There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**
  - Kepivance (Swedish Orphan Biovitrum Ltd)
  - Palifermin 6.25 mg Kepivance 6.25 mg powder for solution for injection vials | 6 vial (£9.265.44)

### UROPROTECTIVE DRUGS

#### Mesna

**INDICATIONS AND DOSE**

Cytotoxic induced urothelial toxicity

**BY MOUTH OR BY INTRAVENOUS INJECTION**

- Adult: Dose to be calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

**SIDE-EFFECTS**

- Common or very common Colic, depression, diarrhoea, fatigue, headache, hypotension, irritability, joint pains, limb pains, nausea, rash, tachycardia, vomiting

**ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of hypersensitivity to thiol-containing compounds.

**PREGNANCY** Not known to be harmful. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**EFFECT ON LABORATORY TESTS** False positive urinary ketones. False positive or false negative urinary erythrocytes.

**DIRECTIONS FOR ADMINISTRATION** For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

- **Tablet**
  - MESNA (Non-proprietary)
    - Mesna 400 mg Mesna 400 mg tablets | 10 tablet (£134.30–£134.40)
    - Mesna 600 mg Mesna 600 mg tablets | 10 tablet (£190.60)

**Solution for injection**

- MESNA (Non-proprietary)
  - Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule (£41.15 Mesna 400mg/4ml solution for injection ampoules | 15 ampoule (£201.15)

2.4 Hyperuricaemia associated with cytotoxic drugs

Drugs used for Hyperuricaemia associated with cytotoxic drugs not listed below; Allopurinol, p. 905
Malignant disease

URATE OXIDASES

Rasburicase

**INDICATIONS AND DOSE**
Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis

**BY INTRAVENOUS INFUSION**
- Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

- CONTRA-INDICATIONS G6PD deficiency
- CAUTIONS Atopic allergies
- SIDE-EFFECTS Fever
- Uncommon Anaphylaxis - bronchospasm - diarrhoea - haemolytic anaemia - headache - hypersensitivity reactions - methaemoglobinaemia - nausea - rash - vomiting
- PREGNANCY Manufacturer advises avoid — no information available.
- BREAST FEEDING Manufacturer advises avoid — no information available.
- MONITORING REQUIREMENTS Monitor closely for hypersensitivity.
- EFFECT ON LABORATORY TESTS May interfere with test for uric acid—consult product literature.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Fasturtec®), give intermittently in Sodium chloride 0.9%; reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- Powder and solvent for solution for infusion
  - Rasburicase 1.5 mg Fasturtec 1.5 mg powder and solvent for solution for infusion vials | 3 vial (Pack) £208.39 (Hospital only)
  - Rasburicase 7.5 mg Fasturtec 7.5 mg powder and solvent for solution for infusion vials | 1 vial (Pack) £289.44 (Hospital only)

2.5 Hormone responsive malignancy

**Hormones, malignant disease**

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hypernephroma. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

**Oestrogens**
Diethylstilbestrol p. 788 is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Ethinylestradiol p. 655 is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver.

**Progestogens**
Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. Medroxyprogesterone acetate p. 695 or megestrol acetate p. 788 are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended.

**Androgens**
Testosterone esters have largely been superseded by other drugs for breast cancer.

**Hormone Antagonists**

**Breast Cancer**
The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these. For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

**Early breast cancer**
All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women. Anastrozole p. 792 and letrozole p. 793 are non-steroidal aromatase inhibitors; exemestane p. 792 is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen p. 751, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years. Trastuzumab p. 743 is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin or ovarian ablation.

**Advanced breast cancer**
Treatment of advanced breast cancer depends on the patient’s drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate p. 695, may be used after aromatase inhibitors and tamoxifen in postmenopausal women.
Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation.

Trastuzumab emtansine p. 744 can be used alone for treating HER2-positive, unresectable, locally advanced breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy.

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

Cytotoxic drugs used in breast cancer
An anthracycline combined with fluorouracil p. 761 and cyclophosphamide p. 750, and sometimes also with methotrexate p. 762 is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

Metastatic disease
The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin hydrochloride p. 754 or epirubicin hydrochloride p. 756) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane either alone or in combination with trastuzumab p. 743 if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capetitabine p. 757, mitoxantrone p. 778, mitomycin p. 767, and vinorelbine p. 775. Trastuzumab p. 743 alone or in combination with trastuzumab p. 743 if they have tumours that overexpress HER2. Trastuzumab emtansine can be used as monotherapy in HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane, or when there is a disease recurrence during or following adjuvant therapy.

The use of bisphosphonates in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

Gonadorelin analogues and gonadotrophin-releasing hormone antagonists
Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (buserelin p. 631, goserelin p. 632, leuporelacte p. 633, or triptorelin p. 635). The gonadotrophin-releasing hormone antagonist, degarelix p. 787, is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease can often be palliated with irradiation or, if widespread, with strontium ranelate p. 626 or prednisolone p. 585.

Gonadorelin analogues
Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol p. 788 but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary.

Gonadorelin analogues are also used in women for breast cancer and other indications. The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men.

Anti-androgens
Cyproterone acetate p. 662, flutamide p. 787 and bicalutamide p. 786 are anti-androgens that inhibit the tumour ‘flare’ which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

Abiraterone acetate p. 786 (in combination with prednisone p. 586 or prednisolone p. 585) and enzalutamide p. 787 are licensed for metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen. Abiraterone acetate p. 786 and enzalutamide p. 787 are also used to treat metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. Medical castration with a luteinising hormone-releasing hormone analogue should be continued during treatment in patients not surgically castrated.

Gonadotrophin-releasing hormone antagonists
Degarelix p. 787 is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour ‘flare’, therefore anti-androgen therapy is not required.

Somatostatin analogues
Lanreotide p. 789, octreotide p. 789 and pasireotide p. 790 are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Lanreotide (Somatuline Autogel®) is also licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 576 and terlipressin acetate p. 77. Pasireotide is licensed for the treatment of Cushing’s disease when surgery has failed or is inappropriate.
Abiraterone acetate

**INDICATIONS AND DOSE**

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone). Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone).

**CAUTIONS**

- Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) · history of cardiovascular disease
- Concomitant use of drugs known to be associated with myopathy or rhabdomyolysis.

**SIDE-EFFECTS**

- **Common or very common** Angina · arthralgia · atrial fibrillation · diarrhoea · dyspepsia · fractures · haematuria · heart failure · hepatotoxicity · hypertension · hypertriglyceridaemia · hypokalaemia · peripheral oedema · rash · sepsis · tachycardia · urinary tract infection
- **Uncommon** Adrenal insufficiency · myopathy · rhabdomyolysis
- **Rare** Allergic alveolitis

**CONCEPTION AND CONTRACEPTION**

Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—sexuality in animal studies.

**HEPATIC IMPAIRMENT**

Use with caution in moderate impairment and only if benefit clearly outweighs risk. Avoid in severe impairment.

**РЕNAL IMPAIRMENT**

Use with caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for details of restarting treatment at a lower dose and discontinue permanently if 20 times the upper limit.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) *NICE TA259*
Enzalutamide

INDICATIONS AND DOSE
Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

BY MOUTH
- Adult: 160 mg once daily, for dose adjustments due to side-effects, consult product literature

CAUTIONS
- Alcoholism - bradycardia - brain injury - brain metastases - brain tumours - history of QT-interval prolongation - history or risk of seizure - recent cardiovascular disease - risk factors for QT-interval prolongation - stroke - uncontrolled hypertension

INTERACTIONS
- Appendix 1 (enzalutamide)
- Avoid concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS
- Common or very common Anxiety - cognitive disorder - dry skin - falls - fractures - headache - hot flush - hypertension - memory impairment - neutropenia - pruritus - visual hallucinations
- Uncommon Leucopenia - seizure
- CONCEPTION AND CONTRACEPTION Men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—vulnerability to QT-interval prolongation.

HEPATIC IMPAIRMENT
- Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT
- Caution in severe impairment—no information available.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Capsule
- CAUTIONARY AND ADVISORY LABELS 25
- Xtandi (Astellas Pharma Ltd)
  - Enzalutamide 40 mg | 112 capsule
  - £2,734.67

Hormone responsive malignancy 787

Flutamide

INDICATIONS AND DOSE
Advanced prostate cancer

BY MOUTH
- Adult: 250 mg 3 times a day

CAUTIONS
- Avoid excessive alcohol consumption - avoid in Acute porphyrias p. 864 - cardiac disease (oedema reported)

INTERACTIONS
- Appendix 1 (flutamide)

SIDE-EFFECTS

HEPATIC IMPAIRMENT
- Use with caution (hepatotoxic).

MONITORING REQUIREMENTS
- Liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms).

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Tablet
- FLUTAMIDE (Non-proprietary)
  - Flutamide 250 mg | 84 tablet
  - £98.58 DT price = £74.84

GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS

Degarelix

INDICATIONS AND DOSE
Advanced hormone-dependent prostate cancer

BY SUBCUTANEOUS INJECTION
- Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region

CAUTIONS
- Diabetes - susceptibility to QT-interval prolongation

INTERACTIONS
- Avoid concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS
- Common or very common Asthenia - dizziness - drowsiness - headache - hot flushes - influenza-like symptoms - injection-site reactions - insomnia - nausea - night sweats - sweating - weight gain

HEPATIC IMPAIRMENT
- Manufacturer advises caution in severe impairment—no information available.

RENAL IMPAIRMENT
- Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS
- Monitor bone density.
Malignant disease

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

*Powder and solvent for solution for injection*
- **Firmagon** (Ferring Pharmaceuticals Ltd) 80 mg – 1 vile
- **Degarelix** (as Degarelix acetate) 120 mg – 2 vile

**INDICATIONS AND DOSE**

- **Breast cancer in postmenopausal women**
  - **BY MOUTH**
    - Adult: 10–20 mg daily

- **Prostate cancer**
  - **BY MOUTH**
    - Adult: 1–3 mg daily

**CAUTIONS**
Cardiovascular disease

**SIDE-EFFECTS**
Arterial thrombosis · bone pain (in breast cancer) · feminising effects in men · fluid retention · gynaecomastia · hypercalcaemia (in breast cancer) · impotence · jaundice · nausea · sodium retention with oedema · thromboembolism · venous thrombosis · withdrawal bleeding

**PREGNANCY**
In first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in fetal offspring. Increased risk of hypospadias in male offspring.

**HEPATIC IMPAIRMENT**
Avoid. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

*Tablet*
- **DIETHYLSTILBESTROL (Non-proprietary)**
  - Diethylstilbestrol 1 mg – 28 tablet
  - Diethylstilbestrol 5 mg – 28 tablet

**INDICATIONS AND DOSE**

- **Breast cancer in postmenopausal women**
  - **BY MOUTH**
    - Adult: 10–20 mg daily

- **Prostate cancer**
  - **BY MOUTH**
    - Adult: 1–3 mg daily

**MEGESTROL ACETATE**

**INDICATIONS AND DOSE**

- **Treatment of breast cancer**
  - **BY MOUTH**
    - Adult: 160 mg once daily

**CONTRA-INDICATIONS**
Acute porphyrias p. 864 · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pempigoid gestationis · history during pregnancy of severe pruritus · history of liver tumours · severe arterial disease · undiagnosed vaginal bleeding

**CAUTIONS**
Asthma · cardiodysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

**INTERACTIONS**
Appendix 1 (progestogens).

**SIDE-EFFECTS**
Acne · adrenal insufficiency · alopecia · anaphylactoid reactions · asthenia · bloating · breast tenderness · carpal tunnel syndrome · change in libido · constipation · Cushing’s syndrome · depression · diarrhoea · dizziness · drowsiness · fluid retention · headache · hirsutism · indigestion · insomnia · jaundice · loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · tumour flare (with or without hypercalcaemia) · urinary frequency · urticaria · vomiting · weight change · weight gain

**PREGNANCY**
 Avoid. Reversible feminisation of male fetuses reported in animal studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, tablet, capsule

*Tablet*
- **Megace** (Bristol-Myers Squibb Pharmaceuticals Ltd) 160 mg – 30 tablet

**DIETHYLSTILBESTROL (Non-proprietary)**

**Somatostatin analogues**

**CAUTIONS**
Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hyperglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses) · may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)

**SIDE-EFFECTS**
Rare Pancreatitis (shortly after administration)

**FREQUENCY NOT KNOWN**
Abdominal pain · anorexia · bloating · diarrhoea · flatulence · gallstones (after long-term treatment) · gastro-intestinal disturbances · hyperglycaemia (with chronic administration) · hypoglycaemia · impaired postprandial glucose tolerance (with chronic administration) · irritation at the injection site · nausea · pain at the injection site · steatorrhoea · vomiting

**MONITORING REQUIREMENTS**
Monitor for signs of tumour expansion (e.g. visual field defects).

**DIRECTIONS FOR ADMINISTRATION**
Injection sites should be rotated.
### Lanreotide

**INDICATIONS AND DOSE**

**SOMATULINE AUTOGEL®**

- **Acromegaly (if somatostatin analogue not given previously)**
  - Adult: Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

- **Neuroendocrine (particularly carcinoid) tumours**
  - Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

- **Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded**
  - Adult: 120 mg every 28 days

- **SOMATULINE LA®**
  - **Acromegaly and neuroendocrine (particularly carcinoid) tumours**
    - Adult: Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response
  - **Thyroid tumours**
    - Adult: Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response

- **CAUTIONS**
  - Cardiac disorders (including bradycardia) - patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment
  - **INTERACTIONS** → Appendix 1 (lanreotide).
  - **SIDE-EFFECTS**
    - Common or very common: Alopecia, biliary dilatation, bradycardia, constipation, dizziness, dyspepsia, headache, lethargy, malaise, musculoskeletal pain, myalgia, raised bilirubin
    - Uncommon: Hot flushes, insomnia
    - Rare: Hypothyroidism
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Manufacturer advises caution—no information available.
  - **MONITORING REQUIREMENTS** Monitor for hypothyroidism when clinically indicated.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Somatuline Autogel** (Ipsen Ltd)
  - **Lanreotide** (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection £55.00
  - **Lanreotide** (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection £73.00

- **Powder and solvent for suspension for injection**
  - **Somatuline LA** (Ipsen Ltd)
    - **Lanreotide** (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial £32.00

### Octreotide

**INDICATIONS AND DOSE**

- **Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas**
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect; if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring)
  - **Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective**
    - Adult: 100–200 micrograms 3 times a day, if no improvement within 3 months
  - **Prevention of complications following pancreatic surgery**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: (consult product literature)
  - **Test dose before use of depot preparation**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given
  - **Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide**
    - **BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
      - Adult: 20 mg every 4 weeks then adjusted according to response to 50 micrograms per day, to be administered into the gluteal muscle, for acromegaly, start depot 1 day after the last dose of subcutaneous octreotide, for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide
  - **Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded**
    - **BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
      - Adult: 30 mg every 4 weeks
  - **Reduce intestinal secretions in palliative care**
    - **Reduce vomiting due to bowel obstruction in palliative care**
      - **BY CONTINUOUS SUBCUTANEOUS INFUSION**
        - Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

- **INTERACTIONS** → Appendix 1 (octreotide).
- **SIDE-EFFECTS**
  - Alopecia, arthrythmias, biliary colic (associated with abrupt withdrawal of subcutaneous octreotide), bradycardia, dehydration, dizziness, dyspepsia, headache, hepatitis, pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide), rash

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Gastro-intestinal side-effects** Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
Hepatic impairment

Adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis.

Monitoring requirements

- With intravenous use ECG monitoring required with intravenous administration.
- Monitor thyroid function on long-term therapy.
- Monitor liver function.

Treatment cessation

Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

Directions for administration

For intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

**Octreotide (Non-proprietary)**

Octreotide (as Octreotide acetate) 50 microgram per 1 ml

Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pasireotide) €10.65

Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) €9.74–€18.60 Octreotide 50micrograms/1ml solution for injection vials | 5 vial (Pasireotide) €14.37–€22.00

Octreotide (as Octreotide acetate) 100 microgram per 1 ml

Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule (Octreotide) €18.61–€32.65 Octreotide 100micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Octreotide) €28.90 Octreotide 100micrograms/1ml solution for injection vials | 5 vial (Octreotide) €27.97–€32.65

Octreotide (as Octreotide acetate) 200 microgram per 1 ml

Octreotide 1mg/5ml solution for injection vials | 1 vial (Octreotide) €65.00–€69.66

Octreotide (as Octreotide acetate) 500 microgram per 1 ml

Octreotide 500micrograms/1ml solution for injection vials | 5 vial (Octreotide) €135.47–€158.25 Octreotide 500micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Octreotide) €135.47–€149.00

Sandostatin (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 50 microgram per 1 ml

Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule (Sandostatin) €14.87

Octreotide (as Octreotide acetate) 100 microgram per 1 ml

Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule (Sandostatin) €27.97

Octreotide (as Octreotide acetate) 200 microgram per 1 ml

Sandostatin 1mg/5ml solution for injection vials | 1 vial (Sandostatin) €55.73

Octreotide (as Octreotide acetate) 500 microgram per 1 ml

Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule (Sandostatin) €135.47

Powder and solvent for suspension for injection

Sandostatin LAR (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 10 mg Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial (Sandostatin) €469.84

Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial (Sandostatin) €776.05

Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial (Sandostatin) €993.44

Pasireotide

Indications and dose

Cushing’s disease when surgery has failed or is inappropriate

By subcutaneous injection

- Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response within 2 months, for dose adjustment due to side effects—consult product literature

Caution

Cardiac disorders (including bradycardia) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

Interactions

Caution with concomitant use of drugs that prolong QT interval.

Side-effects

Pregnancy

Avoid—toxicity in animal studies.

Breast feeding

Avoid—present in milk in animal studies.

Hepatic impairment

Reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment. Avoid in severe impairment.

Monitoring requirements

- Monitor liver function before treatment and after 1, 2, 4, 8, and 12 weeks of treatment.
- QT-interval prolongation Monitor ECG and electrolytes in patients susceptible to QT-prolongation before treatment, after one week, and periodically thereafter.
- Diabetes mellitus In diabetic patients, assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Signifor (Novartis Pharmaceuticals UK Ltd) ▲ Pasireotide (as Pasireotide disparetate) 300 microgram per 1 ml Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule (Signifor) €2,800.00 Pasireotide (as Pasireotide disparetate) 600 microgram per 1 ml Signifor 0.6mg/1ml solution for injection ampoules | 60 ampoule (Signifor) €3,240.00 Pasireotide (as Pasireotide disparetate) 900 microgram per 1 ml Signifor 0.9mg/1ml solution for injection ampoules | 60 ampoule (Signifor) €3,240.00

2.6 Hormone responsive breast cancer

Anti-oestrogens

Fulvestrant

Indications and dose

Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

By deep intramuscular injection

- Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every 1 month, to be administered into the buttock

- Side-effects

Common or very common Anorexia - asthenia - back pain - diarrhoea - headache - hot flushes - hypersensitivity reactions - injection-site reactions - nausea - rash - urinary-tract infections - venous thromboembolism - vomiting
Tamoxifen

**DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin release by occupying oestrogen receptors

**INDICATIONS AND DOSE**

**Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen**

**BY MOUTH**

- **Adult:** 20 mg daily

**Anovulatory infertility**

- **Adult:** Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

**CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**CAUTIONS** Porphyria

**INTERACTIONS** → Appendix 1 (tamoxifen).

**SIDE-EFFECTS**

- Rare Angioedema · bullous pemphigoid · cholestasis · fatty liver · hepatitis · hypersensitivity reactions · hypertriglyceridaemia · interstitial pneumonitis · neutropenia · Stevens-Johnson syndrome

- Frequency not known Alopecia · anaemia · catarracts · corneal changes · decreased platelet counts · endometrial changes · gastrointestinal disturbances · headache · hot flushes · hypercalcaemia if bony metastases · increased risk of thromboembolic events, especially when used with cytotoxics · leucopenia · light-headiness · liver enzyme changes · occasional cystic ovarian swellings in premenopausal women · occasionally oedema · pancreatitis · pruritus vulvae · rashes · retinopathy · suppression of menstruation in some premenopausal women · thrombocytopenia · thromboembolic events · tumour flare · uterine fibroids · vaginal bleeding · vaginal discharge · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

**Endometrial changes** Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

**Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures).

**CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (rarely more than twins).

**PREGNANCY** Avoid—possible effects on fetal development.

**BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.

**PATIENT AND CARER ADVICE**

Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly. Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Faslodex (AstraZeneca UK Ltd)

  Fulvestrant 50 mg per ml

  Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection £52.41

**CONTRA-INDICATIONS**

- Breast cancer (hormone responsive)

**INDICATIONS AND DOSE**

Hormone-dependent metastatic breast cancer in postmenopausal women

**BY MOUTH**

- **Adult:** 60 mg daily

**CONTRA-INDICATIONS** Bradycardia · electrolyte disturbances (particularly uncorrected hypokalaemia) · endometrial hyperplasia · heart failure with reduced left-ventricular ejection fraction · history of arrhythmias · QT prolongation

**CAUTIONS** Avoid in Acute porphyrias p. 864 · history of severe thromboembolic disease

**INTERACTIONS** → Appendix 1 (toremifene).
Avoid concomitant administration of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - **Common or very common** Depression, dizziness, fatigue, hot flushes, nausea, oedema, rash, sweating, vaginal bleeding, vaginal discharge, vomiting
  - **Uncommon** Anorexia, constipation, dyspnoea, endometrial hypertrophy, headache, increased weight, insomnia, thromboembolic events
  - **Very rare** Alopecia, jaundice, transient corneal opacity
  - **Frequency not known** Hypercalcaemia (especially if bone metastases and usually at beginning of treatment)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Endometrial changes: Increased endometrial changes, including hyperplasia, polyps, and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and symptoms such as pelvic pain or pressure should be promptly investigated.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Elimination decreased in hepatic impairment—avoid if severe.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  | Tablet | Anastrozole 1 mg | Anastrozole 1 mg tablets | 28 tablet | £68.56 DT price = £1.98
  | Tablet | Arimidex (AstraZeneca UK Ltd) | Anastrozole 1 mg | Anastrozole 1 mg tablets | 28 tablet | £68.56 DT price = £1.98

- **Exemestane**

  | INDICATIONS AND DOSE | Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed
  | BY MOUTH | Adult: 25 mg daily

  | CONTRA-INDICATIONS | Not indicated for premenopausal women
  | INTERACTIONS | Appendix 1 (exemestane).
  | SIDE-EFFECTS | Common or very common: Abdominal pain, alopecia, anorexia, constipation, depression, dizziness, dyspepsia, fatigue, headache, hot flushes, insomnia, nausea, rash, sweating, vomiting
  | CONTRA-INDICATIONS | Not for premenopausal women
  | CAUTIONS | Susceptibility to osteoporosis
  | SIDE-EFFECTS | Very rare: Allergic reactions, anaphylaxis, angioedema
  | Frequency not known | Anorexia, arthralgia, arthritis, asthenia, bone fractures, bone pain, cutaneous vasculitis, diarrhoea, drowsiness, hair thinning, headache, hot flushes, nausea, rash, slight increases in total cholesterol levels, Stevens–Johnson syndrome, vaginal bleeding, vaginal dryness, vomiting
  | PREGNANCY | Avoid.
  | BREAST FEEDING | Avoid.
  | HEPATIC IMPAIRMENT | Avoid.
  | RENAL IMPAIRMENT | Avoid if moderate to severe impairment.
  | NATIONAL FUNDING/ACCESS DECISIONS | The Scottish Medicines Consortium (SMC) Decisions
  | Scottish Medicines Consortium (SMC) Decisions | The Scottish Medicines Consortium has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  | Tablet | Exemestane (Non-proprietary) | Exemestane 25 mg | Exemestane 25 mg tablets | 30 tablet | £88.80 DT price = £22.48
  | Tablet | Aromasin (Pfizer Ltd) | Exemestane 25 mg | Aromasin 25 mg tablets | 30 tablet | £88.80 DT price = £22.48

- **Osteoporosis** Assess bone mineral density before treatment and at regular intervals.
- **PATIENT AND CARER ADVICE** Asthenia and drowsiness may initially affect ability to drive or operate machinery.
### Letrozole

**INDICATIONS AND DOSE**

- **First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer**
- **Adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women**
- **Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause)** in whom other anti-oestrogen therapy has failed
- **Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years**
- **Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated**

**BY MOUTH**

- **Adult**
  - 2.5 mg daily

**CONTRA-INDICATIONS** Not indicated for premenopausal women

**CAUTIONS** Susceptibility to osteoporosis

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain
  - Alopecia
  - Anorexia
  - Appetite increase
  - Arthralgia
  - Bone fracture
  - Constipation
  - Depression
  - Diarrhoea
  - Dizziness
  - Dry skin
  - Dyspepsia
  - Fatigue
  - Headache
  - Hot flushes
  - Hypercholesterolaemia
  - Hypertension
  - Increased sweating
  - Musculoskeletal pain
  - Nausea
  - Osteoporosis
  - Peripheral oedema
  - Rash
  - Vaginal bleeding
  - Vomiting
  - Weight changes

- **Uncommon**
  - Anxiety
  - Arthritis
  - Blurred vision
  - Breast pain
  - Cardiac events
  - Cataract
  - Cerebrovascular events
  - Cough
  - Dysaesthesia
  - Dyspnoea
  - Eye irritation
  - General oedema
  - Insomnia
  - Leucopenia
  - Memory impairment
  - Mucosal dryness
  - Palpitation
  - Pruritus
  - Pyrexia
  - Stomatitis
  - Tachycardia
  - Taste disturbance
  - Thrombophlebitis
  - Tumour pain
  - Urinary frequency
  - Urinary-tract infection
  - Urticaria
  - Vaginal discharge

- **Rare**
  - Arterial thrombosis
  - Pulmonary embolism

**FREQUENCY NOT KNOWN**

- Hepatitis
- Toxic epidermal necrolysis

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).

**PREGNANCY**

Avoid (isolated cases of birth defects reported).

**BREAST FEEDING**

Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises caution if creatinine clearance less than 10 mL/minute.

**MONITORING REQUIREMENTS**

- Osteoporosis: Assess bone mineral density before treatment and at regular intervals.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - LETROZOLE (Non-proprietary)
  - Letrozole 2.5 mg tablets: 14 tablet (30) £49.90
  - DT price = £2.26
  - 28 tablet (30) £84.86
  - Femara (Novartis Pharmaceuticals UK Ltd)
  - Letrozole 2.5 mg: Femara 2.5 mg tablets: 30 tablet (30) £90.92

### 2.7 Immunotherapy responsive malignancy

**IMMUNOMODULATING DRUGS**

**Mifamurtide**

**INDICATIONS AND DOSE**

- Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

**BY INTRAVENOUS INFUSION**

- **Adult**
  - Infusion to be given over 1 hour (consult product literature or local protocols)

**UNLICENSED USE**

- Not licensed for use in patients over 30 years of age at initial diagnosis.

**CAUTIONS**

- Asthma—consider prophylactic bronchodilator therapy
c- chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy
- History of autoimmune disease
- History of collagen disease
- History of inflammatory disease

**INTERACTIONS**

- Appendix 1 (mifamurtide)

**SIDE-EFFECTS**

- Abdominal pain
- Alopecia
- Anaemia
- Anorexia
- Anxiety
- Blurred vision
- Confusion
- Constipation
- Cough
- Depression
- Diarrhoea
- Dizziness
- Dyspepsia
- Fatigue
- Headache
- Hot flushes
- Hypertension
- Insomnia
- Leucopenia
- Memory impairment
- Mucosal dryness
- Palpitation
- Pruritus
- Pyrexia
- Stomatitis
- Tachycardia
- Taste disturbance
- Thrombophlebitis
- Tumour pain
- Urinary frequency
- Urinary-tract infection
- Urticaria
- Vascular discharge

**FREQUENCY NOT KNOWN**

- Hepatitis
- Toxic epidermal necrolysis

**CONCEPTION AND CONTRACEPTION**

Effective contraception required.

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Avoid—no information available.

**HEPATIC IMPAIRMENT**

Use with caution—no information available.

**RENAL IMPAIRMENT**

Use with caution—no information available.

**MONITORING REQUIREMENTS**

- Monitor renal function, hepatic function and clotting parameters.
- Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme. www.nice.org.uk/TA235

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Histamine dihydrochloride

**INDICATIONS AND DOSE**
Maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission

- **Adult:** consult product literature

**CONTRA-INDICATIONS**
Consult product literature for information about histamine dihydrochloride contra-indications.

**INTERACTIONS**
Appendix 1 (histamine).

**SIDE-EFFECTS**
Consult product literature for side effects.

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during treatment in men and women.

**PREGNANCY**
Manufacturer advises avoid—no information available.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Increased risk of tachycardia and hypotension in moderate to severe impairment.

**RENAL IMPAIRMENT**
Increased risk of hypotension in severe impairment.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2010) that histamine dihydrochloride (Ceplene®) is not recommended for use within NHS Scotland.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Ceplene (Meda Pharmaceuticals Ltd)
- Histamine dihydrochloride 1 mg per 1 ml solution for injection vials 14 vial (POM) £1,181.32

**IMMUNOTHERAPIES**

**Bacillus calmette-guérin**

**DRUG ACTION**
Bacillus Calmette-Guérin is a live attenuated strain derived from Mycobacterium bovis.

**INDICATIONS AND DOSE**
Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection

- **Adult:** consult product literature

**CONTRA-INDICATIONS**
Fever of unknown origin - HIV infection - impaired immune response - severe haematuria - tuberculosis - urinary-tract infection

**CAUTIONS**
Bladder injury (delay administration until mucosal damage healed) - traumatic catheterisation (delay administration until mucosal damage healed) - urethral injury (delay administration until mucosal damage healed)

**SIDE-EFFECTS**
- Rare: Arthralgia - bladder contracture - hypersensitivity reactions - orchitis - rash - renal abscess - transient urethral obstruction
- **Frequency not known:** Cystitis - dysuria - fever - haematuria - influenza-like syndrome - malaise - ocular symptoms - systemic BCG infection (with fatalities)—consult product literature - urinary frequency

**PREGNANCY**
Avoid.

**BREAST FEEDING**
Avoid.

**PRE-TREATMENT SCREENING**
Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).

**INTERFERONS**
**Interferon alfa**

**INDICATIONS AND DOSE**

- **INTRONA® PEN**
  - Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine)
  - Hairy cell leukaemia
  - Follicular lymphoma
  - Lymph or liver metastases of carcinoid tumour
  - Chronic hepatitis B
  - Chronic hepatitis C
  - Adjunct to surgery in malignant melanoma
  - Maintenance of remission in multiple myeloma

- **INTRONA® VIALS**
  - Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine)
  - Hairy cell leukaemia
  - Follicular lymphoma
  - Lymph or liver metastases of carcinoid tumour
  - Chronic hepatitis B
  - Chronic hepatitis C
  - Adjunct to surgery in malignant melanoma
  - Maintenance of remission in multiple myeloma

- **ROFERON-A®**
  - Chronic myelogenous leukaemia
  - Hairy cell leukaemia
  - Chronic hepatitis B
  - Chronic hepatitis C
  - Adjunct to surgery in malignant melanoma
  - AIDS-related Kaposi’s sarcoma
  - Advanced renal cell carcinoma
  - Progressive cutaneous T-cell lymphoma
  - Follicular non-Hodgkin’s lymphoma

**CONTRA-INDICATIONS**
Avoid injections containing benzyl alcohol in neonates

**CONTRA-INDICATIONS, FURTHER INFORMATION**
For contra-indications consult product literature and local treatment protocol.

**CAUTIONS**
For cautions consult product literature and local treatment protocol.

**INTERACTIONS**
Appendix 1 (interferons).
Interferon gamma-1b (Immune interferon)

INDICATIONS AND DOSE
To reduce the frequency of serious infection in chronic granulomatous disease

BY SUBCUTANEOUS INJECTION
Adult: 50 micrograms/m\(^2\) 3 times a week

To reduce the frequency of serious infection in severe malignant osteoporosis

BY SUBCUTANEOUS INJECTION
Adult: 50 micrograms/m\(^2\) 3 times a week

CAUTIONS
Arrhythmias - cardiac disease - congestive heart failure - ischaemia - seizure disorders (including seizures associated with fever)

INTERACTIONS
Appendix 1 (interferons).
Avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response).

SIDE-EFFECTS
Common or very common Abdominal pain - arthralgia - chills - depression - diarrhoea - fatigue - fever - headache - injection-site reactions - myalgia - nausea - rash - vomiting

Rare Confusion - systemic lupus erythematosus

Frequency not known Neutropenia - proteinuria - raised liver enzymes - thrombocytopenia

CONCEPTION AND CONTRACEPTION
Effective contraception required during treatment—consult product literature.

PREGNANCY
Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING
Manufacturers advise avoid—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises caution in severe impairment—risk of accumulation.

RENAI IMPAIRMENT
Manufacturer advises caution in severe impairment—risk of accumulation.

MONITORING REQUIREMENTS
Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
EXCIPIENTS: May contain Benzyl alcohol

Interferon alfa-2b 10 mega u per ml Introna 10 million units/1ml solution for injection vials | 1 vial (Plast) no price available

Interferon alfa-2b 15 mega u per ml Introna 15 million units/1ml solution for injection multidose vials | 1 vial (Plast) £103.94

Interferon alfa-2b 25 mega u per ml Introna 25 million units/1ml solution for injection multidose pens | 1 pre-filled disposable injection (Plast) £74.83

Interferon alfa-2b 50 mega u per ml Introna 60 million units/1ml solution for injection multidose pens | 1 pre-filled disposable injection (Plast) £249.45

Interferon alfa-2b 6 mega u per ml Roferon-A 3 million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £14.20

Interferon alfa-2b 9 mega u per ml Roferon-A 4.5 million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £21.29

Interferon alfa-2b 12 mega u per ml Roferon-A 6 million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £28.37

Interferon alfa-2b 18 mega u per ml Roferon-A 9 million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £42.57

Interferon alfa-2b 50 mega u per ml Roferon-A 150 million units/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £749.45

Interferon alfa-2b (Roche Products Ltd)

Interferon alfa-2a 6 mega u per ml Roferon-A 3 million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £14.20

Interferon alfa-2a 9 mega u per ml Roferon-A 4.5 million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Plast) £21.29

Roferon-A (Roche Products Ltd)
INTERLEUKINS

Aldesleukin

**DRUG ACTION** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

**INDICATIONS AND DOSE**

Metastatic renal cell carcinoma (specialist use only)

- **BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**UNLICENSED USE** Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Cooperative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

**CONTRA-INDICATIONS** Consult product literature for information about aldesleukin contra-indications.

**CAUTIONS** Consult product literature for information about aldesleukin cautions.

**INTERACTIONS**

- **SIDE-EFFECTS**
  - Common or very common Bone-marrow toxicity - CNS toxicity - hepatic toxicity - renal toxicity - thyroid toxicity
  - Frequency not known Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Also consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Use only if potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION**
  - Aldesleukin is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Proleukin** (Novartis Pharmaceuticals UK Ltd)
  - *Aldesleukin 18 mega u Proleukin 18 million unit powder for solution for injection vials | 1 vial £112.00 | 10 vial £1,036.00*

THALIDIOMIDE AND RELATED ANOLOGUES

Lenalidomide

**DRUG ACTION** Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

**INDICATIONS AND DOSE**

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression

- **BY MOUTH**
  - Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexamethasone

- **BY MOUTH**
  - Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

**CAUTIONS**

- High tumour burden—risk of tumour lysis syndrome
- Patients with risk factors for myocardial infarction

**CAUTIONS, FURTHER INFORMATION**

Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.

