day, to be applied to the anogenital area

**INTERACTIONS**
- Appendix 1 (antifungals, imidazole).

**SIDE-EFFECTS**
- Occasional local irritation

**CONCEPTION AND CONTRACEPTION**
- Effect on latex condoms and diaphragms not yet known.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **Excipients:** May contain Hydroxybenzoates (parabens)
- **Gyno-Daktarin (Janssen-Cilag Ltd)**
- **Miconazole nitrate 1.2 gram** Gyno-Daktarin 1200mg vaginal capsules | 1 capsule [PAX] £2.94 DT price = £2.94

**Cream**
- **Excipients:** May contain Butylated hydroxyanisole, fragrances
- **Gyno-Daktarin (Janssen-Cilag Ltd)**
- **Miconazole nitrate 20 mg per 1 gram** Gyno-Daktarin 2% vaginal cream | 78 gram [PAX] £4.33

### Miconazole

**INDICATIONS AND DOSE**

**Vaginal and vulva candidiasis**
- **Child:** 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary

**BY VAGINA USING CREAM**
- **Adult:** 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary

**INTERACTIONS**
- Appendix 1 (antifungals, imidazole).

**SIDE-EFFECTS**
- Occasional local irritation

**CONCEPTION AND CONTRACEPTION**
- Cream and pessaries damage latex condoms and diaphragms.

**PREGNANCY**
- Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **Excipients:** May contain Hydroxybenzoates (parabens)
- **Gyno-Pevaryl (Janssen-Cilag Ltd)**
- **Econazole nitrate 10 mg per 1 gram** Gyno-Pevaryl 1% cream | 15 gram [PAX] £2.11 | 30 gram [PAX] £3.78

**6.3 Vaginal atrophy**

**OESTROGENS**

**Estriol**

**INDICATIONS AND DOSE**

**GYNEST™**
- Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)
- **By Vagina**
- **Adult:** Apply 1 applicatorful daily until improvement occurs, dose to be applied preferably in the evening, reduced to 1 applicatorful twice weekly, attempts to discontinue should be made at 3–6 month intervals with re-examination

**OVESTIN™**
- Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)
- **By Vagina**
- **Adult:** Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, discontinue every 2–3 months for 4 weeks to assess need for further treatment

**Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)**
- **By Vagina**
- **Adult:** Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

**CONTRA-INDICATIONS**
- Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dublin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or...
myocardial infarction) - Rotor syndrome (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

**CAUTIONS**
- Acute porphyrias p. 864 - diabetes (increased risk of heart disease) - factors predisposing to thromboembolism - history of breast nodules - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease - closely monitor breast status (risk of breast cancer) - hypophysal tumours - increased risk of gall-bladder disease - migraine (or migraine-like headaches) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size - interrupt treatment periodically to assess need for continued treatment

**CAUTIONS, FURTHER INFORMATION**

**Risk of breast cancer**
- It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

**Risk of endometrial cancer**
- The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

**Risk of ovarian cancer**
- Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

**Risk of venous thromboembolism**
- Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

**Risk of stroke**
- Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

**Risk of coronary heart disease**
- HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Other conditions**
- The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**INTERACTIONS**
- Appendix 1 (oestrogens).

**SIDE-EFFECTS**
- Abdominal bloating - abdominal cramps - altered blood lipids (may lead to pancreatitis, rashes and chloasma) - breast enlargement - breast tenderness - changes in libido - cholestatic jaundice - contact lenses may irritate - depression - dizziness - fluid retention - glucose intolerance - headache - leg cramps - migraine - mood changes - nausea - premenstrual-like syndrome - sodium retention - vaginal candidiasis - vomiting - weight changes - local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

**Leg Cramps**
- Venous thrombosis should be ruled out.

**Withdrawal Bleeding**
- Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

**CONCEPTION AND CONTRACEPTION**
- Intravaginal cream may damage latex condoms and diaphragms.

**Gynest®**
- May damage latex condoms and diaphragms.

**Ovestin®**
- Effect on latex condoms and diaphragms not yet known.

**PREGNANCY**
- Not known to be harmful.

**RÆST FEEDING**
- Avoid; adverse effects on lactation.

**HEPATIC IMPAIRMENT**
- Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**RENAL IMPAIRMENT**
- Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**MONITORING REQUIREMENTS**
- Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ESTRIOL (Non-proprietary)
- Estriol 100 micrograms per 1 gram
- Estriol 0.01% cream | 80 gram (£4.45)
- Ovestin (Aspen Pharma Trading Ltd)
- Estriol 1 mg per 1 gram
- Ovestin 1mg cream | 15 gram (£4.45)
- DT price = £4.45
- Gynest (Marlborough Pharmaceuticals Ltd)
- Estriol 100 micrograms per 1 gram
- Gynest 0.01% cream | 80 gram (£4.51

1 Immune system

1.1 Immune system disorders and transplantation

Immune response
Azathioprine p. 716, ciclosporin p. 717, mercaptopurine p. 762, and methotrexate p. 762 have a role in the treatment of inflammatory bowel disease.

Corticosteroids and other immunosuppressants

Antiproliferative immunosuppressants
Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 909 is given concurrently.

Mycophenolate mofetil p. 725 is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 750 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants
Prednisolone p. 585 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin p. 717 a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus p. 720 is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus p. 719 is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation. Basiliximab p. 724 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 726 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist...
Malignant disease

induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) p. 723 is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

NICE technology appraisals (TAs)
For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products. www.nice.org.uk/TA85

NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of an immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products. www.nice.org.uk/TA99

ANTIMETABOLITES
Azathioprine

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

INDICATIONS AND DOSE
Severe acute Crohn’s disease | Maintenance of remission of Crohn’s disease | Maintenance of remission of acute ulcerative colitis

**BY MOUTH**
- **Adult:** 2–2.5 mg/kg daily, some patients may respond to lower doses

Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance

**BY MOUTH**
- **Adult:** Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

Autoimmune conditions

**BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- **Adult:** 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Suppression of transplant rejection

**BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- **Adult:** 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

Severe refractory eczema, normal or high TPMT activity

**BY MOUTH**
- **Adult:** 1–3 mg/kg daily

Severe refractory eczema, intermediate TPMT activity

**BY MOUTH**
- **Adult:** 0.5–1.5 mg/kg daily

Generalised myasthenia gravis

**INITIALLY BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- **Adult:** Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

- **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

- **CONTRA-INDICATIONS**
  - When used for severe refractory eczema absent thiopurine methyltransferase (TPMT) activity | very low thiopurine methyltransferase (TPMT) activity

- **CAUTIONS**
  - Reduce dose in elderly | reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1 (azathioprine).
Infections in patients also receiving corticosteroids - interstitial nephritis - liver impairment - malaise - myalgia - nausea - neutropenia - rash - rigors - thrombocytopenia - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Red cell aplasia** Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.

**Neutropenia and thrombocytopenia** Usually resolved by reducing the dose.

**Nausea, vomiting and diarrhoea** Nausea, vomiting and diarrhoea may occur, usually starting early during the course of treatment, and in rheumatoid arthritis it may be appropriate to withdraw the drug.

**Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.

**PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

**BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Reduce dose. Monitor liver function.

**RENAL IMPAIRMENT** Reduce dose.

**PRE-TREATMENT SCREENING**
Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**MONITORING REQUIREMENTS**
- Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

**DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion (Imuran*)*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant; intravenous route should therefore be used only if oral route not feasible.

**PATIENT AND CARER ADVICE**
Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule injection 20–80 mg/mL, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion (Imuran*)*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant; intravenous route should therefore be used only if oral route not feasible.

**IMMUNE SYSTEM DISORDERS AND TRANSPLANTATION**

**CALCINEURIN INHIBITORS AND RELATED DRUGS**

**Ciclosporin** (Cyclosporin)

**DRUG ACTION** Ciclosporin is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

**Severe acute ulcerative colitis refractory to corticosteroid treatment**
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

**Severe active rheumatoid arthritis when conventional second-line therapy ineffective or inappropriate**
- **ADMINISTERED ON EXPERT ADVICE**

**Short-term treatment of severe atopic dermatitis**
- **ADMINISTERED ON EXPERT ADVICE**

**Short-term treatment of very severe atopic dermatitis**
- **ADMINISTERED ON EXPERT ADVICE**

**Severe psoriasis**
- **ADMINISTERED ON EXPERT ADVICE**

---

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **AZATHIOPRINE (Non-proprietary)**
  - Azathioprine 25 mg | 28 tablet | £23.00
  - Azathioprine 50 mg | 56 tablet | £41.00
  - Imuran (Aspen Pharma Trading Ltd)
  - Azathioprine 25 mg | 28 tablet | £10.99
  - Azathioprine 50 mg | 56 tablet | £17.99

- **Brands may include Azapress**

**Powder for solution for injection**
- **Imuran (Aspen Pharma Trading Ltd)**
  - Azathioprine 50 mg | Imuran 50mg powder for solution for injection vials | 1 vial | £15.38
1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone) BY MOUTH
  ▶ Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease
INITIALLY BY INTRAVENOUS INFUSION
  ▶ Adult: 1–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome BY MOUTH
  ▶ Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

● UNLICENSED USE Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

Important safety information
Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

● CONTRA-INDICATIONS Abnormal renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications) · use with tacrolimus specifically contraindicated

● CAUTIONS Hyperuricaemia · in atopic dermatitis Staphylococcus aureus skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in atopic dermatitis allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis and psoriasis discontinue if lymphoproliferative disorder develops · in psoriasis treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option)

● INTERACTIONS → Appendix 1 (ciclosporin).
  For patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer).

● SIDE-EFFECTS GENERAL SIDE-EFFECTS
  ▶ Common or very common Abdominal pain · anorexia · diarrhoea · fatigue · gingival hyperplasia · headache · hepatic dysfunction · hypercholesterolaemia · hyperkalaemia · hyperlipidaemia · hypertension · hypertrichosis · hyperuricaemia · hypomagnesaemia · muscle cramps · myalgia · nausea · paraesthesia · renal dysfunction (renal structural changes on long-term administration) · tremor · vomiting

  ▶ Uncommon Anaemia · oedema · signs of encephalopathy · thrombocytopenia · weight gain

  ▶ Rare Gynaecomastia · haemolytic uraemic syndrome · hyperglycaemia · menstrual disturbances · microangiopathic haemolytic anaemia · motor polyneuropathy · muscle weakness · myopathy · pancreatitis · visual disturbances secondary to benign intracranial hypertension

SPECIFIC SIDE-EFFECTS
  ▶ With intravenous use anaphylaxis

SIDE-EFFECTS, FURTHER INFORMATION
Visual disturbances Discontinue if visual disturbances secondary to benign intracranial hypertension occur.

● PREGNANCY Crosses placenta. There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of ciclosporin during pregnancy needs to be supervised in specialist units.

● BREAST FEEDING Present in milk—manufacturer advises avoid.

● HEPATIC IMPAIRMENT Dosage adjustment based on bilirubin and liver enzymes may be needed.

● RENAL IMPAIRMENT In patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily. Reduce dose by 25–50% if serum creatinine more than 36% above baseline on more than one measurement. In rheumatoid arthritis, reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month.
  In psoriasis and atopic dermatitis, reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month.

● PRE-TREATMENT SCREENING In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis).

● MONITORING REQUIREMENTS
  ▶ Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.
  ▶ Monitor liver function.
  ▶ Monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia).
  ▶ Monitor serum magnesium.
  ▶ Measure blood lipids before treatment and after the first month of treatment.
  ▶ In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
  ▶ Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
  ▶ Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.
  ▶ Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
  ▶ In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.
  ▶ In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum
creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).

- **Monitor hepatic function if concomitant NSAIDs given.**

**DIRECTIONS FOR ADMINISTRATION**

- **With oral use** Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately from other liquids (including water).
- **For intravenous infusion** (Sandimmun®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 ml, give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

**PRESCRIBING AND DISPENSING INFORMATION**

Brand name prescribing. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent confusion.

**EXCIPIENTS:** May contain Ethanol, ethyl lactate, propylene glycol (including sunlight. In psoriasis and atopic dermatitis, counselled on the administration of ciclosporin capsules and oral solution are available including special-order equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

**HANDLING AND STORAGE** Keep medicine measure away from other liquids (including water).

**PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of ciclosporin capsules and oral solution. Avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

**MEDICINAL FORMS**

There can be variations in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, capsules.

**Capsule**

- **Excipients:** May contain Alcohol, propylene glycol.
- **Ciclosporin (Non-proprietary)**
  - Ciclosporin 25 mg: Ciclosporin 25 mg capsules | 30 capsule | £8.50
  - Ciclosporin 50 mg: Ciclosporin 50 mg capsules | 30 capsule | £16.50
  - Ciclosporin 100 mg: Ciclosporin 100 mg capsules | 30 capsule | £24.50

**Capimune (Mylan Ltd)**

- Ciclosporin 25 mg: Capimune 25 mg capsules | 30 capsule | £11.05
  - Ciclosporin 50 mg: Capimune 50 mg capsules | 30 capsule | £22.50
  - Ciclosporin 100 mg: Capimune 100 mg capsules | 30 capsule | £45.00

**Neoral (Novartis Pharmaceuticals UK Ltd)**

- Ciclosporin 10 mg: Neoral 10 mg capsules | 60 capsule | £6.68
  - Ciclosporin 25 mg: Neoral 25 mg capsules | 30 capsule | £6.79
  - Ciclosporin 50 mg: Neoral 50 mg capsules | 30 capsule | £12.88
  - Ciclosporin 100 mg: Neoral 100 mg capsules | 30 capsule | £62.61

**Sandimmun (Novartis Pharmaceuticals UK Ltd)**

- Ciclosporin 25 mg: Sandimmun 25 mg capsules | 30 capsule | £24.65
  - Ciclosporin 50 mg: Sandimmun 50 mg capsules | 30 capsule | £48.27
  - Ciclosporin 100 mg: Sandimmun 100 mg capsules | 30 capsule | £91.61
  - Vanquoral (Teva UK Ltd)
    - Ciclosporin 25 mg: Vanquoral 25 mg capsules | 30 capsule | £13.05
    - Ciclosporin 50 mg: Vanquoral 50 mg capsules | 30 capsule | £25.59
    - Ciclosporin 100 mg: Vanquoral 100 mg capsules | 30 capsule | £48.89

**Solution for infusion**

- **Excipients:** May contain Alcohol, propylene glycol.
- **Neoral (Novartis Pharmaceuticals UK Ltd)**
  - Ciclosporin 100 mg per 1 ml: Neoral 100 mg/ml oral solution (sugar-free) | 50 ml | £55.51
  - Sandimmun (Novartis Pharmaceuticals UK Ltd)
    - Ciclosporin 100 mg per 1 ml: Sandimmun 100 mg/ml oral solution (sugar-free) | 50 ml | £131.27

**Solution for infusion**

- **Excipients:** May contain Alcohol, polyoxyxyl castor oils.
- **Neoral (Novartis Pharmaceuticals UK Ltd)**
  - Ciclosporin 50 mg per 1 ml: Sandimmun 250mg/5ml concentrate for solution for infusion | 10 ampoule | £91.71
  - Sandimmun 50 mg/5 ml concentrate for solution for infusion | 10 ampoule | £193.90

**Sirolimus**

**Drug action** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

**Indications and dose**

Prophylaxis of organ rejection in kidney allograft recipients.

- **By mouth**
  - Adult: Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily for 2–3 months (in combination with ciclosporin and corticosteroid); sirolimus dose should be given 4 hours after ciclosporin), followed by maintenance 2 mg once daily, ciclosporin should then be withdrawn over 4–8 weeks if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration.

**Dose equivalence and conversion**

The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

**Side-effects**

- **Common or very common** Abdominal pain - acne - anaemia - arthralgia - ascites - constipation - diarrhoea - epistaxis - haemolytic uraemic syndrome - headache - hypercholesterolaemia - hyperglycaemia - hypertension - hypertriglyceridaemia - hypokalaemia - hypophosphataemia - impaired healing - leucopenia - lymphocele - Nausea - neutropenia - oedema - osteonecrosis - pleural effusion - pneumonitis - proteinuria...
Malignant disease

- pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- Uncommon Nephrotic syndrome · pancreatitis · pancytopenia · pericardial effusion · pulmonary embolism · pulmonary haemorrhage
- Rare Alveolar proteinosis · anaphylactic reactions · angioedema · exfoliative dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- Frequency not known Focal segmental glomerulosclerosis · reversible impairment of male fertility
- Conception and contraception Effective contraception must be used during treatment and for 12 weeks after stopping.
- Pregnancy Avoid unless essential—toxicity in animal studies.
- Breast feeding Discontinue breast-feeding.

Hepatic impairment
- In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration. Clearance reduced in mild to moderate impairment.
- Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

Monitoring requirements
- Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- Manufacturer advises pre-dose (‘trough’) whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
- Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- When changing between oral solution and tablets, measurement of whole blood ‘trough’ sirolimus concentration after 1–2 weeks is recommended.
- Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

Directions for administration
- Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- Patient and carer advice Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug.
- Tablet
  - Rapamune (Pfizer Ltd)
  - Sirolimus 500 microgram Rapamune 0.5mg tablets
  - 30 tablet [POM] £69.00 DT price = £69.00

- Sirolimus
  - Rapamune 1mg tablets | 30 tablet [POM] £86.49 DT price = £86.49
  - Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [POM] £172.98 DT price = £172.98

Oral solution
- EXCIPIENTS: May contain Ethanol
- Rapamune (Pfizer Ltd)
  - Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution (sugar-free) | 60 ml [POM] £162.41

Tacrolimus

- Drug action Tacrolimus is a calcineurin inhibitor.

Indications and dose

Adoprt®
Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- Adult: 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
- Adult: Seek specialist advice

Advagraf®
Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation
- Adult: 100–200 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- Adult: 200–300 micrograms/kg once daily, to be taken in the morning

Allograft rejection resistant to conventional immunosuppressive therapy
- Adult: Seek specialist advice

Capexion®
Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses
Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

**BY MOUTH**
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

**BY MOUTH**
- Adult: Seek specialist advice

**ENVARSUS®**

Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation

**BY MOUTH**
- Adult: 110–130 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation

**BY MOUTH**
- Adult: 170 micrograms/kg once daily, to be taken in the morning

Rejection therapy

**BY MOUTH**
- Adult: Seek specialist advice

**MODIGRAF®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

**BY MOUTH**
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

**BY MOUTH**
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Rejection therapy

**BY MOUTH**
- Adult: Seek specialist advice

**PROGRAF® CAPSULES**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

**BY MOUTH**
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

**BY MOUTH**
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: Seek specialist advice (consult local protocol)

**TACNI®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate

**BY INTRAVENOUS INFUSION**
- Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Allograft rejection resistant to conventional immunosuppressive therapy

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: Seek specialist advice (consult local protocol)

Rejection therapy

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: Seek specialist advice (consult local protocol)
Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- Adult: Seek specialist advice

Important safety information

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Advagraf® is a prolonged-release capsule that is taken once daily in the morning.
- Advagraf® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand name only.
- CAUTIONS UV light (avoid excessive exposure to sunlight and sunlamps) - increased risk of infections - lymphoproliferative disorders - malignancies - neurotoxicity - QT-interval prolongation
- INTERACTIONS → Appendix 1 (tacrolimus).
- Contra-indication—avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin).
- SIDE-EFFECTS
  - Rare blindness - dehydration - hirsutism - pericardial effusion - posterior reversible encephalopathy syndrome - respiratory distress syndrome - thrombotic thrombocytopenic purpura - toxic epidermal necrolysis
  - Very rare haemorrhagic cystitis - myasthenia - Stevens-Johnson syndrome

Frequency not known agranulocytosis - haemolytic anaemia - pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION

Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to macrolides.

CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment.

PREGNANCY Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.

BRST FEEDING Avoid—present in breast milk.

HEPATIC IMPAIRMENT Dose reduction may be necessary in severe impairment.

twice daily, once in the morning and once in the evening;

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- Adult: Seek specialist advice

VIVADEX®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

BY MOUTH

- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- Adult: Seek specialist advice

Important safety information

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Advagraf®, Prograf®, Capexion®, Tacni®, and Vivadex® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- Midigraf® granules are used to prepare an immediate-release oral suspension which is taken
**MONITORING REQUIREMENTS**

- After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
- Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatitis and renal function.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Prograf®): give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

**PATIENT AND CARER ADVICE**

May affect performance of skilled tasks (e.g. driving). Avoid excessive exposure to UV light including sunlight.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2010) that tacrolimus granules for oral suspension (Modigraf®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, paste, oral solution, mouthwash.