**Second primary malignancy** Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

**INTERACTIONS**

- **SIDE-EFFECTS**

- **Uncommon** Acquired Fanconi syndrome - angioedema - blindness - cataract - clotting disorders - colitis - haemolysis - hepatic failure - ischaemia - secondary malignancies

- **Rare** Stevens-Johnson syndrome - toxic epidermal necrolysis - tumour lysis syndrome
> Frequency not known Cholestatic hepatitis - cytolytic hepatitis - interstitial pneumonitis - leukocytoclastic vasculitis - pancreatitis - toxic hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Rash** If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation. Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected. For information on side effects consult product literature.

**CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

**PREGNANCY Important: teratogenic risk** Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

**BREAST FEEDING** Discontinue breast-feeding—no information available.

**RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.

**MONITORING REQUIREMENTS**
- Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).
- Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).
- Monitor for renal impairment.
- Monitor for signs and symptoms of peripheral neuropathy.
- Monitor visual ability regularly (risk of cataract).
- Hepatic disorders Liver function should be monitored particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

**PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

**PATIENT AND CARER ADVICE** Patient counselling is advised for lenalidomide capsules (pregnancy and contraception). Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- **Lenalidomide for the treatment of multiple myeloma (June 2009) NICE TA171** Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles. [www.nice.org.uk/TA171](http://www.nice.org.uk/TA171)
- **Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014) NICE TA322** Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent anaemia caused by low or intermediate-1-risk myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:
  - the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than 26 cycles (each of 28 days; normally a period of 2 years) will be met by the company. [www.nice.org.uk/TA322](http://www.nice.org.uk/TA322)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies and (March 2014) for those who have received prior treatment with bortezomib and for whom thalidomide has not been tolerated or is contra-indicated.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pomalidomide**

**DRUG ACTION** Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

**INDICATIONS AND DOSE**

Treatment of relapsed or refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone) **BY MOUTH**

- Adult: 4 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature
Thalidomide

**Drug action** Thalidomide has immunomodulatory and anti-inflammatory activity.

**Indications and Dose**
First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone

**By Mouth**
Adult: 200 mg once daily for 6–8 weeks, maximum 12 cycles, dose to be taken at bedtime

**Caution** High tumour burden—risk of tumour lysis syndrome

**Caution, Further Information**
Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.

**Second primary malignancy** Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

**Peripheral neuropathy** Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.

**Prescribing and Dispensing Information**
Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

**Patient and carer advice** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb. Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop. Patient counselling is advised for pomalidomide capsules (pregnancy and contraception).

**National Funding/Access Decisions**

PHOTOREACTORS

Porfimer sodium

Drug action

Porfimer sodium accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

INDICATIONS AND DOSE

Photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer

BY SLOW INTRAVENOUS INJECTION

Adult: (consult product literature)

CONTRA-INDICATIONS

Acute porphyria p. 864 • broncho-oesophageal fistula • tracheo-oesophageal fistula

SIDE-EFFECTS

Alopecia • bone-marrow suppression • constipation • extravasation • hyperuricaemia • nausea • oral mucositis • photosensitivity (sunscreens offer no protection) • thromboembolism • tumour lysis syndrome • vomiting

PREGNANCY

Manufacturer advises avoid unless essential.

BREAST FEEDING

No information available—manufacturer advises avoid.

HEPATIC IMPAIRMENT

Avoid in severe impairment.

PATIENT AND CARER ADVICE

Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

PHOTOSENSITISERS

8 Photodynamic therapy responsive malignancy

800 Malignant disease

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Photofrin (Axcan Pharma Inc)
  Porfimer sodium 15 mg Photofrin 15 mg powder for solution for injection vials | 1 vial (P) no price available (Hospital only)
- Photofrin 75 mg Photofrin 75 mg powder for solution for injection vials | 1 vial (P) no price available (Hospital only)

Side-effects
- Suppression
- Thromboembolism
- Nausea
- Vomiting
- Hyperpigmentation
- Alopecia

INTERACTIONS
- Concomitant photosensitising treatment
- Acute porphyrias
- Myelodysplastic syndromes
- Hepatic impairment
- Renal impairment
- Pregnancy and reproductive function
- Contraception advised

CONTRA-INDICATIONS
- Acute porphyrias
- Myelodysplastic syndromes
- Severe hepatic or renal impairment
- Pregnancy

CONCEPTION AND CONTRACEPTION
- Manufacturer advises avoid pregnancy for at least 3 months after treatment.

BY SLOW INTRAVENOUS INJECTION
- Adult: (consult product literature)

INDICATIONS AND DOSE
Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

PRESCRIBING AND DISPENSING INFORMATION
- No information available

HEDGEHOG PATHWAY INHIBITORS

Vismodegib

DRUG ACTION
Vismodegib is a hedgehog pathway inhibitor.

INDICATIONS AND DOSE
Symptomatic metastatic basal cell carcinoma
Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy

BY MOUTH
- Adult: 150 mg once daily

Important safety information
Risks of incorrect dosing of oral anti-cancer medicines, see p. 745

INTERACTIONS
- Appendix 1 (vismodegib)

SIDE-EFFECTS
- Common or very common
  - Abdominal pain
  - Abnormal hair growth
  - Alopecia
  - Anemia
  - Arthralgia
  - Ataxia
  - Decreased appetite
  - Dehydration
  - Diarrhea
  - Dyspepsia
  - Hyperpigmentation
  - Hyponatremia
  - Hyperuricaemia
  - Mucositis
  - Muscle spasms
  - Musculoskeletal pain
  - Nausea
  - Pruritus
  - Rash
  - Taste disturbances
  - Vomiting
  - Weight loss

CONCEPTION AND CONTRACEPTION
For women of childbearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.

PREGNANCY
- Important: teratogenic risk—may cause severe birth defects and embryo-fetal death.

BREAST FEEDING
- Avoid during treatment and for 24 months after final dose.

HEPATIC IMPAIRMENT
- No information available—manufacturer advises caution in moderate to severe impairment.

RENAL IMPAIRMENT
- No information available—manufacturer advises caution in severe impairment.

PRESCRIBING AND DISPENSING INFORMATION
Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer’s Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme’s pregnancy prevention measures—consult product literature for further information.

PATIENT AND CARER ADVICE
Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer’s pregnancy prevention programme.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
- Cautionary and advisory labels 25
  - Erihide (Roche Products Ltd)
  - Vismodegib 150 mg Vismodegib 150 mg capsules | 28 capsule (P)
  - £6,285.00 (Hospital only)

Temoporfin

DRUG ACTION
Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

INDICATIONS AND DOSE
Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

PRESCRIBING AND DISPENSING INFORMATION
- No information available

CONTRA-INDICATIONS
- Acute porphyrias
- Myelodysplastic syndromes
- Severe hepatic or renal impairment
- Pregnancy

CONCEPTION AND CONTRACEPTION
- Manufacturer advises avoid pregnancy for at least 3 months after treatment.

BY SLOW INTRAVENOUS INJECTION
- Adult: (consult product literature)
TARGETED THERAPY RESPONSIVE MALIGNANCY 801

PROTEASOME INHIBITORS

Bortezomib

**DRUG ACTION** Bortezomib is a proteasome inhibitor.

**INDICATIONS AND DOSE**

Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) | Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) | Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide) | BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

- **Adult:** (consult local protocol)

<table>
<thead>
<tr>
<th>Important safety information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bortezomib injection is for intravenous or subcutaneous administration only. Inadvertent intrathecal administration with fatal outcome has been reported.</td>
</tr>
</tbody>
</table>

**CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease - pericardial disease

**CAUTIONS** Amyloidosis - cardiovascular disease - consider antiviral prophylaxis for herpes zoster infection - dehydration - history of syncope - pulmonary disease (discontinue if interstitial lung disease develops) - risk factors for seizures - risk of neuropathy - consult product literature

**INTERACTIONS** | Appendix 1 (bortezomib).

Caution with concurrent use of medication which may cause hypotension.

**SIDE-EFFECTS**

- **Common or very common** Constipation (cases of ileus reported) - decreased appetite - diarrhoea - dyspnoea - fatigue - headache - herpes zoster - hypotension - myalgia - paraesthesia - peripheral neuropathy - pyrexia - rash - reactivation of herpes zoster - sensory neuropathy

- **Uncommon** Acute diffuse infiltrative pulmonary disorders - heart failure - posterior reversible encephalopathy syndrome (discontinue treatment) - pulmonary hypertension - seizures

- **Rare** Autonomic neuropathy

- **Very rare** Progressive multifocal leucoencephalopathy

- **Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

For further information on side-effects, consult product literature.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

**PREGNANCY** Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.

**RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor blood-glucose concentration in patients on oral antidiabetics.

- Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.

- Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Bortezomib monotherapy for relapsed multiple myeloma** (October 2007) NICE TA129

  Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

  - the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and

  - the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment. [www.nice.org.uk/TA129](http://www.nice.org.uk/TA129)

- **Bortezomib and thalidomide for the first-line treatment of multiple myeloma** (July 2011) NICE TA228

Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:

- high-dose chemotherapy with stem cell transplantation is considered inappropriate and

- the person is unable to tolerate or has contra-indications to thalidomide. [www.nice.org.uk/TA228](http://www.nice.org.uk/TA228)

- **Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation** (April 2014) NICE TA311

Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation. [www.nice.org.uk/TA311](http://www.nice.org.uk/TA311)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium, has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation. [www.nice.org.uk/TA228](http://www.nice.org.uk/TA228)

**SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**

**Targeted therapy responsive malignancy 801**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Velcade** (Janssen-Cilag Ltd)

  **Bortezomib 3.5 mg** Velcade 3.5mg powder for solution for injection vials | 1 vial (Exit) £762.38 (Hospital only)
PROTEIN KINASE INHIBITORS

Afatinib

**DRUG ACTION** Afatinib is a protein kinase inhibitor.

**INDICATIONS AND DOSE**
Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor

BY MOUTH
- Adult: 40 mg once daily for 3 weeks, then increased if tolerated to 50 mg once daily, consult product literature for details on dosing and dose adjustment due to side effects

**CAUTIONS**
Cardiac risk factors - conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment - diarrhoea—proactive management recommended (consult product literature) - exposure to sun (protect skin from exposure to sun) - history of keratitis - new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded - severe dry eyes - signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment - signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) - ulcerative keratitis - use of contact lenses - worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded

**INTERACTIONS** → Appendix 1 (afatinib).

**SIDE-EFFECTS**
- **Common or very common** Acne - conjunctivitis - cystitis - decreased appetite - dehydration - diarrhoea - dry eyes - dry skin - dysgeusia - dyspepsia - epistaxis - hand-foot syndrome - hypokalaemia - muscle spasms - paronychia - pruritus - pyrexia - rash (see Cautions) - renal failure - rhinorhoea - weight loss
- **Uncommon** Interstitial lung disease - keratitis
- **Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

**PREGNANCY** Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises avoid in severe renal impairment.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose. Giotrif® tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

**PATIENT AND CARER ADVICE** Ocular adverse reactions may affect performance of skilled tasks e.g. driving. Patient counselling advised (administration).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014) NICE TA310

Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:
- whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, and
- who have not previously had an EGFR-TK inhibitor, and
- if the manufacturer provides afatinib with the discount agreed in the patient access scheme. www.nice.org.uk/TA310

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

Axitinib

**DRUG ACTION** Axitinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**
Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)

BY MOUTH
- Adult: (consult product literature)

**CONTRA-INDICATIONS** Recent active gastro-intestinal bleeding - untreated brain metastases

**CAUTIONS** Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)

**INTERACTIONS** → Appendix 1 (axitinib).

**SIDE-EFFECTS**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745**
Medicinal forms

Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015)

- **NICE technology appraisals (TAs)**
  - Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment
    - **Inlyta (Pfizer Ltd)**
      - Axitinib 1 mg Inlyta 1mg tablets | 56 tablet £703.40 (Hospital only)
      - Axitinib 3 mg Inlyta 3mg tablets | 56 tablet £2,110.20 (Hospital only)
      - Axitinib 5 mg Inlyta 5mg tablets | 56 tablet £3,517.00 (Hospital only)
      - Axitinib 7 mg Inlyta 7mg tablets | 56 tablet £4,923.80 (Hospital only)

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **Inlyta (Pfizer Ltd)**
      - Axitinib 1 mg Inlyta 1mg tablets | 56 tablet £703.40 (Hospital only)
      - Axitinib 3 mg Inlyta 3mg tablets | 56 tablet £2,110.20 (Hospital only)
      - Axitinib 5 mg Inlyta 5mg tablets | 56 tablet £3,517.00 (Hospital only)
      - Axitinib 7 mg Inlyta 7mg tablets | 56 tablet £4,923.80 (Hospital only)

Bosutinib

**INDICATIONS AND DOSE**

- Treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **Bosulif (Pfizer Ltd)**
      - Bosutinib 100 mg Bosulif 100mg tablets | 28 tablet £859.17 (Hospital only)
      - Bosutinib 500 mg Bosulif 500mg tablets | 28 tablet £3,436.67 (Hospital only)

- **CAUTIONS**
  - Cardiac disease
  - History of pancreatitis— withholding treatment if lipase elevated and abdominal symptoms occur
  - History of QT prolongation— monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment

- **INTERACTIONS**
  - Appendix 1 (bosutinib).
  - Caution with concomitant use of drugs that prolong the QT interval (monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment).

- **SIDE-EFFECTS**
  - Common or very common
    - Abdominal pain
    - Abnormal liver function
    - Acne
    - Arthralgia
    - Biochemical disturbances
    - Cough
    - Decreased appetite
    - Dehydration

    - Renal failure
    - Respiratory failure
    - Skin reaction
    - Stomatitis
    - Upper respiratory tract infection
    - Urticaria
    - Vomiting

- **有效性**
  - Effective

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception required during treatment in women.

- **PREGNANCY**
  - Avoid—toxicity in animal studies.

- **BREAST FEEDING**
  - Effective contraception required during treatment in women.

- **HEPATIC IMPAIRMENT**
  - Reduce starting dose in moderate impairment.
  - Avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor for thyroid dysfunction.
  - Monitor haemoglobin or haematocrit before and during treatment.
  - Monitor for proteinuria before and during treatment.
  - Monitor for symptoms of fistula.
  - Monitor for symptoms of gastrointestinal perforation.
  - Monitor hepatic function before and during treatment.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Bosutinib for previously treated chronic myeloid leukaemia**
      - **(November 2013)** NICE TA299

- **MEDICINAL FORMS**

      - Bosutinib 100 mg Bosulif 100mg tablets | 28 tablet £859.17 (Hospital only)
      - Bosutinib 500 mg Bosulif 500mg tablets | 28 tablet £3,436.67 (Hospital only)
Caboza	

**Drug Action** Cabozantinib is an inhibitor of several protein kinases.

**Indications and Dose**

Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma

**By Mouth**

- Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side effects, consult product literature (closely monitor for first 8 weeks of therapy).

**Important Safety Information**

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**, see p. 745

**Contra-Indications** Reversible Posterior Leukoencephalopathy Syndrome

**Caution** Hypertension—discontinue treatment if uncontrolled despite medical intervention—palmar-plantar erythrodysesthesia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1. Patients at increased risk of fistulas—consult product literature. Patients at increased risk of gastrointestinal perforation—consult product literature. Patients at increased risk of gastro-intestinal perforation—consult product literature. Patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop. Patients at risk of thromboembolic events—consult product literature. Raynaud’s phenomenon—discontinue if symptoms develop. Risk of osteonecrosis of the jaw—susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically.

**Caution, Further Information**

**Elective Surgery** Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.

**Risk of Osteonecrosis of the Jaw** Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.

**Interactions**

- Appendix 1 ( caboza	

Caution with concomitant use of drugs which increase the risk of osteonecrosis of the jaw e.g. bisphosphonates.

**Side-Effects**

- Common or very common: Abdominal pain; abnormal hair growth; abscess; acne; alopecia; anal fissure; anxiety; arthralgia; aspiration; atrial fibrillation; blurred vision; chelitis; chills; cholelithiasis; constipation; decreased appetite; dehydration; depression; diarrhoea; dizziness; dry skin; dysgeusia; dyspepsia; dysphagia; dysuria; erythema; face oedema; folliculitis; fungal infection; gastro-intestinal perforation; gastro-intestinal haemorrhage; glossodynia; haematuria; haemorrhoids; hair colour changes; headache; hyperbilirubinaemia; hyperkeratosis; hypertension; hypoaluminaemia; hypocalcaemia; hypokalaemia; hypophosphataemia; hypotension; hypothyroidism; impaired wound healing; lymphopenia; mucosal inflammation; muscle spasms; musculoskeletal chest pain; nausea; neutropenia; non-gastro-intestinal fistula; oophoronygael pain; osteonecrosis of jaw; pallor; palmar-plantar erythrodysesthesia syndrome; pancreatitis; paraesthesia; peripheral coldness; peripheral neuropathy; platelet disorders; pneumonia; proteinuria; pulmonary embolism; rash; respiratory tract haemorrhage; skin exfoliation; skin hypopigmentation; stomatitis; tinnitus; tremor; venous thrombosis; vomiting.

- Uncommon: Acute renal failure; amnorrhoea; angina; arterial thrombosis; aspergilloma; ataxia; atelectasis; cataract; conjunctivitis; cyst; delirium; facial pain; gastro-intestinal fistula; hepatic encephalopathy; hypocalcaemia; loss of consciousness; oesophagitis; pharyngeal oedema; pneumonitis; posterior reversible encephalopathy syndrome; rhododendroidysia; skin ulcer; speech disorder; supraventricular tachycardia; telangiectasia; transient ischaemic attack; vaginal haemorrhage.

- Frequency not known: Bone-marrow suppression; hyperuricemia; oral mucositis; thromboembolism; tumour lysis syndrome.

**Conception and Contraception** Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.

**Pregnancy** Manufacturer advises avoid unless potential benefit outweighs risk—tocotoxicity in animal studies. See also Pregnancy and reproductive function in Cytoxic drugs, p. 746.

**Breast Feeding** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.

**Hepatic Impairment** Manufacturer advises avoid.

**Renal Impairment** Manufacturer advises caution in renal impairment. Avoid in severe impairment.

**Monitoring Requirements** Monitor urine protein regularly and discontinue if nephrotic syndrome develops.

**Patient and Carer Advice**

Fatigue and weakness may affect performance of skilled tasks e.g. driving. Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**Cautionary and Advisory Labels 25**

- Cometriq (Swedish Orphan Biovitrum Ltd)
- Cabozantinib (as Cabozantinib s-malate) 20 mg Cometriq 20 mg capsules | 7 capsule pack no price available | 21 capsule pack no price available | 84 capsule pack £4,800.00
- Cabozantinib (as Cabozantinib s-malate) 80 mg Cometriq 80 mg capsules | 7 capsule pack no price available | 21 capsule pack no price available | 112 capsule pack £4,800.00
- Cometriq (Swedish Orphan Biovitrum Ltd)
- Cometriq 20 mg capsules and Cometriq 80 mg capsules | 56 capsule pack £4,800.00 | 112 capsule pack £4,800.00

**Crizotinib**

**Drug Action** Crizotinib is a tyrosine kinase inhibitor.

**Indications and Dose**

Treatment of previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer

**By Mouth**

- Adult: 250 mg twice daily, for dose adjustments due to side-effect, consult product literature.

**Important Safety Information**

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**, see p. 745

**Caution** History of diverticulitis (risk of gastro-intestinal perforation—discontinue treatment if
gastrointestinal perforation occurs) - metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) - patients with susceptibility to QT prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required - risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs - vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

**CAUTIONS, FURTHER INFORMATION**

**Hepatic impairment**

Avoid (toxicity in renal impairment). 

**Breast feeding**

Avoid (toxicity in breast feeding). 

**Pregnancy**

Avoid (toxicity in pregnancy). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast feeding**

Avoid—no information available.

**Hepatic impairment**

Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**Renal impairment**

Reduce dose to 250 mg once daily in severe renal impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

**Monitoring requirements**

- Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated.
- Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter.
- Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

**Patient and carer advice**

Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advice to seek immediate medical attention.

**Driving and skilled tasks**

Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).

**National funding/access decisions**

**NICE technology appraisals (TAs)**

- Crizotinib for previously treated non-small-cell lung cancer associated with an anaplastic lymphoma kinase fusion gene (September 2013) NICE TA296

Crizotinib is not recommended within its marketing authorisation, for treating adults with previously treated anaplastic-lymphoma-kinase-positive advanced non-small-cell lung cancer. www.nice.org.uk/TA296

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 25

- Xalkori (Pfizer Ltd) Crizotinib 200 mg Xalkori 200 mg capsules | 60 capsule £4,689.00
- Crizotinib 250 mg Xalkori 250 mg capsules | 60 capsule £4,689.00

**Dabrafenib**

**Drug action**

Dabrafenib is a BRAF kinase inhibitor.

**Indications and dose**

Monotherapy for the treatment of unresectable or metastatic melanoma with BRAF V600 mutation by mouth

- Adult: 150 mg every 12 hours, for dose adjustments due to side effects consult product literature

**Important safety information**

Risks of incorrect dosing of oral anti-cancer medicines, see p. 745

**Contra-indications**

BRAF wild-type melanoma - long QT syndrome - uncorrectable electrolyte abnormalities (including magnesium)

**Caution**

Pyrexia (interrupt treatment if ≥38.5°C and assess for signs and symptoms of infection—consult product literature)

**Interactions**

Appendix 1 (dabrafenib). Contra-indicated with concomitant use of drugs that prolong the QT interval.

**Side-effects**

- Common or very common Acrochordon - arthralgia - basal cell carcinoma - chills - constipation - cough - cutaneous squamous cell carcinoma - decrease in left ventricular ejection fraction - decreased appetite - diarrhoea - dry skin - erythema - hand-foot syndrome - headache - hyperglycaemia - hyperkeratosis - hypophosphataemia - influenza-like symptoms - keratitis - malaise - myalgia - papilloma - pruritus - pyrexia - rash - skin lesions
- Less common or very common Acrochordon - arthralgia - basal cell carcinoma - chills - constipation - cough - cutaneous squamous cell carcinoma - decrease in left ventricular ejection fraction - decreased appetite - diarrhoea - dry skin - erythema - hand-foot syndrome - headache - hyperglycaemia - hyperkeratosis - hypophosphataemia - influenza-like symptoms - keratitis - malaise - myalgia - papilloma - pruritus - pyrexia - rash - skin lesions
- Rare Acrochordon - arthralgia - basal cell carcinoma - chills - constipation - cough - cutaneous squamous cell carcinoma - decrease in left ventricular ejection fraction - decreased appetite - diarrhoea - dry skin - erythema - hand-foot syndrome - headache - hyperglycaemia - hyperkeratosis - hypophosphataemia - influenza-like symptoms - keratitis - malaise - myalgia - papilloma - pruritus - pyrexia - rash - skin lesions

**Side-effects, further information**

Pancreatitis Promptly investigate signs and symptoms of pancreatitis—consult product literature.

**Conception and contraception**

Effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential.
Malignant disease

**Dabrafenib for treating unresectable or metastatic BRAF**

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - Assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment.
  - Assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature.
  - Monitor serum creatinine and other signs of renal failure—consult product literature and interrupt dose as appropriate.
  - Monitor for ophthalmologic reactions including uveitis and iritis.
  - Monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification—consult product literature if abnormalities occur.
- **PATIENT AND CARER ADVICE** Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAS)**
    - Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014) NICE TA321 Dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme. www.nice.org.uk/TA321
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (February 2015) that dabrafenib (Tafinlar®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic BRAF V600 mutation-positive melanoma in patients who have received no prior therapy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 23, 25
  - **Tafinlar** (Novartis Pharmaceuticals UK Ltd)
    - Dabrafenib (as Dabrafenib mesilate) 50 mg Tafinlar 50mg capsules | 28 capsule (PO) £93.33. (Hospital only)
    - Dabrafenib (as Dabrafenib mesilate) 75 mg Tafinlar 75mg capsules | 28 capsule (PO) £1,400.00. (Hospital only)

**Dasatinib**
- **DRUG ACTION** Dasatinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

**Chronic phase chronic myeloid leukaemia (consult product literature for details)**
- **BY MOUTH**
  - Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily

**Accelerated and blast phase chronic myeloid leukaemia**

- **BY MOUTH**
  - Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily

**Important safety information**

**RISKS OF INCORRECT DOING OF ORAL ANTI-CANCER MEDICINES, see p. 745**

- **CAUTIONS** Risk of cardiac dysfunction (monitor closely) - susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)
- **CAUTIONS, FURTHER INFORMATION**
  - **Pulmonary arterial hypertension** Patients should be evaluated for signs and symptoms of underlying cardiopulmonary disease before starting treatment; echocardiography should be performed at the start of treatment in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease. Treatment should be interrupted or the dose reduced in patients who develop dyspnoea or fatigue, while they are evaluated for common aetiologies (e.g. pleural effusion, pulmonary oedema, anaemia or lung infiltration); pulmonary arterial hypertension should be considered in the absence of these conditions, and if there is no improvement following dose reduction or interruption. If pulmonary arterial hypertension is confirmed, dasatinib should be permanently discontinued.

**INTERACTIONS** Appendix 1 (dasatinib).

**SIDE-EFFECTS**

- **Rare** Cor pulmonale - Frequency not known Alopecia - bone-marrow suppression - hyperuricaemia - interstitial lung disease - nausea - oral mucositis - thromboembolism - thrombosis - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment.
**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Dasatinib, high dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012) NICE TA241

Dasatinib is not recommended for the treatment of chronic, accelerated or blast-crisis phase CML in adults with imatinib intolerance or whose CML is resistant to treatment with standard-dose imatinib. www.nice.org.uk/TA241

- Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012) NICE TA251

Dasatinib is not recommended for the first-line treatment of chronic phase Philadelphia-chromosome-positive CML. www.nice.org.uk/TA251

---

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2007) that the use of dasatinib (Sprycel<sup>®</sup>) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

---

**ERLOTINIB**

**DRUG ACTION** Erlotinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy | Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy

**BY MOUTH**

- Adult: 150 mg once daily

Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

**BY MOUTH**

- Adult: 100 mg once daily

---

**Important safety information**

**EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer ( cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.
**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (May 2006) that erlotinib (Tarceva®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy. The Scottish Medicines Consortium has also advised (December 2011) that erlotinib (Tarceva®) is accepted for use within NHS Scotland for the first-line treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) activating mutations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 23

- Erlotinib (as Erlotinib hydrochloride) 25 mg Tarceva 25mg tablets | 30 tablet pack £378.33
- Erlotinib (as Erlotinib hydrochloride) 100 mg Tarceva 100mg tablets | 30 tablet pack £1,134.14
- Erlotinib (as Erlotinib hydrochloride) 150 mg Tarceva 150mg tablets | 30 tablet pack £1,631.53

**Everolimus**

**DRUG ACTION**

Everolimus is a protein kinase inhibitor.

**INDICATIONS AND DOSE**

**VOTUBIA®**

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

BY MOUTH

- Adult: (consult product literature)

Renal angiomyolipoma associated with tuberous sclerosis complex

BY MOUTH

- Adult: (consult product literature)

**AFINITOR®**

Treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy | Treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin | Treatment of hormone-receptor-positive, human epidermal growth factor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in postmenopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor

BY MOUTH

- Adult: 10 mg once daily

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

**CAUTIONS**

- History of bleeding disorders

**INTERACTIONS**

- Appendix 1 (everolimus).

Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- Common or very common: Abdominal pain - anorexia - arthralgia - asthenia - chest pain - convulsions - dehydration - diarrhoea - dry mouth - dysphagia - electrolyte disturbance - epistaxis - eyelid oedema - fatigue - hand-foot syndrome - headache - hypercholesterolaemia - hyperglycaemia - hyperlipidaemia - hypertension - hypoglycaemia - increased susceptibility to aspergillosis - increased susceptibility to candidiasis - increased susceptibility to infections - increased susceptibility to pneumonitis - insomnia - interstitial lung disease - irritability - nail disorders - peripheral oedema - pneumonitis - renal failure - skin disorders - taste disturbance

- Uncommon: Aggression - agitation - congestive heart failure - flushing - impaired wound healing - rhabdomyolysis

- Frequency not known: Alopecia - bone-marrow suppression - haemorrhage - hepatitis B reactivation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Reduce dose or discontinue if severe side-effects occur—consult product literature.

**CONCEPTION AND CONTRACEPTION**

Effective contraception must be used during and for up to 8 weeks after treatment.

**PREGNANCY**

Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Consult product literature.

**MONITORING REQUIREMENTS**

- Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.

- Monitor renal function before treatment and periodically thereafter.

**DIRECTIONS FOR ADMINISTRATION**

**VOTUBIA®**

Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

**PATIENT AND CARER ADVICE**

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Everolimus for the second-line treatment of advanced renal cell carcinoma (April 2011) NICE TA219

Everolimus is not recommended for the second-line treatment of advanced renal cell carcinoma. [www.nice.org.uk/TA219](http://www.nice.org.uk/TA219)

- Everolimus in combination with exemestane for treating advanced HER2-negative hormone-receptor-positive breast cancer after endocrine therapy (August 2013) NICE TA295

Everolimus, in combination with exemestane, is not recommended within its marketing authorisation for treating postmenopausal women with advanced human epidermal growth factor receptor 2 (HER2) negative hormone-receptor-positive breast cancer that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. [www.nice.org.uk/TA295](http://www.nice.org.uk/TA295)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2012) that everolimus (Afinitor®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
**Gefitinib**

**DRUG ACTION** Gefitinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

**BY MOUTH**

- Adult: 250 mg once daily

---

**Important safety information**

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

---

**INTERACTIONS** → Appendix 1 (gefitinib).

**SIDE-EFFECTS**

- **Common or very common** Acne, anorexia, asthenia, bleeperatitis, conjunctivitis, diarrhoea, dry eye, dry mouth, dry skin, epistaxis, haematuria, interstitial lung disease — discontinue if confirmed — nail disorder — proteinuria, pruritus, pyrexia, rash — skin reactions
- **Uncommon** Cornal erosion, pancreatitis
- **Rare** Hepatitis — toxic epidermal necrolysis
- **Frequency not known** Alopecia, bone-marrow suppression — hyperuricaemia — nausea — oral mucositis — thromboembolism — tumour lysis syndrome — vomiting

**PREGNANCY**

Manufacturer advises avoid unless essential — toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment due to cirrhosis.

**RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 20 mL/minute.

**MONITORING REQUIREMENTS**

- Monitor for worsening of dyspnoea, cough and fever — discontinue if interstitial lung disease confirmed.
- Monitor liver function — consider discontinuing if severe changes in liver function occur.

**NICE technology appraisals (TAs)**

- Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192

---

**Ibrutinib**

**DRUG ACTION** Ibrutinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of relapsed or refractory mantle cell lymphoma

**BY MOUTH**

- Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

**TREATMENT OF CHRONIC LYMPHOCYTIC LEUKAEMIA, IN PATIENTS WHO HAVE RECEIVED AT LEAST ONE PRIOR THERAPY, OR AS FIRST-LINE TREATMENT IN PATIENTS WITH 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy**

**BY MOUTH**

- Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

**TREATMENT OF CHRONIC LYMPHOCYTIC LEUKAEMIA, IN PATIENTS WHO HAVE RECEIVED AT LEAST ONE PRIOR THERAPY, OR AS FIRST-LINE TREATMENT IN PATIENTS WITH 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy (patients taking concomitant moderate or potent CYP3A4 inhibitors) | Treatment of relapsed or refractory mantle cell lymphoma (patients taking concomitant moderate or potent CYP3A4 inhibitors)**

**BY MOUTH**

- Adult: 140 mg once daily, for dose adjustments due to side effects consult product literature

**Dose adjustments due to interactions**

Reduce dose in patients taking concomitant potent CYP3A4 inhibitors (such as cobicistat, clarithromycin, darunavir boosted with ritonavir, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir, telithromycin, and voriconazole) or moderate CYP3A4 inhibitors (such as amiodarone, aprepitant, atazanavir, ciprofloxacin, crizotinib, diltiazem, dronedarone, erlotinib, fluconazole, fosamprenavir, imatinib, and verapamil); alternatively temporarily stop ibrutinib if the potent CYP3A4 inhibitor is only required for 7 days or less. Avoid concomitant use with these drugs unless unavoidable.

---

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

---

**CAUTIONS** Family history of congenital short QT syndrome — increased risk of leukostasis, consider withholding treatment temporarily and monitor closely. Patients at risk from further shortening of QTc interval — personal history of congenital short QT syndrome — risk of haemorrhagic events — withhold ibrutinib treatment for at least 5 to 7 days before and after surgery depending on risk of bleeding.

**INTERACTIONS** → Appendix 1 (ibrutinib).

Avoid concomitant use of drugs that increase risk of bleeding.
810 Malignant disease

SIDE-EFFECTS

Common or very common

Arthralgia · atrial fibrillation · blurred vision · bruising · constipation · dehydration · diarrhoea · dizziness · dry mouth · epistaxis · haemorrhage · headache · musculoskeletal pain · peripheral oedema · petechiae · pyrexia · rash · respiratory tract infection · sepsis · sinusitis · skin infection · subdural haematoma · urinary tract infection

Uncommon

Leukostasis

Frequency not known

Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

CONCESSION AND CONTRACEPTION

Highly effective contraception (in addition to barrier method) required during and for one month after treatment.

PREGNANCY

Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING

Manufacturer advises caution in breast feeding—no information available.

Hepatic impairment

Reduce dose to the following quantities in patients with hepatic impairment:

- Adult: 100 mg once daily
- Adult: 75 mg once daily

Renal impairment

Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity. Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.

MONITORING REQUIREMENTS

Monitor full blood count once a month.

Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature.

MEdICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

- Imbruvica (janssen-Cilag Ltd)
- Idelalisib 150 mg

Zydelig 140 mg tablets | 90 capsule | 120 capsule

£4,599.00 | £6,132.00

Idelalisib

DRUG ACTION

Idelalisib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients unsuitable for chemotherapy (in combination with rituximab)

Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)

BY MOUTH

- Adult: 150 mg twice daily, for dose adjustment due to side effects, consult product literature

Imatinib

DRUG ACTION

Imatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa

BY MOUTH

- Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis

BY MOUTH

- Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy)

BY MOUTH

- Adult: 600 mg once daily

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

CAUTIONS

Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature)
Targeted therapy responsive malignancy 811

Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST) | Adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse | Treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

BY MOUTH

Adult: 400 mg once daily

Treatment of unresectable dermatofibrosarcoma protuberans | Recurrent or metastatic dermatofibrosarcoma protuberans, in patients who cannot have surgery

BY MOUTH

Adult: 800 mg daily in 2 divided doses

Treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia

BY MOUTH

Adult: 100–400 mg once daily

Important safety information

- HEPATIC IMPAIRMENT Max. 400 mg daily; reduce dose further if not tolerated.

- RENAL IMPAIRMENT Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.
- MONITORING REQUIREMENTS
  - Monitor for gastrointestinal haemorrhage.
  - Monitor complete blood counts regularly.
  - Monitor for fluid retention.
  - Monitor liver function.
  - Monitor growth in children (may cause growth retardation).
- DIRECTIONS FOR ADMINISTRATION Tablets may be dispersed in water or apple juice.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer imatinib tablets.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs) NICE TA70

- Imatinib for chronic myeloid leukaemia (October 2003) Imatinib 400 mg daily is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously: www.nice.org.uk/TA70

- Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004) NICE TA86 Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond. www.nice.org.uk/TA86

- Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010) NICE TA209 Imatinib 600 mg daily or 800 mg daily is not recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily. www.nice.org.uk/TA209

- Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012) NICE TA241 High-dose imatinib is not recommended for the treatment of chronic, accelerated or blast-crisis phase Philadelphia-chromosome-positive CML that is resistant to standard-dose imatinib. www.nice.org.uk/TA241

- Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014) NICE TA326 Imatinib is recommended as an option for adjuvant treatment of adult patients who are at high risk of relapse after surgery for KIT (CD117)-positive gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years. Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/TA326
Malignant disease

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2002) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

The Scottish Medicines Consortium has also advised (February 2012) that imatinib (Glivec®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21.27

- Glivec (Novartis Pharmaceuticals UK Ltd)
- Imatinib (as imatinib mesilate) 100 mg Glivec 100mg tablets | 60 tablet £918.23
- Imatinib (as imatinib mesilate) 400 mg Glivec 400mg tablets | 30 tablet £1,836.48

Lapatinib

● DRUG ACTION Lapatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)

BY MOUTH

- Adult: 1 g once daily

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)

BY MOUTH

- Adult: 1.25 g once daily

Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)

BY MOUTH

- Adult: 1.5 g once daily

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

● CAUTIONS

Diarrhoea— withhold treatment if severe (consult product literature) - low gastric pH (reduced absorption) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

● INTERACTIONS → Appendix 1 (lapatinib).

Caution with concomitant use of drugs that prolong QT-interval.

● SIDE-EFFECTS

- Common or very common Anorexia · cardiac failure (fatal cases reported) · decreased left ventricular ejection fraction · diarrhoea (treat promptly) · hepatotoxicity (discontinue permanently if severe) · hyperbilirubinemia · malaise · nail disorders · rash
- Uncommon Interstitial lung disease
- Frequency not known Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · respiratory failure (including fatal cases) · thromboembolism · tumour lysis syndrome · vomiting
- PREGNANCY Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT Caution in moderate to severe impairment—metabolism reduced.
- RENAL IMPAIRMENT Caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Monitor left ventricular function.
- Monitor for pulmonary toxicity.
- Monitor liver function before treatment and at monthly intervals.

● DIRECTIONS FOR ADMINISTRATION Always take at the same time in relation to food: either one hour before or one hour after food.

● PATIENT AND CARER ADVICE Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA257

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Tyverb (Novartis Pharmaceuticals UK Ltd)
- Lapatinib ditosylate monohydrate 250 mg Tyverb 250mg tablets | 84 tablet £965.16 | 105 tablet £1,206.45

Nilotinib

● DRUG ACTION Nilotinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of newly diagnosed chronic myeloid leukaemia in the chronic phase

BY MOUTH

- Adult: 300 mg twice daily
Targeted therapy responsive malignancy 813

Treatment of chronic and accelerated phase chronic myeloid leukaemia in patients who have resistance to or intolerance of previous therapy, including imatinib

BY MOUTH

Adult: 400 mg twice daily

Important safety information
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

          • 200 mg Tasigna 200mg capsules | 112 capsule pack £2,432.85

Pazopanib

• DRUG ACTION Pazopanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma

Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy

BY MOUTH

Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

Treatment of selective subtypes of advanced soft tissue sarcoma

BY MOUTH

Adult: (consult product literature)

Important safety information
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

• CONTRA-INDICATIONS Cerebral haemorrhage • clinically significant gastro-intestinal haemorrhage • haemoptysis in the past 6 months
• CAUTIONS Cardiac disease • increased risk of gastro-intestinal fistulae • increased risk of gastro-intestinal perforation • increased risk of haemorrhage • increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop • ischaemic stroke • myocardial infarction • risk of thrombotic events • susceptibility to QT-interval prolongation (including electrolyte disturbances) • transient ischaemic attack

CAUTIONS, FURTHER INFORMATION

Eelective surgery Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.

Blood pressure Blood pressure must be controlled before initiating treatment.

• INTERACTIONS Appendix 1 (pazopanib). Caution with concomitant use of drugs that prolong QT-interval.
• SIDE-EFFECTS
  • Common or very common Abdominal distension • abdominal pain • anorexia • blood disorders • blurred vision • chest pain • cough • dehydration • diarrhoea • dizziness • dry mouth • dry skin • dyspepsia • dyspnoea • epistaxis • flatulence • flushing • hair discoloration • headache • hepatic dysfunction • hiccups • hyperalbuminaemia •
hyperbilirubinaemia · hypertension · hypothyroidism · increased amylase · insomnia · malaise · muscle spasm · myalgia · nail disorders · oedema · paraesthesia · pneumothorax · proteinuria (discontinue if grade 4) · skin discoloration · skin reactions · sweating · taste disturbance · thrombocytopenia · venous thromboembolic events · voice changes · weight loss

- **Uncommon** Arthralgia · bradycardia · cardiac dysfunction · fistula · gastro-intestinal perforation · haemorrhage · hepatic failure · hypertensive crisis · hypomagnesaemia · menstrual disturbances · myocardial infarction · myocardial ischaemia · ophthalmoplegia · peripheral neuropathy · peritonitis · photosensitivity reactions · pulmonary embolism · QT-interval prolongation · stroke · transient ischaemic attack

- **Rare** Thrombotic microangiopathy
- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

### Conception and Contraception
Effective contraception advised during treatment.

- **Pregnancy** Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **Breast Feeding** Discontinue breast-feeding.

- **Hepatic Impairment** Reduce dose to 200 mg once daily in moderate impairment. Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **Renal Impairment** Use with caution if creatinine clearance less than 30 mL/minute—no information available.

### Monitoring Requirements
- Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.
- Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).
- Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.
- Monitor for proteinuria.
- Monitor thyroid function.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

- **Patient and Carer Advice** Patients should be advised not to take antacids for at least 1 hour before or 2 hours after pazopanib.

### National Funding/Access Decisions

**NICE technology appraisals (TAs)**
- Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013) NICE TA215

Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:
- who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 and
- if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme. [www.nice.org.uk/TA215](http://www.nice.org.uk/TA215)

---

### Scottish Medicines Consortium (SMC) Decisions

The **Scottish Medicines Consortium** (SMC) has advised (February 2011) that pazopanib (Votrient®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is not recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

### Indications and Dose

**T**reatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate | Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate

**By Mouth**
- Adult: 45 mg once daily, for dose adjustment due to side effects—consult product literature.

**Dose adjustments due to interactions**

Consider reducing the initial dose to 30 mg once daily with concomitant use of potent inhibitors of cytochrome P450 enzyme CYP3A4 (e.g. clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, telithromycin or voriconazole).

---

### Important Safety Information

**MHRA/CHM Advice: Ponatinib: Risk of Vascular Occlusive Events (November 2014)**

The benefits and risks of ponatinib have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which has recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. The review concluded that available evidence shows that the risk of blood vessel blockage with ponatinib is likely to be dose-dependent. However, the data is insufficient to recommend reducing the dose of ponatinib, and there is a risk that a lower dose might not be as effective as the current dose in all patients and in long-term treatment. Therefore, no change has been made to the recommended starting dose.

Prescribers may wish to consider reducing the dose in patients with chronic phase chronic myeloid leukaemia who are responding well to treatment, and who might be at high risk of blood vessel blockage. Stop ponatinib if a complete response has not occurred within 3 months of treatment, and monitor patients for high blood pressure or signs of heart problems.
Regorafenib

- **Drug action**: Regorafenib is an inhibitor of several protein kinases.

**Indications and dose**

Treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor.

**By mouth**

- Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature.

**Important safety information**

- **Risks of incorrect dosing of oral anti-cancer medicines, see p. 745**

- **Caution**: Ensure measures to prevent hand-foot skin reaction - Gilbert's syndrome—risk of hyperbilirubinemia - history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop - hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) - may impair wound healing— withhold treatment for major surgical procedures - predisposition to bleeding.

- **Interactions** → Appendix 1 (regorafenib). Caution in concomitant treatment with drugs that may increase the risk of bleeding (increased risk of haemorrhagic events).

- **Side-effects**
  - **Uncommon** Atrial flutter - cerebral artery stenosis - cerebral infarction - gastric haemorrhage - hepatotoxicity - jaundice - retinal vein occlusion - retinal vein thrombosis - visual impairment.
  - **Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting.

- **Conception and contraception** Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown — alternative or additional methods of contraception should be used.

- **Pregnancy** Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytopathic drugs, p. 746.

- **Breast feeding** Manufacturer advises discontinue breastfeeding—no information available.

- **Hepatic impairment** Manufacturer advises caution in severe impairment.

- **Renal impairment** No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.

- **Monitoring requirements**
  - Monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter for all patients— withhold treatment if lipase elevated and abdominal symptoms occur.
  - Monitor full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
  - Monitor liver function periodically.
  - Monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Cautionary and advisory labels 3, 25

- Iclusig (Ariad Pharma (UK) Ltd) ▼
  - Ponatinib (as Ponatinib hydrochloride) 15 mg Iclusig 15 mg tablets | 60 tablet (£5.00)
  - Ponatinib (as Ponatinib hydrochloride) 45 mg Iclusig 45 mg tablets | 30 tablet (£5.05)

**Malignant disease**
contraception during treatment and up to 8 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Reduce dose (consult product literature).

- **MONITORING REQUIREMENTS**
  - Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
  - Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.
  - Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.
  - Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.

- **PATIENT AND CARER ADVICE** Counselling advised (administration).

- **INTERACTIONS** → Appendix 1 (ruxolitinib).

- **SIDE-EFFECTS**
  - **Common or very common** Dizziness, flatulence, headache, hypercholesterolaemia, weight gain
  - **Uncommon** Tuberculosis
  - **Frequency not known** Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, progressive multifocal leucoencephalopathy, thromboembolism, tumour lysis syndrome, vomiting
  - **PREGNANCY** Avoid—toxicity in animal studies.

- **NEONATES** Caution in severe impairment—no information available.

- **PEDIATRIC USE** Caution in severe impairment—no information available.

- **GERIATRIC USE** Caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor for infection during treatment.
  - Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **RUXOLITINIB FOR DISEASE-RELATED SPLENOEGALY OR SYMPTOMS IN ADULTS WITH MYELOFIBROSIS**

  - **INDICATIONS AND DOSE**
    - Treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post-polycythaemia vera myelofibrosis or post-essential thrombocythaemia myelofibrosis.
    - **BY MOUTH**
      - **Adult:** (consult product literature or local protocols)

  - **SIDE-EFFECTS**
    - **Common or very common** Dizziness, flatulence, headache, hypercholesterolaemia, weight gain
    - **Uncommon** Tuberculosis
    - **Frequency not known** Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, progressive multifocal leucoencephalopathy, thromboembolism, tumour lysis syndrome, vomiting
    - **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Reduce dose (consult product literature).

- **RENAL IMPAIRMENT** Reduce dose in severe impairment (consult product literature).

- **MONITORING REQUIREMENTS**
  - Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
  - Monitor for infection during treatment.
  - Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **RUXOLITINIB FOR DISEASE-RELATED SPLENOEGALY OR SYMPTOMS IN ADULTS WITH MYELOFIBROSIS**

  - **INDICATIONS AND DOSE**
    - Treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis.
    - **BY MOUTH**
      - **Adult:** (consult product literature or local protocols)

  - **SIDE-EFFECTS**
    - **Common or very common** Dizziness, flatulence, headache, hypercholesterolaemia, weight gain
    - **Uncommon** Tuberculosis
    - **Frequency not known** Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, progressive multifocal leucoencephalopathy, thromboembolism, tumour lysis syndrome, vomiting
    - **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Reduce dose (consult product literature).

- **RENAL IMPAIRMENT** Reduce dose in severe impairment (consult product literature).

- **MONITORING REQUIREMENTS**
  - Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
  - Monitor for infection during treatment.
  - Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **RUXOLITINIB FOR DISEASE-RELATED SPLENOEGALY OR SYMPTOMS IN ADULTS WITH MYELOFIBROSIS**

  - **INDICATIONS AND DOSE**
    - Treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis.
    - **BY MOUTH**
      - **Adult:** (consult product literature or local protocols)

  - **SIDE-EFFECTS**
    - **Common or very common** Dizziness, flatulence, headache, hypercholesterolaemia, weight gain
    - **Uncommon** Tuberculosis
    - **Frequency not known** Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, progressive multifocal leucoencephalopathy, thromboembolism, tumour lysis syndrome, vomiting
    - **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Reduce dose (consult product literature).

- **RENAL IMPAIRMENT** Reduce dose in severe impairment (consult product literature).

- **MONITORING REQUIREMENTS**
  - Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
  - Monitor for infection during treatment.
  - Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

  - Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.
Targeted therapy responsive malignancy 817

Sunitinib

**DRUG ACTION** Sunitinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

- **Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib**
  - **By mouth**
    - Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

- **Treatment of unresectable or metastatic pancreatic neuroendocrine tumours**
  - **By mouth**
    - Adult: 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

**Important safety information**

**RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)**

Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk. Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib. If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

---

**CONCLUSIONS**

- **Cautions** Cardiovascular disease—discontinue if congestive heart failure develops; hypertension; increased risk of bleeding; susceptibility to QT-interval prolongation
- **Interactions** → Appendix 1 (sunitinib).
- **Side-effects**
  - **Common or very common** Acne, anorexia, arthralgia, asthenia, congestive heart failure, constipation, depression, dermatitis, desquamation, diarrhoea, dry skin, dysgeusia, dyspepsia, dysphagia, dysphonia, electrolyte disturbances, erectile dysfunction, exanthema, fatigue, fever, flushing, gastro-oesophageal reflux disease, haemorrhage, hand-foot skin reaction, hoarseness, hyperkeratosis, hypertension, hypophosphataemia, hypophosphatemia, keratoacanthoma, malaise, muscle spasms, myalgia, myocardial infarction, myocardial ischaemia, peripheral neuropathy, proteinuria, pruritus, rash, renal failure, rhinorrhoea, thyroid dysfunction, tinnitus
  - **Uncommon** Altered INR, altered prothrombin time, cholangitis, cholecystitis, dehydration, eczema, erythema multiforme, gastritis, gastrointestinal perforations, gynaecomastia, hypertensive crisis, interstitial lung disease-like events, pancreatitis, posterior reversible encephalopathy syndrome
  - **Rare** Hepatitis, leucocytoclastic vasculitis, nephrotic syndrome, QT-interval prolongation, rhabdomyolysis, Stevens-Johnson syndrome, toxic epidermal necrolysis
  - **Frequency not known** Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting
- **Pregnancy** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **Breast Feeding** Discontinue breast-feeding.
- **Hepatic Impairment** Manufacturer advises caution in severe impairment—no information available.
- **Monitoring Requirements**
  - Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
  - Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
  - Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
  - Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.
- **National Funding/Access Decisions**
- **NICE technology appraisals (TAs)**
  - Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
  - Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.
  - Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. [www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)
  - Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010) NICE TA189
  - Sorafenib is not recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable. [www.nice.org.uk/TA189](http://www.nice.org.uk/TA189)
  - **Medicinal Forms**
    - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**

also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**MONITORING REQUIREMENTS** Monitor for thyroid dysfunction.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Sunitinib for advanced or metastatic renal cell carcinoma (March 2009) NICE TA169
- Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1. [www.nice.org.uk/TA169](http://www.nice.org.uk/TA169)
- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
- Sunitinib and sorafenib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. [www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)
- Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009) NICE TA179
- Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal stromal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer. [www.nice.org.uk/TA179](http://www.nice.org.uk/TA179)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium (SMC) has advised (October 2009 and April 2011) that sunitinib (Suitent®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 14

- Sutent (Pfizer Ltd)
  - Sunitinib (as Sunitinib malate) 12.5 mg 28 capsules £784.70
  - Sunitinib (as Sunitinib malate) 25 mg 28 capsules £1,569.40
  - Sunitinib (as Sunitinib malate) 50 mg 28 capsules £3,138.80

**Torisel**

- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
- Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. [www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

**Malignant disease**

**Temsroliimus**

**INDICATIONS AND DOSE**

First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

**INTERACTIONS**

Appendix 1 (temsroliimus).

- The main active metabolite of temsroliimus is sirolimus—see also interactions of sirolimus and consult product literature.

**SIDE-EFFECTS**

- Common or very common Abdominal pain, acne, anorexia, anxiety, arthralgia, asthenia, bowel perforation, chest pain, cough, depression, diarrhoea, dizziness, drowsiness, dysphagia, dyspnoea, epistaxis, eye disorders, folliculitis, gastrointestinal haemorrhage, hypercholesterolaemia, hyperglycaemia, hyperlipidaemia

- Uncommon Intracerebral bleeding

- Frequency not known Alopecia, bone-marrow suppression, extravasation, hypertension, nausea, oral mucositis, thrombocytopenia, tumour lysis syndrome, vomiting

**Hypersensitivity reactions**

- Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsroliimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, anphylaxis, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsroliimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

**CONCEPTION AND CONTRACEPTION**

Ensure effective contraception during treatment in men and women.

**PREGNANCY**

Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Manufacturer advises discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

- In renal cell carcinoma, reduce dose in severe impairment (consult product literature). Use with caution. In mantle cell lymphoma, avoid in moderate or severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor respiratory function.
- Monitor blood lipids.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
- Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. [www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCipients: May contain Ethanol, propylene glycol

- Torisel (Pfizer Ltd)
  - Temsirolimus 25 mg per 1 ml Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent | 1 vial £620.00 (Hospital only)

- Temsirolimus 25 mg per 1 ml Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent | 1 vial £620.00 (Hospital only)
Targeted therapy responsive malignancy

Vandetanib

- **DRUG ACTION** Vandetanib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE** Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease

  **BY MOUTH**
  - **Adult:** 300 mg once daily, for dose adjustment due to side effects—consult product literature

**Important safety information**

- **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

- **CONTRA-INDICATIONS** Congenital long QT syndrome · QT interval greater than 480 milliseconds

- **CAUTIONS** Brain metastases (intracranial haemorrhage reported) · electrolyte disturbances · history of torsades de pointes · hypertension · phototoxicity reactions reported (wear protective clothing and/or sunscreen) · susceptibility to QT-prolongation

- **INTERACTIONS** → Appendix 1 (vandetanib). Caution with concomitant use of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · alopecia · anxiety · asthenia · balance disorders · blurred vision · cholelithiasis · colitis · conjunctivitis · constipation · corneal changes (including opacity) · corneal deposits · decreased appetite · dehydration · depression · diarrhoea · dizziness · dry eye · dry mouth · dysaesthesia · dyspepsia · dysphagia · dysuria · electrolyte disturbances · epistaxis · gastritis · gastrointestinal haemorrhage · glaucoma · haematuria · haemoptysis · halo vision · hand-foot syndrome · headache · hyperglycaemia · hypotension · hypothyroidism · insomnia · ischaemic cerebrovascular conditions · keratopathy · lethargy · loss of consciousness · micturition urgency · nephrolithiasis · oedema · pain · paraesthesia · photosensitivity · phototoxicity reactions · pneumonitis · poliomyelitis · proteinuria · pyrexia · QT-interval prolongation · taste disturbance · tremor
  - **Uncommon** Accommodation disorders · anuria · aspiration pneumonia · brain oedema · bullous dermatitis · cardiac arrest · cardiac conduction disorders · cardiac rate disorders · cardiac rhythm disorders · cataract · chromaturia · clonus · convulsions · erythema multiforme · faecal incontinence · heart failure · ileus · impaired healing · increased haemoglobin · interstitial lung disease (sometimes fatal) · intestinal perforation · pancreatitis · peritonitis · posterior reversible encephalopathy syndrome · respiratory failure · Stevens-Johnson syndrome · venous arthralgia
  - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 4 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytoxic drugs, p. 746.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).

- **RENAL IMPAIRMENT** Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.

- **PATIENT AND CARER ADVICE** Alert card should be provided. Patients or carers should be given advice on how to administer vandetanib tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Caprelsa (AstraZeneca UK Ltd) ▼
  - Vandetanib 100 mg Caprelsa 100mg tablets | 30 tablet | £2,500.00
  - Vandetanib 300 mg Caprelsa 300mg tablets | 30 tablet | £5,000.00

Vemurafenib

- **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

- **INDICATIONS AND DOSE** Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma

  **BY MOUTH**
  - **Adult:** 960 mg twice daily, for dose adjustment due to side effects—consult product literature

**Important safety information**

- **DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)**

  DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

  **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

- **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma

- **CAUTIONS** Electrolyte disturbances · prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression · susceptibility to QT-prolongation

- **INTERACTIONS** → Appendix 1 (vemurafenib). Caution with concomitant use of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - **Common or very common** Actinic keratosis · alopecia · arthralgia · arthritis · asthenia · basal cell carcinoma · Bell’s palsy · constipation · cough · cutaneous squamous cell carcinoma · decreased appetite · diarrhoea · dizziness · dry skin · erythema · erythema nodosum · fatigue · folliculitis · hand-foot syndrome · headache · hyperkeratosis · keratosis pilaris · musculoskeletal pain · myalgia · new primary melanoma · pain in extremities ·
820 Malignant disease

peripheral oedema • photosensitivity reactions • pyrexia • QT-interval prolongation • seborrhoeic keratosis • skin papilloma • taste disturbance • uveitis

Uncommon Non-cutaneous squamous cell carcinoma • peripheral neuropathy • retinal vein occlusion • Stevens-Johnson syndrome • toxic epidermal necrolysis • vasculitis

Rare Progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia

Frequency not known Alopecia • bone–marrow suppression • hypersensitivity reactions • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION Effective contraception required during for at least 6 months after treatment.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises more frequent monitoring in moderate to severe hepatic impairment (including monthly ECG monitoring during first 3 months of treatment).

RENAI IMPAIRMENT Manufacturer advises caution in severe impairment.

MONITORING REQUIREMENTS

Monitor ECG and electrolytes before treatment, after one week before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed - neutropenic infection - risk of fistula formation (discontinue if fistula develops) - risk of neutropenia - risk of thrombocytopenia

SIDE-EFFECTS

Common or very common Abdominal pain • anaphylaxis • apathy • decreased appetite • dehydration • diarrhoea • dysphonia • dyspnoea • fistula • haemorrhage (including nasal, rectal and gastro-intestinal) • haemorrhoids • hand-foot syndrome • headache • hypertension • infection - leucopenia • malaise • nasopharyngitis • neutropenia (including febrile neutropenia) • oropharyngeal pain • proctalgia • proteinuria • rhinorrhoea • sepsis • skin hyperpigmentation • stomatitis • thrombocytopenia • thromboembolic events (arterial and venous) • toothache • urinary tract infection • weight loss

Uncommon Gastro-intestinal perforation • impaired wound healing • nephrotic syndrome • posterior reversible encephalopathy syndrome • thrombotic microangiopathy

CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).

PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Caution in severe impairment—no information available.

RENAI IMPAIRMENT Caution in severe impairment—no information available.

MONITORING REQUIREMENTS

Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Afiblercept

DRUG ACTION Afiblercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Afiblercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

INDICATIONS AND DOSE

In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen

BY INTRAVENOUS INFUSION

Adult: (consult local protocol)

CONTRA-INDICATIONS Moderate or severe congestive heart failure • uncontrolled hypertension

CAUTIONS Febrile neutropenia • history of cardiovascular disease (may be exacerbated by hypertension) • increased risk of haemorrhage (including fatal events) • increased risk of hypertension • increased risk of thromboembolic events (consult product literature if event occurs) • may impair wound healing— withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed - neutropenic infection - risk of fistula formation (discontinue if fistula develops) - risk of neutropenia - risk of thrombocytopenia

DIRECTIONS FOR ADMINISTRATION Food may affect absorption (take at the same time with respect to food).

PATIENT AND CARER ADVICE Counselling advised (administration).

NICE technology appraisals (TAs)

Vemurafenib 240 mg

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2013) that vemurafenib (Zelboraf®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
product literature if hypertension develops during treatment.

- Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).
- Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
- Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
- Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307
  Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen. www.nice.org.uk/TA307

  - Aflibercept 25 mg per 1 ml Zaltrap 200mg/8ml concentrate for solution for infusion vials | 1 vial £391.30 (Hospital only)
  - Zaltrap 100mg/4ml concentrate for solution for infusion vials | 1 vial £295.65 (Hospital only)
Blood and blood-forming organs

1.1 Anaemias

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 777 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

1.2 Anaemias, G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, Vicia faba); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous;
- susceptibility to the haemolytic risk from drugs varies;
Anaemias, hypoplastic, haemolytic, and renal

1.3 Anaemias, hypoplastic, haemolytic, and renal

Anaemias, hypoplastic, haemolytic, and renal

- Anabolic steroids, pyridoxine hydrochloride p. 882, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin p. 717 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special order’ manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine hydrochloride is also indicated.

Corticosteroids have an important place in the management of haematological disorders. They include conditions with an autoimmune haemolytic anaemia, immune thrombocytopenias, and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukemias, and paraproteinaemias, including multiple myeloma.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 828 is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol. Darbepoetin alfa p. 825 is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 824 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

- **OXYMETHOLONE (Non-proprietary)**
CONTINUOUS ERYTHROPOIETIN RECEPTOR ACTIVATORS

**Methoxy polyethylene glycol-epoetin beta**

**INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins

**BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION**

- **Adult:** Initially 600 nanograms/kg every 2 weeks, dose to be adjusted according to response at intervals of at least 4 weeks, maintenance dose of double the previous fortnightly dose may be given every 4 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks; or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins

**INITIALLY BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 1.2 micrograms/kg every 4 weeks, alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, dose to be adjusted according to response at intervals of at least 4 weeks, patients treated once every 2 weeks may be given maintenance dose of double the previous fortnightly dose every 4 weeks, subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks; or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins

**BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION**

- **Adult:** (consult product literature)

- **SIDE-EFFECTS** Hot flushes

- **PREGNANCY** No evidence of harm in animal studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - Methoxy polyethylene glycol-epoetin beta 250 microgram per 1 ml Miracea 75micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £110.11

**EPOETINS**

**Important safety information**

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

**CONTRA-INDICATIONS** Patients unable to receive thromboprophylaxis - pure red cell aplasia following erythropoietin therapy - uncontrolled hypertension
Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment. During dialysis (increase in unfractuated or low molecular weight heparin dose may be needed) - epilepsy - inadequately treated or poorly controlled blood pressure - interrupt treatment if blood pressure uncontrolled - ischaemic vascular disease - malignant disease - other inflammatory disease (can impair the response to erythropoietin) - risk of thrombosis may be increased when used for anaemia before orthopaedic surgery - avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident - risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy - sickle cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)

**SIDE-EFFECTS**

- **Common or very common** Aggravation of hypertension (dose-dependent) - cardiovascular events - diarrhoea - dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rarely) - headache - hypertensive crisis (in isolated patients with normal or low blood pressure) - increase in blood pressure (dose-dependent) - influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) - nausea - shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications - vomiting

- **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure

- **Frequency not known** Anaphylaxis - angioedema - hyperkalaemia - hypersensitivity reactions - injection-site reactions - peripheral oedema - skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypertensive crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin. Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

**MONITORING REQUIREMENTS**

- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

**Darbepoetin alfa**

**INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

**BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION**

- **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

**BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**BY INTRAVENOUS INJECTION**

- **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

**BY SUBCUTANEOUS INJECTION**

- **Adult:** Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

**SIDE-EFFECTS**

- Injection-site pain - oedema

**PREGNANCY** No evidence of harm in animal studies—manufacturer advises caution.
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Epoetin alfa**
  - Darbepoetin alfa 25 microgram per 1 ml Aranesp
    - Darbepoetin alfa 40 microgram per 1 ml Aranesp

              - Darbepoetin alfa 2500 microgram per 1 ml Aranesp

**Epoetin alfa**

**INDICATIONS AND DOSE**

EPREX® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- **Adult:** Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 ml per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

- **Adult:** Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 ml per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- **Adult:** Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, increased according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 ml per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**Symptomatic anaemia in adults receiving cancer chemotherapy**

- **Adult:** Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 ml per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**NICE technology appraisals (TAs)**

- Erythropoiesis-stimulating agents (epoetin and darbepoetin) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

- Different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used. www.nice.org.uk/TA323

- Manufacturer advises caution.

- There can be variation in the licensing of different medicines.
to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

BY INTRAVENOUS INJECTION

- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

BINOCRIT® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

BY SUBCUTANEOUS INJECTION

- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

BY INTRAVENOUS INJECTION

- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

- Pregnancy
  No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

- Breast Feeding
  Unlikely to be present in milk. Minimal effect on infant.

- Hepatic Impairment
  Manufacturers advise caution in chronic hepatic failure.

- Prescribing and Dispensing Information
  Products containing epoetin alfa are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.

- National Funding/Access Decisions

Nice Technology Appraisals (TAs)

- Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) Nice Ta323
  Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.
  If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used. www.nice.org.uk/ Ta323

Blood and blood-forming organs

Epoetin beta

INDICATIONS AND DOSE
Symptomatic anaemia associated with chronic renal failure

BY SUBCUTANEOUS INJECTION
- Adult: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, dose adjusted according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance, initially reduce dose by half, subsequent dose adjusted according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses, subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

BY INTRAVENOUS INJECTION
- Adult: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, dose to be increased at intervals of 4 weeks; maintenance, initially reduce dose by half, subsequent dose adjusted according to response at intervals of 1–2 weeks, intravenous injection to be administered over 2 minutes, subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

Syndromic anaemia in adults with non-myeloid malignancies receiving chemotherapy

BY SUBCUTANEOUS INJECTION
- Adult: Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3–7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved), increased to 900 units/kg once weekly, dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable

BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

PREGNANCY
No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

BREAST FEEDING
Unlikely to be present in milk. Minimal effect on infant.

HEPATIC IMPAIRMENT
Manufacturers advise caution in chronic hepatic failure.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Erythropoiesis-stimulating agents (epoetin and darboepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA233 Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darboepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy. If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used. www.nice.org.uk/TA233

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Solution for injection

EXCIPIENTS: May contain Phenylalanine

▶ Epoetin beta 1667 unit per 1 ml NeoRecormon 500units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £21.05
▶ Epoetin beta 6667 unit per 1 ml NeoRecormon 2,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £84.17
▶ Epoetin beta 10000 unit per 1 ml NeoRecormon 3,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £126.25
▶ Epoetin beta 13333 unit per 1 ml NeoRecormon 4,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £168.34
▶ Epoetin beta 6667 unit per 1 ml NeoRecormon 10,000units/0.6ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £210.42
▶ NeoRecormon 5,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £420.85
▶ NeoRecormon 6,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £452.50
▶ Epoetin beta 20000 unit per 1 ml NeoRecormon 20,000units/0.6ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Roche Products Ltd) £841.71
▶ Epoetin beta 33333 unit per 1 ml NeoRecormon 30,000units/0.6ml solution for injection pre-filled syringes | 4 pre-filled disposable injection (Roche Products Ltd) £841.71

Epoetin zeta

INDICATIONS AND DOSE
Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

▶ BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks.

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

▶ BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks.

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

▶ BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be increased at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks.

Symptomatic anaemia in adults receiving cancer chemotherapy

▶ BY SUBCUTANEOUS INJECTION

Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, only increase dose if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

▶ BY INTRAVENOUS INJECTION

Adult: 600 units/kg twice weekly for 3 weeks before surgery, intravenous injection to be given over 1–5 minutes, consult product literature for details and advice on ensuring high iron stores.

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

▶ BY SUBCUTANEOUS INJECTION

Adult: 600 units/kg every 1 week for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, maximum 1 mL per injection site, consult product literature for details.

PREGNANCY
No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

BREAST FEEDING
Unlikely to be present in milk. Minimal effect on infant.

HEPATIC IMPAIRMENT
Manufacturers advise caution in chronic hepatic failure.