**Modified-release tablet**

- **Envarsus** (Chiesi Ltd)
  - Tacrolimus (as Tacrolimus monohydrate) 750 microgram Envarsus 750 microgram modified-release tablets | 30 tablet | £44.33
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg Envarsus 1 mg modified-release tablets | 30 tablet | £59.10
  - Tacrolimus (as Tacrolimus monohydrate) 4 mg Envarsus 4 mg modified-release tablets | 30 tablet | £236.40

**Capsule**

CAUTIONARY AND ADVISORY LABELS 23

- **Adoport** (Sandoz Ltd)
  - Tacrolimus 500 microgram Adoport 0.5 mg capsules | 50 capsule | £42.92 DT price = £61.88
  - Tacrolimus 750 microgram Adoport 0.75 mg capsules | 50 capsule | £51.75
  - Tacrolimus 1 mg Adoport 1 mg capsules | 50 capsule | £35.69 DT price = £80.28 | 100 capsule | £111.36
  - Tacrolimus 2 mg Adoport 2 mg capsules | 50 capsule | £111.00

**Granules**

CAUTIONARY AND ADVISORY LABELS 13, 23

- **Modigraf** (Astellas Pharma Ltd)
  - Tacrolimus (as Tacrolimus monohydrate) 200 microgram Modigraf 0.2 mg granules sachets (sugar-free) | 50 sachet | £71.30 DT price = £71.30
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg Modigraf 1 mg granules sachets (sugar-free) | 50 sachet | £35.65 DT price = £35.65

**Solution for infusion**

EXCIPIENTS: May contain Polyoxyl castor oils

- **Prograf** (Astellas Pharma Ltd)
  - Tacrolimus 5 mg per 1 ml Prograf 5 mg/1 ml solution for infusion ampoules | 10 ampoule | £59.51

**IMMUNOGLOBULINS**

**Antithymocyte immunoglobulin**

(rabbit)

**INDICATIONS AND DOSE**

Prophylaxis of organ rejection in heart allograft recipients

**BY INTRAVENOUS INFUSION**

- Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

**BY INTRAVENOUS INFUSION**

- Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

**BY INTRAVENOUS INFUSION**

- Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

**CONTRA-INDICATIONS**

Infection

**SIDE-EFFECTS**

Anaphylaxis - cytokine release syndrome—diarrhoea - dysphagia - fever - hypotension - increased susceptibility to infection - increased susceptibility to malignancy - infusion-related reactions - lymphopenia - myalgia - nausea - neutropenia - pruritus - rash - serum sickness - shivering - thrombocytopenia - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Tolerability is increased by pretreatment with an intravenous corticosteroid and antithistamine; an antipyretic drug such as paracetamol may also be beneficial.

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

Monitor blood count.
• **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion (Thymoglobuline®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

• **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Canakinumab
    - **Drug Action** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

**INDICATIONS AND DOSE**

- **Acute gout** in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them
  - **By Subcutaneous Injection**
    - **Adult:** 150 mg for 1 dose, dose may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated
  - Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)
  - **By Subcutaneous Injection**
    - **Adult:** consult product literature

• **Contra-Indications** Active infection - leucopenia - neutropenia

• **CAUTIONS**
  - History of recurrent infection - latent and active tuberculosis - predisposition to infection

**CAUTIONS, FURTHER INFORMATION**

- **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

• **INTERACTIONS** → Appendix 1 (canakinumab).

- Contra-indicated with concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections).

• **SIDE-EFFECTS**
  - **Common or very common** Back pain - increased susceptibility to infection (including serious infection) - injection-site reactions - malaise - neutropenia - vertigo
  - **Uncommon** Gastro-oesophageal reflux
  - **Frequency not known** Malignancy - vomiting

• **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.

• **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk.

• **BREAST FEEDING**
  - Consider if benefit outweighs risk—not known if present in human milk.

• **HEPATIC IMPAIRMENT**
  - No information available.

• **RENAL IMPAIRMENT**
  - Limited information available but manufacturer advises no dose adjustment required.

• **PRE-TREATMENT SCREENING**
  - Patients should be evaluated for latent and active tuberculosis before starting treatment.

• **MONITORING REQUIREMENTS**
  - Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
  - Monitor for signs and symptoms of tuberculosis during and after treatment.

• **MEDICINAL FORMS**
  - Canakinumab 150 mg ilaris 150mg powder for solution for injection vials | 1 vial £9.927.80

**MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)**

**Basiliximab**

• **Drug Action** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

**INDICATIONS AND DOSE**

- **Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimes (specialist use only)**
  - **By Intravenous Injection or By Intravenous Infusion**
    - **Adult:** Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery; withhold second dose if severe hypersensitivity or graft loss occurs

• **CAUTIONS**
  - Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects

• **INTERACTIONS** → Appendix 1 (basiliximab).

• **SIDE-EFFECTS**
  - Atrial flutter - cardiac arrest - cytokine release syndrome - palpitations - severe hypersensitivity reactions

• **CONCEPTION AND CONTRACEPTION**
  - Adequate contraception must be used during treatment and for 16 weeks after last dose.

• **PREGNANCY**
  - Manufacturer advises avoid—no information available.

• **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

• **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Simulect®) give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.

• **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Simulect (Novartis Pharmaceuticals UK Ltd)**
  - **Basiliximab 10 mg** Simulect 10mg powder and solvent for solution for injection vials | 1 vial £758.69 (Hospital only)
  - **Basiliximab 20 mg** Simulect 20mg powder and solvent for solution for injection vials | 1 vial £842.38 (Hospital only)
Belimumab

INDICATIONS AND DOSE
Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy

BY INTRAVENOUS INFUSION
- Adult: 400 mg every 4 weeks

BY MOUTH
- Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

- CAUTIONS Do not initiate until active infections controlled - history or development of malignancy - predisposition to infection
- INTERACTIONS → Appendix 1 (belimumab).
- SIDE-EFFECTS
  - Common or very common Infusion-related reactions
  - Frequency not known Depressions - diarrhoea - hypersensitivity reactions - infections - insomnia - pyrexia - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- PREGNANCY Avoid unless essential.
- BREAST FEEDING Avoid—present in milk in animal studies.
- RENAL IMPAIRMENT Caution in severe impairment—no information available.
- MONITORING REQUIREMENTS Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Benlysta®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Powder for solution for infusion
    - Benlysty (GlaxoSmithKline UK Ltd)
      Belimumab 120 mg Benlysta 120mg powder for concentrate for solution for infusion vials | 1 vial (POZ) £121.50 (Hospital only)
      Belimumab 400 mg Benlysta 400mg powder for concentrate for solution for infusion vials | 1 vial (POZ) £405.00 (Hospital only)

PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

INDICATIONS AND DOSE
Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

BY MOUTH
- Adult: 1 g twice daily, to be started within 72 hours of transplantation

- CAUTIONS Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) - children (higher incidence of side-effects may call for temporary reduction of dose or interruption) - delayed graft function - elderly (increased risk of infection, gastrointestinal haemorrhage and pulmonary oedema) - increased susceptibility to skin cancer (avoid exposure to strong sunlight) - risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION
Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

- INTERACTIONS → Appendix 1 (mycophenolate).
- Live vaccines Specialist advice should be sought for those being treated with immunosuppressive drugs.

SIDE-EFFECTS
- Frequency not known Interstitial lung disease - intestinal villous atrophy - progressive multifocal leucoencephalopathy - pulmonary fibrosis

SIDE-EFFECTS, FURTHER INFORMATION
Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or...
discontinuation should be considered under specialist supervision.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting treatment. Effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment. **MYFORTIC** Manufacturer advises that men should use condoms during treatment and for 13 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid—congenital malformations reported.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT** No data available in cardiac or hepatic transplant patients with renal impairment.

- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (CellCept®), give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.

- **PATIENT AND CARER ADVICE**

  - Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

    - **MYCOPHENOLATE MOFETIL (Non-proprietary)**
      - Mycophenolate moifetil 500 mg Mycophenolate moifetil 500mg tablets | 50 tablet [Pos] £42.50 DT price = £10.15
      - CellCept (Roche Products Ltd)
      - Mycophenolate moifetil 500 mg CellCept 500mg tablets | 50 tablet [Pos] £82.26 DT price = £10.15
      - Brands may include Myfenax

  - **Gastro-resistant tablet** CAUTIONARY AND ADVISORY LABELS 25

    - Myfortic (Novartis Pharmaceuticals UK Ltd)
      - Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180mg gastro-resistant tablets | 120 tablet [Pos] £96.72
      - Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360mg gastro-resistant tablets | 120 tablet [Pos] £193.43

  - **Capsule**

    - **MYCOPHENOLATE MOFETIL (Non-proprietary)**
      - Mycophenolate moifetil 250 mg Mycophenolate moifetil 250mg capsules | 100 capsule [Pos] £82.26 DT price = £82.26
      - CellCept (Roche Products Ltd)
      - Mycophenolate moifetil 250 mg CellCept 250mg capsules | 100 capsule [Pos] £82.26 DT price = £82.26
      - Brands may include Myfenax

  - **Oral suspension** EXCIPIENTS: May contain Aspartame

    - CellCept (Roche Products Ltd)
      - Mycophenolate moifetil 200 mg per 1 ml CellCept 1g/5ml oral suspension (sugar-free) | 175 ml [Pos] £115.16

  - **Powder for solution for infusion**

    - CellCept (Roche Products Ltd)
      - Mycophenolate moifetil (as Mycophenolate moefetil hydrochloride) 500 mg CellCept 500mg powder for solution for infusion vials | 4 vial [Pos] £36.49

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - **Fampridine**

    - **INDICATIONS AND DOSE** Improvement of walking disability in multiple sclerosis (specialist use only)

      - **BY MOUTH**
        - Adult. 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

      - **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)

      - **CAUTIONS** Atioventricular conduction disorders - predisposition to seizures - sinoatrial conduction disorders - symptomatic cardiac rhythm disorders

      - **INTERACTIONS** Appendix 1 (fampridine). Caution in concomitant use of drugs that lower seizure threshold.
Multiple sclerosis 727

* SIDE-EFFECTS
  * Common or very common: Anxiety, back pain, constipation, dizziness, dyspepsia, dysphoria, headache, insomnia, malaise, nausea, paraesthesia, pharyngolaryngeal pain, tremor, urinary tract infection, vomiting.
  * Uncommon: Seizures.
  * Pregnancy: Avoid—toxicity in animal studies.
  * Breast feeding: Avoid—no information available.
  * Renal impairment: Avoid if eGFR less than 80 mL/minute/1.73 m².
  * Prescribing and dispensing information: Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

* Medicinal forms
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
  - Modified-release tablet

**Dimethyl fumarate**

**Drug action**: Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

**Indications and dose**
- Treatment of adults with relapsing-remitting multiple sclerosis (initiated by a specialist)
- **By mouth**
  - **Adult**: 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustment due to side effects—consult product literature

**Caution**
- Reduced lymphocyte count - risk of serious infections (do not start treatment until resolved and consider suspending treatment if infection develops during treatment) - severe active gastro-intestinal disease

**Side-effects**
- Abdominal pain - burning sensation - diarrhoea - dyspepsia - erythema - flushing (may be severe and indicate hypersensitivity) - gastritis - gastroenteritis - leucopenia - lymphopenia - nausea - proteinuria - pruritus - rash - vomiting

**Side-effects, further information**
- Progressive multifocal leuкоencephalopathy (PML): Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.
- Conception and contraception: Contraception required in women of child-bearing potential (consider non-hormonal methods).
- Pregnancy: Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in animal studies.
- Breast feeding: Manufacturer advises avoid.
- Hepatic impairment: Manufacturer advises caution in severe impairment.
- Renal impairment: Manufacturer advises caution in severe impairment.
- Monitoring requirements
  - Monitor full blood count (including lymphocytes) before treatment (within 6 months before initiation), then every 6 to 12 months thereafter, and as clinically indicated.
  - Monitor patient closely for features of progressive multifocal leuкоencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
  - Monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated.

**Patient and carer advice**
- Patient information leaflet should be provided. Counselling is advised on progressive multifocal leuкоencephalopathy.

**National funding/access decisions**
- **NICE technology appraisals (TAs)**
  - Dimethyl fumarate for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320
  - Dimethyl fumarate is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
    - the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
    - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
  - Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA320](http://www.nice.org.uk/TA320)

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**
- Cautionary and advisory labels 23, 25
  - **Fingolimod (Biogen Idec Ltd)**
  - Dimethyl fumarate 120 mg Tecfidera 120mg gastro-resistant capsules | 14 capsule | £343.00
  - Dimethyl fumarate 240 mg Tecfidera 240mg gastro-resistant capsules | 56 capsule | £1,373.00

**ImmunoModulating drugs**

**Fingolimod**

**Drug action**: Fingolimod is an immunomodulating drug.

**Indications and dose**
- Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)
- **By mouth**
  - **Adult**: 500 micrograms once daily

**Important safety information**
- **MHRA/CHM advice**: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT Bradycardia or heart block after the first dose and following treatment interruption (January 2013)
  - Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:
    - Patients with the following medical conditions:
      1. 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
      2. Significant QT prolongation (QT-interval greater than 470 milliseconds in women or greater than 450 milliseconds in men)
      3. History of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial
infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.

**Patients receiving the following antiarrhythmic or heart-rate lowering drugs:**
- class Ia or class III antiarrhythmics
- beta blockers
- heart rate-lowering calcium channel blockers
- other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).

All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:

**Pre-treatment**
- a 12-lead ECG and blood pressure measurement before starting
- continuous ECG monitoring for 6 hours
- blood pressure and heart rate measurement every hour

**During the first 6 hours of treatment**
- a further 12-lead ECG and blood pressure measurement

If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradyarrhythmia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

**Note**
First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:
- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment

If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

**CONTRA-INDICATIONS** Active infection - active malignancies (except cutaneous basal cell carcinoma) - immunosuppression

**CAUTIONS** Check varicella zoster virus status—consult product literature for further information - chronic obstructive pulmonary disease - pulmonary fibrosis - risk of macular oedema - severe respiratory disease - susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS** → Appendix 1 (fingolimod).

Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**
- Uncommon Macular oedema - neutropenia - pneumonia
- Frequency not known Haemophagocytic syndrome - lymphoma

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.

**PREGNANCY** Avoid (toxicity in animal studies).

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

**MONITORING REQUIREMENTS**
- Eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
- Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature.

- Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatitis, splenomegaly and adenopathy)—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254

Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
- they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and
- the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme

Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA254

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (August 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- Gilenya (Novartis Pharmaceuticals UK Ltd) ▼
- Fingolimod (as Fingolimod hydrochloride) 500 microgram Gilenya 0.5mg capsules | 7 capsule (PO) £367.50 | 28 capsule (PO) £1,470.00

**Glartiramer acetate**

**DRUG ACTION** Glartiramer is an immunomodulating drug comprising synthetic polypeptides.

**INDICATIONS AND DOSE**
Treatment of initial symptoms in patients at high risk of developing multiple sclerosis (initiated under specialist supervision) / Reducing frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years (initiated under specialist supervision) by subcutaneous injection
- Adult: 20 mg daily
INTERFERONS

Interferon beta

INDICATIONS AND DOSE

**REBIF® PRE-FILLED PEN AND SYRINGE**

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis) BY SUBCUTANEOUS INJECTION

- **Adult:** (consult product literature)

**CONTRA-INDICATIONS**

Decompensated liver disease • severe depressive illness

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Consult product literature for further information on contra-indications.

**CAUTIONS**

History of cardiac disorders • history of depressive disorders (avoid in severe depression or in those with suicidal ideation) • history of seizures • history of severe myelosuppression

**CAUTIONS, FURTHER INFORMATION**

Consult product literature for further information on cautions.
8

Malignant disease

Malignant disease

▶ NATIONAL FUNDING/ACCESS DECISIONS

PRESCRIBING AND DISPENSING INFORMATION

Patients should also be monitored for signs and symptoms of hepatic impairment.

▶ CONCEPTION AND CONTRAINDICATIONS

Effective contraception is required during treatment—consult product literature.

▶ PREGNANCY

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

▶ BREAST FEEDING

Avoid—no information available.

▶ HEPATIC IMPAIRMENT

Caution in severe hepatic impairment.

▶ RENAL IMPAIRMENT

Caution in severe renal impairment.

▶ MONITORING REQUIREMENTS

Monitor for signs of hepatic injury—hepatic failure has been reported rarely.

▶ Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).

▶ Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treatment should be stopped immediately and considering interferon beta treatment.

▶ PRESCRIBING AND DISPENSING INFORMATION

BETAFERON® INJECTION

An auto-injector device is available from Bayer Schering.

EXTAVIA®

An auto-injector device (ExtaviPro® 30g) is supplied as part of the ExtaviPro® 30g kit.

REBIF®

Cartridges for use with RebiSmart® auto-injector device.

▶ NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Interferon beta and glatiramer for multiple sclerosis (January 2002) NICE T32

Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment. www.nice.org.uk/TA32

NHS restrictions

 Provision of disease-modifying therapies for multiple sclerosis

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

▶ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

Avonex (Biogen Idec Ltd)

Interferon beta-1a 12 mega u per 1 ml Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 4 pre-filled disposable injection (P) £654.00 | 12 pre-filled disposable injection (P) £1,962.00

Interferon beta-1a 5 mega u per 1 ml Avonex 15micrograms/0.25ml (3million units) solution for injection pre-filled syringes | 4 pre-filled disposable injection (P) £317.52

Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled pen | 4 pre-filled disposable injection (P) £654.00 | 12 pre-filled disposable injection (P) £1,962.00

Rebif (Merck Serono Ltd)

Interferon beta-1a 12 mega u per 1 ml Rebif 22micrograms/0.5ml (6million units) solution for injection 1.5ml cartridges | 4 cartridge (P) £613.52

Rebif 8.8micrograms/0.2ml (2.4million units) solution for injection pre-filled syringes | 6 pre-filled disposable injection (P) no price available

Rebif 8.8micrograms/0.2ml (2.4million units) solution for injection pre-filled pen | 6 pre-filled disposable injection (P) no price available

Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled pen | 6 pre-filled disposable injection (P) no price available

Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection (P) £613.52

Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection (P) £1,962.00

Interferon beta-1a 24 mega u per 1 ml Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled pen | 12 pre-filled disposable injection (P) £813.21

Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection (P) £813.21

Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection (P) £1,962.00

Powder and solvent for solution for injection

Avonex (Biogen Idec Ltd)

Interferon beta-1a 30 microgram Avonex 30microgram powder and solvent for solution for injection vials | 4 vial (P) £654.00

Betalferon (Bayer Plc)

Interferon beta-1b 300 microgram Betalferon 300microgram powder and solvent for solution for injection vials | 15 vial (P) £596.63

Extavia (Novartis Pharmaceuticals UK Ltd)

Interferon beta-1b 300 microgram Extavia 300microgram powder and solvent for solution for injection vials | 15 vial (P) £596.63

Peginterferon beta-1a

▶ DRUG ACTION

Peginterferon beta-1a is a polyethylene glycol-conjugated (‘pegylated’) derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

INDICATIONS AND DOSE

Treatment of relapsing, remitting multiple sclerosis

BY SUBCUTANEOUS INJECTION

Adults: (consult product literature)

▶ CONTRA-INDICATIONS

Severe depression - suicidal ideation

▶ CAUTIONS

History of cardiac disorders - history of depressive disorders (avoid in severe depression or in those with suicidal ideation) - history of seizures - history of severe myelosuppression

CAUTIONS, FURTHER INFORMATION

Consult product literature for further information about cautions.

▶ SIDE-EFFECTS

Consult product literature for information about side effects.
**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.

**BOOSTER FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Caution in severe hepatic impairment.

**RENAL IMPAIRMENT** Caution in severe renal impairment.

**MONITORING REQUIREMENTS**
- Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
- Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- Nephrotic syndrome Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Plegridy (Biogen Idec Ltd)
- Peginterferon beta-1a 126 microgram per 1 ml Plegridy 63 micrograms/0.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (no price available)
- Peginterferon beta-1a 188 microgram per 1 ml Plegridy 94 micrograms/0.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (no price available)
- Peginterferon beta-1a 250 microgram per 1 ml Plegridy 125 micrograms/0.5 ml solution for injection pre-filled pen | 2 pre-filled disposable injection (no price available) 1554.00 | 6 pre-filled disposable injection £1,962.00

**MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)**

**Anti-lymphocyte monoclonal antibodies**
- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

**Important safety information**

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

**SIDE-EFFECTS**
- **Common or very common** Allergic reactions - angioedema - bronchospasm - chills - cytokine release syndrome - dyspnoea - fever - flushing - nausea - pruritus - rash - tumour pain - vomiting
- **Frequency not known** Cardiac events

**SIDE-EFFECTS, FURTHER INFORMATION**

**Infusion-related side-effects** In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

**Cytokine release syndrome** Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

**PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

**MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

**Alemtuzumab**

**INDICATIONS AND DOSE**

Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

**BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

**UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

**CONTRA-INDICATIONS**

Human immunodeficiency virus

**CAUTIONS**

- Hepatitis B carriers - hepatitis C carriers - in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled - not recommended for inactive disease - not recommended for stable disease - patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course - patients with previous autoimmune conditions other than multiple sclerosis - pretreatment before administration is required (consult product literature)

**CAUTIONS, FURTHER INFORMATION**

**Autoimmune mediated conditions** The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature).

For full details of cautions, consult product literature.

**INTERACTIONS**

- Appendix 1 (alemtuzumab).

**SIDE-EFFECTS**

For full side effects details (including monitoring and management) consult product literature.