PRESCRIBING AND DISPENSING INFORMATION
Products containing epoetin zeta are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)

▶ Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323

Solution for injection

EXCIPIENTS: May contain Phenylalanine

▶ Retacrit ( Hospira UK Ltd)

Epoetin zeta 3333 unit per 1 ml Retacrit 2,000units/0.6ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Hospira UK Ltd) £67.88 (Hospital only)
**MONOCLONAL ANTIBODIES**

**Eculizumab**

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

**INDICATIONS AND DOSE**

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

**BY INTRAVENOUS INFUSION**

- Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

**BY INTRAVENOUS INFUSION**

- Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

**CONTRA-INDICATIONS** Patients unvaccinated against Neisseria meningitidis - unresolved Neisseria meningitidis infection

**CAUTIONS** Active systemic infection

**CAUTIONS, FURTHER INFORMATION**

Meningococcal infection Vaccine against Neisseria meningitidis at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.

**SIDE-EFFECTS**

- **Common or very common** Alopecia - arthralgia - blood disorders - cough - dizziness - dysgeusia - dysuria - fatigue - gastro-intestinal disturbances - headache - infection (including meningococcal infection) - influenza-like symptoms - infusion-related reactions - leucopenia - myalgia - nasopharyngitis - oedema - paraesthesia - pruritus - rash - spontaneous erection - thrombocytopenia - vertigo

**CONCEPTION AND CONCEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.

**PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.

**BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.

**MONITORING REQUIREMENTS**

- Monitor for 1 hour after infusion.
- For paroxysmal nocturnal haemoglobinuria, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
- For atypical haemolytic uraemic syndrome, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Soliris®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur).

**PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.

**PATIENT AND CARER ADVICE** A patient information card should be provided. Patient or carers should be advised to report promptly any signs of meningococcal infection.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

- Soliris (Alexion Pharma UK Ltd)

  Eculizumab 10 mg per 1 ml Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial (BNF) £3,120.00 (Hospital only)

### 1.4 Anaemias, iron deficiency

**Anaemias, iron-deficiency**

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

**Oral iron**

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the
speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

### Iron content of different iron salts

<table>
<thead>
<tr>

<td>60 mg</td>
</tr>
<tr>
<td>Ferrous sulfate, dried 200 mg</td>
<td>65 mg</td>
</tr>
</tbody>
</table>

### Compound preparations

Preparations containing iron and folic acid p. 836 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid p. 836 contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 884 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women).

### Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

### Parenteral iron

Iron can be administered parenterally as iron dextran p. 832, iron sucrose p. 832, ferric carboxymaltose below, or iron isomaltoside 1000 p. 832. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

### Iron (injectable)

**Important safety information**

**MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)**

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron. Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks. Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

**SIDE-EFFECTS** Hypersensitivity reactions

**FURTHER INFORMATION**

**Anaphylactic reactions** Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

**Overdose** For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1123.

### Ferric carboxymaltose

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia**

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- **Adult:** Dose calculated according to body-weight and iron deficit (consult product literature)

**CAUTIONS** Allergic disorders - asthma - eczema - hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available. Infection (discontinue if ongoing bacteraemia) - oral iron should not be given until 5 days after last injection

**SIDE-EFFECTS**

- **Common or very common** Dizziness - gastro-intestinal disturbances - headache - injection-site reactions - rash
- **Uncommon** Anaphylaxis - arthralgia - back pain - chest pain - fatigue - flushing - hypertension - hypotension - malaise - myalgia - paraesthesia - peripheral oedema - pruritus - pyrexia - rigors - urticaria
- **Rare** Dyspnoea

**PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.

**HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.
### Iron isomaltoside 1000

#### INDICATIONS AND DOSE
Iron deficiency anaemia

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

#### CONTRA-INDICATIONS
Active rheumatoid arthritis - asthma - eczema - history of allergic disorders

#### CAUTIONS
Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - infection (discontinue if ongoing bacteraemia) - oral iron should not be given until 5 days after last injection

#### SIDE-EFFECTS
- Rare Altered mental status - angioedema - arthralgia - chest pain - diarrhoea - dizziness - hypotension - loss of consciousness - malaise - myalgia - restlessness - seizures - sweating - tachycardia - tremor
- Very rare Foetal bradycardia - haemolysis - headache - hypotension - palpitation - paraesthesia - transient deafness

#### PREGNANCY
Avoid in first trimester.

#### HEPATIC IMPAIRMENT
Avoid in decompensated liver disease and hepatitis.

#### DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Cosmofer®), give intermittently in Sodium chloride 0.9% or Sodium bicarbonate 8.4%. Doses calculated according to body-weight and iron deficit (consult product literature).

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- Cosmofer (Pharmacosmos UK Ltd)
  - Iron (as iron dextran) 50 mg per 1 ml Cosmofer 500mg/10ml solution for injection ampoules | 2 ampoule £9.70
  - Cosmofer 100mg/2ml solution for injection ampoules | 5 ampoule £38.85

---

### Iron dextran

#### INDICATIONS AND DOSE
Iron-deficiency anaemia

BY DEEP INTRAMUSCULAR INJECTION

- Adult: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

#### CONTRA-INDICATIONS
Active rheumatoid arthritis - asthma - eczema - history of allergic disorders

#### CAUTIONS
Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - oral iron should not be given until 5 days after last injection

#### SIDE-EFFECTS
- Rare Altered mental status - angioedema - arthralgia - chest pain - diarrhoea - dizziness - hypotension - loss of consciousness - malaise - myalgia - restlessness - seizures - sweating - tachycardia - tremor
- Very rare Foetal bradycardia - haemolysis - headache - hypotension - palpitation - paraesthesia - transient deafness

#### PREGNANCY
Avoid in first trimester.

#### HEPATIC IMPAIRMENT
Avoid in decompensated liver disease and hepatitis.

#### DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Monofer®), give intermittently in Sodium chloride 0.9%. For details consult product literature.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- Monofer (Vifor Pharma UK Ltd)
  - Iron (as Ferric carboxymaltose) 50 mg per 1 ml Monofer 500mg/10ml solution for injection vials | 1 vial £154.23
  - Monofer 100mg/2ml solution for injection vials | 5 vial £81.18
  - Monofer 500mg/10ml solution for injection vials | 5 vial £405.88

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- Cosmofer (Pharmacosmos UK Ltd)
  - Iron (as iron dextran) 50 mg per 1 ml Cosmofer 500mg/10ml solution for injection ampoules | 2 ampoule £9.70
  - Cosmofer 100mg/2ml solution for injection ampoules | 5 ampoule £38.85

---

### Iron sucrose

#### INDICATIONS AND DOSE
Iron-deficiency anaemia

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

#### CONTRA-INDICATIONS
Anaphylaxis - asthma - eczema - history of allergic disorders

#### CAUTIONS
Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - infection (discontinue if ongoing bacteraemia) - oral iron should not be given until 5 days after last injection

#### SIDE-EFFECTS
- Rare Altered mental status - angioedema - arthralgia - chest pain - diarrhoea - dizziness - hypotension - loss of consciousness - malaise - myalgia - restlessness - seizures - sweating - tachycardia - tremor
- Very rare Foetal bradycardia - haemolysis - headache - hypotension - palpitation - paraesthesia - transient deafness

#### PREGNANCY
Avoid in first trimester.

#### HEPATIC IMPAIRMENT
Avoid in decompensated liver disease and hepatitis.

#### DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Cosmosfer®), give intermittently in Glucose 5% or Sodium chloride 0.9%, dilute 100–200 mg in 100 mL infusion fluid; give 25mg over 15 minutes initially, then give at a rate not exceeding 6.67 mg/minute; total dose infusion diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes).

#### PRESCRIBING AND DISPENSING INFORMATION
A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.
Iron (oral)

- **SIDE-EFFECTS**
  - Constipation
  - Diarrhoea
  - Epigastric pain
  - Nausea
  - Vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Altered bowel habit** Iron preparations taken orally can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease. The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.

- **Overdose**
  - For details on the management of poisoning, see iron salts, under Emergency treatment of poisoning p. 1123.

- **MONITORING REQUIREMENTS**
  - The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

- **INTERACTIONS**
  - Appendix 1 (iron salts).

- **PATIENT AND CARER ADVICE**
  - Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolor stools.

### Ferrous fumarate

Iron deficiency anaemia (prophylactic and therapeutic)

**BY MOUTH**

- Child 12–17 years: 1 tablet daily, dose to be taken before food
- Adult: 1 tablet daily, dose to be taken before food

**INTERACTIONS**

Appendix 1 (iron salts).

**PRESCRIBING AND DISPENSING INFORMATION**

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Ferrous gluconate for iron-deficiency anaemia www.medicinesforchildren.org.uk/ferrous-gluconate-for-iron-deficiency-anaemia

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Feospan® is not prescribable under the National Health Service.

**LESS SUITABLE FOR PRESCRIBING**

Feospan® and Ferrograd® are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
Ferrous sulfate with ascorbic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, ascorbic acid p. 884, ferrous sulfate p. 834.

INDICATIONS AND DOSE
Iron deficiency anaemia
BY MOUTH USING MODIFIED-RELEASE TABLETS
▶ Adult: 1 tablet daily, dose to be taken before food

NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions Ferrograd C® is not prescribable on the National Health Service.

LESS SUITABLE FOR PRESCRIBING Ferrograd C® is less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 25
▶ Ferrograd Folic (Teofarma)
Ferrograd C® is not available on prescription

Ferrograd C® modified-release tablets | 30 tablet | £2.64 DT price = £2.64

POLYSAHCHARIDE-IRON COMPLEX

Iron-deficiency anaemia (prophylactic)
BY MOUTH
▶ Child 1 month to 1 year: 1 drop (approximately 500 micrograms iron) per 450 g body-weight to be given 3 times a daily, dose to be administered from dropper bottle, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established
▶ Child 12–17 years: 2.5 mL daily
▶ Adult: 2.5 mL daily

Iron-deficiency anaemia (therapeutic)
BY MOUTH
▶ Child 2–5 years: 2.5 mL daily
▶ Child 6–11 years: 5 mL daily
▶ Child 12–17 years: 5 mL 1–2 times a day
▶ Adult: 5 mL 1–2 times a day

Iron-deficiency anaemia (therapeutic) if required during second and third trimester of pregnancy
BY MOUTH
▶ Child 12–17 years: 5 mL once daily
▶ Adult: 5 mL once daily

INTERACTIONS → Appendix 1 (iron salts).

PATIENT AND CARER ADVICE Counselling on the use of the dropper advised.

NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions Niferex® is not available on prescription under NHS, except 30-mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SLS'.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral solution
▶ Niferex® (Tillomed Laboratories Ltd)
Iron (as Polysaccharide-iron complex) 100 mg Niferex 100mg/5ml elixir (sugar-free) | 30 ml | £2.16 (sugar-free) | 240 ml | £6.06

Sodium feredate (Sodium ironedetate)

INDICATIONS AND DOSE
Iron-deficiency anaemia (therapeutic)
BY MOUTH USING ORAL SOLUTION
▶ Child 1–11 months: Up to 2.5 mL twice daily, smaller doses to be used initially
▶ Child 1–4 years: 2.5 mL 3 times a day
▶ Child 5–11 years: 5 mL 3 times a day
▶ Child 12–17 years: 5 mL 3 times a day, increased to 10 mL 3 times a day, dose to be increased gradually continued

Ferrous sulfate with folic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, folic acid p. 836.

INDICATIONS AND DOSE
Iron deficiency anaemia
BY MOUTH USING MODIFIED-RELEASE CAPSULES
▶ Adult: 1 capsule daily

BY MOUTH USING MODIFIED-RELEASE TABLETS
▶ Child 12–17 years: 1 tablet daily, to be taken before food
▶ Adult: 1 tablet daily, to be taken before food

LESS SUITABLE FOR PRESCRIBING Folic® and Ferrograd Folic® are less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Blood and blood-forming organs

1.5 Anaemias, megaloblastic

Anaemias, megaloblastic

Most megaloblastic anaemias result from a lack of either vitamin B₁₂ or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is pernicious anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B₁₂.

Vitamin B₁₂ is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B₁₂ should be given prophylactically after total gastrectomy or total ileal resection or after partial gastrectomy if a vitamin B₁₂ absorption test shows vitamin B₁₂ malabsorption.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 837 has completely replaced cyanocobalamin p. 837 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease, rheumatic disease, and severe psoriasis.

Folic acid p. 781 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.
Anaemias, megaloblastic 837

**Prophylaxis in chronic haemolytic states**

**BY MOUTH**
- Adult: 5 mg every 1–7 days, frequency dependent on underlying disease

**Prophylaxis of folate deficiency in dialysis**

**BY MOUTH**
- Child 1–11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12–17 years: 5–10 mg once daily
- Adult: 5 mg every 1–7 days

**Haemolytic anaemia | Metabolic disorders**

**BY MOUTH**
- Child 1 month–11 years: 2.5–5 mg once daily
- Child 12–17 years: 5–10 mg once daily
- Adult 18 years: 5–10 mg once daily

**UNLICENSED USE**
- In adults Not licensed for prevention of methotrexate-induced side-effects in severe Crohn’s disease, rheumatic disease, or severe psoriasis.

**CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

**INTERACTIONS** Appendix 1 (folicates).

**SIDE-EFFECTS**
- Rare Gastro-intestinal disturbances

**PATIENT AND CAREER ADVICE**

**EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided daily doses do not exceed 500 micrograms.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, capsule

**Tablet**
- **FOLIC ACID (Non-proprietary)**
  - Folic acid 400 microgram: Folic acid 400microgram tablets | 90 tablet £1.97 DT price = £2.71
  - Folic acid 5 mg: Folic acid 5mg tablets | 28 tablet £2.00 DT price = £3.09 | 100 tablet £41.75

**Oral solution**
- **FOLIC ACID (Non-proprietary)**
  - Folic acid 500 microgram per 1 ml: Folic acid 2.5mg/5ml oral solution sugar free (sugar-free) | 150 ml £3.16 DT price = £3.16
  - Brands may include Lexpec

**VITAMIN B GROUP**

**Cyanocobalamin**

**INDICATIONS AND DOSE**
- Vitamin B12 deficiency of dietary origin
  - **BY MOUTH**
    - Adult: 50–150 micrograms daily, dose to be taken between meals
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: Initially 1 mg every 2–3 days for 10 doses; maintenance 1 mg every 1 month

**PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when vitamin B12 injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied. Currently available brands of the tablet may not be suitable for vegans.

**NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions Cyanocobalamin liquid, Cytacon® tablets and Cyamen® injection not available on prescription under the NHS.

**LESS SUITABLE FOR PRESCRIBING** Cyanocobalamin is less suitable for prescribing.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, tablet

**Tablet**
- **CYANOCOBALAMIN (Non-proprietary)**
  - Cyanocobalamin 50 microgram: Cyanocobalamin 50microgram tablets | 50 tablet £6.24 DT price = £6.24 | 50 tablet £6.24 DT price = £6.24 | 100 tablet no price available
  - Cyanocobalamin 1 mg: Cyanocobalamin 1000microgram tablets | 28 tablet £6.24
  - Brands may include Cytacon

**Oral solution**
- **CYANOCOBALAMIN (Non-proprietary)**
  - Cyanocobalamin 7 microgram per 1 ml: Cyanocobalamin 75micrograms/5ml oral solution | 200 ml £8.75

**Solution for injection**
- **Cytamen (Focus Pharmaceuticals Ltd)**
  - Cyanocobalamin 1 mg per 1 ml: Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule (£5.50 DT price = £14.50

**Hydroxocobalamin**

**INDICATIONS AND DOSE**
- Prophylaxis of macrocytic anaemias associated with vitamin B12 deficiency
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 1 mg every 2–3 months
  - Pernicious anaemia and other macrocytic anaemias without neurological involvement
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 3 months
  - Pernicious anaemia and other macrocytic anaemias with neurological involvement
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months
  - Tobacco amblyopia
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months
  - Leber’s optic atrophy
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

**POISONING WITH CYANIDES**
- **BY INTRAVENOUS INFUSION**
  - Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability
  - Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

**CAUTIONS** Should not be given before diagnosis fully established
Iron overload

Iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 839 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 884 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

Iron chelators

Deferasirox

Drug action
Deferasirox, is an oral iron chelator.

indications and dose
Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2-5 years with thalassaemia major who receive frequent blood transfusions | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias | Treatment of chronic iron overload in patients with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells)

By mouth
Adult: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature; adjusted in steps of 5–10 mg/kg every 3–6 months, dose adjusted for maintenance according to serum-ferritin concentration; usual dose up to 30 mg/kg daily, increased if necessary up to 40 mg/kg daily and reduced in steps of 5–10 mg/kg, dose to be reduced once control achieved

Treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate (with non-transfusion-dependent thalassaemia syndromes)

By mouth
Adult: Initially 10 mg/kg once daily; adjusted in steps of 5–10 mg/kg every 3–6 months, dose adjusted for maintenance according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 20 mg/kg per day

cautions
Elderly (increased risk of side-effects) | history of liver cirrhosis | not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) | platelet count less than 50 x 10^7/litre; risk of gastro-intestinal ulceration and haemorrhage | unexplained cytopenia—consider treatment interruption

interactions
Appendix 1 (deferasirox)

side-effects
Common or very common | Fatal gastro-intestinal haemorrhage | gastro-intestinal disturbances | gastro-intestinal ulceration | headache | proteinuria | pruritus | rash

uncommon | Anxiety | cholelithiasis | disturbances of hearing and vision | dizziness | fatigue | glucosuria | hepatitis | lens opacity | maculopathy | oedema | pharyngitis | pyrexia | renal tubulopathy | skin pigmentation | sleep disorder

1.6 Iron overload
Deferiprone

**Drug Action** Deferiprone, is an oral iron chelator.

**INDICATIONS AND DOSE** Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contraindicated or is inadequate

**BY MOUTH**
- Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- CONTRA-INDICATIONS History of agranulocytosis or recurrent neutropenia
- INTERACTIONS → Appendix 1 (deferriprone)
- SIDE-EFFECTS Agranulocytosis - arthropathy - blood dyscrasias - gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) - headache - increased appetite - neutropenia - red-brown urine discoloration - zinc deficiency
- CONCEPTION AND CONTRACEPTION Manufacturer advises avoid before intended conception - teratogenic and embryotoxic in animal studies. Contraception advised in females of child-bearing potential.
- PREGNANCY Manufacturer advises avoid during pregnancy - teratogenic and embryotoxic in animal studies.
- BREAST FEEDING Manufacturer advises avoid — no information available.
- HEPATIC IMPAIRMENT Manufacturer advises monitor liver function — interrupt treatment if persistent elevation in serum alanine aminotransferase.
- RENAL IMPAIRMENT Manufacturer advises caution — no information available.
- MONITORING REQUIREMENTS
- Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- Monitor plasma-zinc concentration.
- PATIENT AND CARER ADVICE Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

- MEDICATION FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 14**
- Deferiprone 500 mg Ferriprox 500mg tablets | 100 tablet £75.29
- Deferiprone 1 gram Ferriprox 1000mg tablets | 50 tablet £175.25

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 14**
- Deferiprone 100 mg per 1 ml Ferriprox 100mg/ml oral solution (sugar-free) | 500 ml £70.40

---

**Desferrioxamine mesilate**

*(Deferoxamine Mesilate)*

**INDICATIONS AND DOSE**

**Iron poisoning**

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: Initially up to 15 mg/kg/hour, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service; maximum 80 mg/kg per day

**Aluminium overload in dialysis patients**

**BY INTRAVENOUS INFUSION**
- Adult: (consult product literature or local protocols)

**Chronic iron overload (low iron overload)**

**BY SUBCUTANEOUS INFUSION**
- Adult: The dose should reflect the degree of iron overload

**Chronic iron overload (established overload)**

**BY SUBCUTANEOUS INFUSION**
- Adult: 20–50 mg/kg daily
9

Filgrastim p. 842 is a polyethylene glycol-conjugated (‘pegylated’) derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipegfilgrastim p. 842 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor

**INDICATIONS AND DOSE**

Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)

**BY SUBCUTANEOUS INJECTION**

- Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

**SIDE-EFFECTS**

- **Common or very common** Arthralgia · dizziness · dry mouth · erythema · fatigue · gastrointestinal disturbances · headache · injection-site reactions · insomnia · musclekeletal pain · oral hypoaesthesia · sweating
- **Uncommon** Dyspnoea · hypersensitivity reactions · periorbital swelling
- **Very rare** Acute respiratory distress syndrome · diarrhoea · fever · fatigue · flushing · headache · myalgia · nausea · rash · retinopathy · visual disturbances · epistaxis · hearing loss · hypoesthesia · polyneuropathy · paraesthesia

**INTERACTIONS**

- **Drug** 
  - **Drug action**
    - Use effective contraception during treatment—teratogenic in animal studies.
    - Manufacturer advises avoid unless essential—teratogenic in animal studies.
  - **Drug interaction**
    - Muscle spasms

**CONCEPTION AND CONTRACEPTION**

Use effective contraception during treatment—teratogenic in animal studies.

**PREGNANCY**

Manufacturer advises avoid unless essential—teratogenic in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid unless essential—teratogenic in animal studies.

**RENAI IMPAIRMENT**

Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute. No information available if creatinine clearance less than 20 mL/minute

**MONITORING REQUIREMENTS**

Monitor platelets and white blood cell count.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Desferrioxamine mesilate 500 mg** Desferrioxamine 500mg powder for solution for injection vials | 10 vial [P4T] £39.90–£50.00
- **Desferrioxamine mesilate 2 gram** Desferrioxamine 2g powder for solution for injection vials | 1 vial [P4T] £17.65–£20.00
- **Desferal (Novartis Pharmaceuticals UK Ltd)**
  - **Desferrioxamine mesilate 500 mg** Desferal 500mg powder for solution for injection vials | 10 vial [P4T] £46.63
  - **Desferrioxamine mesilate 2 gram** Desferal 2g powder for solution for injection vials | 1 vial [P4T] £18.66

**GRANULOCYTE-COLONY STIMULATING FACTORS**

**Granulocyte-colony stimulating factors**

**DRUG ACTION**

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim (unglycosylated rhG-CSF) and lenograstim p. 842 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim p. 841 usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 842 is a recombinant human granulocyte-colony stimulating factor. It does not change the duration of chemotherapy-induced neutropenia but reduces the incidence of associated sepsis. Liplinepfilgrastim p. 842 is a polyethylene glycol-conjugated derivative of filgrastim; pegylation increases the duration of filgrastim. Liplinepfilgrastim p. 842 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.
Neutrophilia and stem cell mobilisation

Filgrastim
(Recombinant human granulocyte-colony stimulating factor, G-CSF)

**INDICATIONS AND DOSE**
Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

**BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION**
- **Adult:** 5 micrograms/kg daily until neutrophil count in normal range (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy and to be administered over 30 minutes if given by intravenous infusion.

Reduction in duration of neutropenia (and associated sequelae) in myeloblastic therapy followed by bone-marrow transplantation (specialist use only)

**BY SUBCUTANEOUS INFUSION OR BY INTRAVENOUS INFUSION**
- **Adult:** 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route.

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

**BY SUBCUTANEOUS INFUSION OR BY SUBCUTANEOUS INJECTION**
- **Adult:** 10 micrograms/kg daily for 5–7 days, to be administered by subcutaneous infusion over 24 hours if given.

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

**BY SUBCUTANEOUS INJECTION**
- **Adult:** 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature.

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

**BY SUBCUTANEOUS INJECTION**
- **Adult 18–59 years:** 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature.

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

**BY SUBCUTANEOUS INJECTION**
- **Adult:** Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol.

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

**BY SUBCUTANEOUS INJECTION**
- **Adult:** Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day.

**CONTRA-INDICATIONS**
Severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogentic.

**CAUTIONS**
Osteoporotic bone disease (monitor bone density if given for more than 6 months) - secondary acute myeloid leukaemia.

**INTERACTIONS**
Appendix 1 (filgrastim).

**SIDE-EFFECTS**
- **Common or very common**
  - Alopecia
  - Anorexia
  - Asthenia
  - Bone pain
  - Chest pain
  - Fever
  - Gastro-intestinal disturbances
  - Headache
  - Injection site reactions
  - Leucocytosis
  - Musculoskeletal pain
  - Rash
  - Thrombocytopenia
  - Acute febrile neutrophilic dermatosis
  - Cutaneous vasculitis
  - Pulmonary side effects (particularly interstitial pneumonia)

- **Rare**
  - Splenic rupture
  - Anaemia
  - Dystrophy
  - Gastro-intestinal side effects (including nausea, vomiting, abdominal pain, anorexia, dysuria, proteinuria, haematuria, decreased blood glucose, transient decrease in blood glucose, transient hypotension, urinary abnormalities)

- **Uncommon**
  - Capillary leak syndrome (including fatal cases)
  - Splenic rupture

**MONITORING REQUIREMENTS**
Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (Neupogen®; Nivestin®; Ratiogran®; Zarzio®) give continuously or intermittently in Glucose 5% for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL: should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.

**PRESCRIBING AND DISPENSING INFORMATION**
Products containing filgrastim are not identical and although theoretically there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Blood and nutrition

Solution for injection
- Accofil (Accord Healthcare Ltd)
  - Filgrastim 60 mega u per 1 ml: Accofil 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (£284.20)

- Filgrastim 96 mega u per 1 ml: Nivestim 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (£465.00 (Hospital only))
- Zarzio (Sandz Ltd)
  - Filgrastim 60 mega u per 1 ml: Zarzio 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (£250.75)
  - Filgrastim 96 mega u per 1 ml: Zarzio 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (£399.50)

Lenograstim
(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

INDICATIONS AND DOSE
Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only) / Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION
- Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic-induced neutropenia associated with a significant incidence of febrile neutropenia (specialist use only)

BY SUBCUTANEOUS INJECTION
- Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

BY SUBCUTANEOUS INJECTION
- Adult: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

BY SUBCUTANEOUS INJECTION
- Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy. For timing of leucopheresis, consult product literature

SIDE-EFFECTS
- Mucositis, splenic rupture, toxic epidermal necrosis

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Granocyte®), give intermittently in Sodium chloride 0.9%; initially reconstitute with 1 ml water for injection provided (do not shake vigorously) then dilute with up to 50 ml infusion fluid for each vial of Granocyte-13 or up to 100 ml infusion fluid for Granocyte-34; give over 30 minutes.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
EXCipients: May contain Phenylalanine
- Granocyte (Chugai Pharma UK Ltd)
  - Lenograstim 13.4 mega u Granocyte-13 powder and solvent for solution for injection vials | 1 vial (£40.11) | 5 vial (£200.55)
  - Lenograstim 33.6 mega u Granocyte-34 powder and solvent for solution for injection vials | 1 vial (£62.54) | 5 vial (£312.69)

Lipegfilgrastim
(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

INDICATIONS AND DOSE
Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

BY SUBCUTANEOUS INJECTION
- Adult (specialist use only): 5 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

SIDE-EFFECTS
- Myelosuppressive chemotherapy
- Hypokalaemia

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- LongueX (Teva UK Ltd)
  - Lipegfilgrastim 10 mg per 1 ml LonqueX 6 mg/0.6 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£652.06)

Pegfilgrastim
(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

INDICATIONS AND DOSE
Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

BY SUBCUTANEOUS INJECTION
- Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose expressed as filgrastim

SIDE-EFFECTS
- Acute leukaemia - myelosuppressive chemotherapy

INTERACTIONS
- Appendix 1 (pegfilgrastim).

CAUTIONS
- Acute leukaemia - myelosuppressive chemotherapy
- Rare Capillary leak syndrome (including fatal cases)
1.8 Platelet disorders, essential thrombocythaemia

**Essential thrombocythaemia**

Anagrelide below inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than 1000 x 10^9/L or a history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

**CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS**

**Anagrelide**

**INDICATIONS AND DOSE**

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

*BY MOUTH*

- Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

**CAUTIONS**

Cardiovascular disease—assess cardiac function before and during treatment — concomitant use of drugs that prolong QT-interval— assess cardiac function before and regularly during treatment — risk factors for QT-interval prolongation— assess cardiac function before and regularly during treatment

**INTERACTIONS**

Appendix 1 (anagrelide).

Caution with concomitant aspirin at risk of haemorrhage.

**SIDE-EFFECTS**

- **Common or very common** Anaemia · dizziness · fatigue · fluid retention · gastro-intestinal disturbances · headache · palpititation · rash · tachycardia
- **Uncommon** Alopecia · amnesia · anorexia · arthralgias · arthralgia · back pain · blood disorders · chest pain · confusion · congestive heart failure · depression · dry mouth · dysphagia · ecchymosis · epistaxis · fever · gastro-intestinal haemorrhage · haemorrhage · hypertension · hypoaesthesia · impotence · malaise · myalgia · nervousness · oedema · pancreatitis · paraesthesia · pneumonia pleural effusion · pruritus · skin discoloration · sleep disturbances · syncope · weight changes
- **Rare** Angina · asthenia · cardiomegaly · cardiomyopathy · colitis · dry skin · dysarthria · gastritis · gingival bleeding · impaired coordination · migraine · myocardial infarction · nocturia · pericardial effusion · postural hypotension · pulmonary hypertension · pulmonary infiltrates · renal failure · somnolence · tinnitus · vasodilatation · visual disturbances

**Frequency not known** Hepatitis · interstitial lung disease · Torsade de pointes · tubulointerstitial nephritis

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

**PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- Monitor liver function.
- Monitor serum creatinine.
- Monitor urea.
- Monitor urea and electrolytes (including potassium, magnesium and calcium) before and during treatment.

**PATIENT AND CARER ADVICE**

Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Xagrid (Shire Pharmaceuticals Ltd) ▼

Anagrelide (as Anagrelide hydrochloride) 500 microgram | 100 capsule $[POM] \$404.57$

1.9 Platelet disorders, idiopathic thrombocytopenic purpura

**Idiopathic thrombocytopenic purpura**

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone p. 585, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Immunoglobulin** preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (rh0) immunoglobulin p. 1061 is effective in raising the platelet count in about 80% of unsplenectomised rheus-positive individuals; its effects may last longer than normal immunoglobulin p. 1063 for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 716, cyclophosphamide p. 750, vincristine sulphate p. 773, ciclosporin p. 717, and danazol p. 636. Rituximab p. 734 may also be effective and in some cases induces prolonged remission. For patients with chronic severe...
thrombocytopenia refractory to other therapy, tranexamic acid p. 95 may be given to reduce the severity of haemorrhage.

Eltrombopag below and romiplostim p. 845 are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance).

Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

INDICATIONS AND DOSE

Therapeutic indications

- Chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)
- Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)

BY MOUTH

Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50 x 10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day

Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50 x 10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)

BY MOUTH

Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75 x 10⁹/litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day.

Patient and carer advice

Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

Patient and carer advice

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2010) that eltrombopag (Revolade) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.
Romiplostim

INDICATIONS AND DOSE
Treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision) - Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)

BY SUBCUTANEOUS INJECTION

- Adult: Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50 x 10^9/litre or more is reached, discontinue treatment if inadequate response after 4 weeks at maximum dose, consult product literature for dose adjustments

- CHILDREN AND ADULTS: Use only if essential, as manufacturers advise avoid use in children under 12 years or adolescents under 18 years

- AGED OVER 65 YEARS: Use only if essential, as manufacturers advise use only if essential

- Fluids and electrolytes

- Management of hyperkalaemia

2 Fluid and electrolyte imbalances

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

**Oral preparations for fluid and electrolyte imbalance**

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

**Oral potassium**

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 201 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency (common in the elderly) to reduce the risk of hyperkalaemia.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Management of hyperkalaemia**

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium
Blood and nutrition

Sodium bicarbonate p. 848 is given by mouth for chronic acidicotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where hyperchloraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

**Parenteral preparations for fluid and electrolyte imbalance**

**Electrolytes and water**

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 851 or glucose 5% p. 852) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose p. 852, are best given through an indwelling catheter positioned in a large vein.

**Intravenous sodium**

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

**Compound sodium lactate** (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloaemic acidosis.

Glucose with sodium chloride solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium...

Bicarbonate and lactate

Sodium bicarbonate p. 848 is used to control severe metabolic acidosis (pH<7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For chronic acidotic states, sodium bicarbonate can be given by mouth.

Plasma and plasma substitutes

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride p. 851 and glucose p. 852 (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 853, prepared from whole blood, contains soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is
Blood and nutrition

Concentrated albumin solution may also be used to obtain a salt and water overload than isotonic solutions. Because of interstitial fluid overload, to restore patients with an intravascular fluid deficit and oedema (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Dextran, gelatin p. 854, and the hydroxyethyl starch, tetrasacth, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

**BICARBONATE**

**Sodium bicarbonate**

**INDICATIONS AND DOSE**

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

**BY MOUTH**

- Adult: 4.8 g daily, (57 mmol each of Na⁺ and HCO₃⁻), higher doses may be required and should be adjusted according to response.

Severe metabolic acidosis

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%).

Alkalisation of urine | Relief of discomfort in mild urinary-tract infections

**BY MOUTH**

- Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water.

Maintenance of alkaline urine

**BY MOUTH**

- Adult: 5–10 g daily, to be dissolved in water.

**CONTRA-INDICATIONS** Salt restricted diet

**CAUTIONS** Avoid prolonged use in urinary conditions • cardiac disease • elderly • patients on sodium-restricted diet • respiratory acidosis

**INTERACTIONS** → Appendix 1 (antacids).

**SIDE-EFFECTS**

- When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis, and for maintenance of alkaline urine fluid retention (in those at risk) • hypokalaemia may be exacerbated • increase blood pressure • pulmonary oedema (in those at risk).

- When used for alkalisation of urine, and for relief of discomfort in mild urinary-tract infections alkalaosis on prolonged use • eructation

**PREGNANCY** Use with caution in urinary conditions.

**HEPATIC IMPAIRMENT** In patients with fluid retention, avoid large amounts of sodium.

**RENAL IMPAIRMENT** Avoid (except for specialised role in some forms of renal disease).

**MONITORING REQUIREMENTS**

- With intravenous use Plasma pH and electrolytes should be monitored.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in adults For slow intravenous injection use a small volume of hypertonic solution (such as 50 mL of 8.4%). For continuous intravenous infusion a weaker solution of 1.26% can be infused over 3–4 hours.