**CONCEPTION AND CONTRACEPTION**

Women of childbearing potential should use effective contraception during and for 4 months after treatment.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).
Malignant disease

CAUTIONS

l Drug Action Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

Indications and dose

Highly active relapsing-remitting multiple sclerosis (initiated under specialist supervision)

By intravenous infusion

l Adult: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

Contra-indications

Active infection • active malignancies (except cutaneous basal cell carcinoma) • immunosuppression • progressive multifocal leucoencephalopathy

Cautions

Contra-indications. Further information

Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued. For information on cautions consult product literature.

Interactions

Appendix 1 (natalizumab).

SIDE-EFFECTS

l Common or very common Arthralgia • autoantibodies • nasopharyngitis • urinary-tract infection

l Uncommon Hypersensitivity reactions (discontinue permanently)

Frequency not known Arthralgia (during infusion) • dizziness (during infusion) • fatigue (during infusion) • flushing (during infusion) • headache (during infusion) • increased risk of opportunistic infection • liver toxicity • nausea (during infusion) • pruritus (during infusion) • pyrexia (during infusion) • rigors (during infusion) • urticaria (during infusion) • vomiting (during infusion)

SIDE-EFFECTS, FURTHER INFORMATION

Progressive Multifocal Leucoencephalopathy If Progressive Multifocal Leucoencephalopathy (PML) is suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Liver toxicity Discontinue treatment if significant liver injury occurs.

Pregnancy

Avoid unless essential—toxicity in animal studies.

Breast feeding Present in milk in animal studies—avoid.

Pre-treatment screening

Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab. Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

Monitoring requirements

Monitor liver function.

Arthralgia (during infusion) • dizziness (during infusion) • fatigue (during infusion) • flushing (during infusion) • headache (during infusion) • increased risk of opportunistic infection • liver toxicity • nausea (during infusion) • pruritus (during infusion) • pyrexia (during infusion) • rigors (during infusion) • urticaria (during infusion) • vomiting (during infusion)

Malignant disease

BREAST FEEDING

Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.

Pre-treatment screening

Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.

Monitoring requirements

HPV screening should be carried out annually in female patients.

Prescribing and dispensing information

All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.

Patient and carer advice

Patients should be provided with a Patient Alert Card and Patient Guide.

National funding/access decisions

Teriflunomide

**INDICATIONS AND DOSE**

Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

**BY MOUTH**

- Adult: 14 mg once daily

- **CONTRA-INDICATIONS**
  - Anaemia
  - Leucopenia
  - Neutropenia
  - Serious infection
  - Severe hypoproteinaemia
  - Severe immunodeficiency
  - Significantly impaired bone-marrow function
  - Thrombocytopenia

- **CAUTIONS**
  - Adult over 65 years: anaemia, dyspnoea—assess for interstitial lung disease and consider suspending treatment
  - Hypoproteinaemia (avoid if severe)
  - Impaired bone-marrow function (avoid if severe)
  - Latent tuberculosis
  - Leucopenia
  - Persistent cough—assess for interstitial lung disease and consider suspending treatment
  - Severe infection—delay or suspend treatment until resolved
  - Significant alcohol consumption—signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment—switching between other immunomodulating drugs
  - Thrombocytopenia

- **INTERACTIONS**
  - Appendix 1 (teriflunomide)

- **SIDE-EFFECTS**
  - Common or very common: Acne, alopecia, anxiety, carpal tunnel syndrome, cystitis, diarrhoea, elevated liver enzymes, gastroenteritis, hyperaesthesia, hypertension, laryngitis, leucopenia, menorrhagia, musculoskeletal pain, myalgia, nausea, neuralgia, neutropenia, oral infection, paraesthesia, peripheral neuropathy, pollakiuria, rash, respiratory tract infection, sciatica, tinea pedis, urinary tract infection, vomiting, weight loss

- **Uncommon**
  - Anaemia
  - Thrombocytopenia

- **Very rare**
  - Interstitial lung disease
  - Pancreatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Accelerated elimination procedure**

**Important**

Accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

**Hepatic injury**

Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

**CONCEPTION AND CONTRACEPTION**

Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment.

In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception.

Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.

- Monitor blood pressure before treatment and periodically thereafter.

- Hepatic monitoring: Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range: discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

**TREATMENT CESSATION**

Accelerated elimination procedure

To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give either colestyramine p. 173 or charcoal, activated p. 1130. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007) NICE TA127

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

- **Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

**PYRIMIDINE SYNTHESIS INHIBITORS**

**Teriflunomide**

**DRUG ACTION**

Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.
2 Malignant disease

2.1 Antibody responsive malignancy

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)

Rituximab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

INDICATIONS AND DOSE

Treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (in combination with methotrexate)

BY INTRAVENOUS INFUSION

Adult: 1 g, then 1 g after 2 weeks, patients should receive premedication before each infusion (consult product literature for details)

Treatment of previously untreated stage III-IV follicular lymphoma (in combination with other chemotherapy)

Maintenance therapy in patients with follicular non-Hodgkin’s lymphoma that has responded to induction therapy (in combination with other chemotherapy)

Treatment of diffuse large B-cell non-Hodgkin’s lymphoma (in combination with other chemotherapy)

Treatment of chemotherapy-resistant or relapsed stage III-IV follicular non-Hodgkin’s lymphoma

Previously untreated or relapsed chronic lymphocytic leukaemia

Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis (in combination with glucocorticoids)

BY INTRAVENOUS INFUSION

Adult: Patients should receive premedication before each dose (consult product literature for details)

(consult product literature or local protocols)

CONTRA-INDICATIONS

Severe heart failure (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis) - severe infection - severe, uncontrolled heart disease (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis)

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS

History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported - patients receiving cardiotoxic chemotherapy; in adults exacerbation of angina, arrhythmia, and heart failure have been reported - transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

SPECIFIC CAUTIONS

When used for rheumatoid arthritis predisposition to infection

CAUTIONS, FURTHER INFORMATION

Hepatitis B infection and reactivation

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

INTERACTIONS

Appendix 1 (rituximab).

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

Progressive multifocal leucoencephalopathy

Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

For full details, including management of side-effects, consult product literature.

CONCEPTION AND CONTRACEPTION

Effective contraception (in both sexes) required during and for 12 months after treatment.

PREGNANCY

Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

BREAST FEEDING

Avoid breast-feeding during and for 12 months after treatment.

MONITORING REQUIREMENTS

For full details on monitoring requirements consult product literature.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (MabThera®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1-4 mg/mL and gently invert bag to avoid foaming.

PATIENT AND CARER ADVICE

Alert card Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Rituximab for aggressive non-Hodgkin’s lymphoma

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of
CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV. The use of rituximab for localised (stage I) disease should be limited to clinical trials. www.nice.org.uk/TA65

- **Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma (February 2008) NICE TA57**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma.
  Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma, in remission induced with chemotherapy (with or without rituximab). Rituximab monotherapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy). www.nice.org.uk/TA137

- **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009) NICE TA174**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/TA174

- **Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010) NICE TA193**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:
  - is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or
  - has previously been treated with rituximab, unless it was in the context of a clinical trial, or a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

- **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195**
  Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained. www.nice.org.uk/TA195

- **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma (June 2011) NICE TA226**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy. www.nice.org.uk/TA226

- **Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012) NICE TA243**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
  - cyclophosphamide, vincristine and prednisolone (CVP);
  - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
  - mitoxantrone, chlorambucil and prednisolone (MCP);
  - cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); or
  - chlorambucil is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients. www.nice.org.uk/TA243

- **Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmatic antibody-associated vasculitis (March 2014) NICE TA308**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmatic antibody (ANCA)-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:
  - further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, or
  - cyclophosphamide is contraindicated or not tolerated, or
  - the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, or
  - the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months or
  - the patient has had uroepithelial malignancy. www.nice.org.uk/TA308

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

The Scottish Medicines Consortium has advised (June 2014) that subcutaneous rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **MabThera (Roche Products Ltd)**
  Rituximab 119.66 mg per 1 ml MabThera 1400mg/11.7ml solution for injection vials | 1 vial £34.65 (Hospital only)

**Solution for infusion**

- **MabThera (Roche Products Ltd)**
  Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 1 vial £873.15
MONOClonAL ANTibodies (ANTIneoPlastic)

Bevacizumab

DRUG ACTION Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy / First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate / First-line treatment of metastatic breast cancer in combination with capcitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capcitabine) / Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a / First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy) / First-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel) / First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)

BY INTRAVENOUS INFUSION

Adult: (consult local protocol)

Important safety information

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

CAUTIONS Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) / history of arterial thromboembolism / history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) / history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) / increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) / increased risk of tumour-associated haemorrhage / intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) / uncontrolled hypertension - untreated CNS metastases

INTERACTIONS ➔ Appendix 1 (bevacizumab).

CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 6 months after treatment in women

PREGNANCY Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in cytotoxic drugs, p. 746.

BREAST FEEDING Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.

MONITORING REQUIREMENTS

Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.

Monitor blood pressure.

Monitor for congestive heart failure.

Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).

Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118

Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy. www.nice.org.uk/TA118

Bevacizumab (first-line), sorafenib (firstand second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178

Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. www.nice.org.uk/TA178

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine is not recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212

Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214

Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer. www.nice.org.uk/TA214
Brentuximab vedotin and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007). www.nice.org.uk/TA242

Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263

Bevacizumab in combination with capecitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. www.nice.org.uk/TA263

Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/TA284

Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents. www.nice.org.uk/TA285

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2012) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for infusion

Avastin® (Roche Products Ltd)

Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial (POD) £324.40 (Hospital only)

Avastin 100mg/4ml solution for infusion vials | 1 vial (POD) £242.66 (Hospital only)

Brentuximab vedotin

INDICATIONS AND DOSE

Treatment of relapsed or refractory CD-30 positive Hodgkin’s disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option | Relapsed or refractory systemic anaplastic large cell lymphoma

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

CAUTIONS

Elevated BMI—risk of hyperglycaemia • high tumour burden—risk of tumour lysis syndrome • rapidly proliferating tumours—risk of tumour lysis syndrome

INTERACTIONS

Appendix 1 (brentuximab vedotin).

SIDE-EFFECTS

Common or very common

Abdominal pain • anorexia • anxiety • arthralgia • cholangitis • constipation • cough • dehydration • diarrhoea • dizziness • dyspepsia • dyspnoea • electrolyte disturbances • fatigue • headache • hyperglycaemia • hypertension • hypotension • hypoesthesia • ileus • infection • insomnia • leukocytosis • myalgia • pleural effusion • proteinuria • rash • skin reactions • sweating • tachycardia • vertigo

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for infusion

Avastin® (Roche Products Ltd)

Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial (POD) £324.40 (Hospital only)

Avastin 100mg/4ml solution for infusion vials | 1 vial (POD) £242.66 (Hospital only)

Catumaxomab

INDICATIONS AND DOSE

Treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible

BY INTRAPERITONEAL INFUSION

Adult: (consult product literature)

CAUTIONS

Haemodynamic insufficiency • hypoproteinaemia • oedema

INTERACTIONS

Appendix 1 (catumaxomab).

SIDE-EFFECTS

Common or very common

Abdominal pain • anorexia • anxiety • arthralgia • cholangitis • constipation • cough • dehydration • diarrhoea • dizziness • dyspepsia • dyspnoea • electrolyte disturbances • fatigue • headache • hyperglycaemia • hypertension • hypotension • hypoesthesia • ileus • infection • insomnia • leukocytosis • myalgia • pleural effusion • proteinuria • rash • skin reactions • sweating • tachycardia • vertigo
Cetuximab

**INDICATIONS AND DOSE**

Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated. Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy). Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy).

**BY INTRAVENOUS INFUSION**

- Adult (initiated by a specialist): consult product literature or local protocols.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

**CONTRA-INDICATIONS**

RAS mutated colorectal tumours (or if RAS tumour status unknown) - combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status.

**CAUTIONS**

Cardiopulmonary disease - cardiovascular disease - history of keratitis - pulmonary disease - discontinue if interstitial lung disease - risk factors for keratitis - severe dry eye - ulcerative keratitis (including contact lens use).

**INTERACTIONS**

Appendix 1 (cetuximab).

**SIDE-EFFECTS**

- Very rare: Stevens-Johnson syndrome - toxic epidermal necrolysis.

**PREGNANCY**

Use only if potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Avoid breast-feeding during and for 2 months after treatment—no information available.

**PRE-TREATMENT SCREENING**

Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.

**DIRECTIONS FOR ADMINISTRATION**

Resuscitation facilities should be available.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145.

- Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated. www.nice.org.uk/TA145

- Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009) NICE TA172.

- Cetuximab in combination with platinum-based chemotherapy is not recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck. www.nice.org.uk/TA172.

Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is unresectable; and
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be...
assessed for resection of liver metastases. www.nice.org.uk/TA176

- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

Cetuximab monotherapy or combination chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that cetuximab (Erbitux®) is accepted for restricted use within NHS Scotland, in combination with irinotecan or oxaliplatin-based chemotherapy, for the treatment of RAS wild-type metastatic colorectal cancer in patients who have not previously received chemotherapy for their metastatic disease (first-line treatment).

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Erbitux (Merck-Serono Ltd)
  
  Cetuximab 5 mg per 1 ml 100mg/20ml solution for infusion vials | 1 vial (£0.178.10 (Hospital only))
  
  Erbitux 500mg/100ml solution for infusion vials | 1 vial (£0.180.50 (Hospital only))

Ipilimumab

- **DRUG ACTION** Ipilimumab causes T-cell activation.

**INDICATIONS AND DOSE**

Treatment of unresectable or metastatic advanced melanoma

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

- **CAUTIONS** For full details consult product literature.

- **INTERACTIONS** Appendix 1 (ipilimumab).

- **SIDE-EFFECTS, FURTHER INFORMATION**

**SIDE-EFFECTS** Infusion-related side-effects

**IMMUNE-RELATED REACTIONS** A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

For further information on side-effects, (including monitoring and management of side effects) consult product literature.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception.

- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- **BREAST FEEDING** Discontinue breast-feeding—no information available.

- **HEPATIC IMPAIRMENT** Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.

- **MONITORING REQUIREMENTS** For information on monitoring of side effects, consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268

Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA268

- Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319

Ipilimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA319

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2013) that ipilimumab (Yervoy®) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Yervoy (Bristol-Myers Squibb Pharmaceuticals Ltd)
  
  Ipilimumab 5 mg per 1 ml 50mg/10ml concentrate for solution for infusion vials | 1 vial (£3,750.00 (Hospital only))
  
  Ipilimumab 200mg/40ml concentrate for solution for infusion vials | 1 vial (£15,000.00 (Hospital only))

Obinutuzumab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

**INDICATIONS AND DOSE**

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** For obinutuzumab contra-indications, consult product literature.

- **CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

Hepatitis B infection and reactivation

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking obinutuzumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on the cautions of obinutuzumab, consult product literature.

- **INTERACTIONS** Appendix 1 (obinutuzumab).

- **SIDE-EFFECTS** For full side effect details for obinutuzumab (including monitoring and management), consult product literature.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 18 months after treatment.

- **PREGNANCY** Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- Gazyvaro (Roche Products Ltd)
  - Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial (£3,312.00 (Hospital only)

---

**Ofatumumab**
The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

**INDICATIONS AND DOSE**
- Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab
- Treatment of CLL in patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)

**BY INTRAVENOUS INFUSION**
- Adult: Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details (consult local protocol)

---

**CONTRA-INDICATIONS**
For full details on the contra-indications for ofatumumab, consult product literature.

**CAUTIONS**
History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur

**CAUTIONS, FURTHER INFORMATION**
- Hepatitis B infection and reactivation
  - Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking ofatumumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details about the cautions for ofatumumab, consult product literature.

**INTERACTIONS**
- Appendix 1 (ofatumumab).
Panitumumab

**DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

**INDICATIONS AND DOSE**
Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) / Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin- and irinotecan-containing chemotherapy regimens) BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

**INTERACTIONS**

- Contraindications and precautions
  - INTERACTIONS
  - CONTRA-INDICATIONS
  - Common or very common
  - Anorexia, anxiety, back pain, biochemical disturbances, cellulitis, cheilitis, chills, cough, deep vein thrombosis, dyspnea, dysphonia, electrolyte disturbances, epistaxis, eyelash growth, flushing, folliculitis, gastro-oesophageal reflux disease, hyperhydrosis, insomnia, malaise, pain in extremities, peripheral oedema, pulmonary embolism, pyrexia, rectal haemorrhage, severe hypersensitivity reactions (possibly delayed), urinary tract infection, weight loss
  - Uncommon
  - Bronchospasm, cyanosis, hirsutism, infusion-related reactions, nasal dryness
  - Rare
  - Keratitis, skin necrosis, Stevens-Johnson syndrome
  - Toxic epidermal necrolysis
  - Frequency not known
  - Abdominal pain, acne, alopecia, bone-marrow suppression, conjunctivitis, constipation, dehydration, diarrhoea, dizziness, dry eyes, dry mouth, dry skin, erythema, extravasation, hand-foot syndrome, headache, hypertension, hypertrichosis, hyperuricaemia, hypocalcaemia, hypomagnesaemia, hypotension, increased lacrimation, interstitial lung disease, mucosal inflammation, nail disorders, nausea, ocular disorders, ocular hyperaemia, oral mucositis, pruritus, rash, skin reactions, tachycardia, thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception during and for at least 6 months after treatment in women

**PREGNANCY**
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Manufacturer advises avoid breastfeeding during and for 2 months after treatment.

**PRE-TREATMENT SCREENING**
Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.

**MONITORING REQUIREMENTS**

- Monitor for hypomagnesaemia.
- Monitor for hypocalcaemia.
- Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)

- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
- Panitinumab monotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ELECTROLYTES: May contain Sodium
  - Vectibix (Amgen Ltd)
    - Panitumumab 20 mg per 1 ml Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial (P) £1.517.16 (Hospital only)
    - Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial (P) £1379.29 (Hospital only)

Pertuzumab

**DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

**INDICATIONS AND DOSE**
Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist) BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

**CAUTIONS**
Conditions that could impair left ventricular function, history of congestive heart failure, impaired left ventricular function, prior anthracycline exposure, radiotherapy to the chest area, recent myocardial infarction, serious cardiac arrhythmia, uncontrolled hypertension

**INTERACTIONS**

- Appendix 1 (pertuzumab).
Siltuximab

**DRUG ACTION** Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

**INDICATIONS AND DOSE**

Treatment of multicentric Castleman’s disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative

*By intravenous infusion*

- Adult: 11 mg/kg every 3 weeks

**CAUTIONS** Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation—severe infection—withdraw treatment until resolved—treat infection prior to treatment

**CAUTIONS, FURTHER INFORMATION**

Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment. Consult product literature for further information about siltuximab cautions.

**INTERACTIONS** Appendices 1 (siltuximab).

Live vaccines should not be given concurrently or within 4 weeks before starting siltuximab treatment.

**SIDE-EFFECTS**

- **Common or very common** When used in combination with trastuzumab and docetaxel: anaemia; arthralgia; chills; constipation; cough; decreased appetite; diarrhoea; dizziness; dry skin; dyspepsia; dyspnoea; febrile neutropenia; headache; increased lacrimation; infusion-related reactions; insomnia; left ventricular dysfunction; leucopenia; malaise; myalgia; nail disorder; nasopharyngitis; neutropenia; oedema; pain; paronychia; peripheral neuropathy; pleural effusion; pruritus; pyrexia; rash; severe hypersensitivity reactions; taste disturbance; upper respiratory tract infection

- **Uncommon** Interstitial lung disease (when used in combination with trastuzumab and docetaxel)

- **Frequency not known** Alopecia; bone-marrow suppression; extravasation; hyperuricaemia; nausea; oral mucositis; thromboembolism; tumour lysis syndrome; vomiting

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least six months after treatment in women of childbearing potential

**PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Caution—no information available.

**RENAL IMPAIRMENT** Caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.
- Monitor for febrile neutropenia.

**DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Perjeta (Roche Products Ltd)

  - Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials | 1 vial (£2,395.00 Hospital only)

- Sylvant (Janssen-Cilag Ltd)

  - Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial (£415.00 Hospital only)
  - Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial (£1,661.00 Hospital only)

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related side effects Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids should be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

**CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 3 months after treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Use with caution in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.
- Monitor for infection during treatment.

**DIRECTIONS FOR ADMINISTRATION** For Intravenous infusion (Sylvant®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Sylvant (Janssen-Cilag Ltd)

  - Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial (£415.00 Hospital only)
  - Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial (£1,661.00 Hospital only)
Trastuzumab

INDICATIONS AND DOSE
Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

BY INTRAVENTRUS INFUSION OR BY SUBCUTANEOUS INJECTION
Adult: (consult product literature or local protocols)
Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)

BY INTRAVENTRUS INFUSION OR BY SUBCUTANEOUS INJECTION
Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

BY INTRAVENTRUS INFUSION
Adult: (consult product literature or local protocols)

CONTRA-INDICATIONS
Severe dyspnoea at rest

CAUTIONS
Coronary artery disease | history of hypertension | symptomatic heart failure | uncontrolled arrhythmias

INTERACTIONS
Appendix 1 (trastuzumab)

Use with anthracyclines
Concomitant use of trastuzumab with anthracyclines is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

SIDE-EFFECTS
Acne | alopecia | anaphylaxis | angioedema | anxiety | arthralgia | arthritis | asthenia | bone pain | bone-marrow suppression | cardiotoxicity | chest pain | chills | depression | dizziness | drowsiness | dry eye | dry skin | ecchymosis | extravasation | fever | gastrointestinal symptoms | headache | hepatitis | hypersensitivity reactions | hypertension | hypotonia | hyperuricaemia | hypotension | increased lacrimation | infection | infusion-related side-effects (possibly delayed onset) | insomnia | leg cramps | malaise | mastitis | myalgia | nail disorders | nausea | oedema | oral mucositis | paraesthesia | paresthesia | peripheral neuropathy | pruritus | pulmonary events (possibly delayed onset) | rash | sweating | taste disturbance | thromboembolism | tremor | tumour lysis syndrome | urticaria | vomiting | weight loss

PREGNANCY
Manufacturer advises avoid—oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Avoid breast-feeding during treatment and for 7 months afterwards.

MONITORING REQUIREMENTS
Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.

DIRECTIONS FOR ADMINISTRATION
Resuscitation facilities should be available during administration of trastuzumab.

PRESCRIBING AND DISPENSING INFORMATION
When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is not interchangeable with trastuzumab emtansine.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34
Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.
Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients. www.nice.org.uk/TA34

Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107
Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable). www.nice.org.uk/TA107

Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208
Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:
• have not received treatment for metastatic disease and
• have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.
www.nice.org.uk/TA208

Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257
Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).
Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA257

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2013) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.
Trastuzumab emtansine

- **DRUG ACTION** Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

### INDICATIONS AND DOSE

**Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist).**

**Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist).**

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

### CAUTIONS

- Dyspnoea at rest—increased risk of pulmonary events - history of congestive heart failure - patients over 75 years - peripheral neuropathy (temporarily discontinue treatment—consult product literature) - recent history of myocardial infarction - recent history of unstable angina - risk of left ventricular dysfunction - consult product literature for specific risks with trastuzumab treatment - serious arrhythmias

### INTERACTIONS

- Appendix 1 (trastuzumab), Caution with concomitant anticoagulant medication—increased risk of thrombocytopenia with haemorrhagic events.

### SIDE-EFFECTS

- Uncommon Hepatic failure - hepatic toxicity - interstitial lung disease - nodular regenerative hyperplasia - pneumonitis - portal hypertension

- Frequency not known Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

### CONCEPTION AND CONCEPTION

- Effective contraception must be used during and for 6 months after stopping treatment in women and men.

### PREGNANCY

- Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

### BREAST FEEDING

- Manufacturer advises avoid breast-feeding during and for 6 months after treatment.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

### DIRECTIONS FOR ADMINISTRATION

- Resuscitation facilities should be available during administration of trastuzumab emtansine.

### PRESCRIBING AND DISPENSING INFORMATION

- When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are not interchangeable.

### HEPATIC IMPAIRMENT

- Consult product literature for dose modification in cases of abnormal liver function tests. Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

### RENAL IMPAIRMENT

- No information available—manufacturer advises caution in severe impairment.

### MONITORING REQUIREMENTS

- Monitor hepatic function before each dose.
- Monitor for signs and symptoms of neurotoxicity.
- Monitor closely for infusion-related and hypersensitivity reactions.
- Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
- Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
- Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

### DIRECTIONS FOR ADMINISTRATION

- Resuscitation facilities should be available during administration of trastuzumab emtansine.

### PRESCRIBING AND DISPENSING INFORMATION

- When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are not interchangeable.

### 2.2 Cytotoxic responsive malignancy

#### Cytotoxic drugs

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion
is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

**Guidelines for handling cytotoxic drugs**

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

**Intrathecal chemotherapy**

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from: Department of Health PO Box 777 London SE1 6XH Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

**Safe systems for cytotoxic medicines**

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

**Important safety information**

**Risks of incorrect dosing of oral anti-cancer medicines**

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

**Doses**

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks (www.cancer.nhs.uk/networks.htm) should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

**Side-effects of cytotoxic drugs**

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

**Extravasation of intravenous drugs**

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

**Oral mucositis**

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 761, methotrexate p. 762, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

**Tumour lysis syndrome**

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and...
Malignant disease

bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia
Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 909 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 762 or azathioprine p. 716 should be reduced if allopurinol needs to be given concomitantly.

Rasburicase p. 784, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression
All cytotoxic drugs except vincristine sulfate p. 773 and bleomycin p. 766 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 749, lomustine p. 752, and melphalan p. 752. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06 × 10^9/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response.

Alopecia
Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism
Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Pregnancy and reproductive function
Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins—women of childbearing age should use effective contraception during and after treatment. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Alkylating drugs often severely affect gametogenesis and carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Nausea and vomiting
Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual’s susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide, methotrexate (less than 100 mg/m^2, low dose in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m^2).

Highly emetogenic treatment—cisplatin p. 768, dacarbazine p. 751, and high doses of cyclophosphamide.

Prevention of acute symptoms
For patients at low risk of emesis, pretreatment with dexamethasone p. 581 or lorazepam p. 412 may be used.

For patients at high risk of emesis, a 5HT3-receptor antagonist, usually given by mouth in combination with dexamethasone p. 581 and the neurokinin receptor antagonist aprepitant p. 351 is effective.

Prevention of delayed symptoms
For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT3-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide hydrochloride p. 347 is also licensed for delayed chemotherapy-induced nausea and vomiting.
Prevention of anticipatory symptoms
Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Treatment for cytotoxic-induced side effects

Anthracycline side-effects
Anthracycline-induced cardiotoxicity
The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Anthracycline extravasation
Local guidelines for the management of extravasation should be followed or specialist advice sought. See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression
Folinic acid p. 781 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 762 and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’). Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 462. When folinic acid and fluorouracil p. 761 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 782, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Urothelial toxicity
Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 750 and ifosfamide p. 751; it is caused by the metabolite acrolein. Mesna p. 783 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide p. 750 by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

Anthracycines and other cytotoxic antibiotics
Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increased toxicity. Daunorubicin p. 754, doxorubicin hydrochloride p. 754, epirubicin hydrochloride p. 756 and idarubicin hydrochloride p. 756 are anthracycline antibiotics. Mitoxantrone p. 778 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and clinical trials suggest that it is as effective in the treatment of breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 779 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 766 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin’s lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 767 is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity and therefore it is usually administered at 6-weekly intervals.

Vinpca alkaloids
The vinca alkaloids, vincristine sulfate p. 773, vinorelbine sulfate p. 773, and vindesine sulfate p. 774, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). Vinorelbine p. 775 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

Antimetabolites
Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Alkyating drugs
Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide p. 750 is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide p. 751 is related to cyclophosphamide and is given intravenously.

Melphalan p. 752 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 752 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 749 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin’s lymphomas, and brain tumours. Carmustine implants are licensed for intracranial use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.
Extramustine phosphate p. 751 is a combination of an oestrogen and chloromethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

**ALKYLATING AGENTS**

**Bendamustine hydrochloride**

**INDICATIONS AND DOSE**

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma

**BY INTRAVENOUS INFUSION**

- **CONTRA-INDICATIONS** Jaundice, low leucocyte count, low platelet count, major surgery less than 30 days before start of treatment, severe bone marrow suppression

- **CAUTIONS** Avoid in Acute porphyrias p. 864 - cardiac disorders—monitor serum potassium and ECG

- **INTERACTIONS** → Appendix 1 (bendamustine).

- **SIDE-EFFECTS**
  - **Common or very common** Aplasia, bone-marrow suppression, extravasation, hyperuricaemia, male sterility, nausea, oral mucositis, premature menopause, secondary malignancy, Stevens-Johnson syndrome
  
  - **Very rare** Anticholinergic syndrome, diarrhoea, dysphagia, encephalopathy, multiple organ failure, myocardial infarction, neurological disorders, paraesthesia, peripheral neuropathy, phlebitis, pulmonary fibrosis, tachycardia, taste disturbance

  - **Frequency not known** Alopecia, bone-marrow suppression, drowsiness, exacerbation, hyperuricaemia, increased risk of neutropenic sepsis, increased risk of skin toxicities, increased risk of thrombocytopenia, peripheral neuropathy, pulmonary fibrosis, rash, secondary malignancy, Stevens-Johnson syndrome

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men.

- **PREGNANCY** Avoid (teratogenic and mutagenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** No information available on use in patients with creatinine clearance less than 10 mL/minute.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)** Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011) NICE TA216

  Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate. www.nice.org.uk/TA216

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (March 2011) that bendamustine (Levact®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - Levact (Napp Pharmaceuticals Ltd)
      - Bendamustine hydrochloride 25 mg: Levact 25 mg powder for concentrate for solution for infusion vials | 5 vial [POM] £347.26 (Hospital only)
      - Bendamustine hydrochloride 100 mg: Levact 100 mg powder for concentrate for solution for infusion vials | 5 vial [POM] £1,379.04 (Hospital only)

  - Important safety information
    - RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

  - **CAUTIONS** Avoid in Acute porphyrias p. 864 - high dose (antiepileptic prophylaxis required) - history of seizures (antiepileptic prophylaxis required) - ineffective once in blast crisis phase - previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) - previous radiation therapy (increased risk of hepatic veno-occlusive disease) - risk of second malignancy - three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

  - **INTERACTIONS** → Appendix 1 (busulfan).

  - **SIDE-EFFECTS**
    - **GENERAL SIDE-EFFECTS**
      - **Common or very common** Cardiac tamponade in thalassaemia, hepatic fibrosis, hepatic veno-occlusive disease, hepatotoxicity, hyperbilirubinaemia, jaundice, pneumonia, skin hyperpigmentation
      - **Rare** Aplastic anaemia, seizures, visual disturbances
      - **Very rare** Gynaecomastia, myasthenia gravis
      - **Frequency not known** Alopecia, bone-marrow suppression, hyperuricaemia, irreversible bone-marrow aplasia, lung toxicity, male sterility, nausea, oral mucositis, premature menopause, secondary malignancy, thrombocytopenia, tumour lysis syndrome, vomiting

- **SPECIFIC SIDE-EFFECTS**
  - With intravenous use extravasation

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Lung toxicity: Discontinue if lung toxicity develops.
Carmustine

INDICATIONS AND DOSE
Multiple myeloma | Non-Hodgkin's lymphomas | Brain tumours
BY INTRAVENOUS INFUSION
Adult: (consult product literature)

Recurrence glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as an adjunctive treatment to surgery and radiotherapy
BY INTRAVESIONAL IMPLANTATION
Adult: (consult product literature)

Cautions
Avoid in acute porphyrias p. 864

Interactions
Appendix 1 (carmustine).

Side-effects
general side-effects
Alopecia | bone-marrow suppression (delayed) | hyperuricaemia | irritable to tissues | male sterility | nausea | oral mucositis | premature menopause | secondary malignancy | thromboembolism | tumour lysis syndrome | vomiting

specific side-effects
With intravenous use pulmonary fibrosis (delayed) | renal damage (cumulative)

SIDE-EFFECTS, FURTHER INFORMATION
Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during treatment in men or women.

Chlorambucil

INDICATIONS AND DOSE
Some lymphomas and chronic leukaemias (used either alone or in combination therapy)
BY MOUTH
Adult: (consult local protocol)

Cautions
Avoid in acute porphyrias p. 864 | children with nephrotic syndrome (increased seizure risk) | history of epilepsy (increased seizure risk)

Side-effects
Uncommon: Skin rash
Very rare: Male sterility (in prepubertal and pubertal males)
Frequency not known: Alopecia | bone-marrow suppression | hyperuricaemia | nausea | oral mucositis | premature menopause | secondary malignancy | Stevens-Johnson syndrome | thromboembolism | toxic epidermal necrolysis | tumour lysis syndrome | vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

Skin reactions
If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during treatment in men or women.

Pregnancy
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

Breast Feeding
Discontinue breast-feeding.

National funding/access decisions
NICE technology appraisals (TAs)
Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121
Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres. www.nice.org.uk/TA121

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Implant
Gliadel (Eisai Ltd)
Carmustine 7.7 mg Gliadel 7.7 mg implant | 8 device (PMS £520.00 (Hospital only))

Important safety information
Risks of incorrect dosing of oral anti-cancer medicines, see p. 745
patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
- bendamustine-based therapy is not suitable and
- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA343

Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia
(June 2015) NICE TA344
Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
- the person is ineligible for fludarabine-based therapy and
- bendamustine is not suitable and
- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.
Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- CHLORAMBUCIL (Non-proprietary)
  Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet | PAY £60.51 DT price = £60.51

Cyclophosphamide

INDICATIONS AND DOSE
Rheumatoid arthritis with severe systemic manifestations
BY MOUTH
- Adult: 1–1.5 mg/kg daily
Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)
BY INTRAVENOUS INJECTION
- Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every 1 month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna
Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours
BY MOUTH OR BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

UNLICENSED USE
Not licensed for rheumatoid arthritis with severe systemic manifestations.

Important safety information
RISKS OF INCORRECT DOsing OF ORAL ANti-CANCer MEDICINES, see p. 745

CONTRA-INDICATIONS
Haemorrhagic cystitis

CAUTIONS
Avoid in Acute porphyrrias p. 864 | diabetes mellitus | previous or concurrent mediastinal irradiation—risk of cardiotoxicity

INTERACTIONS
- Appendix 1 (cyclophosphamide).

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
- Common or very common: Anorexia | cardiotoxicity at high doses | disturbances of carbohydrate metabolism | inappropriate secretion of anti-diuretic hormone | interstitial pulmonary fibrosis | pancreatitis | pigmentation of nails | pigmentation of palms | pigmentation of soles | urothelial toxicity
- Rare: Hepatotoxicity | renal dysfunction
- Frequency not known: Alopecia | bone–marrow suppression | haemorrhagic cystitis | hyperuricaemia | male sterility | nausea | oral mucositis | premature menopause | secondary malignancy | thromboembolism | tumour lysis syndrome | vomiting

SPECIFIC SIDE-EFFECTS
- With intravenous use: extravasation

SIDE-EFFECTS, FURTHER INFORMATION
Haemorrhagic cystitis
A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially intravenously then by mouth) can also help prevent cystitis.

Secondary malignancy
Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

CONCEPTION AND CONCEPTION
Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women.

PREGNANCY
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Discontinue breast-feeding during and for 36 hours after stopping treatment.

HEPATIC IMPAIRMENT
Reduce dose—consult local treatment protocol for details.

RENAL IMPAIRMENT
Reduce dose if serum creatinine concentration greater than 120 micromol/litre.

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (cyclophosphamide injection; Baxter) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, solution for infusion, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS
25, 27
- CYCLOPHOSPHAMIDE (Non-proprietary)
  Cyclophosphamide (as Cyclophosphamide monohydrate)
  50 mg Cyclophosphamide 50mg tablets | 100 tablet | NICE £139.00 DT price = £139.00

Powder for solution for injection
- CYCLOPHOSPHAMIDE (Non-proprietary)
  Cyclophosphamide (as Cyclophosphamide monohydrate)
  500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial | £9.66-£9.95
  Cyclophosphamide (as Cyclophosphamide monohydrate) 1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial | £10.66-£11.47
  Cyclophosphamide (as Cyclophosphamide monohydrate) 2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial | NICE no price available

BNF 70
Dacarbazine

INDICATIONS AND DOSE
Metastatic melanoma | Soft tissue sarcomas (combination therapy) | Hodgkin’s disease (combination therapy)

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
Adult: (consult local protocol)

● CAUTIONS
Caution in handling—irritant to tissues

● INTERACTIONS
Appendix 1 (dacarbazine).

● SIDE-EFFECTS

▶ Rare Irritant to skin - irritant to tissues - liver necrosis due to hepatic vein thrombosis
▶ Frequency not known Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - myelosuppression - oral mucositis - severe nausea - severe vomiting - tumour lysis syndrome - vomiting

CONCEPTION AND CONTRACEPTION
Ensure effective contraception during and for at least 6 months after treatment in men or women.

● PREGNANCY
Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● BREAST FEEDING
Discontinue breast-feeding.

● HEPATIC IMPAIRMENT
Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

● RENAL IMPAIRMENT
Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

PRESCRIBING AND DISPENSING INFORMATION
Dacarbazine is a component of a commonly used combination for Hodgkin’s disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial 

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial 

Powder for solution for infusion

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial

Estramustine phosphate

INDICATIONS AND DOSE
Prostate cancer

BY MOUTH
Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

Important safety information
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745.

CONTRA-INDICATIONS
Peptic ulceration - severe cardiovascular disease - thromboembolic disorders.

CAUTIONS
Avoid in Acute porphyrias p. 864 - cardiovascular disease - cerebrovascular disease - conditions which might be aggravated by fluid retention (such as epilepsy or migraine) - congestive heart failure - diabetes - hypercalcaemia - hypertension

INTERACTIONS
Appendix 1 (estramustine).

SIDE-EFFECTS

▶ Rare Angioedema

SIDE-EFFECTS, FURTHER INFORMATION
Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

CONCEPTION AND CONTRACEPTION
Men should use effective contraceptive methods during treatment.

HEPATIC IMPAIRMENT
Manufacturer advises caution. Avoid in severe impairment. In hepatic impairment, manufacturer advises regular liver function tests.

RENAL IMPAIRMENT
Manufacturer advises caution.

DIRECTIONS FOR ADMINISTRATION
Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.

PATIENT AND CARER ADVICE
Patients should be given advice on how to administer estramustine capsules.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 23

Estracyt (Pfizer Ltd)

Estramustine phosphate (as Estramustine sodium phosphate) 140 mg Estracyt 140mg capsules | 100 capsule 

Ifosfamide

INDICATIONS AND DOSE
Malignant disease

BY INTRAVENOUS INFUSION
Adult: (consult local protocol)

CONTRA-INDICATIONS
Acute infection - urinary-tract infection - urinary-tract obstruction - urothelial damage

CAUTIONS
Avoid in Acute porphyrias p. 864 - diabetes mellitus

INTERACTIONS
Appendix 1 (ifosfamide).

SIDE-EFFECTS

▶ Common or very common Confusion - disorientation - drowsiness - psychosis - renal toxicity (may lead to tubular dysfunction, Fanconi’s syndrome, or diabetes insipidus) - restlessness - uraemic toxicity
▶ Uncommon Severe encephalopathy
▶ Rare Anaemia - constipation - convulsions - diarrhoea
▶ Very rare Jaundice - syndrome of inappropriate antidiuretic hormone secretion - thrombophlebitis
▶ Frequency not known Acute pancreatitis - alopecia - arthralgias - bone-marrow suppression - extravasation - heart failure - hyperuricaemia - male sterility - nausea - oral mucositis - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting
**Lomustine**

**Drug Action** Lomustine is a lipid-soluble nitrosourea.

**Indications and Dose**

**Hodgkin’s disease resistant to conventional therapy**

- **By mouth**
  - Adult: 120–130 mg/m² every 6–8 weeks, dose is for when lomustine is used alone

**Malignant melanoma**

- Certain solid tumours

**By mouth**

- Adult: 60–130 mg/m² daily for 14 days, then reduced to 2–6 mg once weekly

**Localised malignant melanoma of the extremities and localised soft tissue sarcoma of the extremities**

- Adult: 6–10 mg/kg daily for 5–7 days, then reduced to 2–4 mg/kg daily until satisfactory response

**Immunosuppressed patients**

- Adult: 40 mg capsules (melphalan)

**Melphalan**

**Indications and Dose**

- Multiple myeloma

**By Mouth**

- Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 5 weeks

**By intravenous injection or by intravenous infusion**

- Adult: (consult product literature)

**Polyctyemia vera**

**By mouth**

- Adult: Initially 6–10 mg daily for 5–7 days

**Localised malignant melanoma of the extremities and localised soft tissue sarcoma of the extremities**

- By regional arterial perfusion

- Adult: (consult local protocol)

**Important safety information**

- **Risks of incorrect dosing of oral anti-cancer medicines**, see p. 745

**Caution** Avoid in Acute porphyrias, see p. 864

**Interactions** → Appendix 1 (melphalan).

**Side-effects**

- **General side-effects**

  - Rare: Interstitial pneumonitis, life threatening pulmonary fibrosis

  - **Frequency not known**

    - Alopecia, bone-marrow suppression, haematuria, male sterility, nausea, oral mucositis, permanent bone marrow damage (with prolonged use), premature menopause, secondary malignancy, thrombocytopaenia, tumour lysis syndrome, vomiting

- **Specific side-effects**

  - With intravenous use: extravasation

**Side-effects, further information**

- Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **Conception and contraception** Manufacturer advises adequate contraception during treatment in men or women.

- **Pregnancy** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **Breastfeeding** Discontinue breast-feeding.

- **Renal impairment** Reduce dose initially (consult product literature).

- **Monitoring requirements** Monitor full blood count before and throughout treatment.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

  **Capsule**

  - **Lomustine (non-proprietary)**

    - Lomustine 40 mg: Lomustine 40 mg capsules | 20 capsule pack £67.60

- **Prescribing and dispensing information** The brand name CCNU® has been used for lomustine capsules.