- With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

**PRESCRIBING AND DISPENSING INFORMATION** Oral solutions of sodium bicarbonate are required occasionally; these are available from ‘special-order’ manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution, powder, capsule, liquid, mouthwash

## Oral Rehydration Salts

### Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

#### Indications and Dose

**Fluid and electrolyte loss in diarrhoea**

- **By Mouth**
  - Child 1-11 months: 1–1½ times usual feed volume to be given
  - Child 11 years: 200 mL, to be given after every loose motion
  - Child 12–17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss
  - Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

#### Directions for Administration

Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

#### Prescribing and Dispensing Information

Flavours of oral powder formulations may include black currant, citrus, or natural.

#### Patient and Carer Advice

- **Medicines for Children leaflet: Oral rehydration salts**
  - www.medicinesforchildren.org.uk/oral-rehydration-salts
  - After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

- **Powder**
  - Dioralyte® (Sanofi)
    - Disodium hydrogen citrate 530 mg, Glucose 3.56 gram,
    - Potassium chloride 300 mg, Sodium chloride 470 mg
  - Dioralyte oral powder sachets citrus | 20 sachet (£6.72)
  - Dioralyte oral powder sachets plain | 20 sachet (£6.72)
  - Dioralyte oral powder sachets blackcurrant | 20 sachet (£6.72)

### Potassium chloride with glucose, sodium bicarbonate and sodium chloride

#### Indications and Dose

**Fluid and electrolyte loss in diarrhoea**

- **By Mouth**
  - Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

#### Directions for Administration

Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 50 mmol, K⁺ 20 mmol, Cl⁻ 40 mmol, HCO₃⁻ 30 mmol, and glucose 111 mmol.

#### Prescribing and Dispensing Information

Flavours of oral powder formulations may include banana, orange, black current, lemon and lime, plain, or multiflavoured.

#### Patient and Carer Advice

Patients and carers should be advised how to reconstitute Electrolade® oral powder.

After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

### Potassium chloride with calcium chloride dihydrate, and sodium chloride

#### (Ringer’s solution)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 863, sodium chloride p. 851.

#### Indications and Dose

**Electrolyte imbalance**

- **By Intravenous Infusion**
  - Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

#### Prescribing and Dispensing Information

Ringer’s solution for injection provides the following ions (in mmol/ litre), Ca²⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156.

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

- **Infusion**
  - **Calcium Chloride Dihydrate with Potassium Chloride and Sodium Chloride**
    - Calcium chloride 320 microgram per 1 mL, Potassium chloride 300 microgram per 1 mL, Sodium chloride 8.6 mg per 1 mL
    - Polyfusor C ringsers infusion 500mL bottles | 1 bottle (£2.81) | 200mL bottles | 1 bottle (£6.84)
Potassium chloride with calcium chloride, sodium chloride and sodium lactate
(Sodium Lactate Intravenous Infusion, Compound; Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)
The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 863, sodium chloride p. 851, calcium chloride p. 857.

INDICATIONS AND DOSE
For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium
BY INTRAVENOUS INFUSION
> Adult: (consult product literature)

PRESCRIBING AND DISPENSING INFORMATION
Compound sodium lactate intravenous infusion contains Na⁺ 131 mmol, K⁺ 5 mmol, Ca⁺⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Infusion
> CALCIUM CHLORIDE WITH POTASSIUM CHLORIDE AND SODIUM CHLORIDE AND SODIUM LACTATE (Non-proprietary)
Calcium chloride 270 microgram per 1 ml, Potassium chloride 400 microgram per 1 ml, Sodium chloride 6 mg per 1 ml, Sodium lactate 3.17 mg per 1 ml Sodium lactate compound infusion 1 litre | 1 bag (POM) no price available | 10 bag (POM) no price available

Potassium chloride with glucose
The properties listed below are those particular to the combination only. For the properties of the components please consider, glucose p. 852, potassium chloride p. 863.

INDICATIONS AND DOSE
Electrolyte imbalance
BY INTRAVENOUS INFUSION
> Adult: Dosed according to the deficit or daily maintenance requirements

PRESCRIBING AND DISPENSING INFORMATION
Compound potassium chloride 3 mg per 1 ml, Potassium chloride 3 mg per 1 ml, Sodium chloride 4.5 mmol/1 litre / glucose 5% infusion 500 ml bags | 1 bag (POM) £1.67

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, infusion
Infusion
> GLUCOSE WITH POTASSIUM CHLORIDE (Non-proprietary)
Glucose anhydrous 50 mg per 1 ml, Potassium chloride 3 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag (POM) £1.67
Potassium chloride 0.3% (potassium 40mmol/1litre) / glucose 5% infusion 1 litre bags | 1 bag (POM) £1.79
Glucose anhydrous 50 mg per 1 ml, Potassium chloride 1.5 mg per 1 ml Potassium chloride 0.15% (potassium 10mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag (POM) £1.67
Potassium chloride 0.15% (potassium 20mmol/1litre) / glucose 5% infusion 1 litre bags | 1 bag (POM) £2.20
Glucose anhydrous 50 mg per 1 ml, Potassium chloride 2 mg per 1 ml Potassium chloride 0.2% (potassium 27mmol/1litre) / glucose 5% infusion 1 litre bags | 1 bag (POM) £2.20

Potassium chloride with potassium bicarbonate
The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 863.

INDICATIONS AND DOSE
Potassium depletion
BY MOUTH
> Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Effervescent tablet
CAUTIONARY AND ADVISORY LABELS 13, 21
> Sando-K (NK Pharma Ltd) Potassium bicarbonate 400 mg, Potassium chloride 600 mg
Sando-K effervescent tablets | 100 tablet (P) £7.65 DT price + £7.65
Potassium chloride with sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 863, sodium chloride below.

INDICATIONS AND DOSE

Electrolyte imbalance

BY INTRAVENOUS INFUSION

- Adult: Depending on the deficit or the daily maintenance requirements (consult product literature)

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, infusion

Infusion

- POTASSIUM CHLORIDE WITH SODIUM CHLORIDE (Non-proprietary)

Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (POM) £1.42
Potassium chloride 0.3% (potassium 40mmol/litre) / Sodium chloride 0.9% infusion 1 litre bags | 1 bag (POM) £1.79
Potassium chloride 1.5 mg per 1 ml, Sodium chloride 9 mg per 1 ml Potassium chloride 0.15% (potassium 10mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (POM) £1.67
Potassium chloride 0.15% (potassium 20mmol/litre) / sodium chloride 0.9% infusion 1 litre bags | 1 bag (POM) £2.20 | 10 bag (POM) £22.00
Potassium chloride 2 mg per 1 ml, Sodium chloride 9 mg per 1 ml Potassium chloride 0.2% (potassium 13.3mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (POM) £1.67
Potassium chloride 0.2% (potassium 27mmol/litre) / sodium chloride 0.9% infusion 1 litre bags | 1 bag (POM) £2.20

SODIUM

Sodium chloride

INDICATIONS AND DOSE

Prophylaxis of sodium chloride deficiency

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

Chronic renal salt wasting

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

Management of diabetic ketoacidosis (if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

BY INTRAVENOUS INFUSION

- Adult: 500 ml, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

Diluent for instillation of drugs to the bladder

BY INTROVASCULAR INSTILLATION

- Adult: (consult product literature)

CAUTIONS

GENERAL CAUTIONS:

Dilutional hyponatraemia especially in children and the elderly

SPECIFIC CAUTIONS:

- With intravenous use avoid excessive administration - cardiac failure - hypertension - peripheral oedema - pulmonary oedema - restrict intake in impaired renal function - toxaemia of pregnancy

SIDE-EFFECTS

- With intravenous use administration of large doses may give rise to sodium accumulation - hyperchloraemic acidosis - oedema

MONITORING REQUIREMENTS

With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

PRESCRIBING AND DISPENSING INFORMATION

With intravenous use The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, irrigation, solution for infusion, oral solution, capsule, eye ointment, nebuliser liquid, infusion

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

Sodium chloride 18 mg per 1 ml Sodium chloride 1.8% infusion 500ml bottles | 1 bottle (POM) £3.28
Sodium chloride 27 mg per 1 ml Sodium chloride 2.7% infusion 500ml bottles | 1 bottle (POM) £3.28
Sodium chloride 50 mg per 1 ml Sodium chloride 5% infusion 500ml bottles | 1 bottle (POM) £3.28
**Blood and nutrition**

**Sodium chloride with glucose**

The properties listed below are those particular to the combination only. For the properties of the components please consider, glucose below, sodium chloride p. 851.

**INDICATIONS AND DOSE**

**Combined water and sodium depletion**

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**MONITORING REQUIREMENTS**

Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order restrictions to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

**SIDE-EFFECTS**

Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children. Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.

**PRESCRIBING AND DISPENSING INFORMATION**

Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.

**EXCEPTIONS TO LEGAL CATEGORY**

- With intravenous use. Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

**SUGARS**

**Glucose**

(Dextrose Monohydrate)

**INDICATIONS AND DOSE**

**Energy source**

- Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

**Water replacement**

- Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

**Hypoglycaemia**

- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

- Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

**Management of diabetic ketoacidosis**

**BY INTRAVENOUS INFUSION**

- Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

- Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 ml/hour, in addition to the sodium chloride 0.9% infusion

**Oral glucose tolerance test**

**BY MOUTH**

- Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

**Establish presence of gestational diabetes**

**BY MOUTH**

- Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

**Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)**

**BY INTRAVENOUS INFUSION**

- Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

**Dose equivalence and conversion**

75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

**CAUTIONS**

Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children. Glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

**SUGAR**

**Glucose**

(Dextrose Monohydrate)

**INDICATIONS AND DOSE**

**Energy source**

- Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

**Water replacement**

- Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

**Hypoglycaemia**

- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

- Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
2.1 Low blood volume

**COLLOIDS**

**Albumin solution**

*(Human albumin solution)*

### INDICATIONS AND DOSE

- Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions)
- Plasma exchange (with isotonic solutions)
- Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%)
- Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)
- Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

#### CONTRA-INDICATIONS

- Cardiac failure - severe anaemia

#### CAUTIONS

- Correct dehydration when administering concentrated solution - history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) - history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) - increased capillary permeability

#### SIDE-EFFECTS

- Anaphylaxis - chills - fever - hypersensitivity reactions - hypotension - increased salivation - nausea - tachycardia - vomiting

#### MONITORING REQUIREMENTS

- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

**PRESCRIBING AND DISPENSING INFORMATION**

- A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **Flexbumin** (Baxter Healthcare Ltd)
  - Albumin solution human 200 gm per 1 litre
  - 20% infusion

- **Albumin solution human 50 gm per 1 litre**
  - Human albumin Grifols 5% solution for infusion

**Solution for infusion**

- **Albumin solution human 50 gm per 1 litre**
  - Human albumin Grifols 5% solution for infusion

**Plasma and plasma substitutes**

**Dextran 70 with sodium chloride**

### INDICATIONS AND DOSE

Initial treatment of hypovolaemia with hypotension induced by traumatic injury

**BY INTRAVENOUS INFUSION**

- Adult: 250 mL, to be given over 2–5 minutes, followed immediately by administration of isotonic fluids, using RescueFlow®

#### CAUTIONS

- Cardiac disease - hypomosmolarity - severe hypoglycaemia - severe liver disease

#### SIDE-EFFECTS

- Rare: Severe anaphylactic reactions
- **FREQUENCY NOT KNOWN**
  - Hypersensitivity reactions - transient increase in bleeding time

#### PREGNANCY

- Avoid – reports of anaphylaxis in mother causing fetal anaoxia, neurological damage and death.

#### HEPATIC IMPAIRMENT

- Use with caution in severe impairment.

#### RENAL IMPAIRMENT

- Use with caution.

#### MONITORING REQUIREMENTS

- Where possible, monitor central venous pressure.
- Urine output should be monitored. Care should be taken to avoid haemocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.
Blood and nutrition

854 Fluid and electrolyte imbalances

- **EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

- **PRESCRIBING AND DISPENSING INFORMATION**

  - **Medications**
    - **Plasma and plasma substitutes** are often used in very ill patients.

  - **Hepatic Impairment**
    - **Rare**
    - **Side-Effects**
      - Monitor for hypersensitivity reactions.
      - Monitor renal function.

  - **Renal Impairment**
    - Use with caution in severe impairment.

  - **Monitoring Requirements**
    - Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
    - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

  - **Prescribing and Dispensing Information** The gelatin is partially degraded.

- **MEDICINAL FORMS**

  - **Gelatin**

    - **Indications and Dose**
      - Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

    - **By Intravenous Infusion**
      - **Adult:** Initially 500–1000 mL, use 3.5–4% solution
        - Urine output should be monitored.
        - Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
        - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

    - **Cautions** Cardiac disease • severe liver disease

    - **Side-Effects**
      - Rare: Severe anaphylactic reactions
      - Frequency not known: Hypersensitivity reactions • transient increase in bleeding time

    - **Pregnancy**
      - Manufacturer of Geloplasma® advises avoid at the end of pregnancy.

    - **Hepatic Impairment**
      - Use with caution in severe impairment.

    - **Renal Impairment**
      - Use with caution in renal impairment.

    - **Prescribing and Dispensing Information** The gelatin is partially degradable.

- **MEDICINAL FORMS**

  - **Gelatin**

    - **Indications and Dose**
      - Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

    - **By Intravenous Infusion**
      - **Adult:** Initially 500–1000 mL, use 3.5–4% solution

    - **Cautions** Cardiac disease • severe liver disease

    - **Side-Effects**
      - Rare: Severe anaphylactic reactions
      - Frequency not known: Hypersensitivity reactions • transient increase in bleeding time

    - **Pregnancy**
      - Manufacturer of Geloplasma® advises avoid at the end of pregnancy.

    - **Hepatic Impairment**
      - Use with caution in severe impairment.

    - **Renal Impairment**
      - Use with caution in renal impairment.

    - **Prescribing and Dispensing Information**
      - The gelatin is partially degradable.

- **Tetrastarch**

  - **Indications and Dose**

    - **Voluvyn® Infusion**
      - Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient
      - **By Intravenous Infusion**
        - **Adult:** Initially 10–20 mL, then increased to up to 30 mL/kg/daily for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

    - **Voluvyn® Infusion**
      - Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient
      - **By Intravenous Infusion**
        - **Adult:** Initially 10–20 mL, then increased to up to 30 mL/kg/daily for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

  - **Contra-Indications** Burns • cerebral haemorrhage • critically ill patients • dehydration • hyperhydration • intracranial haemorrhage • pulmonary oedema • sepsis • severe coagulopathy

  - **Cautions** Cardiac disease • care should be taken to avoid haematocrit concentration from falling below 25–30% • children • renal impairment • severe liver disease • surgery • trauma

  - **Side-Effects**
    - Rare: Severe anaphylactic reactions
    - Frequency not known: Hypersensitivity reactions • pruritus • raised serum amylose • transient increase in bleeding time

  - **Hepatic Impairment**
    - Avoid in severe impairment.

  - **Renal Impairment**
    - Avoid.

  - **Monitoring Requirements**
    - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.
    - Monitor renal function.
    - Monitor for hypersensitivity reactions.
    - Urine output should be monitored.

  - **Prescribing and Dispensing Information**
    - A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification. Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Infusion**
    - **Gelaspan** (B.Braun Medical Ltd)
      - Gelatin 40 mg per 1 ml
        - Gelaspan 4% infusion 500ml Ecobags | 1 bag (Freeflex) £2.78 (Hospital only) | 20 bag (Freeflex) no price available (Hospital only)

    - Volulyte 6% infusion 500ml Freeflex bags | 15 bag (Freeflex) £229.60
2.2 Calcium imbalance

Calcium

Calcium supplement

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate 857 injection 10% should be given, with plasma-calium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride p. 857 injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 858.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 851. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The bisphosphonates are useful and pamidronate disodium p. 623 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon)/salcatonin p. 627 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

Hyperparathyroidism

Paricalcitol p. 888 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure. Parathyroidectomy may be indicated for hyperparathyroidism.

2.3 Hypercalcaemia and hypercalciuria

CALCIMIMETIC AGENTS

Cinacalcet

- **DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

**INDICATIONS AND DOSE**

* Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis

**BY MOUTH**

- Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

**TREATMENT OF HYPERCALCAEMIA IN PARATHYROID CARCINOMA**

- **Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate**

**BY MOUTH**

- Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

**Dose adjustments due to interactions**

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CAUTIONS** Treatment should not be initiated in patients with hypocacalcaemia

- **INTERACTIONS** → Appendix 1 (cinacalcet).

- **SIDE-EFFECTS**

  - **Common or very common** Anorexia - asthenia - dizziness - myalgia - nausea - paraesthesia - rash - reduced testosterone concentrations - vomiting

  - **Uncommon** Diarrhoea - dyspepsia - seizures

  - **Frequency not known** Allergic reactions - angioedema - heart failure - hypotension

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment. Monitor closely in hepatic impairment especially when increasing dose.

- **MONITORING REQUIREMENTS**

  - Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.

- In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.
2.4 Hypocalcaemia

**CALCIUM**

**Calcium salts**

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) - conditions associated with hypercalcuria (e.g. some forms of malignant disease)
- **CAUTIONS** History of nephrolithiasis - sarcoidosis
- **INTERACTIONS** → Appendix 1 (antacids, calcium salts).
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Rare Gastro-intestinal disturbances
    - Frequency not known Hypercalcaemia
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use arrhythmias - bradycardia - fall in blood pressure - injection-site reactions - peripheral vasodilatation - severe tissue damage with extravasation - sweating
  - **RENAI IMPAIRMENT** Use with caution.

**Calcium carbonate with calcium lactate gluconate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate above.

- **INDICATIONS AND DOSE**
  - Calcium deficiency
    - **BY MOUTH**
      - Adult: Dose according to requirements

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble tablet formulations may include orange or fruit flavour.

**Calcium carbonate**

- **INDICATIONS AND DOSE**
  - Phosphate binding in renal failure and hyper-phosphataemia
    - **BY MOUTH**
      - Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, dispersible tablet, oral suspension, capsule.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS 25**
  - **EXCIPIENTS:** May contain Aspartame
    - **CALCIUM CARBONATE (Non-proprietary)**
      - Calcium (as Calcium carbonate) 600 mg HealthAid Strong Calcium 600mg chewable tablets | 60 tablet £3.99
      - Calcium carbonate 1.25 gram Calcium carbonate 1.25g tablets | 100 tablet no price available
      - Calcium carbonate 1.5 gram Calcium carbonate 1.5g tablets | 100 tablet no price available
  - **Chewable tablet**
    - **CAUTIONARY AND ADVISORY LABELS 24**
    - **EXCIPIENTS:** May contain Aspartame
      - **CALCIUM CARBONATE (Non-proprietary)**
        - Calcium (as Calcium carbonate) 600 mg HealthAid Strong Calcium 600mg chewable tablets | 60 tablet £3.99
      - Calcium carbonate 1.25 gram Calcium carbonate 1.25g chewable tablets sugar free (sugar-free) | 100 tablet 12.50 DT price = £9.33
      - Adcal (ProStrakan Ltd)
        - Calcium carbonate 1.5 gram Adcal 1500mg chewable tablets (sugar-free) | 100 tablet £8.70 DT price = £8.70
      - Calcichew (Forum Health Products Ltd)
        - Calcium carbonate 1.25 gram Calcichew 500mg chewable tablets (sugar-free) | 100 tablet £3.33 DT price = £9.33
      - Calcium carbonate 2.5 gram Calcichew Forte chewable tablets (sugar-free) | 60 tablet £13.16 DT price = £13.16
  - **Effervescent tablet**
    - **CAUTIONARY AND ADVISORY LABELS 13**
    - **EXCIPIENTS:** May contain Aspartame
      - Cacit (Warner Chilcott UK Ltd)
        - Calcium carbonate 1.25 gram Cacit 500mg effervescent tablets (sugar-free) | 76 tablet £11.81 DT price = £11.81

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble tablet formulations may include orange.
Hypomagnesaemia 857

Calcium chloride

**INDICATIONS AND DOSE**
- Severe acute hypocalcaemia or hypocalcaemic tetany
  - **BY INTRAVENOUS INJECTION**
    - Adult: Dose according to requirements
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion
  - **DIRECTIONS FOR ADMINISTRATION**
    - Care should be taken to avoid extravasation.

**Calcium gluconate**

**INDICATIONS AND DOSE**
- Severe acute hypocalcaemia or hypocalcaemic tetany
  - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
    - Adult: Initially 10–20 mL, calcium gluconate injection 10% strength (containing approximately 2.25–4.5 mmol of calcium) should be administered with plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence; (by continuous intravenous infusion) 100 mL, adjusted according to response, dose to be diluted, calcium gluconate 10% should be administered
- Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)
  - **BY SLOW INTRAVENOUS INJECTION**
    - Adult: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement
  - **Calcium deficiency / Mild asymptomatic hypocalcaemia**
    - **BY MOUTH**
      - Adult: Dose according to requirements
      - **Dose equivalence and conversion**
        - 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

**Important safety information**
The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

**Monitoring requirements**
- Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

**Directions for administration**
- For continuous intravenous infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Avoid bicarbonates, phosphates, or sulfates.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, solution for infusion, oral solution, capsule

**Effervescent tablet**
- **CAUTIONARY AND ADVISORY LABELS**
  - **13 ELECTROLYTES: May contain Sodium**
  - **Calcium gluconate (Non-proprietary)**
    - Calcium gluconate 1 gram
      - Calcium gluconate 1g effervescent tablets | 28 tablet | £15.68 DT price = £15.68
  - **Solution for injection**
    - **Calcium gluconate (Non-proprietary)**
      - Calcium gluconate 100 mg per 1 mL
        - Calcium gluconate 10% solution for injection 10 mL ampoules | 10 ampoule | £74.53-£82.44

**Calcium lactate**

**INDICATIONS AND DOSE**
- Calcium deficiency
  - **BY MOUTH**
    - Adult: Dose according to requirements

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Calcium lactate (Non-proprietary)**
  - Calcium lactate 300 mg
    - Calcium lactate 300mg tablets | 84 tablet no price available DT price = £4.57 | 84 tablet | £4.57

2.5 Hypomagnesaemia

**Magnesium**

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton. Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 858 as an osmotic laxative. Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypomagnesaemia (causing muscle weakness and arrhythmias) is rare.

**Hypomagnesaemia**

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate...
and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth, but there is limited evidence of benefit; magnesium glycerophosphate below tablets and liquid [unlicensed] are available from ‘special-order’ manufacturers or specialist importing companies.

**Arrhythmias**
Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de points*.

**Myocardial infarction**
Limited evidence that magnesium sulfate below prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

**Eclampsia and pre-eclampsia**
Magnesium sulfate injection is the drug of choice for the emergency treatment of eclampsia and pre-eclampsia with developing eclampsia. The patient should be monitored carefully.

---

**MAGNESIUM**

**Magnesium glycerophosphate**

**Prevention of seizures in pre-eclampsia**
INITIALLY BY INTRAVENOUS INJECTION
▶ Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

**Treatment of seizures and prevention of seizure recurrence in eclampsia**
INITIALLY BY INTRAVENOUS INJECTION
▶ Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose of 2 g by intravenous injection

**Hypomagnesaemia**
BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION
▶ Adult: Up to 40 g, dose given over up to 5 days may be required to replace the deficit (allowing for urinary losses)

**Hypomagnesaemia maintenance (e.g. in intravenous nutrition)**
BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION
▶ Adult: 2.5–5 g daily, usual dose 3 g daily

**Emergency treatment of serious arrhythmias**
BY INTRAVENOUS INJECTION
▶ Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

**Rapid bowel evacuation (acts in 2–4 hours)**
BY MOUTH
▶ Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

**Dose equivalence and conversion**
Magnesium sulfate heptahydrate 1 g equivalent to Mg$^{2+}$ approx. 4 mmol.
solution for infusion

  - Epsom Salts | 200 gram (GSS) £0.91

2.6 Phosphate imbalance

**Phosphorus**

**Phosphate supplements**

Oral phosphate p. 861 supplements may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets. Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 873.

**Phosphate-binding agents**

Calcium-containing preparations are used as phosphate-binding agents in the management of hypophosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation. Sevelamer p. 861 is licensed for the treatment of hypophosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 860 is licensed for the control of hypophosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

2.7 Hyperphosphataemia

**Aluminium**

**Aluminium hydroxide**

**Indications and dose**

Hyperphosphataemia in renal failure

**By mouth using capsules**

- Adult: 4–20 capsules daily in divided doses, to be taken with meals

Antacid

Initial: By mouth using capsules

- Adult: 1 capsule 4 times a day and (by mouth) 1 capsule, to be taken at bedtime
CONTRA-INDICATIONS  Hypophosphataemia - infants - neonates

INTERACTIONS  Appendix 1 (antacids). Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

SIDE-EFFECTS  Constipation - hyperaluminaemia

HEPATIC IMPAIRMENT  Avoid; can cause constipation which can precipitate coma.

RENAI IMPAIRMENT  There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

PRESCRIBING AND DISPENSING INFORMATION  Alu-caps® are low in sodium.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

Capsule
- Alu-Cap (Meda Pharmaceuticals Ltd)
- Aluminium hydroxide 475 mg Alu-Cap 475mg capsules  | 120 capsule £13.71 DT price = £13.71

Calcium acetate

The properties listed below are those particular to the drug only. For properties common to the class, see Calcium salts, p. 856.

INDICATIONS AND DOSE

PHOSEX® TABLETS

Hyphosphataemia
- Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum-phosphate concentration, usual dose 4–6 tablets daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

RENACET® TABLETS

Hyphosphataemia
- Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

PHOSLO® CAPSULES

Hyphosphataenia
- Adult: Initially 2 capsules, to be taken with each meal, dose to be adjusted according to serum-phosphate concentration, usual dose 3–4 capsules, to be taken with each meal

DIRECTIONS FOR ADMINISTRATION

PHOSEX® TABLETS
Phose® tablets are taken with meals. Tablets can be broken to aid swallowing, but not chewed (bitter taste).

RENACET® TABLETS
Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet® to reduce the possible interference with absorption of other drugs. Renacet® tablets are taken with meals.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer Phose®, Renacet® tablets, and PhosLo® tablets.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet
CAUTIONARY AND ADVISORY LABELS 25
- Phose (Pharmacosmos UK Ltd)
- Calcium acetate 1 gram Phosex 1g tablets  | 180 tablet £19.79
- Renacet (Stanningley Pharma Ltd)
- Calcium acetate 475 mg Renacet 475mg tablets  | 100 tablet £5.38
- Calcium acetate 950 mg Renacet 950mg tablets  | 100 tablet £10.25

Capsule
EXCIPIENTS: May contain Propylene glycol
- PhosLo (Stanningley Pharma Ltd)
- Calcium acetate 667 mg PhosLo 667mg capsules  | 200 capsule £14.40 DT price = £14.40

PHOSPHATE BINDERS

Lanthanum

INDICATIONS AND DOSE

Hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more who cannot be controlled by a low-phosphate diet

BY MOUTH
- Adult: 1.5–3 g daily in divided doses, dose to be adjusted according to serum-phosphate concentration every 2–3 weeks, to be taken with or immediately after meals

CAUTIONS  Acute peptic ulcer· bowel obstruction · Crohn’s disease – ulcerative colitis

INTERACTIONS  Appendix 1 (lanthanum).

SIDE-EFFECTS
- Common or very common  Gastro-intestinal disturbances · headache · hypocalcaemia
- Uncommon  Alopecia · anorexia · arthralgia · asthenia · chest pain · dizziness · dry mouth · eosinophilia · hypercalcaemia · hyperglycaemia · hyperparathyroidism · hypophosphataemia · increased appetite · malaise · myalgia · osteoporosis · peripheral oedema · stomatitis · sweating · taste disturbances · thirst · vertigo
- Frequency not known  Accumulation of lanthanum in bone · transient changes in QT interval

PREGNANCY  Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING  Manufacturer advises caution—no information available.

HEPATIC IMPAIRMENT  Lanthanum excreted in bile—possible accumulation in obstructive jaundice.

DIRECTIONS FOR ADMINISTRATION  Tablets are to be chewed. Each sachet of powder to be mixed with soft food and consumed within 15 minutes.

PATIENT AND CARER ADVICE  Patient and carers should be given advice on how to administer lanthanum tablets and powder.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2007) that lanthanum (Fosrenol®) is accepted for restricted use within NHS Scotland for the control of...
hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**INDICATIONS AND DOSE**

**RENVELA®**
Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

**BY MOUTH**
- Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

**RENAVEL®**
Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

**BY MOUTH**
- Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be given with meals and adjusted according to serum-phosphate concentration; usual dose 2.4–12 g daily in 3 divided doses

**CONTRA-INDICATIONS** Bowel obstruction

**CAUTIONS** Gastro-intestinal disorders

**INTERACTIONS** Appendix 1 (sevelamer).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Abdominal pain · constipation · diarrhea · dyspepsia · flatulence · nausea · vomiting
- Frequency not known Ileus · intestinal obstruction (higher incidence with sevelamer hydrochloride salt) · intestinal perforation · pruritus · rash

**RENAVEL®**
- Frequency not known Diverticulitis

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

**RENVELA®**
Unlikely to be present in milk (however, manufacturer advises avoid).

**RENAVEL®** Manufacturer advises use only if potential benefit outweighs risk.

**DIRECTIONS FOR ADMINISTRATION**

**RENVELA®**
For powder for oral suspension, each sachet to be dispersed in 60 mL water.

**PATIENT AND CARER ADVICE**

**RENVELA®**
Patients and carers should be advised on how to administer Renvela powder for oral suspension.

**MEDICINAL FORMS**

There can be variation in the licensing of the different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

| EXCIPIENTS: May contain Propylene glycol |
| SEVELAMER (Non-proprietary) |
| Sevelamer 800 mg: Sevelamer 800mg tablets | 180 tablet | £134.48-£167.04 DT price = £167.04 |
| Renvela (Sanofi) |
| Sevelamer 800 mg: Renagel 800mg tablets | 180 tablet | £167.04 DT price = £167.04 |

| Sevelamer carbonate 2.4 gram: Renvela 2.4g oral powder sachets (sugar-free) | 60 sachet | £167.04 |

**2.8 Hypophosphataemia**

**Phosphate**

**INDICATIONS AND DOSE**

Treatment of moderate to severe hypophosphataemia

**BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

For established hypophosphataemia (with monobasic potassium phosphate)

**BY INTRAVENOUS INFUSION**
- Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), dose only increased in critically ill patients; dose is approximately equivalent to 30 mmol in adults, dose to be infused over 6–12 hours, according to severity in the following situations

- Vitamin D-resistant hypophosphataemic osteomalacia

**BY MOUTH USING EFFERVESCENT TABLETS**
- Adult: 4–6 tablets daily

**SIDE-EFFECTS**

- Common or very common Diarrhoea
- Frequency not known Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

**RENAL IMPAIRMENT** Reduce dose. Monitor closely in renal impairment.

**MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.
Blood and nutrition

2.9 Hyperkalaemia

Drugs used for Hyperkalaemia not listed below; Calcium gluconate, p. 857 · Insulin, p. 603

CATION-EXCHANGE RESINS

Calcium polystyrene sulfonate

INDICATIONS AND DOSE

CALCIUM RESONIUM®

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
BY MOUTH
→ Adult: 15 g 3–4 times a day
BY RECTUM
→ Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

SORBISTERIT® POWDER

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
BY MOUTH
→ Adult: 20 g 1–3 times a day
BY RECTUM
→ Adult: 40 g 1–3 times a day, retained for 6 hours followed by irrigation to remove resin from colon

CONTRA-INDICATIONS

Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis

INTERACTIONS → Appendix 1 (polystyrene sulfonate resins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment) · hypomagnesaemia · intestinal necrosis (reported with concomitant use of sorbitol) · ischaemic colitis · nausea · necrosis · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

→ With oral use · gastro-intestinal concretions
→ With rectal use · faecal impaction

PREGNANCY

Manufacturers advise use only if potential benefit outweighs risk—no information available.

Sodium polystyrene sulfonate

INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
BY MOUTH
→ Adult: 15 g 3–4 times a day
BY RECTUM
→ Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon

CONTRA-INDICATIONS

Obstructive bowel disease

CAUTIONS

Congestive heart failure · hypertension · oedema

INTERACTIONS → Appendix 1 (polystyrene sulfonate resins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypercalcaemia · hypomagnesaemia · intestinal necrosis (reported with concomitant use of sorbitol) · ischaemic colitis · nausea · necrosis · sodium retention · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

→ With oral use · gastro-intestinal concretions
→ With rectal use · faecal impaction

PREGNANCY

Manufacturers advise use only if potential benefit outweighs risk—no information available.

BREAST FEEDING

Manufacturers advise use only if potential benefit outweighs risk—no information available.

MONITORING REQUIREMENTS

Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
Hypokalaemia

Potassium bicarbonate with potassium acid tartrate

**INDICATIONS AND DOSE**
Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)

**BY MOUTH**
- Adult: (consult product literature)

**CONTRA-INDICATIONS**
- Hypochloraemia

**CAUTIONS**
- Cardiac disease
- Elderly

**INTERACTIONS**
- Appendix 1 (potassium salts).

**SIDE-EFFECTS**
- Abdominal pain
- Diarrhoea
- Flatulence
- Nausea
- Vomiting

**RE/LN IMPAIRMENT**
- Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

**DIRECTIONS FOR ADMINISTRATION**
- To be dissolved in water before administration.

**PRESCRIBING AND DISPENSING INFORMATION**
- Tablets do not contain chloride.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Potassium chloride**

**INDICATIONS AND DOSE**
Prevention of hypokalaemia (patients with normal diet)

**BY MOUTH**
- Adult: 2–4 g daily in divided doses
Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, oral solution, infusion.

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

- Kay-Cee-L (Geistlich Sons Ltd)
  Potassium chloride 75 mg per 1 ml Kay-Cee-L syrup (sugar-free) 500 ml (£1.29)

Solution for infusion

- POTASSIUM CHLORIDE (Non-proprietary)
  Potassium chloride 75 mg per 1 ml (potassium chloride 15%) solution for infusion 10 ml ampoules 10 ampoule (PZN) £1.85  20 ampoule (PZN) £4.50
  Potassium chloride 200 mg per 1 ml (potassium chloride 20%) solution for infusion 5 ml ampoules 10 ampoule (PZN) £3.84-£4.00
  Potassium chloride 20% (potassium 27 mmol/10 ml) solution for infusion 10 ml ampoules 10 ampoule (PZN) £10.98

3 Metabolic disorders

3.1 Acute porphyrias

Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 865 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises. In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrias is available at www.wmic.wales.nhs.uk/porphyria_info.php.