**Urothelial toxicity** Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

**Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Conception and contraception** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women.

**Pregnancy** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breastfeeding** Discontinue breast-feeding.

**Renal Impairment** Avoid in severe impairment.

**Consequences and contraception** Manufacturer advises adequate contraception during treatment in men or women.

**Pregnancy** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breastfeeding** Discontinue breast-feeding.

**Renal Impairment** Reduce dose initially (consult product literature).

**Monitoring requirements** Monitor full blood count before and throughout treatment.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.
**Indications and Dose**

Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults

**By Mouth**

- Adult: (consult product literature)

**Important Safety Information**

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**, see p. 745

**Cautions**

- Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements

**Interactions**

- Appendix 1 (temozolomide).

**Side-Effects**

- Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

**Side-Effects, Further Information**

For further information on side-effects consult product literature.

**Conception and Contraception**

Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment.

**Pregnancy**

Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast Feeding**

Discontinue breast-feeding.

**Hepatic Impairment**

Use with caution in severe impairment—no information available.

**Renal Impairment**

Manufacturer advises caution—no information available.

**Monitoring Requirements**

- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fetal liver injury reported).
- Monitor for myelodysplastic syndrome.
- Monitor for secondary malignancies.

**NICE Technology Appraisals (TAs)**

- Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121

**Thiotepa**

**Indications and Dose**

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy by intravenous infusion

- Adult: (consult local protocol)

**Cautions**

- Avoid in Acute porphyrias p. 864

**Interactions**

- Appendix 1 (thiotepa).

**Side-Effects**

- Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, male sterility, nausea, oral mucositis, premature menopause—secondary malignancy, thromboembolism, tumour lysis syndrome, vomiting

**Side-Effects, Further Information**

Secondary malignancy—Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Pregnancy**

Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast Feeding**

Discontinue breast-feeding.

**NICE Technology Appraisals (TAs)**

- Thiotepa (Tepadina) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.
Daunorubicin

INDICATIONS AND DOSE
Acute myelogenous leukaemia | Acute lymphocytic leukaemia

BY INTRAVENOUS INFUSION
Adult: (consult local protocol)
Advanced AIDS-related Kaposi’s sarcoma (liposomal formulation only)

BY INTRAPERITONEAL INSTILLATION
Adult: (consult product literature)

CONTRA-INDICATIONS
Myocardial insufficiency | previous treatment with maximum cumulative doses of daunorubicin or other anthracycline | recent myocardial infarction | severe arrhythmia

Thiotepa 15 mg Thiotepa 15mg powder for concentrate for solution for infusion vials | 1 vial (£70) no price available
Thiotepa 100 mg Thiotepa 100mg powder for concentrate for solution for infusion vials | 1 vial (£70) no price available

Treosulfan

INDICATIONS AND DOSE
Ovarian cancer
BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAPERITONEAL INSTILLATION
Adult: (consult product literature)

SIDE-EFFECTS
Common or very common
Skin pigmentation

RARE
Allergic alveolitis | haemorrhagic cystitis | pulmonary fibrosis

Frequency not known
Alopecia | bone-marrow suppression | extravasation of intravenous drugs | hyperuricaemia | nausea | oral mucositis | thromboembolism | tumour lysis syndrome | vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Secondary malignancy | prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

PREGNANCY
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
CAUTIONARY AND ADVISORY LABELS 25
Treosulfan (Non-proprietary)
Treosulfan 250 mg | 100 capsule (£20) £622.10

Powder for solution for injection
Treosulfan 1 gram | 1 g powder for solution for injection vials | 5 vial (£20) £256.35
Treosulfan 5 gram | 5 g powder for solution for injection vials | 5 vial (£20) £990.64

ANTHRACYCLINES

Doxorubicin hydrochloride

INDICATIONS AND DOSE
Acute leukaemia | Hodgkin’s lymphoma | Non-Hodgkin’s lymphoma | Some solid tumours including breast cancer

BY INTRAVENOUS INJECTION
Adult: (consult product literature)
Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

BY INTRAPERITONEAL INSTILLATION
Adult: (consult product literature)
CAELYX®
For AIDS-related Kaposi’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

BY INTRAVENOUS INFUSION
▶ Adult: (consult product literature)

MYOCET®
For use with cyclophosphamide for metastatic breast cancer
▶ Adult: (consult product literature)

● CONTRA-INDICATIONS Consult product literature
● CAUTIONS Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypertension · previous myocardial irradiation
● INTERACTIONS → Appendix 1 (doxorubicin). Caution is necessary with concomitant use of cardiotonic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

SIDE-EFFECTS
● Common or very common Dehydration · diarrhoea · red colouration of the urine
● Uncommon Supraventricular tachycardia (related to drug administration)
● Frequency not known Alopecia · bone-marrow suppression · cardiomyopathy (with higher cumulative doses) · consult product literature · extravasation · heart failure (potentially fatal) · hyperuricaemia · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Extravasation Extravasation can cause severe tissue necrosis. Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose. Cardiotoxic Some evidence suggests that weekly low-dose administration may be less cardiotoxic.

Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment. Elevated bilirubin concentration Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING Discontinue breast-feeding.

● HEPATIC IMPAIRMENT Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

● RENAL IMPAIRMENT Consult product literature in severe impairment.

● MONITORING REQUIREMENTS Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

● DIRECTIONS FOR ADMINISTRATION Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

● PRESCRIBING AND DISPENSING INFORMATION Doxorubicin is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
▶ Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91 Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy. Pegylated liposomal doxorubicin is an option for advanced ovarian cancer that does not respond to, or relapses within 12 months of completing initial platinum-based chemotherapy. Paclitaxel alone or pegylated liposomal doxorubicin are options for advanced ovarian cancer in patients who are allergic to platinum compounds. Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds and for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate.

www.nice.org.uk/TA91

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection
▶ DOXORUBICIN HYDROCHLORIDE (Non-proprietary)
Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 10mg/5ml solution for injection vials | 1 vial (£5.55) (Hospital only) Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial (£2.00) Doxorubicin 50mg/25ml solution for infusion vials | 1 vial (£4.30) £10.00 Doxorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial (£2.00) £20.00 Doxorubicin 10mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £20.00 Doxorubicin 50mg/25ml solution for infusion vials | 1 vial (£2.00) £40.00 Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 10mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00 Doxorubicin 50mg/25ml solution for infusion vials | 1 vial (£2.00) £20.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £40.00 Doxorubicin 10mg/ml solution for infusion Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00 Doxorubicin 10mg/ml solution for infusion Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00 Doxorubicin 10mg/ml solution for infusion Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00 Doxorubicin 50mg/ml solution for infusion Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00 Doxorubicin 50mg/ml solution for infusion Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00 Doxorubicin 50mg/ml solution for infusion Cytosafe vials | 1 vial (£2.00) £80.00 Doxorubicin 50mg/ml solution for injection Cytosafe vials | 1 vial (£2.00) £160.00

Powder for solution for injection
▶ Doxorubicin (medac UK)
Doxorubicin hydrochloride 10 mg Doxorubicin 10mg powder for solution for injection vials | 10 vial (£12.80)
Doxorubicin hydrochloride 50 mg Doxorubicin 50mg powder for solution for injection vials | 10 vial (£31.40)

Solution for infusion
▶ DOXORUBICIN HYDROCHLORIDE (Non-proprietary)
Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 200mg/100ml solution for injection Cytosafe vials | 1 vial (£412.00)
Epirubicin hydrochloride

**INDICATIONS AND DOSE**
Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer

**BY INTRAVENOUS INFUSION OR BY INTRAVESICAL INSTILLATION**

- **Adult:** (consult product literature or local protocols)

  - **CONTRA-INDICATIONS**
    - Bladder inflammation or contraction (when used as a bladder instillation) - catheterisation difficulties (when used as a bladder instillation) - haematuria (when used as a bladder instillation) - invasive tumours penetrating the bladder (when used as a bladder instillation) - myocardiopathy - previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina - urinary tract infections (when used as a bladder instillation)

  - **CAUTIONS**
    - Caution in handling—irritant to tissues

  - **INTERACTIONS**
    - Appendix 1 (epirubicin).

  Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

  - **SIDE-EFFECTS**
    - Alopecia - bone-marrow suppression - cardiotoxicity - extravasation - hyperpigmentation of nails - hyperpigmentation of oral mucosa - hyperpigmentation of skin - hyperuricaemia - nausea - oral mucositis - red colouration of the urine - thromboembolism - tumour lysis syndrome - vomiting

  **SIDE-EFFECTS, FURTHER INFORMATION**

  **Cardiotoxicity**
  A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity.

  - **PREGNANCY**
    - Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

  - **BREAST FEEDING**
    - Discontinue breast-feeding.

  - **HEPATIC IMPAIRMENT**
    - Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.

  - **RENAL IMPAIRMENT**
    - Dose reduction may be necessary in severe impairment.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

- **EPIRUBICIN HYDROCHLORIDE (Non-proprietary)**
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Epirubicin 10mg/5ml solution for injection vials | 1 vial (Pos) £122.24
    - Epirubicin 50mg/25ml solution for injection vials | 1 vial (Pos) £110.88

- **Pharmorubicin (Pfizer Ltd)**
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial (Pos) £110.19
    - Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial (Pos) £121.24

**Solution for infusion**

- **EPIRUBICIN HYDROCHLORIDE (Non-proprietary)**
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Epirubicin 200mg/100ml solution for infusion vials | 1 vial (Pos) £1386.16

- **Pharmorubicin (Pfizer Ltd)**
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial (Pos) £1386.16

**Idarubicin hydrochloride**

**INDICATIONS AND DOSE**

- **Acute non-lymphocytic leukaemias monotherapy**
  - **BY MOUTH**
    - Adult: 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

- **Acute non-lymphocytic leukaemia in combination therapy**
  - **BY MOUTH**
    - Adult: 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

- **Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)—monotherapy**
  - **BY INTRAVENOUS INJECTION**
    - Adult: 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

- **Acute leukaemia | Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)**
  - **BY INTRAVENOUS INJECTION**
    - Adult: (consult product literature)

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES,** see p. 745

- **CONTRA-INDICATIONS**
  - Previous treatment with maximum cumulative dose of idarubicin or other anthracycline - recent myocardial infarction - severe arrhythmias - severe myocardial insufficiency

- **CAUTIONS**
  - Caution in handling—irritant to tissues

- **INTERACTIONS**
  - Appendix 1 (idarubicin).

  Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

  **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**

  - Common or very common
    - Abdominal pain - cardiac disorders - diarrhoea - haemorrhage - rash - red pigmentation of the urine

  - Uncommon
    - Nail hyperpigmentation - skin hyperpigmentation
Cytotoxic responsive malignancy 757

- Frequency not known  
  Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use extravasation
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746:
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose. Avoid in severe impairment.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

**MEDICINAL FORMS**

- **INDICATIONS AND DOSE**
  - **BY MOUTH**
  - **BY INJECTION**
  - **CAPSULE**
  
  **Capsule**
  
  **Capecitabine (Celgene Ltd)**
  
  Capecitabine is metabolised to fluorouracil.

- **Solution for injection**

  **Solution for injection**
  
  **Zavedos (Pfizer Ltd)**
  
  There can be variation in the licensing of different medicines containing the same drug.

**ANTIMETABOLITES**

Azacitidine

- **DRUG ACTION** Azacitidine is a pyrimidine analogue.

**INDICATIONS AND DOSE**

- **Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haemopoietic stem cell transplantation**

  **BY SUBCUTANEOUS INJECTION**
  
  - Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Advanced malignant hepatic tumour

- **CAUTIONS** History of severe congestive heart failure · unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) · unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)

- **SIDE-EFFECTS**

  - **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · cerebral haemorrhage · constipation · diarrhoea · dizziness · drowsiness · dyspepsia · dyspnoea · gastro-intestinal disturbances · haematuria · haemorrhage · headache · hypertension · hypokalaemia · hypotension · injection-site reactions · insomnia · myalgia · pneumonia · rash

  - **Uncommon** Anaphylactic reactions · hypersensitivity reactions

- **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hepatic coma · hepatic failure · hyperuricaemia · nausea · oral mucositis · renal failure · thromboembolism · tumour lysis syndrome · vomiting

**Capecitabine**

- **DRUG ACTION** Capecitabine is metabolised to fluorouracil.

**INDICATIONS AND DOSE**

- **Stage III colon cancer, adjuvant following surgery (monotherapy)**
  
  **BY MOUTH**
  
  - Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

- **Stage III colon cancer, adjuvant following surgery (combination therapy)**

  **BY MOUTH**
  
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

**Metastatic colorectal cancer (monotherapy)**

**BY MOUTH**

- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature (continued)
Malignant disease

Metastatic colorectal cancer (combination therapy)

**BY MOUTH**
- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

**BY MOUTH**
- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)

**BY MOUTH**
- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **CAUTIONS** Diabetes mellitus · diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption · electrolyte disturbances · history of angina pectoris · history of arrhythmias · history of significant cardiovascular disease · nervous system disease
- **INTERACTIONS** → Appendix 1 (capecitabine).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** For further information on side-effects, consult product literature
- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS**
  - Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
  - Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.
  - Monitor plasma-calcium concentration.
  - Monitor for eye disorders (including keratitis and corneal disorders).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Capecitabine and tegafur for uracil for metastatic colorectal cancer (May 2003) NICE TA61
    - Capecitabine or tegafur with uracil [now discontinued] (in combination with folic acid) is an option for the first-line treatment of metastatic colorectal cancer. www.nice.org.uk/TA61

- **Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100**
  - Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer. www.nice.org.uk/TA100

- **Capecitabine for the treatment of advanced gastric cancer (July 2010) NICE TA191**
  - Capecitabine in combination with a platinum-based regimen is recommended for the first-line treatment of inoperable advanced gastric cancer. www.nice.org.uk/TA191

- **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212**
  - Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212

- **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263**
  - Bevacizumab in combinations with capecitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. www.nice.org.uk/TA263

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 21

- **CAPECITABINE (Non-proprietary)**
  - Capecitabine 150 mg Capcitabine 150mg tablets | 60 tablet £46.02 (Hospital only) | 60 tablet £39.99
  - Capecitabine 300 mg Capcitabine 300mg tablets | 120 tablet £205.99 (Hospital only) | 120 tablet £185.00

- **Xeloda** (Roche Products Ltd)
  - Capecitabine 150 mg Xeloda 150mg tablets | 60 tablet £40.02
  - Capecitabine 500 mg Xeloda 500mg tablets | 120 tablet £265.55 (Hospital only) | 120 tablet £265.00

**Cladribine**

**INDICATIONS AND DOSE**

**LITAK®**

- **Hairy cell leukaemia**
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: (consult product literature or local protocols)
  - **LEUSTAT®**
    - **B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent** Hairy cell leukaemia
  - **BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature or local protocols)

- **CAUTIONS** Use irradiated blood only

- **CAUTIONS, FURTHER INFORMATION**
  - Immunosuppressive effect of cladribine Cladribine has a potent and prolonged immunosuppressive effect. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be
administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1 (cladribine).
- **SIDE-EFFECTS** Abdominal pain, acute renal failure (with high doses), alopecia, anxiety, arthralgia, athrosis, bone-marrow suppression, chills, constipation, cough, diarrhoea, dizziness, dyspnoea, extravasation, flatulence, haemolytic anaemia, headache, hyperuricaemia, insomnia, malaise, myalgia, nausea, oedema, oral mucositis, pruritus, purpura, rash, severe myelosuppression (with neutropenia, anaemia and thrombocytopenia), severe neurotoxicity (with high doses), sweating, thrush, tachycardia, thromboembolism, tumour lysis syndrome, vomiting.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises caution for men who should not father children during and for 6 months after treatment.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Regular monitoring recommended in hepatic impairment.
- **RENAL IMPAIRMENT** Regular monitoring recommended in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Litak® for subcutaneous use only—no dilution required.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Litak (Lipomed GmbH)
  - Cladribine 2 mg per 1 ml Litak 10 mg/5 ml solution for injection vials | 1 vial £165.00 (Hospital only) | 5 vials £820.00 (Hospital only)

**Solution for infusion**

- Leustat (Janssen-Cilag Ltd)
  - Cladribine 1 mg per 1 ml Leustat 10 mg/10 ml solution for infusion vials | 1 vial £156.70

**Cytarabine**

**DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

**INDICATIONS AND DOSE**

Induction of remission of acute myeloblastic leukaemia

- **BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION**
  - Adult: (consult local protocol)
  - Lymphomatous meningitis
    - BY INTRATHECAL INJECTION
      - Adult: (consult local protocol)

**Important safety information**

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

**INTERACTIONS** → Appendix 1 (cytarabine).

**SIDE-EFFECTS** Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.
- **MONITORING REQUIREMENTS** Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyt®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- Cytarabine (Non-proprietary)
  - Cytarabine 20 mg per 1 ml Cytarabine 500 mg/25 ml solution for injection vials | 1 vial £135.00
  - Cytarabine 100 mg/5 ml solution for injection vials | 5 vials £20.98–£30.00

- Cytarabine 100 mg per 1 ml Cytarabine 500 mg/5 ml solution for injection vials | 5 vials £100.00
  - Cytarabine 100 mg/1 ml solution for injection vials | 5 vials £30.00

- Cytarabine 2 g/20 ml solution for injection vials | 1 vial £73.00

**Suspension for Injection**

- DepoCyt (Napp Pharmaceuticals Ltd)
  - Cytarabine 10 mg per 1 ml DepoCyt 50 mg/5 ml suspension for injection vials | 1 vial no price available (Hospital only)
Decitabine

**DRUG ACTION** Decitabine is a pyrimidine analogue.

**INDICATIONS AND DOSE**
Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy

- **BY INTRAVENOUS INFUSION**
  - Elderly: (consult local protocol)

- **CAUTIONS**
  - History of severe congestive heart failure - history of unstable cardiac disease
  - **INTERACTIONS** → Appendix 1 (decitabine).

- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea - epistaxis - headache
  - **Uncommon** Acute febrile neutrophilic dermatosis
  - **Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution - no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute - no information available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain Potassium, sodium
  - **Dacogen** (Janssen-Cilag Ltd)
    - Decitabine 50 mg Dacogen 50mg powder for concentrate for solution for infusion vials (1 vial; £170.86)

Fludarabine phosphate

**INDICATIONS AND DOSE**
Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves

- **BY MOUTH**
  - Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles
  - **BY INTRAVENOUS INJECTION** or **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**Important safety information**
**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES,** see p. 745.

- **CONTRA-INDICATIONS** Haemolytic anaemia

- **CAUTIONS** Increased susceptibility to skin cancer - worsening of existing skin cancer

**CAUTIONS, FURTHER INFORMATION**
**Immunosuppression** Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs. Co-trimoxazole is used to prevent pneumocytis infection.

- **INTERACTIONS** → Appendix 1 (fludarabine).

- **SIDE-EFFECTS**
  - **Common or very common** Acute myeloid leukaemia - anorexia - chills - cough - diarrhoea - fever - immunosupression - malaise - myelodysplastic syndrome - myelosuppression (may be cumulative) - oedema - peripheral neuropathy - pneumonia - rash - visual disturbances - weakness
  - **Uncommon** Autoimmune disorder - confusion - fibrosis - haemorrhage - immune-mediated haemolytic anaemia - neutropenia - pneumonitis - pulmonary toxicity - thrombocytopenia
  - **Rare** Agitation - arthralgia - blindness - coma - heart failure - optic neuropathy - seizures - skin cancer - Stevens-Johnson syndrome - toxic epidermal necrolysis
  - **Frequency not known** Alopecia - bone-marrow suppression - extravasation - haemorrhagic cystitis - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS**
  - Monitor for signs of haemolysis.
  - Monitor for neurological toxicity.
  - Assess creatinine clearance in patients over 65 years before treatment initiation.

- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - **Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29**
    - Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
      - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
      - cyclophosphamide, doxorubicin and prednisolone (CAP)
    - or
      - cyclophosphamide, vincristine and prednisolone (CVP)
    - Intravenous fludarabine should only be used when oral fludarabine is contra-indicated. www.nice.org.uk/TA29
  - **Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119**
    - Fludarabine monotherapy is not recommended for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/TA119

**Scottish Medicines Consortium (SMC) Decisions**
The **Scottish Medicines Consortium** has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Fluorouracil

INDICATIONS AND DOSE
Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer in combination with folic acid in advanced colorectal cancer.

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRA-ARTERIAL INFUSION

Adult: (consult product literature)

• INTERACTIONS → Appendix 1 (fluorouracil).

• SIDE-EFFECTS
  • Rare Cerebellar syndrome
  • Frequency not known Alopecia, bone-marrow suppression, desquamative hand-foot syndrome (on prolonged infusion), extravasation, hyperuricaemia, mucositis, myelosuppression, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

• PREGNANCY
  Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

• BREAST FEEDING Discontinue breast-feeding.

• HEPATIC IMPAIRMENT Manufacturer advises caution.

• HANDLING AND STORAGE Caution in handling—irritant to tissues.

• MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

• FLUOROURACIL (Non-proprietary)
  Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml
  Fluorouracil 250mg/25ml solution for injection via 1 vial (Pom) £6.40 | 10 vial (Pom) £64.00 Fluorouracil 250mg/10ml solution for injection via 5 vial (Pom) £20.00–£24.00
  Fluorouracil 500mg/20ml solution for injection via 1 vial (Pom) £12.80

Fluorouracil 500mg/10ml solution for injection via 1 vial (Pom) £3.20

Solution for infusion

• FLUOROURACIL (Non-proprietary)
  Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml
  Fluorouracil 50mg/ml solution for infusion via 1 vial (Pom) £4.78
  Fluorouracil 5mg/50ml solution for infusion via 1 vial (Pom) £6.20

Fluorouracil 5mg/ml solution for infusion via 1 vial (Pom) £64.00 Fluorouracil 2.5g/50ml solution for infusion via 1 vial (Pom) £82.00

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml
  Fluorouracil 5g/100ml solution for infusion via 1 vial (Pom) £64.00 Fluorouracil 2.5g/50ml solution for infusion via 1 vial (Pom) £82.00

Gemcitabine

INDICATIONS AND DOSE
First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin). Treatment of locally advanced or metastatic pancreatic cancer. Treatment of advanced or metastatic bladder cancer (in combination with cisplatin). Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin). Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel).

BY INTRAVENOUS INFUSION

Adult: (consult local protocol)

• INTERACTIONS → Appendix 1 (gemcitabine).

• SIDE-EFFECTS
  • Rare Haemolytic uraemic syndrome
  • Frequency not known Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, influenza-like symptoms, myelosuppression, mucositis, myelosuppression, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

• CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

• PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

• BREAST FEEDING Discontinue breast-feeding.

• HEPATIC IMPAIRMENT Manufacturer advises caution.

• RENAL IMPAIRMENT Manufacturer advises caution.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma. www.nice.org.uk/TA25

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate. www.nice.org.uk/TA116

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

• MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
Solution for infusion

- **GEMCITABINE (Non-proprietary)**
  - Gemcetabine (as Gemcetabine hydrochloride)
    - **200 mg** Gemcetabine 200mg/5.3ml concentrate for solution for infusion vials | 1 vial [RSP] £25.00 (Hospital only) | 1 vial [POM] £32.00
    - Gemcetabine 200mg/2ml concentrate for solution for infusion vials | 1 vial [POM] no price available
    - Gemcetabine (as Gemcetabine hydrochloride) 1 gram Gemcetabine 1g/26.3ml concentrate for solution for infusion vials | 1 vial [POM] £125.00 (Hospital only) | 1 vial [POM] £162.00
    - Gemcetabine 1g/10ml concentrate for solution for infusion vials | 1 vial [POM] no price available
    - Gemcetabine (as Gemcetabine hydrochloride) 2 gram Gemcetabine 2g/20ml concentrate for solution for infusion vials | 1 vial [POM] no price available
    - Gemcetabine 2g/52.6ml concentrate for solution for infusion vials | 1 vial [POM] £250.00 (Hospital only)

Powder for solution for infusion

- **GEMCITABINE (Non-proprietary)**
  - Gemcetabine (as Gemcetabine hydrochloride)
    - **200 mg** Gemcetabine 200mg powder for solution for infusion vials | 1 vial [POM] £32.00–£32.55 (Hospital only) | 1 vial [PO] £32.00
    - Gemcetabine (as Gemcetabine hydrochloride) 1 gram Gemcetabine 1g powder for solution for infusion vials | 1 vial [PO] £162.00–£162.76 (Hospital only) | 1 vial [POM] £162.00
    - Gemcetabine (as Gemcetabine hydrochloride) 1.5 gram Gemcetabine 1.5g powder for solution for infusion vials | 1 vial [PO] £231.93
    - Gemcetabine (as Gemcetabine hydrochloride) 2 gram Gemcetabine 2g powder for solution for infusion vials | 1 vial [PO] £324.00 (Hospital only) | 1 vial [POM] £324.00
  - **Gemzar**
    - Gemzar (Eli Lilly and Company Ltd)
      - Gemcetabine (as Gemcetabine hydrochloride) 200 mg Gemzar 200mg powder for solution for infusion vials | 1 vial [PO] £32.55 (Hospital only)
      - Gemcetabine (as Gemcetabine hydrochloride) 1 gram Gemzar 1g powder for solution for infusion vials | 1 vial [PO] £162.76 (Hospital only)

Mercaptopurine (6-Mercaptopurine)

**INDICATIONS AND DOSE**

Severe acute Crohn’s disease | Maintenance of remission of Crohn’s disease | Ulcerative colitis

**BY MOUTH**

- Adult: 1–1.5 mg/kg daily, some patients may respond to lower doses

Acute leukaemias | Chronic myeloid leukaemia

**BY MOUTH USING TABLETS**

- Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response

**BY MOUTH USING ORAL SUSPENSION**

- Adult: Initially 25–75 mg/m² daily, adjusted according to response

**Dose equivalence and conversion**

Mercaptopurine tablets and Xaluprine™ oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

**UNLICENSED USE**

Not licensed for use in severe ulcerative colitis and Crohn’s disease.

**Important safety information**

Risks of incorrect dosing of oral anti-cancer medicines, see p. 745

**CONTRA-INDICATIONS**

Absent thiopurine methyltransferase activity

**CAUTIONS**

Reduced thiopurine methyltransferase activity

**CAUTIONS, FURTHER INFORMATION**

Thiopurine methyltransferase

The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**INTERACTIONS**

Appendix 1 (mercaptopurine).

**SIDE-EFFECTS**

- Rare: Pancreatitis - transient oligospermia
- Very rare: Intestinal ulceration - lymphoma
- Frequency not known: Alopecia - anorexia - bone-marrow suppression - hepatotoxicity - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Gastro-intestinal side-effects

Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

- PREGNANCY: Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- BREAST FEEDING: Discontinue breast-feeding.
- HEPATIC IMPAIRMENT: May need dose reduction.
- RENAL IMPAIRMENT: Reduce dose.
- PRE-TREATMENT SCREENING: Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- MONITORING REQUIREMENTS: Monitor liver function.
- PRESCRIBING AND DISPENSING INFORMATION: Flavours of oral liquid formulations may include raspberry.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, tablet, capsule.

**Tablet**

- **MERCAPTOPURINE (Non-proprietary)**
  - Mercaptopurine 50 mg Mercaptopurine 50mg tablets | 25 tablet [POM] £5.45 DT price = £5.04
  - Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension | 100 ml [POM] £17.00

**Methotrexate**

**DRUG ACTION**

Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

**INDICATIONS AND DOSE**

Severe Crohn’s disease

**BY INTRAMUSCULAR INJECTION**

- Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

Maintenance of remission of severe Crohn’s disease

**BY MOUTH**

- Adult: 10–25 mg once weekly

Moderate to severe active rheumatoid arthritis

**BY MOUTH**

- Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week
Severe active rheumatoid arthritis
BY INTRavenous INJECTION OR BY INTRAMUScular INJECTION OR BY SUBCUTANeous INJECTION
▶ Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

Neoplastic diseases
BY INTRavenous INJECTION OR BY INTRATHecal INJECTION OR BY INTRASpinal INJECTION OR BY INTRAMUScular INJECTION OR BY INTRAVenous INFUSION OR BY MOUTH
▶ Adult: (consult product literature)

Severe psoriasis unresponsive to conventional therapy (specialist use only)
BY MOUTH OR BY INTRAMUScular INJECTION OR BY INTRavenous INJECTION OR BY SUBCUTANeous INJECTION
▶ Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

● UNLICENSED USE Not licensed for use in severe Crohn’s disease.

Important safety information
Note that the dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:
● the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
● only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
● the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
● the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

● CONTRA-INDICATIONS Active infection (in non-malignant conditions) - ascites - immunodeficiency syndromes (in non-malignant conditions) - significant pleural effusion

● CAUTIONS Acute porphyrias p. 864 - diarrhoea - extreme caution in blood disorders (avoid if severe) - peptic ulceration - photosensitivity — psoriasis lesions aggravated by UV radiation (skin ulceration reported) - risk of accumulation in pleural effusion or ascites—drain before treatment - ulcerative colitis - ulcerative stomatitis

CONTRA-INDICATIONS, FURTHER INFORMATION
Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
Liver toxicity Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.
Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

● INTERACTIONS ▶ Appendix 1 (methotrexate).

If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored.

● SIDE-EFFECTS
▶ Rare Pneumonitis

SIDE-EFFECTS, FURTHER INFORMATION
In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects. Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity. Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

● CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 3 months after treatment in men or women.

● PREGNANCY Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).

● BREAST FEEDING Discontinue breast-feeding—present in milk.

● HEPATIC IMPAIRMENT When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

● RENAL IMPAIRMENT Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.

● PRE-TREATMENT SCREENING Exclude pregnancy before treatment. Patients should have full blood count and renal and liver function tests before starting treatment.

● MONITORING REQUIREMENTS
▶ In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
  ● have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months
  ● be advised to report all symptoms and signs suggestive of infection, especially sore throat
  ● Local protocols for frequency of monitoring may vary.
  ● Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

● PRESCRIBING AND DISPENSING INFORMATION Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

● PATIENT AND CARER ADVICE Methotrexate treatment booklets. Methotrexate treatment booklets should be issued where appropriate.
In England, Wales, and Northern Ireland, they are available for purchase from:
3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores. NHS Hospitals can order supplies from
www.nhsforms.co.uk or by emailing nhsforms@mhm.com.
In Scotland, treatment booklets can be obtained by
emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.
These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.
Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen. Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs. Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution

**Tablet**

- **METHOTREXATE (Non-proprietary)**
  - Methotrexate 2.5 mg: Methotrexate 2.5mg tablets | 24 tablet (P) £13.75 | 28 tablet (P) £13.82 DT price = £2.80 | 100 tablet (P) £14.19
  - Methotrexate 10 mg: Methotrexate 10mg tablets | 100 tablet (P) £57.21 DT price = £35.15
- **Maxtrex (Pfizer Ltd)**
  - Methotrexate 2.5 mg: Maxtrex 2.5mg tablets | 24 tablet (P) £2.39 | 100 tablet (P) £9.96
  - Methotrexate 10 mg: Maxtrex 10mg tablets | 100 tablet (P) £45.16 DT price = £35.15

**Solution for injection**

- **METHOTREXATE (Non-proprietary)**
  - Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml Methotrexate 5mg/2ml solution for injection vials | 5 vial (P) £30.00 £36.00
  - Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 1g/40ml solution for injection vials | 1 vial (P) £43.68 (Hospital only) | 1 vial (P) £44.57 £67.50
  - Methotrexate 500mg/20ml solution for injection vials | 1 vial (P) £8.88 (Hospital only) | 1 vial (P) £25.07 £48.00
  - Methotrexate 50mg/2ml solution for injection vials | 1 vial (P) £4.49 (Hospital only) | 1 vial (P) £3.00 | 5 vial (P) £35.00
  - Methotrexate 200mg/8ml solution for injection vials | 1 vial (P) £10.02
  - Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 1g/10ml solution for injection vials | 1 vial (P) £85.00
  - **Metoject PEN (medac UK)**
    - Methotrexate 50 mg per 1 ml Metoject PEN 30mg/0.6ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £18.95 Metoject PEN 22.5mg/0.45ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £18.45 Metoject PEN 12.5mg/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £16.50 Metoject PEN 20mg/0.4ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £17.84 Metoject PEN 17.5mg/0.35ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £17.50 Metoject PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £14.85 Metoject PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £15.29 Metoject PEN 27.5mg/0.55ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £18.89 Metoject PEN 25mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £18.48 Metoject PEN 15mg/0.3ml solution for injection pre-filled pen | 1 pre-filled disposable injection (P) £16.57

**Solution for infusion**

- **METHOTREXATE (Non-proprietary)**
  - Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial (P) £200.57
  - Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial (P) £400.00

---

**Nelarabine**

**INDICATIONS AND DOSE**

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimes

BY INTRAVENOUS INFUSION

- **Adults:** (consult local protocol)
  - **CAUTIONS**
    - Previous or concurrent craniospinal irradiation
    - Frequency not known
    - Neurotoxicity
    - Female patients
  - **SIDE-EFFECTS**
    - Common or very common
    - Neurotoxicity (discontinue)
    - Frequency not known
    - Abdominal pain, - anaemia, - nausea
    - Electrolyte disturbances
    - Fatigue
    - Headache
    - Hypothyroidism
    - Hypotension
    - Muscle weakness
    - Myalgia
    - Oedema
    - Oral mucositis
    - Parasthesia
    - Peripheral neurological disorders
    - Pleural effusion
    - Pyrexia
    - Seizures
    - Taste disturbance
    - Thromboembolism
    - Tremor
    - Tumour lysis syndrome
    - Vomiting
  - **PREGNANCY**
    - Avoid (toxicity in animal studies).
    - See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
  - **BREAST FEEDING**
    - Discontinue breast-feeding.
  - **MONITORING REQUIREMENTS**
    - Neurotoxicity
    - Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.
  - **PATIENT AND CARER ADVICE**
    - Drowsiness may affect
    - Close monitoring for neurological events is
    - Neurotoxicity (discontinue)
    - Frequency not known
    - Abdominal pain, - anaemia, - nausea
    - Electrolyte disturbances
    - Fatigue
    - Headache
    - Hypothyroidism
    - Hypotension
    - Muscle weakness
    - Myalgia
    - Oedema
    - Oral mucositis
    - Parasthesia
    - Peripheral neurological disorders
    - Pleural effusion
    - Pyrexia
    - Seizures
    - Taste disturbance
    - Thromboembolism
    - Tremor
    - Tumour lysis syndrome
    - Vomiting
  - **CONCEPTION AND CONCEPTION**
    - Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (March 2008) that the use of nelarabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **NELARABINE (Novartis Pharmaceuticals UK Ltd)**
  - Nelarabine 5 mg per 1 ml
    - Atriance 250mg/50ml solution for infusion vials | 6 vial (P) £1,332.00

---

**Malignant disease**
Pemetrexed

- **DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

**INDICATIONS AND DOSE**

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)

**BY INTRAVENOUS INFUSION**

- **CAUTIONS** Diabetes - history of cardiovascular disease - prophylactic folic acid supplementation required (consult product literature) - prophylactic vitamin B12 supplementation required (consult product literature)

- **INTERACTIONS** → Appendix 1 (pemetrexed).
  
  - Caution with concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature).
  
  - **SIDE-EFFECTS**
    
    - Common or very common Conjunctivitis - dehydration - gastro-intestinal disturbances - increased lacrimation - neuropathy - oedema - skin disorders
    
    - Uncommon Arrhythmias - colitis - interstitial pneumonia
    
    - Rare Acute renal failure - hepatitis - peripheral ischaemia
    
    - **Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - Stevens-Johnson syndrome - thromboembolism - toxic epidermal necrolysis - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**

    - Pemetrexed for the treatment of non-small cell lung cancer (August 2007) NICE TA124
    
      Pemetrexed is not recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy.

    - Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135
    
      Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

    - Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181
    
      Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma. www.nice.org.uk/TA181

- **Pemetrexed for the treatment of non-small cell lung cancer** (June 2010) NICE TA190

  Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel. www.nice.org.uk/TA190

- **Pemetrexed maintenance treatment following induction therapy with pemetrexed and cisplatin for non-squamous non-small-cell lung cancer** (April 2014) NICE TA309

  Pemetrexed is not recommended for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer in patients whose disease has not progressed immediately following induction therapy with pemetrexed and cisplatin.

  www.nice.org.uk/TA309

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The Scottish Medicines Consortium has advised (January 2010) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The Scottish Medicines Consortium has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**

    - **ELECTROLYTES:** May contain Sodium

    - **Alimta (Eli Lilly and Company Ltd)**

      Pemetrexed (as Pemetrexed disodium) 100 mg Alimta 100mg powder for concentrate for solution for infusion vials | 1 vial £35.00 (Hospital only)

      Pemetrexed (as Pemetrexed disodium) 500 mg Alimta 500mg powder for concentrate for solution for infusion vials | 1 vial £170.00 (Hospital only)

**Tegafur with gimeracil and oteracil**

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.
**INDICATIONS AND DOSE**

Treatment of advanced gastric cancer when used in combination with cisplatin

**BY MOUTH**

- Adult: (consult local protocol)

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

- **CONTRA-INDICATIONS**
  - Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS** → Appendix 1 (tegafur).
- **SIDE-EFFECTS**
  - Alopecia · bone-marrow suppression · hyperuricaemia · nausea · neuropathy · ocular toxicity · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 6 months after treatment.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENA L IMPAIRMENT** Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature. Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2012) that tegafur with gimeracil and oteracil (Teysuno®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 23**

- **Teyusu** (Nordic Pharma Ltd)
  - Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg, Tegafur 15 mg; Teyusu 15mg/4.35mg/11.8mg capsules | 126 capsule [P32] £279.72
  - Gimeracil 5.8 mg, Oteracil (as Oteracil potassium) 15.8 mg, Tegafur 20 mg; Teyusu 20mg/5.8mg/15.8mg capsules | 84 capsule [P32] £248.40

**Antineoplastic Antibiotics**

**Bleomycin**

**INDICATIONS AND DOSE**

Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin’s lymphoma

**BY INTRAVENOUS INJECTION OR BY LOCAL INFILTRATION OR BY INTRA-ARTERIAL INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (bleomycin).
- **SIDE-EFFECTS**
  - Common or very common Dermatological toxicity · mucositis
  - Frequency not known Alopecia · chills (after drug administration) · extravasation · fever (after drug administration) · hypersensitivity reactions · hyperuricaemia · increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques · less bone marrow suppression · nausea · oral mucositis · progressive pulmonary fibrosis (dose-related) · pulmonary
toxicity - Raynaud’s phenomenon - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypersensitivity reactions**

Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously.

**Progressive pulmonary fibrosis**

This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug.

**Respiratory failure**

Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

**PREGNANCY**

Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Discontinue breast feeding.

**RENAL IMPAIRMENT**

Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.

**PRESCRIBING AND DISPENSING INFORMATION**

To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Bleo-Kyowa (Prostrakan Ltd)**
  - Bleomycin (as Bleomycin sulfate) 15000 unit: £190.00

**Mitomycin**

**INDICATIONS AND DOSE**

**Recurrent superficial bladder tumours (bladder instillation)**

- **BY INTRAVESICAL INSTILLATION**
  - Adult: (consult product literature or local protocols)

**Upper gastro-intestinal cancers**

**Breast cancers**

- **BY INTRAVENTOUS INJECTION**
  - Adult: (consult product literature or local protocols)

**CAUTIONS**

Caution in handling—irritant to tissues

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Alopecia - bone marrow damage - bone-marrow suppression - hyperuricaemia - lung fibrosis - nausea - oral mucositis - renal damage - thromboembolism - tumour lysis syndrome - vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

**Bone-marrow toxicity**

Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a permanent effect.

**PREGNANCY**

Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Discontinue breast-feeding.

**Carboplatin**

**INDICATIONS AND DOSE**

Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)

**BY INTRAVENOUS INFUSION**

- **Adult**: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

**INTERACTIONS**

- **Appendix 1 (platinum compounds)**

**SIDE-EFFECTS**

Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - myelosuppression - nausea - nausea - nephrotoxicity - neurotoxicity - oral mucositis - ototoxicity - thromboembolism - tumour lysis syndrome - vomiting - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and otoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

**PREGNANCY**

Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Discontinue breast-feeding.

**RENAL IMPAIRMENT**

Reduce dose. Avoid if creatinine clearance less than 20 mL/minute. Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

Carboplatin can be given in an outpatient setting.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **CARBOPLATIN (Non-proprietary)**
  - Carboplatin 10 mg per 1 ml: Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial £22.04 (Hospital only) | 1 vial £20.00 Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial £56.92 (Hospital only) | 1 vial £50.00 Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial £260.00 Carboplatin 600mg/60ml solution for infusion vials | 1 vial £260.00 Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial £168.85 (Hospital only) | 1 vial £160.00 Carboplatin 450mg/45ml solution for infusion vials | 1 vial £179.48 Carboplatin 150mg/15ml solution for infusion vials | 1 vial £65.83 Carboplatin 50mg/5ml solution for infusion vials | 1 vial £22.86
Cisplatin

INDICATIONS AND DOSE
Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination) by intravenous infusion
- Adult: (consult product literature)

- CAUTIONS
- CAUTIONS, FURTHER INFORMATION
  Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.
- INTERACTIONS → Appendix 1 (platinum compounds).
- SIDE-EFFECTS Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, hypomagnesaemia, myelosuppression, nephrotoxicity, oral mucositis, ototoxicity, peripheral neuropathy, severe nausea, severe vomiting, thromboembolism, tumour lysis syndrome
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- PREGNANCY Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Avoid if possible—nephrotoxic.
- MONITORING REQUIREMENTS
  - Nephrotoxicity Monitoring of renal function is essential.
  - Monitor full blood count.
  - Monitor audiometry.
  - Monitor plasma electrolytes.
- DIRECTIONS FOR ADMINISTRATION Cisplatin is increasingly given in a day care setting.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
- Solution for infusion
  - CISPLATIN (Non-proprietary)
    Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial (hospital only) no price available
    Cisplatin 100mg/100ml solution for infusion vials | 1 vial (hospital only) £50.22 (Hospital only) | 1 vial (hospital) £52.93-£55.64 Cisplatin 10mg/10ml solution for infusion vials | 1 vial (hospital) £5.90 (Hospital only) | 1 vial (hospital) £5.90 Cisplatin 50mg/50ml solution for infusion vials | 1 vial (hospital) £25.37 (Hospital only) | 1 vial (hospital) £26.74-£28.11 Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial (hospital) no price available Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial (hospital) no price available

Oxaliplatin

INDICATIONS AND DOSE
Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) | Treatment of colon cancer after resection of the primary tumour (adjuvant treatment) by intravenous infusion
- Adult: (consult product literature)

- CONTRA-INDICATIONS Peripheral neuropathy with functional impairment
- INTERACTIONS → Appendix 1 (platinum compounds).
- SIDE-EFFECTS Alopecia, bone-marrow suppression, extravasation, gastro-intestinal disturbances, hyperuricaemia, myelosuppression, nausea, neurotoxicity (dose limiting), ototoxicity, posterior reversible encephalopathy syndrome (associated with oxaliplatin combination chemotherapy) - sensory peripheral neuropathy (dose limiting), thromboembolism, transient vision loss (reversible on discontinuation), tumour lysis syndrome, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Reduce dose in mild to moderate impairment (consult product literature). Avoid if creatinine clearance less than 30 mL/minute.
- NATIONAL FUNDING/ACCESS DECISIONS
  NICE technology appraisals (TAs)
  - Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
    A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. www.nice.org.uk/TA93
  - Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100
    Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer. www.nice.org.uk/TA100

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
- Solution for infusion
  - OXALIPLATIN (Non-proprietary)
    Oxaliplatin 5 mg per 1 ml Oxaliplatin 100mg/20ml concentrate for solution for infusion vials | 1 vial (hospital) £33.00 (Hospital only) | 1 vial (hospital) £33.15 Oxaliplatin 50mg/10ml concentrate for solution for infusion vials | 1 vial (hospital) £5.90 Oxaliplatin 20mg/100ml concentrate for solution for infusion vials | 1 vial (hospital) £25.37 Oxaliplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial (hospital) £26.74-£28.11 Oxaliplatin 200mg/40ml concentrate for solution for infusion vials | 1 vial (hospital) no price available
  - OXALIPLATIN (Non-proprietary)
    Oxaliplatin 50 mg Oxaliplatin 50mg powder for solution for infusion vials | 1 vial (hospital) £15.00-£15.67 Oxaliplatin 100 mg Oxaliplatin 100mg powder for solution for infusion vials | 1 vial (hospital) £29.90-£31.30

RETINOID AND RELATED DRUGS

Bexarotene

- DRUG ACTION Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.
Tretinoin

**INDICATIONS AND DOSE**
Induction of remission in acute promyeloctic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

**BY MOUTH**
- Adult: 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

**CAUTIONS**
- Increased risk of thromboembolism during first month of treatment

**INTERACTIONS**
- Appendix 1 (retinoids).

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
**Retinoic acid syndrome**
Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

**CONCEPTION AND CONTRACEPTION**
Exclude pregnancy before starting treatment. Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).

**PREGNANCY**
Teratogenic. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Avoid (discontinue breast-feeding).

**HEPATIC IMPAIRMENT**
Reduce dose to 25 mg/m².

**RENAL IMPAIRMENT**
Reduce dose to 25 mg/m².

**MONITORING REQUIREMENTS**
Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**
Tretinoin is the acid form of vitamin A.
For further information on side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).
- **PREGNANCY** See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS** Monitor electrolytes—correct dehydration.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous infusion

- **HEPATIC IMPAIRMENT** Reduce dose according to liver enzymes (consult product literature). Avoid in severe impairment.
- **RENAL IMPAIRMENT** Monitor liver function in hepatic impairment.
- **BREAST FEEDING** Discontinue breast-feeding.
- **CONCEPTION AND CONTRACEPTION** Effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Cabazitaxel for hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (May 2012) NICE TA255
      - Cabazitaxel in combination with prednisone or prednisolone is not recommended for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen.
      - Patients currently receiving cabazitaxel in combination with prednisone or prednisolone for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA255

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - **EXCIPIENTS:** May contain Ethanol
      - **Jevtana (Sanofi)**
        - Cabazitaxel 40 mg per vial JEVTA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial (£90.00) £3,696.00 (Hospital only)

**Docetaxel**

**INDICATIONS AND DOSE**

Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capcitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-esophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

- **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult product literature or local protocols)

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 864 - consult product literature
- **INTERACTIONS**
  - **Appendix 1 (docetaxel).**
- **SIDE-EFFECTS**
  - Alopecia | bone-marrow suppression | cytoid macular oedema | extravasation | fatal respiratory disorders | gastro-intestinal toxicity | heart failure | hypersensitivity reactions | hyperuricaemia | nausea | oral mucositis | peripheral neurotoxicity | persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment | severe skin reactions | thromboembolism | tumour lysis syndrome | vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity reactions and fluid retention | Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions (consult product literature). Consult product literature for monitoring and management of side effects.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.
- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to liver enzymes (consult product literature). Avoid in severe impairment. Monitor liver function in hepatic impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101
      - Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks]. www.nice.org.uk/TA101
    - Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA109
      - Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer. www.nice.org.uk/TA109
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised that docetaxel (Taxotere®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - **EXCIPIENTS:** May contain Ethanol
  - **DOCETAXEL (Non-proprietary)**
    - Docetaxel 10 mg per vial Docetaxel 80mg/8ml concentrate for solution for infusion vials | 1 vial (£53.47) £3,257.75 (Hospital only)
    - Docetaxel 16 mg per vial Docetaxel 160mg/16ml concentrate for solution for infusion vials | 1 vial (£166.75) (£1,063.50) (Hospital only)
    - Docetaxel 20 mg per vial Docetaxel 200mg/20ml concentrate for solution for infusion vials | 1 vial (£362.75) (£2,478.00) (Hospital only)
    - Docetaxel 20 mg per vial Docetaxel 80mg/4ml concentrate for solution for infusion vials | 1 vial (£53.47) £90.00
    - Docetaxel 140mg/7ml concentrate for solution for infusion vials:
      - 1 vial (£90.00) Docetaxel 20mg/1ml concentrate for solution for infusion vials | 1 vial (£160.00)
Paclitaxel

**Drug Action** Paclitaxel is a member of the taxane group of drugs.

**Indications and Dose**
- Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only).
- Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only).
- Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only).
- Adjunct treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only).
- Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only).
- Treatment of advanced AIDS-related Kaposi’s sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only).
- First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only).
- Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only).
- In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only).

**By Intravenous Infusion**
- Adult: (consult product literature or local protocols)

**Cautions** Avoid in Acute porphyrias p. 864. Consult product literature—patients aged over 75 years with metastatic adenocarcinoma of the pancreas.

**Interactions** Appendix 1 (paclitaxel).

**Side-Effects**
- Common or very common: Arrhythmia, arthralgia, febrile neutropenia, gastro-intestinal disorders, myalgia, peripheral neuropathy, sensory neuropathy, tachycardia.
- Rare: Bradycardia, cardiac arrest, congestive heart failure, left ventricular dysfunction.
- Frequency not known: Alopecia, arthralgias (nearly always asymptomatic), asymptomatic hypotension, bone marrow suppression, bradycardia, cardiac conduction defects, extravasation, hypersensitivity reactions, hyperuricaemia, muscle pain, myelosuppression, nausea, neutropenia, oral mucositis, pneumonitis, Stevens-Johnson syndrome, thromboembolism, toxic epidermal necrolysis, tumour lysis syndrome, vomiting.

**Side-Effects, Further Information**

**Hypersensitivity Reactions** Routine premedication with a corticosteroid, an antihistamine and a histamine H1-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

**Conception and Contraception** Ensure effective contraception during and for at least 6 months after treatment in men or women.

**Pregnancy** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast Feeding** Discontinue breast-feeding.

**Hepatic Impairment** Avoid in severe impairment.

**Monitoring Requirements**
- Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.
- Patients should be monitored for signs and symptoms of pneumonitis and sepsis.

**Prescribing and Dispensing Information** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Prescribers should specify the brand to be dispensed.

**National Funding/Access Decisions**

**NICE Technology Appraisals (TAs)**
- Paclitaxel for ovarian cancer (January 2003) NICE TA55
  *Either* paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).
  *www.nice.org.uk/TA55*.
- Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91
  *Paclitaxel*, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy.
  *Paclitaxel* alone is an option for advanced ovarian cancer in patients who are allergic to platinum compounds. *www.nice.org.uk/TA91*.
- Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA108
  *Paclitaxel*, within its licensed indication, is *not* recommended for the adjuvant treatment of women with early node-positive breast cancer. *www.nice.org.uk/TA108*.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Infusion**

**Exciipients:** May contain Polyoxyl castor oils

**Paclitaxel** (Non-proprietary)
- Paclitaxel 6 mg per 1 ml Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial ( Hosp) £300.52, £301.52 (Hospital only) | 1 vial ( Hosp) £105.84
  *Paclitaxel* 100mg/16.7ml concentrate for solution for infusion vials | 1 vial ( Hosp) £303.65-£374.00 (Hospital only) | 1 vial ( Hosp) £117.21
  *Paclitaxel* 300mg/50ml concentrate for solution for infusion vials | 1 vial ( Hosp) £861.52-£1,122.00 (Hospital only) | 1 vial ( Hosp) £951.63

**Powder for Suspension for Infusion**

**Electrolytes:** May contain Sodium

**Abraxane** (Celgene Ltd)
- Abraxane albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial ( Hosp) £246.00 (Hospital only)

**Cytotoxic Responsive Malignancy 771**
TOPOISOMERASE I INHIBITORS

Irinotecan hydrochloride

• **DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**INDICATIONS AND DOSE**

Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed.

- First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab).
- First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab).

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bowel obstruction - chronic inflammatory bowel disease

- **CAUTIONS** Raised plasma-bilirubin concentration - risk factors for cardiac disease

- **INTERACTIONS** → Appendix 1 (irinotecan).

- **SIDE-EFFECTS**
  - Uncommon Interstitial pulmonary disease
  - Frequency not known Acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature) - alopecia - anorexia - asthenia - bone-marrow suppression - extravasation - gastro-intestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment) - hyperuricaemia - myelosuppression (dose limiting) - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 1 month after treatment in women and up to 3 months after treatment in men.

- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range. Monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature).

- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor respiratory function.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91

Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds and for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate. www.nice.org.uk/TA91

- Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183

Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin. www.nice.org.uk/TA183

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **IRINOTECAN HYDROCHLORIDE (Non-proprietary)**
  - Irinotecan hydrochloride trihydrate 20 mg per 1 ml  
  - E001.25–E000.00 (Hospital only) Irinotecan 40mg/2ml concentrate for solution for infusion vials | 1 vial (PFS) £50.35
  - E390.00 (Hospital only) | 1 vial (PFS) £53.00
  - Irinotecan 100mg/5ml concentrate for solution for infusion vials | 1 vial (PFS) £53.00 (Hospital only) Campto 40mg/2ml concentrate for solution for infusion vials | 1 vial (PFS) £123.50
  - Campto (Pfizer Ltd)

- **TOPOTECAN HYDROCHLORIDE (Non-proprietary)**
  - Camptosar 100mg/5ml concentrate for solution for infusion vials | 1 vial (PFS) £130.00 (Hospital only) Campto 40mg/2ml concentrate for solution for infusion vials | 1 vial (PFS) £390.00 (Hospital only)

**Topotecan**

• **DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**INDICATIONS AND DOSE**

Metastatic ovarian cancer when first-line or subsequent treatment has failed.

- Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB cervical cancer (in combination with cisplatin)

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate.

**BY INTRAVENOUS INFUSION OR BY MOUTH**

- Adult: (consult product literature or local protocols)

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

- **SIDE-EFFECTS** Alopecia - anorexia - asthenia - bone-marrow suppression - extravasation - gastro-intestinal effects - hyperuricaemia - myelosuppression (dose-limiting) - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

- **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose. Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91

- Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183

Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin. www.nice.org.uk/TA183
Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184

Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2007) that topotecan (Hycamtin®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

The Scottish Medicines Consortium has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

Hycamtin® (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 250 microgram Hycamtin 0.25mg capsules | 10 capsule £75.00

Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg capsules | 10 capsule £90.00

Solution for infusion

TOPOTECAN (Non-proprietary)

Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml Topotecan 4mg/4ml concentrate for solution for infusion vials | 1 vial £261.56 (hospital only) | 1 vial £250 no price available | 5 vial £1,453.10 (hospital only) | 5 vial £1,453.10 Topotecan 1mg/1ml concentrate for solution for infusion vials | 1 vial £87.88 (hospital only) | 1 vial £87.88 (hospital only) | 5 vial £488.25 (hospital only) | 5 vial £488.25

Powder for solution for infusion

Hycamtin® (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg powder for concentrate for solution for infusion vials | 1 vial £97.65

Topotecan (as Topotecan hydrochloride) 4 mg Hycamtin 4mg powder for concentrate for solution for infusion vials | 1 vial £348.76

Brands may include Potactasol

VINKA ALKALOIDS

Vinblastine sulfate

INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

Adults: (consult product literature)

Important safety information

Vinblastine is for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

CAUTIONS

Caution in handling—irritant to tissues

INTERACTIONS

Appendix 1 (vinblastine).

SIDE-EFFECTS

Abdominal pain, alopecia, autonomic neuropathy, constipation, hyperuricaemia, loss of deep tendon reflexes, motor weakness, myelosuppression (dose-limiting), nausea, neurotoxicity, oral mucositis, ototoxicity, peripheral neuropathy, peripheral paraesthesia, severe bronchospasm following administration (more commonly when used in combination with mitomycin-C), severe local irritation (care must be taken to avoid extravasation), thromboembolism, tumour lysis syndrome, vomiting.

SIDE-EFFECTS, FURTHER INFORMATION

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine.

Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

PREGNANCY

Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Dose reduction may be necessary—consult local treatment protocol for details.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

VINBLASTINE SULFATE (Non-proprietary)

Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial £85.00

Vincristine sulfate

INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

Adult: (consult local protocol)
Malignant disease

SIDE-EFFECTS
- Rare: Diarrhoea - inappropriate secretion of antidiuretic hormone - intestinal necrosis - paralytic ileus - seizures - urinary retention
- Frequency not known: Abdominal pain - alopecia - autonomic neuropathy - constipation - extravasation - eye disorders - hyperuricaemia - loss of deep tendon reflexes - motor weakness - muscle wasting - myelosuppression (negligible) - nausea - neurotoxicity - oral mucositis - otoxicity - peripheral neuropathy - peripheral paraesthesia - severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) - severe local irritation (care must be taken to avoid extravasation) - thromboembolism - tumour lysis syndrome - vomiting

INTERACTIONS
- Neuromuscular disease
- Some solid tumours (e.g. breast and lung cancer)
- Cytotoxic drugs, p. 746.

MEDICINAL FORMS
- Vincristine sulfate (Non-proprietary)
  - Solution for injection
- Vinflunine
  - Powder for solution for injection

HEPATIC IMPAIRMENT
Dose reduction may be necessary.

BREAST FEEDING
Discontinue breast-feeding.

SIDE-EFFECTS, FURTHER INFORMATION
- Neurotoxicity: Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

PREGNANCY
Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

SIDE-EFFECTS
- Alopecia - autonomic neuropathy - bone-marrow suppression - extravasation - hyperuricaemia - irritant to tissues - myelosuppression (dose-limiting) - nausea - neurotoxicity - oral mucositis - peripheral neuropathy - severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) - severe local irritation (if extravasated) - thromboembolism - tumour lysis syndrome - vomiting

SIDES EFFECTS, FURTHER INFORMATION
- Neurotoxicity: Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Eldisine (Genus Pharmaceuticals Ltd)
  - Vinflunine sulfate 5 mg. Eldisine 5mg powder for solution for injection vials | 1 vial [POD] £78.30 (Hospital only)

Vinflunine

INDICATIONS AND DOSE
Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)
- Adult: (consult local protocol)

Important safety information
Vinflunine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal. The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

CONTRA-INDICATIONS
- Contra-indications, further information
- Intrathecal injection contra-indicated.

CAUTIONS
- Cardiovascular disease - QT-interval prolongation (avoid hypokalaemia)

INTERACTIONS
- Appendix 1 (vinflunine).

SIDE-EFFECTS
- Common or very common: Anorexia - cutaneous reactions - dehydration - diarrhoea - dyspepsia - fatigue - hypertension - hypotension - insomnia - oedema - sweating - tachycardia - thrombosis
- Uncommon: Increased weight - myocardial infarction - renal failure
BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

Adult: (consult product literature)

Important safety information
Vinorelbine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal. The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

CONTRA-INDICATIONS

With oral use concurrent radiotherapy if treating the liver - long-term oxygen therapy - previous significant surgical resection of small bowel - previous significant surgical resection of stomach

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

CAUTIONS

Caution in handling - irritant to tissues - ischaemic heart disease

INTERACTIONS ➔ Appendix 1 (vinorelbine).

SIDE-EFFECTS

Rare Pancreatitis

Frequency not known Alopecia - autonomic neuropathy - extravasation - hyperuricaemia - inappropriate anti-diuretic hormone secretion - myelosuppression (dose-limiting) - nausea - neurotoxicity - oral mucositis - peripheral neuropathy - QT-interval prolongation - severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) - severe local irritation (if extravasated) - thromboembolism - tumour lysis syndrome - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception during and for up to 3 months after treatment.

PREGNANCY

Avoid unless essential - teratogenicity and embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Reduce dose - consult product literature.

RENAL IMPAIRMENT

Reduce dose if creatinine clearance less than 60 mL/minute - consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013) NICE TA272

Vinflunine is not recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy. www.nice.org.uk/Ta272

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Javlor (Pierre Fabre Ltd)

Vinflunine (as Vinflunine ditartrate) 25 mg per 1 mL

Javlor 250mg/10ml concentrate for solution for infusion | 1 vial (PSt) £1.062.50

Javlor 50mg/2ml concentrate for solution for infusion | 1 vial (PSt) £212.50

Vinorelbine

DRUG ACTION

Vinorelbine is a semi-synthetic vinca alkaloid.

INDICATIONS AND DOSE

Advanced breast cancer | Advanced non-small cell lung cancer

BY MOUTH

Adult: 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. 160 mg once weekly)

CONTRA-INDICATIONS

Manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.

PREGNANCY

Avoid unless essential (teratogenicity, and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Reduce oral dose in moderate impairment. Avoid oral use in severe impairment. Reduce intravenous dose in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

OTHER CYTOTOXIC DRUGS

Arsenic trioxide

INDICATIONS AND DOSE
Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy

BY INTRAVENOUS INFUSION
> Adult: (consult local protocol)

> CAUTIONS Hypokalaemia (correct before treatment) - hypomagnesaemia (correct before treatment) - previous treatment with anthracyclines (increased risk of QT interval prolongation)

> INTERACTIONS → Appendix 1 (arsenic trioxide).

Avoid concomitant administration with drugs causing QT interval prolongation.

SIDE-EFFECTS
> Common or very common Atrial fibrillation - atrial flutter - diarrhoea - fatigue - haemorrhage - hyperglycaemia - hypokalaemia - myalgia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Leucocyte activation syndrome
Signs and symptoms of leucocyte activation syndrome include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during treatment in men and women.

PREGNANCY
Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Discontinue breast-feeding.

HEPATIC IMPAIRMENT
Manufacturer advises caution—limited information available.

RENAI IMPAIRMENT
Manufacturer advises caution—limited information available.

MONITORING REQUIREMENTS
ECG required before and during treatment—consult product literature.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
> Trisenox (Teva UK Ltd)
Arsenic trioxide 1 mg per 1 ml Trisenox 10mg/10ml concentrate for solution for infusion ampoules | 10 ampoule (PO) £2,920.00 (Hospital only)

Crisantaspase

DRUG ACTION
Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

INDICATIONS AND DOSE
Acute lymphoblastic leukaemia

BY Intramuscular injection OR BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION
> Adult: (consult product literature)

> CONTRA-INDICATIONS
History of pancreatitis related to asparaginase therapy

SIDE-EFFECTS
> Common or very common Coagulation disorders - confusion - convulsions - diarrhoea - dizziness - drowsiness - headache - lethargy - liver dysfunction - neurotoxicity - pancreatitis

> Uncommon
Anaphylaxis - changes in blood lipids - hyperglycaemia

> Rare
CNS depression

> Very rare
Abdominal pain - hypertension - myalgia

> Frequency not known
Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

PREGNANCY
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Discontinue breast-feeding.