Further information may be obtained from: www.porphyria-europe.org and also from:

Welsh Medicines Information Centre

- Welsh Medicines Information Centre

- University Hospital of Wales
- Cardiff
- (029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylation drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Hormone replacement therapy (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Sulphonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)
Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)
- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosantan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Disopyramide
- Disulfiram
- Erythromycin
- Ethosuximide
- Etamsylate
- Ethosuximide
- Etomidate
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metoprolol
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxycodone
- Pentazocine (buprenorphine, codeine, diacorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe)
- Pentoxifylline
- Phenoxybenzamine
- Phenyltoin
- Pivmecillinam
- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Rifampicin
- Rizulore
- Risperidone
- Selegiline
- Spirolactone
- Sulfinpyrazole
- Tamoxifen
- Teliromycin
- Temoparin
- Tiagabine
- Tizolone
- Tindizole
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine (contact Welsh Medicines Information Centre for further advice)
- Zuclopenthixol

HAEM DERIVATIVES

Haem arginate
(Human hemin)

INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphryia variegata | Hereditary coproporphyria

BY INTRAVENOUS INFUSION
- Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

SIDE-EFFECTS
- Common or very common pain at injection site - thrombophlebitis at injection site
- Rare Fever - hypersensitivity reactions
- Frequency not known Headache

PREGNANCY
Manufacturer advises avoid unless essential.

BREAST FEEDING
Manufacturer advises avoid unless essential—no information available.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Normosang®), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Normosang (Orphan Europe (UK) Ltd)
Haem arginate 25 mg per 1 ml Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule £1,737.00
3.2 Carnitine deficiency

CARNITINE DERIVATIVES
Levocarnitine
(Carnitine)

INDICATIONS AND DOSE
Primary carnitine deficiency due to inborn errors of metabolism
BY MOUTH
- Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day
BY SLOW INTRAVENOUS INJECTION
- Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes
Secondary carnitine deficiency in haemodialysis patients
INITIALLY BY SLOW INTRAVENOUS INJECTION
- Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

- CAUTIONS
  - Diabetes mellitus

- SIDE-EFFECTS
  - Abdominal pain • body odour • diarrhoea • nausea • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects may be dose-related during first week and after any dose increase.

- PREGNANCY
  - Appropriate to use; no evidence of teratogenicity in animal studies.

- RENAL IMPAIRMENT
  - Accumulation of metabolites may occur with chronic oral administration in severe impairment.

- MONITORING REQUIREMENTS
  - Monitoring of free and acyl carnitine in blood and urine recommended.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
    - Carnitor (Sigma-Tau Pharma Ltd)
      - L-Carnitine 330 mg • Carnitor 330mg tablets | 90 tablet £103.95
    - Chewable tablet
      - Carnitor (Sigma-Tau Pharma Ltd)
      - L-Carnitine 1 gram • Carnitor 1g chewable tablets | 10 tablet £35.00
    - Capsule
      - LEVOCARNITINE (Non-proprietary)
        - L-Carnitine 250 mg • Carnitine 250mg capsules | 125 capsule £11.96
        - L-Carnitine 500 mg • Carnitine 500mg capsules | 60 capsule £11.67
    - Oral solution
      - LEVOCARNITINE (Non-proprietary)
        - L-Carnitine 300 mg per 1 ml • Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml £5.55
      - Carnitor (Sigma-Tau Pharma Ltd)
        - L-Carnitine 100 mg per 1 ml • Carnitor oral single dose 1g solution (sugar-free) | 10 unit dose £35.00
    - Solution for injection
      - Carnitor (Sigma-Tau Pharma Ltd)
      - L-Carnitine 200 mg per 1 ml • Carnitor 1g/5ml solution for injection ampoules | 5 ampoule £59.50

3.3 Fabry’s disease

ENZYMES
Agalsidase alfa

- DRUG ACTION
  - Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

INDICATIONS AND DOSE
Fabry’s disease (specialist use only)
BY INTRAVENOUS INFUSION
- Adult: 200 micrograms/kg every 2 weeks

- INTERACTIONS
  - Appendix 1 (agalsidase alfa and beta).

- SIDE-EFFECTS
  - Common or very common Acne • angioedema • arthralgia • asthenia • bradycardia • chest pain • cough • dizziness •
    - Hypersensitivity reactions • hypertension • hypotension • influenza-like symptoms • muscle spasms • myalgia • nasopharyngitis • neutropenic pain • oedema • palpitation • paraesthesia • pruritus • rash • rhinorrhea • sleep disturbances • syncope • tachycardia • taste disturbances • tinnitus • tremor • urticaria

- Uncommon
  - Cold extremities • ear pain • ear swelling • injection-site reactions • parosmia • skin discoloration

SIDE-EFFECTS, FURTHER INFORMATION
Infusion-related reactions
Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- PREGNANCY
  - Use with caution.

- BREAST FEEDING
  - Use with caution—no information available.

- DIRECTIONS FOR ADMINISTRATION
  - Administration for intravenous infusion, give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Replagal (Shire Pharmaceuticals Ltd)
  - Agalsidase alfa 1 mg per 1 ml • Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial £1.068 & 64

Agalsidase beta

- DRUG ACTION
  - Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

INDICATIONS AND DOSE
Fabry’s disease (specialist use only)
BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg every 2 weeks

- INTERACTIONS
  - Appendix 1 (agalsidase alfa and beta).

- SIDE-EFFECTS
  - Common or very common Acne • angioedema • arthralgia • asthenia • bradycardia • chest pain • cough • dizziness •

- Chest pain • cough • dizziness •

- Eye irritation • fatigue • flushing • gastrointestinal disturbances • headache • hypersensitivity reactions • hypertension • hypotension • influenza-like symptoms • muscle spasms • myalgia • nasopharyngitis • neutropenic pain • oedema • palpitation • paraesthesia • pruritus • rash • rhinorrhea • sleep disturbances • syncope • tachycardia • taste disturbances • tinnitus • tremor • urticaria

- **Uncommon** Cold extremities - ear pain - ear swelling - injection-site reactions - parosmia - skin discoloration

### SIDE-EFFECTS, FURTHER INFORMATION

#### Infusion-related reactions

Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—no information available.

#### DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion*, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions infusion rate may be increased gradually once tolerance has been established.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

- **Fabrazyme (Genzyme Therapeutics Ltd)**
  - Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial (£315.08)
- **Agalsidase beta 35 mg** Fabrazyme 35mg powder for solution for infusion vials | 1 vial (£2,196.59)

### 3.4 Gaucher’s disease

**Drugs used for Gaucher’s disease not listed below; Miglustat, p. 870**

#### ENZYMES

**Imiglucerase**

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

#### INDICATIONS AND DOSE

**Non-neurological manifestations of type I Gaucher’s disease (specialist use only)**

**By intravenous infusion**

- Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

- **SIDE-EFFECTS**
  - **Common or very common** Angioedema - backache - cyanosis - flushing - hypersensitivity reactions - hypotension - paraesthesia - tachycardia - urticaria
  - **Uncommon** Abdominal cramps - arthralgia - diarrhoea - dizziness - fatigue - fever - headache - injection-site reactions - nausea - vomiting

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** No information available.

- **MONITORING REQUIREMENTS**
  - Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
  - When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cerezyme®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Cerezyme (Genzyme Therapeutics Ltd)**
  - Imiglucerase 400 unit Cerezyme 400unit powder for solution for infusion vials | 1 vial (£1,071.29)

**Velaglucerase alfa**

- **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

#### INDICATIONS AND DOSE

**Type I Gaucher’s disease (specialist use only)**

**By intravenous infusion**

- Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

- **SIDE-EFFECTS** Abdominal pain - arthralgia - back pain - bone pain - dizziness - flushing - headache - hypersensitivity reactions - hypotension - hypertension - malaise - nausea - pyrexia - rash - tachycardia - urticaria

- **SIDE-EFFECTS, FURTHER INFORMATION**

  **Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** Manufacturer advises use with caution—no information available.

- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (VPRIV®), give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60
minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
ELECTROLYTES: May contain Sodium
- VPRIV (Shire Human Genetic Therapies UK Ltd)
  - Velaglucerase alfa 400 unit VPRIV 400 units powder for solution for infusion vials | 1 vial no price available

### 3.5 Homocystinuria

#### Methyl Donors

**Betaine**

**INDICATIONS AND DOSE**
Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

**BY MOUTH**
- Adult: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

**SIDE-EFFECTS**
- Uncommon: Agitation, alopecia, anorexia, depression; gastro-intestinal disorders; personality disorder; reversible cerebral oedema; sleep disturbances; urinary incontinence; urticaria
- PREGNANCY: Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING: Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS: Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- DIRECTIONS FOR ADMINISTRATION: Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.
- PRESCRIBING AND DISPENSING INFORMATION: Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
- NATIONAL FUNDING/ACCESS DECISIONS
  - Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, tablet

- **Powder**
  - Cystadane (Orphan Europe (UK) Ltd)
  - Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram no price available

### 3.6 Mucopolysaccharidosis

#### Enzymes

**Galsulfase**

**DRUG ACTION**
Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

**INDICATIONS AND DOSE**
Mucopolysaccharidosis VI (specialist use only)
- **BY INTRAVENOUS INFUSION**
  - Adult: 1 mg/kg once weekly

**CAUTIONS**
- Acute febrile illness (consider delaying treatment) - acute respiratory illness (consider delaying treatment) - infusion-related reactions can occur - respiratory disease

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related reactions
Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**PREGNANCY**
- Manufacturer advises avoid unless essential.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (Naglaze®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- Naglaze® (BioMarin Europe Ltd)
  - Galsulfase 1 mg per 1 ml Naglaze 5mg/5ml solution for infusion vials | 1 vial no price available

**Idursulfase**

**DRUG ACTION**
Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

**INDICATIONS AND DOSE**
Mucopolysaccharidosis II (specialist use only)
- **BY INTRAVENOUS INFUSION**
  - Adult: 500 micrograms/kg once weekly

**CAUTIONS**
- Acute febrile respiratory illness (consider delaying treatment) - infusion-related reactions can occur - severe respiratory disease
Laronidase

**INDICATIONS AND DOSE**

**Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)**

**BY INTRAVENOUS INFUSION**

- Adult: 100 units/kg once weekly

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyrretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**PREGNANCY**

Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

Monitor immunoglobulin G (IgG) antibody concentration.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Aldurazyme®) give intermittently in Sodium chloride 0.9%; body-weight over 20 kg use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 45 units/kg/hour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Elaprase (Shire Pharmaceuticals Ltd)
  - Idursulfase 2 mg per 1 ml Elaprase 6mg/3ml concentrate for solution for infusion vials | 1 vial (£25) £1065.00

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

ELECTROLYTES: May contain Sodium

- Aldurazyme (Genzyme Therapeutics Ltd)
  - Laronidase 100 unit per 1 ml Aldurazyme 500units/5ml solution for infusion vials | 1 vial (£34) £444.70

3.7 Nephropathic cystinosis

**AMINO ACIDS AND DERIVATIVES**

**Mercaptamine**

(Cysteamine)

**INDICATIONS AND DOSE**

Nephropathic cystinosis (specialist use only)

**BY MOUTH**

- Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

**Important safety information**

**SAFE PRACTICE**

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

**CAUTIONS**

Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine.

**SIDE-EFFECTS**

- Common or very common Abdominal pain · alopecia · anaphylaxis · angioedema · blood pressure changes · cold extremities · cough · diarrhoea · dizziness · dysphonia · fatigue · flushing · headache · influenza-like symptoms · infusion-site reactions · musculoskeletal pain · nausea · pain in extremities · pailor · paraesthesia · pruritus · rash · restlessness · tachycardia · urticaria · vomiting

**FREQUENCY NOT KNOWN**

- Bronchospasm · infusion-related reactions · respiratory arrest

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyrretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature.

**ALLERGY AND CROSS-SENSITIVITY**

Contraindicated if history of hypersensitivity to penicillamine.

**PREGNANCY**

Avoid—teratogenic and toxic in animal studies.

**BREAST FEEDING**

Avoid.

**MONITORING REQUIREMENTS**

Leucocyte-cystine concentration and haematological monitoring required—consult product literature.
3.8 Niemann-Pick type C disease

GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

**DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

**INDICATIONS AND DOSE**

Mild to moderate type I Gaucher’s disease for whom enzyme replacement therapy is unsuitable (under expert supervision)

**BY MOUTH**

- Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

**BY MOUTH**

- Adult: 200 mg 3 times a day

**SIDE-EFFECTS** Abdominal pain · anamnesis · anorexia · ataxia · chills · constipation · decreased libido · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hypoaesthesia · insomnia · malaise · muscle spasm · muscle weakness · nausea · paraesthesia · peripheral neuropathy · thrombocytopenia · tremor · vomiting · weight changes

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.

**RENAL IMPAIRMENT** For Gaucher’s disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m². For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor cognitive and neurological function.
- Monitor growth and platelet count in Niemann-Pick type C disease.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

### 3.9 Pompe disease

**ENZYMES**

**Alglucosidase alfa**

**DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

**INDICATIONS AND DOSE**

**Pompe disease (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - **Adult:** 20 mg/kg every 2 weeks

**CAUTIONS**

- Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction

**SIDE-EFFECTS**

- Common or very common Agitation · anaphylaxis · antibody formation · blood pressure changes · bronchospasm · chest discomfort · cold extremities · cough · cyanosis · diarrhoea · dizziness · facial oedema · fatigue · flushing · headache · hypersensitivity reactions · injection-site reactions · irritability · muscle spasm · myalgia · nausea · paraesthesia · pruritus · pyrexia · rash · restlessness · sweating · tachycardia · tachypnoea · tremor · urticaria · vomiting

**Frequency not known** Infusion-related reactions · necrotising skin lesions · severe skin reactions · ulcerative skin lesions

**SIDE-EFFECTS, FURTHER INFORMATION**

**Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

**PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

- Monitor closely if cardiac dysfunction.
- Monitor closely if respiratory dysfunction.
- Monitor immunoglobulin G (IgG) antibody concentration.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Myozyme®), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Myozyme (Genzyme Therapeutics Ltd)**
  - Alglucosidase alfa 50 mg Myozyme 50 mg powder for concentrate solution for infusion vials | 1 vial (BH) £356.06 (Hospital only)

---
3.10 Tyrosinaemia type I

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone (NTBC)

INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

BY MOUTH

Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

SIDE-EFFECTS

- Common or very common Conjunctivitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- Uncommon Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risks—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—adverse effects in animal studies.
- PRE-TREATMENT SCREENING Slit-lamp examination of eyes recommended before treatment.
- MONITORING REQUIREMENTS
  - Monitor liver function regularly.
  - Monitor platelet and white blood cell count every 6 months.
- DIRECTIONS FOR ADMINISTRATION Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.
- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Capsule

- Orfadin (Swedish Orphan Biavitrum Ltd)
  - Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule £564.00
  - Nitisinone 5 mg Orfadin 5mg capsules | 60 capsule £1,127.00
  - Nitisinone 10 mg Orfadin 10mg capsules | 60 capsule £2,062.00

3.11 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Carglumic acid

INDICATIONS AND DOSE

Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

BY MOUTH

Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

Hyperammonaemia due to organic acidaemia (under expert supervision)

BY MOUTH

Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

Important safety information

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

SIDE-EFFECTS

- Common or very common Sweating
- Uncommon Bradycardia · diarrhea · pyrexia · vomiting
- PREGNANCY Manufacturer advises avoid unless essential—no information available.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- DIRECTIONS FOR ADMINISTRATION Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.
- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13

- Carbaglu (Orphan Europe (UK) Ltd)
  - Carglumic acid 200 mg Carbaglu 200mg dispersible tablets (sugar-free) | 5 tablet £299.00 (sugar-free) | 60 tablet £3,499.00

AMMONIA LOWERING DRUGS

Sodium phenylbutyrate

INDICATIONS AND DOSE

Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)

BY MOUTH

- Adult: 9.9–13 g/m² daily in divided doses, with meals; maximum 20 g per day

Important safety information

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

CAUTIONS

- Congestive heart failure (preparations contain significant amounts of sodium)
- INTERACTIONS → Appendix 1 (sodium phenylbutyrate).
- SIDE-EFFECTS
  - Common or very common Alkalosis · blood disorders · body odour · decreased appetite · depression · gastro-intestinal disturbances · headache · irritability · menstrual disorders · metabolic acidosis · oedema · rash · renal tubular acidosis · syncope · taste disturbance · weight gain
  - Uncommon Arrhythmias · pancreatitis · peptic ulcer · rectal bleeding
- SIDE-EFFECTS, FURTHER INFORMATION
  - Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.
- CONCEPTION AND CONTRACEPTION
  - Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- PREGNANCY
  - Avoid—toxicity in animal studies.
9

872 Trace element deficiencies

**Zinc acetate**

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson’s disease.

**INDICATIONS AND DOSE**

Wilson’s disease (initiated under specialist supervision)

**BY MOUTH**

- Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

**Dose equivalence and conversion**

Doses expressed as elemental zinc.

**PHARMACOKINETICS**

Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

- **INTERACTIONS** → Appendix 1 (zinc).

- **SIDE-EFFECTS**
  - Common or very common Gastric irritation (usually transient)
  - Uncommon Leucopenia - sideroblastic anaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

- **PREGNANCY** Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

**MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **CAPSULE**
  - **CAUTIONARY AND ADVISORY LABELS** 6, 22
  - **TRIENTINE DIHYDROCHLORIDE (Non-proprietary)**
    - Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule (BNF) no price available

3.12 Wilson’s disease

Drugs used for Wilson’s disease not listed below; Penicillamine, p. 896

**COPPER ABSORPTION INHIBITORS**

**Zinc acetate**

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson’s disease.

**INDICATIONS AND DOSE**

Wilson’s disease (initiated under specialist supervision)

**BY MOUTH**

- Adult: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

- **INTERACTIONS** → Appendix 1 (trientine).

- **SIDE-EFFECTS**
  - Common or very common Nausea - rash
  - Very rare Anaemia
  - Frequency not known Colitis - duodenitis

- **PREGNANCY** Teratogenic in animal studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.

- **PRESCRIBING AND DISPENSING INFORMATION** Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **CAPSULE**
  - **CAUTIONARY AND ADVISORY LABELS** 6, 22
  - **TRIENTINE DIHYDROCHLORIDE (Non-proprietary)**
    - Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule (BNF) no price available

4 Trace element deficiencies

**Trace elements**

**Selenium**

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

**Zinc**

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders p. 864, or in zinc-losing states.
Zinc is used in the treatment of Wilson’s disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

## 4.1 Selenium deficiency

### SELENIUM

#### Indications and dose

**Selenium deficiency**

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Adult: 100–500 micrograms daily

- **Interactions** Appendix 1 (selenium).

- **Medicinal forms**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - SELENIUM (Non-proprietary)
  
  Selenium (as L-Selenomethionine) 100 microgram Solgar Selenium 100microgram tablets | 100 tablet no price available
  L-Selenomethionine 200 microgram EN-Selenium 200microgram tablets | 30 tablet £8.60
  Solgar Selenium 200microgram tablets | 50 tablet no price available 250 tablet no price available
  HealthAid Selenium 200microgram tablets | 60 tablet £3.90
  Lamberts Selenium 200microgram tablets | 60 tablet £4.08
  SelenoPrecise (Pharma Nord (UK) Ltd)
  
  Selenium (as L-Selenomethionine) 100 microgram SelenoPrecise 100microgram tablets | 60 tablet £6.75
  L-Selenomethionine 200 microgram SelenoPrecise 200microgram tablets | 60 tablet £4.02

  **Capsule**

  - SELENIUM (Non-proprietary)
  
  L-Selenomethionine 200 microgram Selenium 200microgram capsules | 30 capsule £2.98 | 60 capsule £5.39

  **Oral solution**

  - Solenase (Baxter Healthcare Ltd)
  
  Selenium (as Sodium selenite) 50 microgram per 1 ml Solenase 100micrograms/2ml oral solution 2ml unit dose ampoules | 20 unit dose | no price available
  Selenium 500micrograms/10ml oral solution unit dose vials | 10 unit dose | no price available

  **Solution for injection**

  - Solenase (Baxter Healthcare Ltd)
  
  Selenium (as Sodium selenite) 50 microgram per 1 ml Solenase 100micrograms/2ml solution for injection ampoules | 10 ampoule (POT) no price available
  Selenium 500micrograms/10ml solution for injection vials | 10 vial (POT) no price available

  **Solution for infusion**

  - SELENIUM (Non-proprietary)
  
  Selenium (as Sodium selenite) 10 microgram per 1 ml Selenium 100micrograms/10ml solution for infusion vials | 10 vial no price available

## 4.2 Zinc deficiency

### Zinc

#### Zinc sulfate

**Indications and dose**

**Zinc deficiency or supplementation in zinc-losing conditions**

BY MOUTH USING EFFERVESCENT TABLETS

- Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
  
  - Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
  
  - Child (body-weight 30 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
  
  - Adult (body-weight 30 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

**Additional elemental zinc for intravenous nutrition**

BY INTRAVENOUS INJECTION

- Adult: 6.5 mg daily (Zn$^{2+}$ 100 micromol)

**Unlicensed use** Solvazine$^{	ext{®}}$ is not licensed for use in acrodermatitis enteropathica.

**Interactions** → Appendix 1 (zinc).

**Side-effects** Abdominal pain · diarrhoea · dyspepsia · gastric irritation · gastritis · headache · irritability · lethargy · nausea · vomiting

**Pregnancy** Crosses placenta; risk theoretically minimal, but no information available.

**Breast-feeding** Present in milk; risk theoretically minimal, but no information available.

**Renal impairment** Accumulation may occur in acute renal failure.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution, capsule, liquid

**Effervescent tablet**

CAUTIONARY AND ADVISORY LABELS 13, 21

- Solvazine (Galen Ltd)
  
  Zinc sulfate monohydrate 125 mg Solvazinc 125mg effervescent tablets (sugar-free) | 90 tablet (POT) £14.95 OT price = £14.95

## 5 Nutrition

### Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns;

---

1. 1000 kcal = 4200kJ; 1000 kJ = 238.8 kcal. All entries are Prescription-only medicines.
2. Excludes protein- or amino acid-derived energy.
The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated and peritoneal dialysis is contraindicated. Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin p. 837, is given by intramuscular injection; regular vitamin B₉ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 836 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

1 1000 kcal = 4200kJ; 1000 kJ = 238.8 kcal. All entries are Prescription-only medicines.
2 Excludes protein- or amino acid-derived energy
Blood and nutrition utilisation of amino acids than glucose alone. Glucose p.

amino acids; they often contain an energy source (usually with electrolytes. Solutions vary in their composition of

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 852 is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose p. 852 in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration
Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

PARENTERAL NUTRITION

Parenteral nutrition supplements

**INDICATIONS AND DOSE**

**Dipeptiven 20G/100mL Concentrate for Solution for Infusion Bottles**

Amino acid supplement for hypercatabolic or hypermetabolic states

**By Intravenous Infusion**

- Adult: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

### CAUTIONS

**Peditrace®**

Reduced biliary excretion, reduced biliary excretion in cholestatic liver disease, reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required), total parenteral nutrition exceeding one month.

CAUTIONS, FURTHER INFORMATION

Total parental nutrition exceeding one month

Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.

**DIRECTIONS FOR ADMINISTRATION**

Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted.

Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

**Dipeptiven 20G/100mL Concentrate for Solution for Infusion Bottles**

For addition to infusion solutions containing amino acids.

**Peditrace®**

For addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions, and glucose intravenous infusions.

**Decan®**

For addition to infusion solutions.

**Additrace®**

For addition to Vamin® solutions and glucose intravenous infusions.

**Tracutril®**

For addition to infusion solutions.

**Glycophos®**

For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions.

**Addiphos®**

For addition to Vamin® solutions and glucose intravenous infusions.

**Cernivet®**

Dissolve in 5mL water for injection.

**Vitlipid N Infant**

For addition to Intralipid®.

**Vitlipid®**

For addition to Intralipid®.

**Solvitio®**

Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only.

**PRESCRIBING AND DISPENSING INFORMATION**

**Dipeptiven®**

Dipeptiven® solution contains N(2)-L-alanyl-glutamine 200mg/mL (providing L-alanine 82 mg, L-glutamine 134.6mg)

**Peditrace®**

For use in neonates (when kidney function established, usually second day of life), infants, and children.

**Decan®**

For patients over 40kg.

**Additrace®**

For patients over 40kg.

**Tracutril®**

For adults.

**Glycophos®**

Glycophos® Sterile Concentration solution contains phosphate 20mmol, Na+ 40mmol/20mL

**Addiphos®**

Addiphos sterile solution contains phosphate 40mmol, K+ 30mmol, Na+ 30 mmol/20mL

**Vitlipid N Adult®**

For adults and children over 11 years.
## 5.2 Nutrition (oral)

### Enteral nutrition

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, proteins, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

### Enteral nutrition in children

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

## 5.3 Phenyketonuria

**Phenyketonuria**

**Phenyketonuria** (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair. Sapropterin dihydrochloride p. 880, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with **phenylketonuria** and **tetrahydrobiopterin deficiency**.
Blood and nutrition

5.4 Special diets

Nutrition in special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

Coeliac disease
Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription.

6 Vitamin deficiencies

Vitamins

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Their use as general ‘pick-me-ups’ is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 884 and pyridoxine hydrochloride p. 882, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine p. 882 (B₁), riboflavin (B₂), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 206, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (Pabrinex®), followed by oral...
administration of thiamine p. 882 in the longer term. Anaphylaxis has been reported with parenteral B vitamins. As with other vitamins of the B group, pyridoxine hydrochloride p. 882 (B6) deficiency is rare, but it may occur during isoniazid therapy or penicillamine treatment in Wilson’s disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride p. 882 are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid p. 177 inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 836 and vitamin B12 are used in the treatment of megaloblastic anaemia. Folic acid p. 781 (available as calcium folinate) is used in association with cytotoxic therapy.

**Vitamin C**

Vitamin C (ascorbic acid p. 884) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment. Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

**Vitamin D**

The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol p. 887 (calciferol, vitamin D2), colecalciferol (vitamin D3) p. 886, dihydrotrachysterol p. 887, alfacalcidol (1α-hydroxycholecalciferol) p. 885, and calcitriol (1,25-dihydroxycholecalciferol) p. 885. Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D2) or colecalciferol (vitamin D3) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing calcium carbonate with colecalciferol p. 886 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol p. 885 or calcitriol p. 885 should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis. Paricalcitol p. 888, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

**Vitamin E**

The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestatics. In young children with congenital cholestatics, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E. Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

**Vitamin K**

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadion sodium phosphate p. 889 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

**Other compounds**

Potassium aminobenzoate p. 882 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie’s disease. In Peyronie’s disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

**MULTIVITAMINS**

**Vitamins A and D**

**INDICATIONS AND DOSE**

Prevention of vitamin A and D deficiency

**BY MOUTH**

- Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
- Adult: (consult product literature)

**UNLICENSED USE** Not licensed in children under 6 months of age.

**INTERACTIONS** → Appendix 1 (vitamins).

**SIDE-EFFECTS**

**Overdose** Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

**PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**VITAMINS A AND D (Non-proprietary)**

Vitamin A 4000 unit, Vitamin D 400 unit

**Vitamins A, C and D**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ascorbic acid p. 884, vitamin D p. 884.
Vitamin B6

Pyridoxine hydrochloride

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral drops**
- **VITAMINS A, C AND D (Non-proprietary)**
  - Ascorbic acid 150 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Vitamin A 5000 iu per 1 ml, Vitamin A and D3 concentrate 0.55 mg per 1 ml, Vitamin D 2000 iu per 1 ml
  - Healthy Start Children’s Vitamin drops | 10 ml no price available

**INTERACTIONS** → Appendix 1 (vitamins).

**SIDE-EFFECTS** Sensory neuropathy (with high doses when given for extended periods)

**Overdose**
Overdosage induces toxic effects.

**INDICATIONS AND DOSE**

**Deficiency states**
- Adult: 20–50 mg 1–3 times a day
- Isoniazid-induced neuropathy (prophylaxis)
  - Adult: 10–20 mg daily
- Isoniazid-induced neuropathy (treatment)
  - Adult: 50 mg 3 times a day

**UNLICENSED USE**

**PRESCRIBING AND DISPENSING INFORMATION**
This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies. Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

**VITAMIN B GROUP**

Potassium aminobenzoate

**INDICATIONS AND DOSE**

Peyronie’s disease | Scleroderma

**BY MOUTH**
- Adult: 12 g daily in divided doses, to be taken after food

**INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

**INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

**INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

**INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

**INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

Thiamine

(Vitamin B1)

**INDICATIONS AND DOSE**

**Mild deficiency**
- Adult: 25–100 mg daily

**Severe deficiency**
- Adult: 200–300 mg daily in divided doses

**Important safety information**
MHRA/CHM ADVICE (SEPTEMBER 2007)
Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:
- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
Vitamin B substances with ascorbic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider ascorbic acid p. 884, thiamine p. 882.

**INDICATIONS AND DOSE**

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states) | Maintenance of vitamins B and C in chronic intermittent haemodialysis

**BY INTRAVENOUS INFUSION**

- Adult: See MHRA/CHM advice in Thiamine monograph (consult product literature).

**Treatment of Wernicke’s encephalopathy**

- Adult: 2–3 pairs 3 times a day for 2 days, discontinue if no response, continue treatment if symptoms respond after 2 days; (by intravenous infusion or by deep intramuscular injection) 1 pair once daily for 5 days or for as long as improvement continues, give deep intramuscular injection into the gluteal muscle

**Prophylaxis of Wernicke’s encephalopathy in alcohol dependence**

**BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 1 pair once daily for at least 3–5 days, give deep intramuscular injection into the gluteal muscle

**Caution**

Anaphylaxis may occasionally follow injection.

**Breast Feeding**

Severely thiamine-deficient mothers should avoid breast-feeding as toxic methylglyoxal present in milk.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- Thiamine (Non-proprietary) Thiamine hydrochloride 50 mg Thiamine 50mg tablets | 100 tablet [p] no price available DT price = £7.13 | 100 tablet £7.13 DT price = £7.13
- Thiamine hydrochloride 100 mg Thiamine 100mg tablets | 100 tablet [p] no price available DT price = £11.55 | 100 tablet £11.55 DT price = £11.55
- Benerva (Bayer Pic) Thiamine hydrochloride 50 mg Benerva 50mg tablets | 100 tablet [p] £3.98 DT price = £7.13
- Thiamine hydrochloride 100 mg Benerva 100mg tablets | 100 tablet [p] £6.16 DT price = £11.55
- Tyvera (Teva UK Ltd, Almus Pharmaceuticals Ltd) Thiamine hydrochloride 50 mg Tyvera 50mg tablets | 100 tablet [p] £5.46–6.72 DT price = £7.13
- Thiamine hydrochloride 100 mg Tyvera 100mg tablets | 100 tablet [p] £8.46–9.18 DT price = £11.55

**Modified-release tablet**

- Thiamine (Non-proprietary) Thiamine hydrochloride 100 mg HealthAid Vitamin B1 100mg modified-release tablets | 90 tablet £4.18

**Unlicensed use**

Pabrinex® doses in BNF may differ from those in product literature.

**Directions for administration**

Give (Pabrinex® I/V High Potency) intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Ampoules contents should be mixed, diluted, and administered without delay; give over 30 minutes.

**Prescribing and dispensing information**

Some formulations of Pabrinex® may contain benzyl alcohol (avoid in neonates). Pabrinex® I/M High Potency injection is for intramuscular use only. Pabrinex® I/V High Potency injection is for intravenous use only.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Not applicable**

**Excipients:** May contain benzyl alcohol

- Pabrinex Intramuscular High Potency (Archimedes Pharma UK Ltd) Pabrinex Intramuscular High Potency solution for injection 5ml and 2ml ampoules | 20 ampoule | £22.53 DT price = £22.53
- Pabrinex Intravenous High Potency (Archimedes Pharma UK Ltd) Pabrinex Intravenous High Potency solution for injection 5ml and 5ml ampoules | 20 ampoule | £22.53 DT price = £22.53

**Vitamin B complex**

**Indications and dose**

Prophylaxis of deficiency

**By mouth using tablets**

- Adult: 1–2 tablets daily, this dose is for vitamin B compound tablets

**Treatment of deficiency**

**By mouth using tablets**

- Adult: 1–2 tablets 3 times daily as a single dose, this dose is for vitamin B compound strong tablets

**Less suitable for prescribing**

Vitamin B compound tablets are less suitable for prescribing. Vitamin B compound strong tablets are less suitable for prescribing.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- VITAMIN B COMPLEX (Non-proprietary) Nicotinamide 15 mg, Riboflavin 1 mg, Thiamine hydrochloride 1 mg Vitamin B compound tablets | 28 tablet | no price available DT price = £26.62 | 1000 tablet £10.50 Nicotinamide 20 mg, Pyridoxine hydrochloride 2 mg, Riboflavin 2 mg, Thiamine hydrochloride 5 mg Vitamin B compound strong tablets | 28 tablet | no price available DT price = £1.95 | 1000 tablet no price available | 1000 tablet [p] no price available

**Psychosis following narciss or electroconvulsive therapy**

Toxicity from acute infections

**By intravenous infusion or by deep intramuscular injection**

- Adult: 1 pair twice daily for up to 7 days, give deep intramuscular injection into the gluteal muscle

**Haemodialysis**

**By intravenous infusion**

- Adult: 1 pair every 2 weeks
Blood and nutrition

Vitamins with minerals and trace elements

**INDICATIONS AND DOSE**

**KETOVITE® TABLETS**

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism / Adjunct in restricted, specialised, or synthetic diets

**BY MOUTH**

▶ Adult: 1 tablet 3 times a day, use with Ketonal® Liquid for complete vitamin supplementation.

**FORCEVAL® CAPSULES**

Vitamin and mineral deficiency and as adjunct in synthetic diets

**BY MOUTH**

▶ Adult: 1 capsule daily, one hour after a meal

**CAUTIONS, FURTHER INFORMATION**

Iron overload: Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

**INTERACTIONS** → Appendix 1 (vitamins).

**PRESCRIBING AND DISPENSING INFORMATION**

To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**VITAMIN D AND ANALOGUES**

Vitamin D and analogues (systemic)

**CONTRA-INDICATIONS**

Hypercalcaemia - metastatic calcification

**INTERACTIONS** → Appendix 1 (vitamins).

**SIDE-EFFECTS**

Overdose: Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.