DIRECTIONS FOR ADMINISTRATION
Facilities for the management of anaphylaxis should be available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
> Erwinase (EUSA Pharma Ltd)
Crisantaspase 10000 unit Erwinase 10,000 unit powder for solution for injection vials | 5 vial (PO) £3,065.00

Eribulin

INDICATIONS AND DOSE
Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease

BY INTRAVENOUS INJECTION
> Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

> CONTRA-INDICATIONS
Congenital long QT syndrome

> CAUTIONS
Bradyarrhythmias (increased susceptibility to QT-interval prolongation) - congestive heart failure (increased susceptibility to QT-interval prolongation) - electrolyte disturbances (increased susceptibility to QT-interval prolongation) - susceptibility to QT-interval prolongation

INTERACTIONS → Appendix 1 (eribulin).

Caution with concomitant use of drugs that prolong QT-interval.

SIDE-EFFECTS
Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - myelosuppression -
nausea·oral mucositis·peripheral neuropathy·QT-interval prolongation·thromboembolism·tumour lysis syndrome·vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for up to 3 months after treatment in men or women.
- **PREGNANCY** Avoid unless essential (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **Renal impairment** Consider dose reduction if creatinine clearance less than 40 mL/minute.
- **MONITORING REQUIREMENTS**
  - Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).
  - ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.
  - Monitor electrolytes periodically.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **SIDE-EFFECTS** Alopecia·bone marrow suppression·hyperuricaemia·irritant to tissues·nausea·oral mucositis (more common if given with doxorubicin)·thromboembolism·tumour lysis syndrome·vomiting
- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAL IMPAIRMENT** Consider dose reduction—consult local treatment protocol for details.

**DIRECTIONS FOR ADMINISTRATION** Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- ETOPOSIDE (Non-proprietary)
  - Etoposide 20 mg per 1 ml

**Hydroxycarbamide**

*(Hydroxyurea)*

**INDICATIONS AND DOSE**
Treatment of chronic myeloid leukaemia | Treatment of cancer of the cervix in conjunction with radiotherapy | Polycythaemia

**BY MOUTH**

- Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days

**Sickle-cell disease—consult with a specialist centre**

- Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

**IEC monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.**

**Medical safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop).
- **INTERACTIONS** → Appendix 1 (hydroxycarbamide).
- **SIDE-EFFECTS**
  - Common or very common Headache·myelosuppression·skin reactions
  - Rare Amenorrhoea (in sickle-cell disease)·fever (in sickle-cell disease)
  - Frequency not known Alopecia·bleeding (in sickle-cell disease)·bone marrow suppression·dizziness·hyperuricaemia·hypomagnesaemia (in sickle-cell disease)·nausea·oral mucositis·rash·reduced sperm count and activity·skin cancers (particularly in elderly patients)·thromboembolism·tumour lysis syndrome·vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.

---

**Etoposide**

**INDICATIONS AND DOSE**
Small cell carcinoma of the bronchus, the lymphomas and testicular cancer

**BY MOUTH**

- Adult: 120–240 mg/m² daily for 5 days

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

**INTERACTIONS** → Appendix 1 (etoposide).

**SIDE-EFFECTS**

- Alopecia·bone marrow suppression·hyperuricaemia·irritant to tissues·nausea·oral mucositis (more common if given with doxorubicin)·thromboembolism·tumour lysis syndrome·vomiting

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.
Mitotane

**DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

**INDICATIONS AND DOSE** Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

**BY MOUTH**
- Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring. In severe illness initial dose can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

**CAUTIONS** Avoid in Acute porphyrias p. 864 • risk of accumulation in overweight patients

**INTERACTIONS** → Appendix 1 (mitotane).

**SIDE-EFFECTS**
- Common or very common Anaemia • anorexia • asthenia • ataxia • cognitive impairment • confusion • diarrhoea • dizziness • drowsiness • endocrine side effects • epigastric discomfort • gastro-intestinal disturbances • gynaecomastia • headache • hypercholesterolaemia • hypertriglyceridaemia • hypogonadism • leucopenia • liver disorders • movement disorder • myasthenia • nausea • neuropathy • neurotoxicity • parasthesia • prolonged bleeding time • rash • thrombocytopenia • thyroid disorders • vomiting
- Rare Flushing • haematuria • haemorrhagic cystitis • hypersalivation • hypertension • hypouricaemia • ocular disorders • postural hypotension • proteinuria • pyrexia • visual disturbances
- Frequency not known Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

**PREGNANCY** Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.

**RENAI IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

**MONITORING REQUIREMENTS**
- Plasma-mitotane concentration for optimum response
- Monitor plasma-mitotane concentration—consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION** Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

**PATIENT AND CARER ADVICE** Central nervous system toxicity may affect performance of skilled tasks (e.g. driving). Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

**Tablet**
- SIKLOS (Nordic Pharma Ltd)
  - Hydroxyurea 100 mg | 60 tablet [PO]
  - Hydroxyurea 1 gram | 30 tablet [PO]
- HYDROXYCARBAMIDE (non-proprietary)
  - Hydroxyurea 500 mg | 100 capsule [PO]
  - Hydroxyurea 1000 mg | 30 capsule [PO]
  - Hydroxyurea 1500 mg | 30 capsule [PO]

**Capsule**
- HYDROXYCARBAMIDE (non-proprietary)
  - Hydroxyurea 500 mg | 100 capsule [PO]

**INDICATIONS AND DOSE** Metastatic breast cancer • Non-Hodgkin’s lymphoma • Adult acute non-lymphocytic leukaemia • Non-resectable primary hepatocellular carcinoma

**BY INTRAVENOUS INFUSION**
- Adult: (consult local protocol)
Cytotoxic responsive malignancy 779

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Powder for solution for injection
    - Nipent (Hospital UK Ltd)
    - Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial £786.78 (Hospital only)

Pixantrone

**INDICATIONS AND DOSE**
- Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)
- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**
- Active severe infection - risk factors for severe infection

**CAUTIONS**
- Active cardiovascular disease - cardiac risk factors - caution in handling - irritant to tissues - concurrent radiotherapy to the mediastinal area - history of cardiovascular disease - previous radiotherapy to the mediastinal area - previous therapy with anthracyclines - previous therapy with anthracenediones

**INTERACTIONS**
- Caution with concurrent use of cardiotoxic drugs.
- Increased risk of cardiotoxicity. Contra-indicated with concurrent immunisation with live virus vaccines.

**SIDE-EFFECTS**
- Common or very common: Abdominal pain - abnormal liver function tests - biochemical disturbances - bone pain - cardiac disorders - cardiac toxicity (during or following treatment) - chromaturia - conjunctivitis - constipation - cough - diarrhoea - drowsiness - dry mouth - dyspepsia - dyspnnea - electrolyte disturbances - haematuria - headache - hypotension - infection - loss of appetite - malaise - nail disorder - oedema - pallor - paraesthesia - proteinuria - pruritus - pyrexia - severe myelosuppression - skin discoloration - tachycardia - taste disturbances - vein discoloration - weight loss

- Frequency not known: Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - photosensitivity - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION**
- Ensure effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**
- Manufacturer advises avoid - toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
- Manufacturer advises avoid - no information available.

**HEPATIC IMPAIRMENT**
- No information available - manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
- No information available - manufacturer advises caution.

**MONITORING REQUIREMENTS**
- Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

---

**Pentostatin**

**INDICATIONS AND DOSE**
- Hairy cell leukaemia (initiated in specialist centres)
- **BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: To be given on alternate weeks (consult product literature)

**INTERACTIONS**
- Appendix 1 (pentostatin)

**SIDE-EFFECTS**
- Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - immunosuppression - myelosuppression - nausea - neurotoxicity (withhold or discontinue) - oral mucositis - severe rash (withhold treatment) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises that men should not father children during and for 6 months after treatment.

**PREGNANCY**
- Avoid (teratogenic in animal studies).

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Limited information available.

**RENAL IMPAIRMENT**
- Avoid if creatinine clearance less than 60 ml/minute.

---

**Solution for infusion**
- Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial £121.85
- Mitoxantrone (Baxter Healthcare Ltd) Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial no price available
- Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial no price available

---

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**SIDE-EFFECTS, FURTHER INFORMATION**
- Cardiotoxicity Cardiac examinations are recommended after a cumulative dose of 160 mg/m².

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**
- Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Use with caution — consult local treatment protocol.

---

**RENAL IMPAIRMENT**
- If trastuzumab needs to be used, cardiac function should be monitored closely.

**SIDE-EFFECTS**

---

**SIDE-EFFECTS, FURTHER INFORMATION**
- Heart failure - electrocardiographic abnormalities - ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

---

**INTERACTIONS**
- Concomitant use of cardiotoxic drugs - increased risk of cardiotoxicity. Contra-indicated with concurrent immunisation with live virus vaccines.

---

**SIDE-EFFECTS**
- Common or very common: Abnormal liver function tests - biochemical disturbances - bone pain - cardiac disorders - cardiotoxicity (during or following treatment) - chromaturia - conjunctivitis - constipation - cough - diarrhoea - drowsiness - dry mouth - dyspepsia - dyspnnea - electrolyte disturbances - haematuria - headache - hypotension - infection - loss of appetite - malaise - nail disorder - oedema - pallor - paraesthesia - proteinuria - pruritus - pyrexia - severe myelosuppression - skin discoloration - tachycardia - taste disturbances - vein discoloration - weight loss

---

**UNCOMMON**

---

**FREQUENCY NOT KNOWN**
- Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - photosensitivity - thromboembolism - tumour lysis syndrome - vomiting

---

**CONCEPTION AND CONTRACEPTION**
- Ensure effective contraception during and for at least 6 months after treatment in men or women.

---

**PREGNANCY**
- Manufacturer advises avoid - toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

---

**BREAST FEEDING**
- Manufacturer advises avoid - no information available.

---

**HEPATIC IMPAIRMENT**
- No information available - manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

---

**RENAL IMPAIRMENT**
- No information available - manufacturer advises caution.

---

**MONITORING REQUIREMENTS**
- Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.
Malignant disease

- Full blood count and cardiac function should be monitored throughout treatment.
- **PATIENT AND CARER ADVICE**
  Photosensitivity
  Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NICE technology appraisals (TAs)**
  - Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma (February 2014) NICE TA306
  Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma in patients:
  - who have previously been treated with rituximab and
  - who are receiving third- or fourth-line treatment and
  - if the manufacturer provides pixantrone with the discount agreed in the patient access scheme. www.nice.org.uk/TA306

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - ELECTROLYTES: May contain Sodium
  - Pixuvri (CTI Life Sciences Ltd) ▼
  - Pixantrone (as Pixantrone dimaleate) 29 mg
  - powder for concentrate for solution for infusion vials | 1 vial | no price available

**Procarbazine**
- **DRUG ACTION**
  Procarbazine is a mild monoamine-oxidase inhibitor.

- **INDICATIONS AND DOSE**
  Hodgkin’s lymphoma
  - Adult: (consult local protocol)

- **SIDE-EFFECTS**
  - Common or very common
  - Loss of appetite
  - Frequency not known
  - Alopecia • bone-marrow suppression • hypersensitivity rash (discontinue treatment) • hyperuricaemia • jaundice • myelosuppression • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting
  - **PREGNANCY**
  - Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
  - **BREAST FEEDING**
  - Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.
  - **RENAI IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.

**Raltitrexed**
- **DRUG ACTION**
  Raltitrexed is a thymidylate synthase inhibitor.

- **INDICATIONS AND DOSE**
  Palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used
  - BY INTRAVENOUS INFUSION
  - Adult: (consult local protocol)

- **INTERACTIONS**
  - Appendix 1 (raltitrexed).

- **SIDE-EFFECTS**
  - Alopecia • bone-marrow suppression • extravasation • gastro-intestinal effects • hyperuricaemia • myelosuppression • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting
  - **CONCEPTION AND CONTRACEPTION**
  - Ensure effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY**
  - See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAI IMPAIRMENT**
  - Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature). Avoid if creatinine clearance less than 25 mL/minute.

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
  - Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
  - Raltitrexed is not recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies. www.nice.org.uk/TA93

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - Tomudex (Hospira UK Ltd)
  - Raltitrexed 2 mg
  - Tomudex 2mg powder for solution for infusion vials | 1 vial | £175.00

**Trabectedin**
- **INDICATIONS AND DOSE**
  Treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated
  - Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)
  - BY INTRAVENOUS INFUSION
  - Adult: (consult product literature or local protocols)

- **SIDE-EFFECTS**
  - Common or very common
  - Loss of appetite
  - Frequency not known
  - Alopecia • bone-marrow suppression • hypersensitivity rash (discontinue treatment) • hyperuricaemia • jaundice • myelosuppression • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting
  - **PREGNANCY**
  - Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
  - **BREAST FEEDING**
  - Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.
  - **RENAI IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.

- **CONTRA-INDICATIONS**
  - Elevated creatine phosphokinase (consult product literature).

- **INTERACTIONS**
  - Caution in concomitant use with hepatotoxic drugs (avoid alcohol).
Trabectedin for the treatment of relapsed ovarian cancer

- Rare Hepatic failure (fatal cases reported)
- Frequency not known Abdominal pain, alopecia, anorexia, arthralgia, anemia, back pain, bone-marrow suppression, constipation, cough, dehydration, diarrhea, dizziness, dyspepsia, dyspnea, extravasation, fatigue, flushing, headache, hepatobiliary disorders, hyperuricaemia, hypokalaemia, hypotension, increased blood creatine kinase, insomnia, myalgia, nausea, oedema, oral mucositis, paraesthesia, peripheral neuropathy, pyrexia, taste disturbance, thromboembolism, tumour lysis syndrome, vomiting

Side-effects, further information
A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

- Conception and contraception Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.
- Pregnancy See Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- Breast feeding Manufacturer advises avoid breastfeeding during and for 3 months after treatment.
- Renal impairment Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.

Monitoring requirements
- Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).

National funding/access decisions
- NICE technology appraisals (TAs)
  - Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185
    Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer. www.nice.org.uk/TA185
  - Trabectedin for the treatment of relapsed ovarian cancer (April 2011) NICE TA222
    Trabectedin in combination with pegylated liposomal doxorubicin is not recommended for the treatment of relapsed platinum-sensitive ovarian cancer. www.nice.org.uk/TA222

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Yondelis (Pharma Mar, S.A.)
  - Trabectedin 250 microgram Yondelis 0.25 mg powder for concentrate for solution for infusion vials [1 vial] no price available (Hospital only)
  - Trabectedin 1 mg Yondelis 1 mg powder for concentrate for solution for infusion vials [1 vial] no price available (Hospital only)

2.3 Cytotoxic drug-induced side effects

Folates

Folinic acid

Indications and dose
Prevention of methotrexate-induced adverse effects
- By Intramuscular injection or by intravenous infusion
  - Adult: 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdosage
- By Intravenous injection or by Intravenous infusion
  - Adult: Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer
- By slow intravenous injection
  - Adult: (consult product literature)

Sodiofolin®
As an antidote to methotrexate
- By Intravenous infusion or by Intravenous injection
  - Adult: (consult product literature)

Adjunct to fluorouracil in colorectal cancer
- By Intravenous injection or by Intravenous infusion
  - Adult: (consult product literature)

Contra-indications
Intrathecal injection

- Caution Not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency
- Avoid simultaneous administration of methotrexate

- Interactions
  - Appendix 1 (folates).

- Side-effects
  - Rare Agitation (after high doses) - depression (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

- Pregnancy
  - Not known to be harmful; benefit outweighs risk.

- Breast feeding
  - Presence in milk unknown but benefit outweighs risk.

National funding/access decisions
- NICE technology appraisals (TAs)
  - Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212
    Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Folinic acid (as Calcium folinate) 3 mg per 1 ml Calcium folinate 3mg/1ml solution for injection ampoules [5 ampoule] £30.00–£36.00
- Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 15mg/2ml solution for injection ampoules [5 ampoule] £38.99–£38.00
- Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 50mg/5ml solution for injection ampoules [1 vial] £18.44 (Hospital)
Levofolic acid

**DRUG ACTION** Levofolic acid is an isomer of folinic acid.

### INDICATIONS AND DOSE

**Prevention of methotrexate-induced adverse effects**

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**

- Adult: Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

**Suspected methotrexate overdosage**

- Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 150 mg/minute, consult poisons information centres for advice on continuing management

**Adjunct to fluorouracil in colorectal cancer**

- Adult: (consult product literature)

### CONTRA-INDICATIONS

- Intrathecal injection

### CAUTIONS

- Not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B<sub>12</sub> deficiency
- Avoid simultaneous administration of methotrexate

### INTERACTIONS

- Appendix 1 (folates).

### SIDE-EFFECTS

- Rare
  - Agitation (after high doses)
  - Depression (after high doses)
  - Insomnia (after high doses)
  - Pyrexia (after parenteral use)

- PREGNANCY
  - Not known to be harmful; benefit outweighs risk.

- BREAST FEEDING
  - Presence in milk unknown but benefit outweighs risk.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Isovorin** (Pfizer Ltd)
  - Levofolic acid (as Calcium levofolinate) 10 mg per 1 ml
  - Isovorin 75mg/15.5ml solution for injection vials | 1 vial (£11.62)
  - Isovorin 25mg/2.5ml solution for injection vials | 1 vial (£8.13)

---

**IRON CHELATORS**

**Dexrazoxane**

**INDICATIONS AND DOSE**

**CARDIOXANE®**

Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m<sup>2</sup> of doxorubicin or a prior cumulative dose of 540 mg/m<sup>2</sup> of epirubicin when further anthracycline treatment is required

**BY INTRAVENOUS INFUSION**

- Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

**Savene®**

Anthracycline extravasation

**BY INTRAVENOUS INFUSION**

- Adult: Initially 1 g/m<sup>2</sup> daily (max. per dose 2 g) for 2 days, then 500 mg/m<sup>2</sup> for 1 day, first dose to be given as soon as possible and within 6 hours after injury

### CONTRA-INDICATIONS

- Children

### CAUTIONS

- Myelosuppression (effects may be additive to those of chemotherapy)

**CARDIOXANE®**

Manufacturer advises caution in patients with heart failure—no information available

Manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available

Manufacturer advises caution in patients with symptomatic valvular heart disease—no information available

Manufacturer advises caution in patients with uncontrolled angina—no information available

### INTERACTIONS

- Appendix 1 (dexrazoxane)

### SIDE-EFFECTS

**CARDIOXANE®**

- **Common or very common**
  - Anorexia
  - Astenia
  - Diarrhoea
  - Dizziness
  - Dry mouth
  - Dyspnoea
  - Erythema
  - Infection
  - Malaise
  - Nausea
  - Oedema
  - Paraesthesia
  - Peripheral neuropathy
  - Stomatitis
  - Syncope
  - Vomiting

- **Uncommon**
  - Abdominal pain
  - Acute myeloid leukaemia
  - Constipation
  - Cough
  - Dyspepsia
  - Headache
  - Lymphoedema
  - Nail disorder
  - Reduced ejection fraction
  - Tachycardia
  - Thrombocytopenia
  - Thromboembolism

**Savene®**

- **Common or very common**
  - Alopecia
  - Anaemia
  - Bleeding disorders
  - Blood disorders
  - Cough
  - DIARRHOEA
  - Dizziness
  - Dry mouth
  - Dyspnoea
  - Erythema
  - Fatigue
  - Headache
  - Hypersensitivity reactions
  - Leucopenia
  - Mucositis
  - Nausea
  - Oedema
  - Peripheral neuropathy
  - Peripheral oedema
  - Pruritus
  - Pyrexia
  - Stomatitis
  - Syncope
  - Thrombocytopenia
  - Tremor
  - Vaginal haemorrhage
  - Vomiting

**Uncommon**

- Drowsiness
- Myalgia
- Thromboembolism

**Common or very common**

- Alopecia
- Anaemia
- Blood disorders
- Bleeding disorders
- Blood disorders
- Cough
- DIARRHOEA
- Dizziness
- Dry mouth
- Dyspnoea
- Erythema
- Fatigue
- Headache
- Hypersensitivity reactions
- Leucopenia
- Mucositis
- Nausea
- Oedema
- Peripheral neuropathy
- Peripheral oedema
- Pruritus
- Pyrexia
- Stomatitis
- Syncope
- Thrombocytopenia
- Tremor
- Vaginal haemorrhage
- Vomiting

### CONCEPTION AND CONTRACEPTION

Ensure effective contraception during and for at least 3 months after treatment in men and women.

### PREGNANCY

Avoid unless essential (toxicity in animal studies).

### BREAST FEEDING

Discontinue breast-feeding.
Hypertension associated with cytotoxic drugs

### Palifermin

**DRUG ACTION** Palifermin is a human keratinocyte growth factor.

**INDICATIONS AND DOSE**

Management of oral mucositis in patients with haematological malignancies receiving myeloblastic radiochemotherapy with autologous haematopoietic stem-cell support

**BY INTRAVENOUS INJECTION**

- Adult: 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloblastic therapy) then 3 further doses at least 24 hours after myeloblastic therapy, and more than 4 days after most recent palifermin injection, starting on the same day as (but after) stem-cell infusion

**SIDE-EFFECTS**

- Arthralgia
- Discoloration of the tongue
- Erythema
- Fever
- Oedema
- Oral paraesthesia
- Pruritus
- Rash
- Skin hyperpigmentation
- Taste disturbance
- Thickening of the tongue

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—毒性 in animal studies.

**MEDICAL FORMS**