**PREGNANCY**

High doses teratogenic in animals but therapeutic doses unlikely to be harmful.

**BRACE FEEDING**

Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.

**MONITORING REQUIREMENTS**

Important: All patients receiving pharmacological doses of vitamin D should have their plasma–calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.
Vitamin deficiencies 885

Alfacalcidol (1α-Hydroxycholecalciferol)

**INDICATIONS AND DOSE**

Patients with severe renal impairment requiring vitamin D therapy

**BY MOUTH OR BY INTRAVENOUS INJECTION**

- Adult: Initially 1 microgram daily, dose to be adjusted to avoid hypercalcemia; maintenance 0.25–1 microgram daily
- Elderly: Initially 500 nanograms daily, dose adjusted to avoid hypercalcemia; maintenance 0.25–1 microgram daily

**Hypophosphataemic rickets** | **Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism**

**BY MOUTH OR BY INTRAVENOUS INJECTION**

- Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
- Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

**Prevention of vitamin D deficiency in renal or cholestatic liver disease**

**BY MOUTH OR BY INTRAVENOUS INJECTION**

- Child 1 month–11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
- Child 1 month–11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary
- Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

**Dose equivalence and conversion**

One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants
- **SIDE-EFFECTS**
  - Rare Nephrocalcinosis · pruritus · rash · urticaria
- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - The concentration of alfacalcidol in One-Alpha® drops is 10 times greater than that of the former preparation One-Alpha® solution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

- **EXCIPIENTS**: May contain Sesame oil
- **ALFACALCIDOL (Non-proprietary)**
  - Alfacalcidol 250 nanogram Alfacalcidol 250nanogram capsules | 30 capsule (PO) £6.33 DT price + £2.51

  - One-Alpha (LEO Pharma)
    - Alfacalcidol 250 nanogram One-Alpha 250nanogram capsules | 30 capsule (PO) £3.37 DT price + £2.51
    - Alfacalcidol 500 nanogram One-Alpha 0.5microgram capsules | 30 capsule (PO) £6.27 DT price + £5.18

- **Solution for injection**

- **EXCIPIENTS**: May contain Alcohol, propylene glycol
- **One-Alpha (LEO Pharma)**
  - Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/ml oral drops (sugar-free) | 10 ml (PO) £21.30 DT price + £21.30

Calcitriol (1,25-Dihydroxycholecalciferol)

**INDICATIONS AND DOSE**

**Renal osteodystrophy**

**BY MOUTH**

- Adult: Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

**Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)**

**BY MOUTH**

- Adult: Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

**Established postmenopausal osteoporosis**

**BY MOUTH**

- Adult: 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENA L IMPAIRMENT** Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma calcium, phosphate, and creatinine during dosage titration. Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION** Contents of capsule may be administered by oral syringe.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension
Colecalciferol
(Cholecalciferol; Vitamin D₃)

**INDICATIONS AND DOSE**

**Prevention of vitamin D deficiency**

- **BY MOUTH**
  - Adult: 400 units daily

**Treatment of vitamin D deficiency**

- **BY MOUTH**
  - Adult: 800 units daily, higher doses may be necessary for severe deficiency

**RENAL IMPAIRMENT**

Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS**

Monitor plasma-calcium concentration in patients receiving high doses.

**DIRECTIONS FOR ADMINISTRATION**

**INVITA D3**

- May be mixed with a small amount of cold or lukewarm food immediately before administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral drops, oral solution, capsule

Colecalciferol with calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecaciferol p. 886, calcium p. 856.

**INDICATIONS AND DOSE**

Calcium and vitamin D deficiency

**BY MOUTH**

- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

- CAUTIONARY AND ADVISORY LABELS 13, 21
- Calfivit D3 (A. Menarini Farmaceutica Internazionale SRL)
- Cacit D3 (A. Menarini Farmaceutica Internazionale SRL)
- Cacit D3 Forte (A. Menarini Farmaceutica Internazionale SRL)
- Natecal

Dihydrotachysterol

**INDICATIONS AND DOSE**

Acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism

**BY MOUTH**

- Adult: (consult product literature)

**RENAI IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Ergocalciferol

(Calciferol; Vitamin D<sub>2</sub>)

#### INDICATIONS AND DOSE

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease

**BY MOUTH**

- Adult: Up to 40 000 units daily
- Hypocalcaemia of hypoparathyroidism to achieve normocalcaemia

**BY MOUTH**

- Adult: Up to 100 000 units daily
- Prevention of vitamin D deficiency

**BY MOUTH**

- Adult: 400 units daily
- Treatment of vitamin D deficiency

**BY MOUTH**

- Adult: 800 units daily, higher doses may be necessary for severe deficiency

**CAUTIONS** Take care to ensure correct dose in infants

**RENAI IMPAIRMENT** Monitor plasma-calcium concentration in hepatic impairment.

**MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

**PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecaciferol or ergocalciferol should be dispensed or supplied. When the strength of the medicines ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, oral solution, capsule

**Tablet**

- ERGOCALCIFEROL (Non-proprietary)
  - Ergocalciferol 12.5 microgram (Dispersible Medical Equipment Ltd)
  - Ergocalciferol 125 microgram (Stirling Anglian Pharmaceuticals Ltd)

**Capsule**

- ERGOCALCIFEROL (Non-proprietary)
  - Ergocalciferol 1.25 mg (Warner Chilcott UK Ltd)

**Oral solution**

- Eciferol (Disposable Medical Equipment Ltd)

Ergocalciferol with calcium lactate and calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol above, calcium lactate p. 857.
**VITAMIN E**

**Alpha tocopherol**
(Tocopherol)

**INDICATIONS AND DOSE**
Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

**BY MOUTH USING ORAL SOLUTION**
- Child: 17 micrograms/kg daily, dose to be adjusted as necessary

- **CONTRA-INDICATIONS**
  - Preterm neonates

- **CAUTIONS**
  - Predisposition to thrombosis

- **INTERACTIONS**
  - Appendix 1 (Vitamin E)

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea
  - Uncommon: Alopecia, asthenia, disturbances in serum-potassium concentration, disturbances in serum-sodium concentration, headache, pruritus, rash

- **PREGNANCY**
  - Manufacturer advises caution, no evidence of harm in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution—no information available. Manufacturer advises monitor closely in hepatic impairment.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content. Manufacturer advises monitor closely in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Tocofersolan is a water-soluble form of D-alpha tocopherol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Oral solution**
  - Vedrop (Orphan Europe (UK) Ltd)
  - D-alpha tocopherol (as Tocofersolan) 50 micrograms/1 ml Vedrop 50mg/ml oral solution (sugar-free) 20 ml £5.45 (sugar-free) 60 ml £16.65

**Alpha tocopheryl acetate**
(Tocopherol)

**INDICATIONS AND DOSE**
Vitamin E deficiency

**BY MOUTH**
- Child: 2–10 micrograms/kg daily, increased if necessary up to 20 micrograms/kg daily

**Malabsorption in cystic fibrosis**

**BY MOUTH**
- Child 1–11 months: 50 micrograms once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 1–11 years: 100 micrograms once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 12–17 years: 200–200 micrograms once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Adult: 100–200 micrograms once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
Phytomenadione
(Vitamin K<sub>1</sub>)

**INDICATIONS AND DOSE**

Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 5 mg for 1 dose, stop warfarin treatment
- INR &gt; 8.0 with minor bleeding in patients on warfarin

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR &lt;5
- INR &gt; 8.0 with no bleeding in patients on warfarin

**BY MOUTH**
- Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR &lt;5

**5.0–8.0 with minor bleeding in patients on warfarin**

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR &lt;5

**Peri-operative antiocoagulation (after warfarin stopped)**

**BY MOUTH**
- Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR &gt;1.5

**CAUTIONS**
- Intravenous injections should be given very slowly—risk of vascular collapse
- KONAKION<sup>®</sup> MM
  - Reduce dose in elderly.
- **INTERACTIONS** ▶ Appendix 1 (vitamins).
- **SIDE-EFFECTS**
  - KONAKION<sup>®</sup> MM
  - Anaphylactoid reactions.
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk.
- **HEPATIC IMPAIRMENT**
  - KONAKION<sup>®</sup> MM
  - Caution—glycocholic acid may displace bilirubin.
- **DIRECTIONS FOR ADMINISTRATION**
  - KONAKION<sup>®</sup> MM
  - May be administered by slow intravenous injection or by intravenous infusion in glucose 5%: not for intramuscular injection. For *intravenous infusion*, give intermittently in glucose 5%; dilute with 55ml; may be injected into lower part of infusion apparatus.

**MEDICINAL FORMS**

6.1 Neural tube defects
(prevention in pregnancy)

Neural tube defects (prevention in pregnancy)
Folic acid p. 836 supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines.
- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with Sickle-cell disease p. 820 should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

3.3 Spasticity

1 Arthritis

Arthritis

Rheumatoid arthritis and other inflammatory disorders
A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol p. 354 or codeine phosphate p. 360 can also be used.

Drugs are also used to influence the rheumatic disease process itself. For rheumatoid arthritis these disease-modifying antirheumatic drugs (DMARDs) include methotrexate p. 762, cyclosporin p. 717, cyclophosphamide p. 750, leflunomide p. 895, penicillamine p. 896, gold, antimalarials (chloroquine p. 536 and hydroxychloroquine sulfate p. 894), and sulfasalazine p. 37. Corticosteroids also have a significant role in the management of rheumatoid arthritis.

Drugs which may affect the disease process in psoriatic arthritis include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators.

Osteoarthritis and soft-tissue disorders
For pain relief in osteoarthritis and soft-tissue disorders, paracetamol p. 354 should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin p. 354 may provide temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation. Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 693 and rubefacients are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (Suplasyrn®, Synovis®, Hylan G-F 20, Synvisc®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (SportVis®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

Rheumatic disease, suppressing drugs
Certain drugs such as those affecting the immune response can suppress the disease process in rheumatoid arthritis and psoriatic arthritis; gold, penicillamine p. 896, hydroxychloroquine sulfate p. 894, chloroquine p. 536, and sulfasalazine p. 37 can also suppress the disease process in rheumatoid arthritis while sulfasalazine p. 37 and possibly gold can suppress the disease process in psoriatic arthritis. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice
The choice of a disease-modifying antirheumatic drug should take into account co-morbidity and patient preference. Methotrexate p. 762, sulfasalazine p. 37, intramuscular gold, and penicillamine p. 896 are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid, should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine p. 896 are effective in palindromic rheumatism. Systemic and discoid lupus erythematosus are
Musculoskeletal system

sometimes treated with chloroquine p. 536 or hydroxychloroquine sulfate p. 894. If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

Gold

Gold can be given as sodium aurothiomalate p. 897 for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Penicillamine

Penicillamine p. 896 has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common. Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Sulfasalazine

Sulfasalazine p. 37 has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

Antimalarials

The antimalarial hydroxychloroquine sulfate p. 894 is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine p. 536 is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine. Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride p. 438 is sometimes used in discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate p. 762 is a disease-modifying anti-rheumatic drug suitable for moderate to severe rheumatoid arthritis. Azathioprine p. 716, ciclosporin p. 717, cyclophosphamide p. 750, leflunomide p. 895, and the cytokine modulators are considered more toxic and are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 836 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide acts on the immune system as a disease-modifying anti-rheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine p. 37 and methotrexate p. 762, may be chosen when these drugs cannot be used.

Ciclosporin p. 717 is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide p. 750 may be used for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active visceralitis).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine p. 716 is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide p. 895, methotrexate p. 762, or azathioprine p. 716 [unlicensed indication] may be used.

Juvenile idiopathic arthritis

Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying anti-rheumatic drugs. Methotrexate p. 762 is effective; sulfasalazine p. 37 is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine p. 896 are no longer used.

Cytokine modulators have a role in juvenile idiopathic arthritis.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 901, certolizumab pegol p. 902, etanercept p. 903, golimumab p. 904, and infliximab p. 906 inhibit the activity of tumour necrosis factor alpha (TNF-α).

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other disease-modifying anti-rheumatic drugs (including methotrexate p. 762) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis and severe active ankylosing spondylitis that have not responded adequately to other disease-modifying anti-rheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to disease-modifying anti-rheumatic drugs (including methotrexate p. 762) has been inadequate. Certolizumab pegol can be used in combination with
methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active *ankylosing spondylitis* in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active *axial spondylarthropathy*, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept p. 903 is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in combination with methotrexate p. 762 when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other disease-modifying antirheumatic drugs, and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab p. 904 is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment.

Infliximab p. 906 is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to disease-modifying antirheumatic drugs.

Rituximab p. 734 is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 900 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra p. 897 inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Belimumab p. 725 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Tocilizumab p. 898 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 899 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

### CHONDROPROTECTIVE DRUGS

#### Glucosamine

- **DRUG ACTION** Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

#### INDICATIONS AND DOSE

**ALATERIS®**

- Symptomatic relief of mild to moderate osteoarthritis of the knee
  - **BY MOUTH**
  - ▶ Adult: 2 tablets once daily, review treatment if no benefit after 2–3 months

**DOLENIO®**

- Symptomatic relief of mild to moderate osteoarthritis of the knee
  - **BY MOUTH**
  - ▶ Adult: 1 tablet once daily, review treatment if no benefit after 2–3 months

**GLUSARTEL®**

- Symptomatic relief of mild to moderate osteoarthritis of the knee
  - **BY MOUTH**
  - ▶ Adult: 1 sachet once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

#### CAUTIONS

- Asthma · impaired glucose tolerance · predisposition to cardiovascular disease

#### INTERACTIONS

- Appendix 1 (glucosamine).

#### SIDE-EFFECTS

- Common or very common: Abdominal pain · constipation · diarrhoea · drowsiness · dyspepsia · fatigue · flatulence · headache · nausea
- Uncommon: Flushing · pruritus · rash
- Frequency not known: Hair loss · visual disturbances

#### ALLERGY AND CROSS-SENSITIVITY

- Contraindicated if patient has a shellfish allergy.

#### PREGNANCY

- Manufacturers advise avoid—no information available.

#### BREAST FEEDING

- Manufacturers advise avoid—no information available.

#### MONITORING REQUIREMENTS

- Monitor blood-glucose concentration before treatment and periodically thereafter in patients with impaired glucose tolerance.
- Monitor cholesterol in patients with predisposition to cardiovascular disease.
**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (May 2008) that glucosamine (Alateris®) and (July 2011) glucosamine (Glusartel®) are not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing—the mechanism of action is not understood and there is limited evidence to show it is effective.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **ELECTROLYTES:** May contain Sodium
- **GLUCOSAMINE (Non-proprietary)**
  - Glucosamine hydrochloride 1.5g tablets | 30 tablet £4.69
  - Glucosamine hydrochloride 750mg tablets | 60 tablet £6.64
  - Glucosamine sulfate 750mg tablets | 30 tablet £9.00 | 90 tablet £22.00
  - 100 tablet no price available Glucosamine sulfate 500mg tablets | 30 tablet £5.50 | 90 tablet £27.49 | 100 tablet £22.50
  - Glucosamine sulfate 1000mg tablets | 180 tablet £5.79 | 360 tablet £10.75
  - Glucosamine sulfate 1.5g tablets | 30 tablet £6.20 DT price = £18.20 | 90 tablet £6.35
- **Alateris (MWK Healthcare Ltd)**
  - Glucosamine (as Glucosamine hydrochloride) 625 mg Alateris 625mg tablets | 60 tablet £18.40 DT price = £18.40
- **Dolenio (Alissa Healthcare Research Ltd)**
  - Dolenio 1500mg tablets | 30 tablet £9.20 DT price = £18.20

**Chewable tablet**
- **Gosachew (Glucosamine hydrochloride)** (Enmogen Healthcare Ltd)
  - Gosachew 1500mg chewable tablets | 30 tablet £93.50
- **GLUCOSAMINE (Non-proprietary)**
  - Glucosamine hydrochloride 750mg capsules | 60 capsule £8.51
  - Glucosamine sulfate 500mg capsules | 30 capsule £5.20 | 30 capsule £15.55 | 90 capsule £7.23
  - 100 capsule £22.50 | 180 capsule £13.01
  - Glucosamine sulfate 1g capsules | 90 capsule £6.00

**Oral solution**
- **GLUCOSAMINE (Non-proprietary)**
  - Glucosamine 5mg/ml liquid (sugar-free) | 500 ml £7.08 (sugar-free) | 1000 ml £12.50

**Powder**

**CAUTIONARY AND ADVISORY LABELS 13**

**EXCIPIENTS:** May contain Aspartame

**ELECTROLYTES:** May contain Sodium

- **Glusartel (HFA Healthcare Ltd)**
  - Glusartel 1500mg oral powder sachets (sugar-free) | 30 sachet £18.40

**DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS**

**Hydroxychloroquine sulfate**

**INDICATIONS AND DOSE**

Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice) **BY MOUTH**

- **Adult:** 200–400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

**CAUTIONS**

- Acute porphyrias p. 864 | elderly | G6PD deficiency | may aggravate myasthenia gravis | may exacerbate psoriasis | neurological disorders (especially in those with a history of epilepsy) | severe gastro-intestinal disorders

**CAUTIONS, FURTHER INFORMATION**

**Screening for ocular toxicity** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009). The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

**Before treatment:**
- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

**During treatment:**
- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor’s advice about stopping treatment
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

**INTERACTIONS** Appendix 1 (chloroquine and hydroxychloroquine). Concurrent use of hepatotoxic drugs should be avoided.

**SIDE-EFFECTS**

- **Common or very common** Gastro-intestinal disturbances - headache - pruritus - rashes - skin reactions
- **Uncommon** Convulsions - discoloration of skin, nails, and mucous membranes - ECG changes - hair depigmentation - hair loss - keratopathy - ototoxicity - retinal damage - visual changes
- **Rare** Acute generalised exanthematous pustulosis - agranulocytosis - angioedema - aplastic anaemia - blood disorders - cardiomyopathy - emotional disturbances - exfoliative dermatitis - hepatic damage - mental changes - myopathy - neuromyopathy - photosensitivity - psychosis - Stevens-Johnson syndrome - thrombocytopenia

**Frequency not known** Bronchospasm - diffuse parenchymal lung disease - drug rash with eosinophilia and systemic symptoms

**Overdose** Hydroxychloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**PREGNANCY** It is not necessary to withdraw an antimarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**BREAST FEEDING** Avoid—risk of toxicity in infant.

**HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

**MONITORING REQUIREMENTS** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, above).

**PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

**PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce
possible interference with hydroxychloroquine absorption.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

● INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (specialist use only)

BY MOUTH
Adult: Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

Active psoriatic arthritis

BY MOUTH
Adult: Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

● CONTRA-INDICATIONS
Serious infection - severe hypoproteinaemia - severe immunodeficiency

● CAUTIONS
Anaemia (avoid if significant and due to causes other than rheumatoid arthritis) - history of tuberculosis - impaired bone-marrow function (avoid if significant and due to causes other than rheumatoid arthritis) - leucopenia (avoid if significant and due to causes other than rheumatoid arthritis) - thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis)

● INTERACTIONS
Increased risk of toxicity with other haematotoxic and hepatotoxic drugs. Caution if recent treatment with other myelotoxic disease-modifying anti-rheumatic drugs. Caution - washout procedures recommended before switching to other disease-modifying antirheumatic drugs (consult product literature).

● SIDE-EFFECTS

Common or very common Abdominal pain - alopecia - anorexia - arthralgia - arthralgia - dizziness - dry skin - headache - increased blood pressure - leucopenia - nausea - oral mucosal disorders - paraesthesia - pruritus - rash - tenosynovitis - vomiting

Uncommon Anaemia - anxiety - hyperlipidaemia - hypokalaemia - hypophosphataemia - taste disturbance - tendon rupture - thrombocytopenia

Rare Eosinophilia - hepatitis - interstitial lung disease - jaundice - pancytopenia - severe infection

Very rare Hepatic failure - pancreatitis - peripheral neuropathy - progressive multifocal leucoencephalopathy - Stevens-Johnson syndrome - toxic epidermal necrolysis - vasculitis

Frequency not known Bone-marrow toxicity - hypouricaemia - malignancy - reduced sperm count - renal failure

SIDE-EFFECTS, FURTHER INFORMATION
Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).

Hepatotoxicity Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment (and institute washout procedure - consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

● CONCEPTION AND CONTRACEPTION
Effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception - consult product literature.

● PREGNANCY
Avoid - active metabolite teratogenic in animal studies.

● BREAST FEEDING
Present in milk in animal studies - manufacturer advises avoid.

● HEPATIC IMPAIRMENT
Avoid - active metabolite may accumulate.

● RENAL IMPAIRMENT
Manufacturer advises avoid in moderate or severe impairment - no information available.

● PRE-TREATMENT SCREENING
Exclude pregnancy before treatment.

● MONITORING REQUIREMENTS
Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.

● TREATMENT CESSATION
Washout Procedure The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give either colysetamine p. 173 or charcoal, activated p. 1130. Procedure may be repeated as necessary.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Penicillamine

**DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson’s disease (hepatolenticular degeneration).

**INDICATIONS AND DOSE**

**Severe active rheumatoid arthritis (administered on expert advice)**

**BY MOUTH**
- Adult: Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
- Elderly: Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg at intervals of at least 4 weeks; maximum 1 g per day

**Wilson’s disease**

**BY MOUTH**
- Adult: 1.5–2 g daily in divided doses, to be taken before food; maintenance 0.75–1 g daily for 1 year; maximum 2 g per day
- Elderly: 20 mg/kg daily in divided doses, adjusted according to response; maximum 2 g per day

**Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)**

**BY MOUTH**
- Adult: Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily

**Cystinuria, therapeutic**

**BY MOUTH**
- Adult: 1–3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food

**Cystinuria, prophylactic**

**BY MOUTH**
- Adult: 0.5–1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime
- Elderly: Minimum dose to maintain urinary cystine below 200 mg/litre is recommended

**CONTRA-INDICATIONS** Lupus erythematosus

**CAUTIONS** Neurological involvement in Wilson’s disease

**INTERACTIONS** → Appendix 1 (penicillamine).

Caution with gold treatment (avoid concomitant use if possible).

**SIDE-EFFECTS**
- Common or very common Anorexia · fever · nausea · proteinuria · rash · thrombocytopenia
- Rare Alopecia · breast enlargement (male and female) · elastosis perforans · haematuria (withdraw immediately if cause unknown) · mouth ulceration · pseudoxanthoma elasticum · skin laxity · stomatitis
- Frequency not known Agranulocytosis · aplastic anaemia · blood disorders · bronchiolitis · cholestatic jaundice · dermatomyositis · glomerulonephritis · Goodpasture’s syndrome · haemolytic anaemia · haemolytic leucopenia · late rashes (consider dose reduction) · lupus erythematosus · myasthenia gravis · nephrotic syndrome · neuropsychiatric complications (especially if neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended) · neuropathy · pancreatitis · polymyositis · pneumonitis · pulmonary haemorrhage · rheumatoid arthritis · septic arthritis (in patients with rheumatoid arthritis) · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · urticaria · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Proteinuria** Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

**Rash** Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.

**Taste loss** Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued.

**Nausea** Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retting and that low initial doses are used and only gradually increased.

**ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.

**PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.

**BRONCOPLASTIC SIMULATIONS** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**RENAI IMPAIRMENT** Reduce dose and monitor renal function or avoid (consult product literature).

**MONITORING REQUIREMENTS**

- Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase).
- A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.
- Longer intervals may be adequate in cystinuria and Wilson’s disease.
- Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 3 × 10⁹/litre or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).

**PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 5, 22

- **PENICILLAMINE (Non-proprietary)**
  - Penicillamine 125 mg Penicillamine 125mg tablets 56 tablet [PTE] £25.80 DT price = £11.20
  - Penicillamine 250 mg Penicillamine 250mg tablets 56 tablet [PTE] £52.45 DT price = £21.46
  - Distamine (Alliance Pharmaceuticals Ltd)
  - Penicillamine 125 mg Distamine 125mg tablets 100 tablet [PTE] £10.34
  - Penicillamine 250 mg Distamine 250mg tablets 100 tablet [PTE] £17.78
Sodium aurothiomalate

**INDICATIONS AND DOSE**

Active progressive rheumatoid arthritis (administered on expert advice)

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then gradually reduced to 50 mg every 4 weeks for up to 5 years after complete remission, benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given

Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, if no response is seen within 2 months, alternative treatment should be sought

- **CONTRA-INDICATIONS** Exfoliative dermatitis - history of blood disorders - history of bone marrow aplasia - necrotising enterocolitis - pulmonary fibrosis - systemic lupus erythematosus

- **CAUTIONS** Colitis - eczema - elderly - history of urticaria

**CAUTIONS, FURTHER INFORMATION**

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre.

- **INTERACTIONS** → Appendix 1 (sodium aurothiomalate).

- **SIDE-EFFECTS** Alopecia - blood disorders (sometimes sudden and fatal) - colitis - gold deposits in eye - heparotoxicity with cholestatic jaundice - irreversible pigmentation in sun-exposed areas (on prolonged parenteral treatment) - mouth ulcers - nephrotic syndrome - peripheral neuropathy - proteinuria - pulmonary fibrosis - severe anaphylactic reactions - skin reactions - stomatitis - taste disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

- **PREGNANCY** Consider reducing dose and frequency. Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiiosyncratic reactions.

- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

- **MONITORING REQUIREMENTS**

  - Urine tests and full blood counts (including total and differential white cell and platelet counts) must be performed before starting treatment and before each intramuscular injection.
  - Monitor for pulmonary fibrosis with annual chest X-ray.

- **PATIENT AND CARER ADVICE** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  **CAUTIONARY AND ADVISORY LABELS 11**

  - **Myocrisin** (Sanofi)
    - Sodium aurothiomalate 20 mg per 1 ml
    - Sodium aurothiomalate 100 mg per 1 ml
  - **Kineret** (Swedish Orphan Biovitrum Ltd)
    - Anakinra 150 mg per 1 ml

**INTERLEUKIN INHIBITORS**

Anakinra

**INDICATIONS AND DOSE**

Treatment of rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone

**BY SUBCUTANEOUS INJECTION**

- Adult: 100 mg once daily

- **CONTRA-INDICATIONS** Neutropenia

- **CAUTIONS** History of asthma (risk of serious infection) - predisposition to infection

- **INTERACTIONS** → Appendix 1 (anakinra).

- **SIDE-EFFECTS**

  - Common or very common Neutropenia
  - Frequency not known Antibody formation - headache - infections - injection-site reactions - malignancy

**SIDE-EFFECTS, FURTHER INFORMATION**

Blood disorders Neutropenia reported commonly—discontinue if neutropenia develops.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months.

- **PATIENT AND CARER ADVICE** Blood disorders Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (July 2002) that anakinra is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  - **Kineret** (Swedish Orphan Biovitrum Ltd)
    - Anakinra 150 mg per 1 ml
      - Kineret 100mg/0.67ml solution for injection pre-filled syringes | 28 pre-filled disposable injection \( \text{POD} \) £734.44
Tocilizumab

INDICATIONS AND DOSE
Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs

BY INTRAVENOUS INFUSION
- Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg); for dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature

CONTRA-INDICATIONS
Do not initiate if absolute neutrophil count less than 2 x 10^9/litre - severe active infection

CAUTIONS
History of diverticulitis - history of intestinal ulceration - history of recurrent or chronic infection - pre-existing severe active infection

CAUTIONS, FURTHER INFORMATION
Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

INTERACTIONS
Appendix 1 (tocilizumab).

SIDE-EFFECTS
- Common or very common Abdominal pain - antibody formation - dizziness - gastritis - headache - hypercholesterolaemia - hypersensitivity - hypertension - injection - leukopenia - mouth ulceration - neutropenia - peripheral oedema - pruritus - raised hepatic transaminases - rash - upper respiratory-tract infection
- Uncommon Anaphylaxis - gastric ulcer - gastro-intestinal perforation - hypertriglyceridaemia - hypothyroidism - infusion related reactions - nephrolithiasis
- Frequency not known Thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION
Neutrophil and platelet counts Discontinue if absolute neutrophil count less than 0.5 x 10^9/litre or platelet count less than 50 x 10^9/microlitre.

CONCEPTION AND CONTRACEPTION
Effective contraception required during and for 3 months after treatment.

PREGNANCY
Manufacturer advises avoid unless essential - toxicity in animal studies.

BREAST FEEDING
Manufacturer advises use only if potential benefit outweighs risk - no information available.

HEPATIC IMPAIRMENT
Manufacturer advises caution - consult product literature.

RENAL IMPAIRMENT
Manufacturer advises monitor renal function closely in moderate or severe impairment.

PRE-TREATMENT SCREENING
Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS
- Monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks.
- Monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated.
- Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- Monitor for demyelinating disorders.

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (RoActemra®), give intermittently in Sodium chloride

0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.

PATIENT AND CARER ADVICE
An alert card should be provided. Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Tocilizumab for the treatment of rheumatoid arthritis (February 2012) NICE TA247
Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:
- the disease has responded inadequately to disease-modifying anti-rheumatic drugs (DMARDs) and is used as described for tumour necrosis factor (TNF) inhibitor treatments (specifically the recommendations on disease activity and treatment) in the NICE guidance (October 2007) Adalimumab, etanercept and infliximab for the treatment of rheumatoid arthritis, or
- the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, and tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance (August 2010) Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, or
- the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
- and the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2012) that tocilizumab (RoActemra®) is accepted for restricted use within NHS Scotland as monotherapy in patients who are intolerant to methotrexate or where continued treatment with methotrexate is inappropriate, for the treatment of moderate to severe active rheumatoid arthritis in adults who have either responded inadequately to, or who were intolerant to, previous therapy with one or more disease-modifying antirheumatic drugs or tumour necrosis factor inhibitors, in accordance with the British Society for Rheumatology guidance on prescribing TNF-α blockers in adults with rheumatoid arthritis (2005).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- RoActemra (Roche Products Ltd)
  Tocilizumab 180 mg per 1 ml RoActemra 162mg/0.9ml solution for injection pre-filled syringes | 4 pre-filled disposable injection £913.12 (Hospital only)

Solution for infusion
- RoActemra (Roche Products Ltd)
  Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial £512.00 (Hospital only)
  RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial £256.00 (Hospital only)
  RoActemra 80mg/4ml concentrate for solution for infusion vials | 1 vial £102.40 (Hospital only)
### Ustekinumab

#### INDICATIONS AND DOSE

Severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and phototherapy, or when these treatments cannot be used because of intolerance or contra-indications

**BY SUBCUTANEOUS INJECTION**
- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg every 4 weeks, review treatment if no response within 28 weeks
- Adult (body-weight 100 kg and above): Initially 80 mg, then 80 mg every 4 weeks, review treatment if no response within 28 weeks

#### CONTRA-INDICATIONS
- Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs

**BY SUBCUTANEOUS INJECTION**
- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg every 4 weeks, review treatment if no response within 28 weeks
- Adult (body-weight 100 kg and above): Initially 80 mg, then 80 mg every 4 weeks, review treatment if no response within 28 weeks

Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs

#### INTERACTIONS
- **Appendix 1 (ustekinumab).**
- **SIDE-EFFECTS**
  - **Common or very common**
    - Arthralgia, diarrhoea, dizziness, headache, infections (sometimes severe), injection-site reactions, malaise, myalgia, nausea, ophthalmic pain, pruritus
  - **Uncommon**
    - Depression, facial palsy, hypersensitivity reactions (possibly delayed onset), nasal congestion, pustular psoriasis
  - **Rare**
    - Exfoliative dermatitis

#### CONCEPTION AND CONTRACEPTION
- Manufacturer advises effective contraception during treatment and for 3 months after stopping treatment.

#### PREGNANCY
- Avoid.

#### BREAST FEEDING
- Manufacturer advises avoid—present in milk in animal studies.

#### PRE-TREATMENT SCREENING
- Tuberculosis Patients should be evaluated for tuberculosis before treatment.

#### MONITORING REQUIREMENTS
- Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.

- Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.

#### PATIENT AND CARER ADVICE
- Exfoliative dermatitis Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.

- Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

#### NATIONAL FUNDING/ACCESS DECISIONS

- **NICE technology appraisals (TAs)**
  - **Ustekinumab for plaque psoriasis in adults (September 2009)**
    - NICE TA180
    - Ustekinumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withheld if the response is not adequate after 16 weeks.
    - For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose. [www.nice.org.uk/TA180](http://www.nice.org.uk/TA180)
  - **Ustekinumab for treating active psoriatic arthritis (June 2015)**
    - NICE TA340
    - Ustekinumab is an option, alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults only when:
      - treatment with tumour necrosis factor (TNF) alpha inhibitors is contraindicated but would otherwise be considered (as described in the NICE guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (April 2011) or goltimubumab for the treatment of psoriatic arthritis (August 2010)) and
      - the patient has had treatment with 1 or more TNF-alpha inhibitors.
    - Ustekinumab is recommended only if the manufacturer provides the 90 mg dose of ustekinumab for patients who weigh more than 100 kg at the same cost as the 45 mg dose, as agreed in the patient access scheme.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

T-CELL ACTIVATION INHIBITORS

Abatacept

**INDICATIONS AND DOSE**
Moderate to severe active rheumatoid arthritis (in combination with methotrexate) in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor) initially by intravenous infusion

- Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 500 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
- Adult (body-weight 60-100 kg): 750 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 750 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
- Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 1 g every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

**SIDE-EFFECTS**
- Common or very common Abdominal pain - conjunctivitis - cough - diarrhoea - dizziness - dyspepsia - fatigue - flushing - headache - hypertension - infection - leucopenia - nausea - pain in extremities - paraesthesia - stomatitis - vomiting
- Frequency not known Lung cancer - lymphoma
- **CONTRA-INDICATIONS** Severe infection
- **CAUTIONS** Do not initiate until active infections are controlled - elderly (increased risk of side-effects) - predisposition to infection (screen for latent tuberculosis and viral hepatitis) - progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)
- **INTERACTIONS** → Appendix 1 (abatacept).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **ABATACEPT (Non-proprietary)**
  - Abatacept 125 mg per 1 ml Orencia ClickJet 125mg/1ml solution for injection pre-filled pen | 4 pre-filled disposable injection £1.60
  - Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Abatacept 125 mg per 1 ml Orencia 125mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection £1.60

- **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain Sodium
  - Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials | 1 vial £3.02

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195
  - Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.
  - Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months. www.nice.org.uk/TA195
  - Abatacept for the treatment of rheumatoid arthritis after the failure of conventional disease-modifying antirheumatic drugs (April 2013) NICE TA280

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (July 2013) that abatacept (Orencia®) is accepted for restricted use within NHS Scotland for adults with severe active rheumatoid arthritis, confirmed on at least two occasions, one month apart. This advice is contingent upon the patient access scheme.

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during treatment and for 14 weeks after last dose.

**PREGNANCY**
Manufacturer advises avoid unless essential.

**BREAST FEEDING**
Present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion, reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).
TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Adalimumab

INDICATIONS AND DOSE
Severe plaque psoriasis either refractory to at least 2 standard systemic treatments or phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications.

BY SUBCUTANEOUS INJECTION
- Adult: Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, discontinue treatment if no response within 16 weeks.

Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to other disease-modifying drugs (including methotrexate) has been inadequate.

Severe, active, and progressive rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) not previously treated with methotrexate.

BY SUBCUTANEOUS INJECTION
- Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks.

Active and progressive psoriatic arthritis that has not responded adequately to other disease-modifying antirheumatic drugs. Severe active ankylosing spondylitis that has not responded adequately to other disease-modifying antirheumatic drugs. Severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of, NSAIDs.

BY SUBCUTANEOUS INJECTION
- Adult: 40 mg every 2 weeks, discontinue treatment if no response within 12 weeks.

Severe active Crohn’s disease.

BY SUBCUTANEOUS INJECTION
- Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose.

Severe active Crohn’s disease (accelerated regimen).

BY SUBCUTANEOUS INJECTION
- Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose.

Severe active ulcerative colitis.

BY SUBCUTANEOUS INJECTION
- Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 8 weeks of initial dose.

CONTRA-INDICATIONS Moderate or severe heart failure - severe infection.

CAUTIONS Children should be brought up to date with current immunisation schedule before initiating therapy - demyelinating disorders (risk of exacerbation) - development of malignancy - do not initiate until active infections are controlled (discontinue if new serious infection develops) - hepatitis B virus—monitor for active infection - history of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection.

CAUTIONS, FURTHER INFORMATION

Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

INTERACTIONS Appendix 1 (adalimumab).

SIDE-EFFECTS

Common or very common Anxiety· benign tumours· chest pain· cough· dehydration· dermatitis· dizziness· dyspepsia· dyspnoea· electrolyte disturbances· eye disorders· flushing· gastrointestinal haemorrhage· haematuria· hyperlipidaemia· hypertension· hyperuricaemia· impaired healing· mood changes· musculoskeletal pain· oedema· onycholysis· paraesthesia· rash· renal impairment· skin cancer· sleep disturbances· tachycardia· vomiting

Uncommon Aortic aneurysm· arthrythmias· cholecytis· cholelithiasis· dysphagia· erectile dysfunction· hearing loss· hepatic steatosis· intestinal lung disease· leukaemia· lymphoma· malignancy· neuropathy· nocturia· pancreatitis· pneumonitis· rhadomolysis· solid tumours· tinnitus· tremor· vascular occlusion

Rare Autoimmune hepatitis· demyelinating disorders· myocardial infarction

Frequency not known Abdominal pain· anaemia· antibody formation· aplastic anaemia· blood disorders· cutaneous vasculitis· depression· fever· headache· hypersensitivity reactions· injection-site reactions· leucopenia· lupus erythematosus-like syndrome· nausea· new onset psoriasis· pancytopenia· pleural effusion· pruritus· pulmonary embolism· sarcoidosis· Stevens-Johnson syndrome· thrombocytopenia· worsening heart failure· worsening psoriasis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, sepsicaemia, and hepatitis B reactivation.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

PREGNANCY Avoid.

BREAST FEEDING Avoid; manufacturer advises avoid for at least 5 months after last dose.

PRE-TREATMENT SCREENING
Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS
Monitor for infection before, during, and for 4 months after treatment.

Monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.

PATIENT AND CARER ADVICE An alert card should be provided.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.
Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

△ Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007) [NICE TA130]

The tumour necrosis factor alpha (TNF-α) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF-α inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contraindications, adalimumab or etanercept can be given as monotherapy. Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF-α inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy. Use of TNF-α inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended. www.nice.org.uk/TA130

△ Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008) [NICE TA143]

Adalimumab or etanercept are treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms. Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF-α inhibitor (adalimumab or etanercept). However an alternative TNF-α inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response. Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop. See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment. www.nice.org.uk/TA143

△ Adalimumab for plaque psoriasis in adults (June 2008) [NICE TA146]

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks. www.nice.org.uk/TA146

△ Infliximab and adalimumab for Crohn’s disease (May 2010) [NICE TA187]

△ Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) [NICE TA195]

△ Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) [NICE TA199]

△ Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) [NICE TA239]

NICE recommended. See Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) TA239 www.nice.org.uk/TA239 p. 907

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium issued similar advice for plaque psoriasis to NICE TA146 in May 2008.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 1D

- Humira (AbbVie Ltd)

Adalimumab 50 mg per 1 ml Humira 40mg/0.8ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [Post] £704.28
Humira 40mg/0.8ml solution for injection vials | 2 vial [Post] £704.28
Humira 40mg/0.8ml solution for injection pre-filled disposable devices | 2 pre-filled disposable injection [Post] £704.28

Certolizumab pegol

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate)

BY SUBCUTANEOUS INJECTION

- Adult: 400 mg every 2 weeks for 3 doses, then 200 mg every 2 weeks, review treatment if no response within 12 weeks

Treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs | Treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs

BY SUBCUTANEOUS INJECTION

- Adult: 400 mg every 2 weeks for 3 doses, then 200 mg every 2 weeks, alternatively 400 mg every 4 weeks, review treatment if no response within 12 weeks

● CONTRA-INDICATIONS

Moderate to severe heart failure - severe active infection

● CAUTIONS

Demyelinating CNS disorders (risk of exacerbation) - do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) - hepatitis B virus (monitor for active infection) - history or development of
malignancy • mild heart failure (discontinue if symptoms develop or worsen) • predisposition to infection

**CAUTIONS, FURTHER INFORMATION**

**Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. Patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis is given concurrently with certolizumab pegol.

**INTERACTIONS** → Appendix 1 (certolizumab pegol).

**SIDE-EFFECTS**

- **Common or very common** Hypertension • rash • sensory abnormalities
- **Uncommon** Acne • alopecia • anxiety • appetite disorders • arrhythmias • ascites • asthma • benign tumours • cardiomyopathies • cholestasis • cough • dermatitis • dizziness • dyslipidaemia • ecchymosis • electrolyte disorders • gastro-intestinal disorders • gastro-intestinal perforation • gastro-intestinal ulcer • haematuria • haemorrhage • heart failure • hepatic disorders • impaired healing • influenza-like illness • ischaemic coronary artery disorders • leukaemia • lymphoma • malignancy • menstrual disorders • mood disorders • muscle disorders • nail disorders • new onset or worsening psoriasis • ocular inflammation • oedema • peripheral neuropathy • photosensitivity • pleural effusion • renal impairment • skin cancer • skin discoloration • solid tumours • syncope • tinnitus • tremor • visual disturbance
- **Rare** Atiroyentricular block • cerebrovascular accident • cholelithiasis • impaired coordination • interstitial lung disease • nephropathy • Raynaud’s phenomenon • seizures • sexual dysfunction • splenomegaly • thyroid disorders • trigeminal neuralgia
- **Frequency not known** Abdominal pain • anaemia • antibody formation • aplastic anaemia • blood disorders • depression • fever • headache • hypersensitivity reactions • infections • injection-site reactions • leucopenia • lupus erythematosus-like syndrome • multiple sclerosis • nausea • pancytopenia • pruritus • thrombocytopenia • worsening heart failure

**SIDE-EFFECTS, FURTHER INFORMATION**

**Infection** Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 5 months after last dose.

**PREGNANCY** Avoid.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**PRE-TREATMENT SCREENING**

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.

**PATIENT AND CARER ADVICE** An alert card should be provided.

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss and fever) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Certolizumab pegol for the treatment of rheumatoid arthritis** (February 2010) NICE TA186

Certolizumab pegol is an option for the treatment of patients with rheumatoid arthritis only if:

- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis), and
- the manufacturer provides the first 12 weeks of certolizumab pegol (10 prefilled 200-mg syringes) free of charge to all patients starting treatment. [www.nice.org.uk/TA186](http://www.nice.org.uk/TA186)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**CAUTIONARY AND ADVISORY LABELS** 10

- **Certolizumab pegol 200 mg per 1 ml** Cimzia 200mg/1ml solution for injection pre-filled syringes | 2 syringe [£715.00](http://www.nice.org.uk/TA186)

**Etanercept**

**INDICATIONS AND DOSE**

Moderate to severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate | Severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate | Active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs | Severe ankylosing spondylitis inadequately responsive to conventional therapy

**BY SUBCUTANEOUS INJECTION**

- Adult: 25 mg twice weekly, alternatively 50 mg once weekly
- Severe plaque psoriasis either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications

**BY SUBCUTANEOUS INJECTION**

- Adult: 25 mg twice weekly for up to 24 weeks, alternatively 50 mg once weekly for up to 24 weeks, discontinue if no response after 12 weeks

**CONTRA-INDICATIONS** Active infection

**CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy • development of malignancy • diabetes mellitus • heart failure (risk of exacerbation) • hepatitis B virus—monitor for active infection • hepatitis C infection (monitor for worsening infection) • history of blood disorders • history of malignancy • history or increased risk of demyelinating disorders • predisposition to infection (avoid if predisposition to septicemia) • significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin

**CAUTIONS, FURTHER INFORMATION**

**Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis...
who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

- **INTERACTIONS** → Appendix 1 (etanercept).

- **SIDE-EFFECTS**
  - **Uncommon** Interstitial lung disease - new onset or worsening psoriasis - rash - skin cancer - uveitis
  - **Rare** Demyelinating disorders - lymphoma - seizures - Stevens-Johnson syndrome - vasculitis
  - **Very rare** Toxic epidermal necrolysis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Associated with infections, sometimes severe, including tuberculosis, sepsis, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

- **PREGNANCY**
  - Avoid—limited information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Use with caution in moderate to severe alcoholic hepatitis.

- **PRE-TREATMENT SCREENING**
  - Tuberculosis
  - Patients should be evaluated for tuberculosis before treatment.

- **MONITORING REQUIREMENTS**
  - Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

- **PATIENT AND CARER ADVICE**
  - An alert card should be provided.
  - Blood disorders
  - Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
  - Tuberculosis
  - Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - Etanercept and efalizumab for plaque psoriasis in adults (July 2006) NICE TA103
    - Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to phototherapy, or when standard treatments cannot be used because of intolerance or contraindications. Etanercept should be withdrawn if the response is not adequate after 12 weeks. www.nice.org.uk/TA103
    - Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007) NICE TA130
    - NICE recommended. See Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007) TA130 www.nice.org.uk/TA130 p. 902

**Golimumab**

**INDICATIONS AND DOSE**

Treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it

- **By subcutaneous injection**
  - **Adult (body-weight up to 80 kg):** Initially 200 mg, then 100 mg after 2 weeks; maintenance 50 mg every 4 weeks, review treatment if no response after 4 doses
  - **Adult (body-weight 80 kg and above):** Initially 200 mg, then 100 mg after 2 weeks; maintenance 100 mg every 4 weeks, review treatment if no response after 4 doses
Treatment of moderate to severe active rheumatoid arthritis (in combination with methotrexate) when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate. Treatment of severe, active, and progressive rheumatoid arthritis (in combination with methotrexate) in patients not previously treated with methotrexate. Treatment of active and progressive psoriatic arthritis as monotherapy or in combination with methotrexate when response to DMARD therapy has been inadequate. Treatment of severe active ankylosing spondylitis when there is inadequate response to conventional treatment.

**CONTRA-INDICATIONS** Moderate or severe heart failure - severe active infection

**CAUTIONS** Active infection (do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled) - demyelinating disorders (risk of exacerbation) - hepatitis B virus - monitor for active infection - history or development of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection - risk factors for dysplasia or carcinoma of the colon - screen for dysplasia regularly

**Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 2 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection.

**INTERACTIONS** → Appendix 1 (golimumab).

**SIDE-EFFECTS**

- **Common or very common** Asthenia - dizziness - dyspepsia - hypertension
- **Rare** Impaired wound healing

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.

**PREGNANCY** Use only if essential.

**BREAST FEEDING** Manufacturer advises avoid during and for at least 6 months after treatment – present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution – no information available.

**PRE-TREATMENT SCREENING**

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.

**DIRECTIONS FOR ADMINISTRATION** For doses requiring multiple injections, each injection should be administered at a different site.

Missed dose: if dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date.

**PATIENT AND CARER ADVICE** An alert card should be provided.

Tuberculosis All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Golimumab for the treatment of psoriatic arthritis** (April 2011) NICE TA220

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

www.nice.org.uk/TA220

- **Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs** (June 2011) NICE TA225

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to conventional disease-modifying antirheumatic drugs (DMARDs) only, including methotrexate, if:

- golimumab is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors, and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

Alternatively, golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to DMARDs including a TNF inhibitor, if:

- golimumab is used as described in the NICE guidance (August 2010) for other TNF inhibitors, and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

www.nice.org.uk/TA225
Golimumab for the treatment of ankylosing spondylitis (August 2011) NICE TA233

Golimumab is an option for the treatment of severe, active ankylosing spondylitis in adults only if:

- Golimumab is used as described in the NICE guidance (May 2008) for adalimumab and etanercept, and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

Patients who are already receiving golimumab for the treatment of severe, active ankylosing spondylitis who do not fulfill the criteria for treatment with adalimumab and etanercept, described in the NICE guidance (May 2008), can continue treatment until they and their specialist consider it appropriate to stop. www.nice.org.uk/TA233

Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

NICE recommended. See Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) TA329 www.nice.org.uk/TA329 p. 907

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that golimumab (Simponi®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- Simponi (Merck Sharp & Dohme Ltd)
  - Golimumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled disposable devices | 1 pre-filled disposable injection [PFS] £762.97 Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PFS] £1,525.94
  - Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PFS] £627.97

Infliximab

INDICATIONS AND DOSE

Severe active Crohn’s disease

BY INTRavenous INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

Fistulating Crohn’s disease

BY INTRavenous INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Severe active ulcerative colitis

BY INTRavenous INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response 14 weeks after initial dose

Rheumatoid arthritis (in combination with methotrexate)

BY INTRavenous INFUSION

Adult: Initially 3 mg/kg, then 3 mg/kg after 2 weeks, followed by 3 mg/kg after 4 weeks, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased in steps of 1.5 mg/kg every 8 weeks,

increased if necessary up to 7.5 mg/kg every 8 weeks, alternatively increased if necessary to 3 mg/kg every 4 weeks, discontinue if no response by 12 weeks of initial infusion or after dose adjustment

Ankylosing spondylitis

BY INTRavenous INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion

Psoriatic arthritis (in combination with methotrexate)

BY INTRavenous INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, followed by 5 mg/kg every 8 weeks

Plaque psoriasis

BY INTRavenous INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 14 weeks of initial infusion

Important safety information

Adequate resuscitation facilities must be available when infliximab is used.

CONTRA-INDICATIONS

Moderate or severe heart failure - severe infections

CAUTIONS

Demyelinating disorders (risk of exacerbation) - development of malignancy - hepatitis B virus—monitor for active infection - history of colon carcinoma (in inflammatory bowel disease) - history of dysplasia (in inflammatory bowel disease) - history of malignancy - history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection (discontinue if new serious infection develops) - risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks

CAUTIONS, FURTHER INFORMATION

Tuberculosis

Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab.

Hypersensitivity reactions

Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.

INTERACTIONS

Appendix 1 (infliximab).

SIDE-EFFECTS

Common or very common - Alopecia - arthralgia - constipation - diarrhoea - dizziness - dry skin - dyspepsia - ecchymosis - epistaxis - flushing - gastro-intestinal haemorrhage - gastro-oesophageal reflux - hyperhydrosis - hypertension - hypoaesthesia - hypotension - myalgia - new onset or worsening psoriasis - palpititation - paraesthesia - rash - sleep disturbances - tachycardia
PATIENT AND CARER ADVICE

DIRECTIONS FOR ADMINISTRATION

When used for plaque psoriasis, monitor for non-

Monitor for symptoms of delayed hypersensitivity if

Monitor for infection before, during, and for

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

Monitor for infection before, during, and for

All patients should be observed carefully for 1–2 hours

Monitor for symptoms of delayed hypersensitivity if

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Remicade®), give intermittently in Sodium chloride 0.9%; reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution.

PATIENT AND CARER ADVICE

An alert card should be provided.

Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007) NICE TAI30

NICE recommended. See Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007) TAI30 www.nice.org.uk/TAI30 p. 902

Infliximab for plaque psoriasis in adults (January 2008) NICE TAI34

Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008) NICE TAI43

NICE recommended. See Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)TAI43 www.nice.org.uk/TAI43 p. 902

Infliximab for acute exacerbations of ulcerative colitis (December 2008) NICE TAI63

Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate. www.nice.org.uk/TAI63

Infliximab and adalimumab for Crohn’s disease (May 2010) NICE TAI87

Infliximab or adalimumab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn’s disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.

Infliximab or adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab or infliximab can be restarted [but see Hypersensitivity Reactions under Infliximab]. www.nice.org.uk/TAI87

Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TAI95

NICE recommended. See Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) TAI95 www.nice.org.uk/TAI95 p. 900

Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TAI99

Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

Infliximab, adalimumab and golimumab are options for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and
mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies. Gollimubam is recommended only if the manufacturer provides the 100 mg dose of gollimubam at the same cost as the 50 mg dose, as agreed in the patient access scheme. The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen. Infliximab, adalimumab or gollimubam should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Hyperuricaemia and gout

Gout

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack. The management of gout in adolescents requires specialist supervision.

Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac sodium p. 921, diclofenac potassium p. 920, etoricoxib p. 925, indometacin p. 929, ketoprofen p. 930, naproxen p. 934 or sulindac p. 937. Colchicine below is an alternative in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes. Sulfinpyrazone p. 909 can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes. Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

Colchicine

INDICATIONS AND DOSE

Acute gout

BY MOUTH

- Adult: 500 micrograms 2–4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

BY MOUTH

- Adult: 500 micrograms twice daily

Prophylaxis of familial Mediterranean fever (recurrent polyserositis)

BY MOUTH

- Adult: 0.5–2 mg once daily

- UNLICENSED USE: BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.

- CONTRA-INDICATIONS: Blood disorders

Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term (‘interval’) treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol p. 909 or febuxostat p. 910 alternatively the uricosuric drug sulfinpyrazone p. 909 may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine below should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

Sulfinpyrazone p. 909 can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment.

Benzbromarone (available from ’special-order’ manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

ALKALOIDS

Colchicine

Hyperuricaemia and gout 909

XANTHINE OXIDASE INHIBITORS

Allopurinol

INDICATIONS AND DOSE
Prophylaxis of gout of and uric acid and calcium oxalate renal stones | Prophylaxis of hyperuricaemia associated with cancer chemotherapy

BY MOUTH
- Adult: Initially 100 mg daily, adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food
- Adult: 100–200 mg daily, dose to be taken preferably after food
- Adult: 300–600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

CONTRA-INDICATIONS
Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately

CAUTIONS
Ensure adequate fluid intake (2–3 litres/day) for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

CAUTIONS, FURTHER INFORMATION
Administer prophylactic NSAID (not aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack.

INTERACTIONS
Appendix 1 (allopurinol).

SIDE-EFFECTS
- Common or very common Gastro-intestinal disorders - rashes (withdraw therapy); if rash mild re-introduce cautiously but discontinue promptly if recurrence
- Very rare Seizures

Tablet
CAUTIONARY AND ADVISORY LABELS 12, 21
- SULFINPYRAZONE (Non-proprietary)
  - Sulfinpyrazone 100 mg Sulfinpyrazone 100mg tablets | 84 tablet [P] £9.40 DT price + £41.25
  - Sulfinpyrazone 200 mg Sulfinpyrazone 200mg tablets | 84 tablet [P] £113.76 DT price + £79.00

Sulfinpyrazone

(Sulphinpyrazone)

INDICATIONS AND DOSE
- Gout prophylaxis | Hyperuricaemia

BY MOUTH
- Adult: Initially 60–80 mg daily, dose to be increased to 800 mg daily after several weeks; dose to be taken preferably after food
- Adult: 100–300 mg daily, dose to be increased to 800 mg daily over 3–6 weeks; dose to be taken preferably after food
- Adult: 800 mg daily, dose to be increased to 800 mg daily over 3–6 weeks; dose to be taken preferably after food

CONTRA-INDICATIONS
Acute porphyrias p. 864 - acute gout attack - history of blood disorders - peptic ulceration

CAUTIONS
Cardiac disease (may cause salt and water retention) - ensure adequate fluid intake (2–3 litres daily) and render urine alkaline during initial treatment

INTERACTIONS
Appendix 1 (sulfinpyrazone).

SIDE-EFFECTS
- Rare Acute renal failure - blood disorders - gastrointestinal bleeding - gastrointestinal ulceration - hepatitis - jaundice - raised liver enzymes
- Frequency not known Allergic skin reactions - gastrointestinal disturbances - salt retention - water retention

ALLERGY AND CROSS-SENSITIVITY Avoid in hypersensitivity to aspirin, salicylates, NSAIDs.

PREGNANCY
Manufacturer advises caution—no information available.

BREAST FEEDING
No information available.

HEPATIC IMPAIRMENT
Avoid in severe impairment.

RENAL IMPAIRMENT
Reduce dose. Avoid in severe impairment.

MONITORING REQUIREMENTS
Regular blood counts before treatment and at regular intervals during treatment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

URICOSURICS

Sulfinpyrazone

(Sulphinpyrazone)

INDICATIONS AND DOSE
- Gout prophylaxis | Hyperuricaemia

BY MOUTH
- Adult: 300–800 mg daily in divided doses (max. per dose 300 mg), dose to be increased to 800 mg daily over 2–3 weeks; dose to be taken preferably after food
- Adult: 800 mg daily, dose to be increased to 800 mg daily over 2–3 weeks; dose to be taken preferably after food
- Adult: 800 mg daily, dose to be increased to 800 mg daily over 2–3 weeks; dose to be taken preferably after food

CONTRA-INDICATIONS
Acute gout attacks - gastrointestinal bleeding - gastrointestinal ulceration - hepatitis - jaundice - raised liver enzymes

CAUTIONS
Cardiac disease (may cause salt and water retention) - ensure adequate fluid intake (2–3 litres daily) and render urine alkaline during initial treatment

INTERACTIONS
Appendix 1 (sulfinpyrazone).

SIDE-EFFECTS
- Common or very common Gastro-intestinal disorders - rashes (withdraw therapy); if rash mild re-introduce cautiously but discontinue promptly if recurrence
- Very rare Seizures
Febuxostat

**INDICATIONS AND DOSE**

Treatment of chronic hyperuricaemia in gout

**BY MOUTH**

- **Adult:** Initially 80 mg once daily, if after 2–4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg daily

**Important safety information**

**MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)**

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

**CONTRA-INDICATIONS**

- Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately

**CAUTIONS**

- Congestive heart failure - ischaemic heart disease - thyroid disorders - transplant recipients

**CAUTIONS. FURTHER INFORMATION**

Administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack.

**INTERACTIONS**

- Appendix 1 (febuxostat).

**SIDE-EFFECTS**

- Common or very common: Abnormal liver function tests - gastro-intestinal disturbances - headache - oedema - rash
- Uncommon: Appetite change - arthralgia - arthritis - atrial fibrillation - bronchitis - bursitis - chest pain - cholelithiasis

**PREGNANCY**

Manufacturer advises avoid—limited information available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Max. 80 mg daily in mild impairment. No dose information available in moderate or severe impairment.

**RENAL IMPAIRMENT**

- Use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **PRE-TREATMENT SCREENING**
  - Monitor liver function tests before treatment as indicated.
  - **MONITORING REQUIREMENTS**
  - Monitor liver function tests periodically during treatment as indicated.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Febuxostat for the management of hyperuricaemia in patients with gout (December 2008) NICE TA164
  - Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.
  - For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.
  - [www.nice.org.uk/TA164](http://www.nice.org.uk/TA164)

- Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium issued similar advice to NICE guidance: Febuxostat for the management of hyperuricaemia in patients with gout (December 2008), in August 2010.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **FEBUXOSTAT (Non-proprietary)**
  - **Febuxostat 80 mg**
    - **Febuxostat 120 mg**
  - Brands may include Uriceto, Zyloric
  - [Price information available.](http://www.nice.org.uk/TA164)

**3 Neuromuscular disorders**

**Neuromuscular disorders**

**Drugs that enhance neuromuscular transmission**

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second line
Myasthenia gravis and Lambert-Eaton myasthenic syndrome

immunosuppressant such as azathioprine p. 716 is frequently used to reduce the dose of corticosteroid. Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases
Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1099.

Neostigmine p. 912 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 74 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 912 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy
Corticosteroids are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In generalised myasthenia gravis prednisolone p. 585 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in ocular myasthenia. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In generalised myasthenia gravis azathioprine p. 716 is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Ciclosporin p. 717, methotrexate p. 762, or mycophenolate mofetil p. 725 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

Acetylcholine-release enhancers
Amifampridine below is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 726 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability.

Skeletal muscle relaxants
The drugs described are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 914 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract p. 913 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene sodium p. 1101 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly. Diazepam p. 267 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anticonvulsants.

Tizanidine p. 913 is an alpha-2-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

Other muscle relaxants
The clinical efficacy of methocarbamol p. 915 and meprobamate p. 265 as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

3.1 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

ACETYLCHOLINE-RELEASE ENHANCERS

Amifampridine

INDICATIONS AND DOSE
Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)

BY MOUTH
• Adult: Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

● CONTRA-INDICATIONS Congenital QT syndromes • epilepsy • uncontrolled asthma

● CAUTIONS Non-paraneoplastic form of Lambert-Eaton myasthenic syndrome
Neostigmine methysulfate

**INDICATIONS AND DOSE**

**Treatment of myasthenia gravis**

**BY MOUTH**

- **Adult:** Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

- **Adult:** 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

**Reversal of non-depolarising (competitive) neuromuscular blockade**

**BY INTRAVENOUS INJECTION**

- **Adult:** 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrrolate or atropine, to be given over 1 minute

**UNLICENSED USE**

Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection in neonate is unlicensed.

**CAUTIONS**

- With intravenous use glycopyrrolate or atropine should also be given when reversing neuromuscular blockade

**INTERACTIONS → Appendix 1 (parasympathomimetics).**

**RENAI IMPAIRMENT**

May need dose reduction.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

| Neostigmine bromide 15 mg | Neostigmine 15mg tablets |
| Neostigmine bromide 15 mg | Neostigmine 15mg tablets |
| 140 tablet | £93.60 |

**Solution for injection**

- **NEOSTIGMINE (Non-proprietary)**
  - Neostigmine methylsulfate 2.5 mg per 1 ml | Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule | £4.95-5.06

Pyridostigmine bromide

**DRUG ACTION**

Pyridostigmine bromide has weaker muscarinic action than neostigmine.

**INDICATIONS AND DOSE**

**Myasthenia gravis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** 30–120 mg, dose to be given at suitable intervals throughout the day; usual dose 0.3–1.2 g daily in divided doses, it is advisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor downregulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialist neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily
3.2 Nocturnal leg cramps

Nocturnal leg cramps
Quinine salts, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine p. 540 should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdose and accidental fatalities have occurred.

3.3 Spasticity

Drugs used for Spasticity not listed below; Dantrolene sodium, p. 1101 - Diazepam, p. 267

ALPHA₂-ADRENOCEPTOR AGONISTS

Tizanidine

INDICATIONS AND DOSE
Spasticity associated with multiple sclerosis or spinal cord injury or disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 2 mg for 1 dose, then increased in steps of 2 mg/24 hours every 3–4 days in divided doses, adjusted according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

● CAUTIONS Elderly
● INTERACTIONS Appendix 1 (muscle relaxants). Caution with concomitant administration of drugs that prolong QT interval.

● SIDE-EFFECTS
  ● Common or very common Altered liver enzymes (discontinue if persistently raised—consult product literature) - dizziness - drowsiness - dry mouth - fatigue - gastro-intestinal disturbance - hypotension - nausea
  ● Uncommon Bradycardia
  ● Frequency not known Asthenia - blurred vision - confusion - convulsions - hallucinations - hepatitis - insomnia - liver failure - syncope

● PRENANCY Avoid (toxicity in animal studies).
● BREAST FEEDING Avoid (present in milk in animal studies).
● HEPATIC IMPAIRMENT Avoid in severe impairment; use in moderate impairment only if potential benefit outweighs risk.
● RENAL IMPAIRMENT Manufacturer advises caution.
● MONITORING REQUIREMENTS Monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue.
● TREATMENT CESSATION Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure.
● PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
PYRIDOSTIGMINE BROMIDE (Non-proprietary) Pyridostigmine bromide 60 mg tablets | 200 tablet | £45.58 DT price = £45.58
Mestinon (Meda Pharmaceuticals Ltd) Pyridostigmine bromide 60 mg Mestinon 60mg tablets | 200 tablet | £45.57 DT price = £45.58

CANNABINODS

Cannabis extract

INDICATIONS AND DOSE
Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

BY BUCCAL ADMINISTRATION

Adult: (consult product literature)

● CONTRA-INDICATIONS Family history of psychosis - history of other severe psychiatric disorder - personal history of psychosis
● CAUTIONS History of epilepsy - significant cardiovascular disease
● INTERACTIONS Appendix 1 (cannabis extract).
● SIDE-EFFECTS
  ● Common or very common Amnesia - blurred vision - constipation - depression - diarrhoea - disorientation - dissociation - dizziness - drowsiness - dry mouth - dystarhria - impaired attention - increased or decreased appetite - malaise - mood disturbance - mouth ulcer - nausea - oral pain - taste disturbance - vertigo - vomiting
  ● Uncommon Abdominal pain - delusions - hallucinations - hypertension - oomucosal discoloration - palpititation - paranoia - pharyngitis - stomatitis - suicidal thoughts - syncope - tachycardia - tooth discoloration
  ● Frequency not known Anxiety - seizures
● CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.
● PREGNANCY Manufacturer advises use only if potential benefit outweighs risks.
● BREAST FEEDING Avoid—present in milk.
● HEPATIC IMPAIRMENT Manufacturer advises more frequent monitoring in significant hepatic impairment—possible risk of prolonged or enhanced effect.
RENAL IMPAIRMENT  Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.

MONITORING REQUIREMENTS  Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.

PATIENT AND CARER ADVICE  For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and Driving under Guidance on prescribing, p. 1

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Spray  EXCIPIENTS: May contain Propylene glycol
- Sativex (Bayer Plc)  Cannabinoids 2.5 mg per 1 dose, Dronabinol 2.7 mg per 1 dose  Sativex oromucosal spray | 270 dose (BNF) £375.00 (CPD-1)

gamma-AMINOBUTYRIC ACID ANALOGUES AND DERIVATIVES

Baclofen

INDICATIONS AND DOSE  Pain of muscle spasm in palliative care

BY MOUTH  
- Adult: 5–10 mg 3 times a day  
- Adult: 5 mg twice daily  

Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

BY MOUTH  
- Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)

BY INTRATECAL INJECTION  
- Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

CONTRA-INDICATIONS  
- With intrathecal use Local infection - systemic infection
- With oral use Avoid oral route in active peptic ulceration

CAUTIONS  GENERAL CAUTIONS  Cerebrovascular disease - diabetes - elderly - epilepsy - history of peptic ulcer - hypertonic bladder - sphincter - Parkinson’s disease - psychiatric illness - respiratory impairment

SPECIFIC CAUTIONS  
- With intrathecal use Coagulation disorders - malnutrition (increased risk of post-surgical complications) - previous spinal fusion procedure

INTERACTIONS  → Appendix 1 (muscle relaxants).

SIDE-EFFECTS  

- Rare  Abdominal pain - changes in hepatic function - dysarthria - erectile dysfunction - paraesthesia - taste disturbances

- Very rare  Hypothermia

PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING  Present in milk—amount probably too small to be harmful.

HEPATIC IMPAIRMENT  With oral use Manufacturer advises use with caution.

RENAL IMPAIRMENT  With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk. Excreted by kidney.

TREATMENT CESSATION  Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

PRESCRIBING AND DISPENSING INFORMATION  Flavours of oral liquid formulations may include raspberry.

PATIENT AND CARER ADVICE  Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution

Tablet  
EXCIPIENTS: May contain Gluten
- BACLOFEN (Non-proprietary)  Baclofen 10 mg  Baclofen 10mg tablets | 84 tablet (BNF) £9.99 DT price = £1.85
- Lioresal (Novartis Pharmaceuticals UK Ltd)  Baclofen 10 mg  Lioresal 10mg tablets | 100 tablet (BNF) £12.38

Oral solution  
EXCIPIENTS: May contain Gluten
- BACLOFEN (Non-proprietary)  Baclofen 1 mg per 1 ml  Baclofen 5mg/5ml oral solution sugar free (sugar-free) | 300 ml (BNF) £22.45 DT price = £4.59
- Lioresal (Novartis Pharmaceuticals UK Ltd)  Baclofen 1 mg per 1 ml  Lioresal 5mg/5ml liquid (sugar-free) | 300 ml (BNF) £8.59 DT price = £4.59

Brands may include Lyflex

Important safety information  Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.
Solution for injection

MUSCLE RELAXANTS

Methocarbamol

INDICATIONS AND DOSE
Short-term symptomatic relief of muscle spasm
BY MOUTH
▶ Adults: 1.5 g 4 times a day; reduced to 750 mg 3 times a day if required
▶ Elderly: Up to 750 mg 4 times a day, may be sufficient

CONTRA-INDICATIONS
Brain damage - coma - epilepsy - myasthenia gravis - precoma

INTERACTIONS → Appendix 1 (muscle relaxants).

SIDE-EFFECTS

PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING
Present in milk in animal studies—manufacturer advises caution.

HEPATIC IMPAIRMENT
Manufacturer advises caution; half-life may be prolonged.

RENAL IMPAIRMENT
Manufacturer advises caution.

PATIENT AND CARER ADVICE
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

LESS SUITABLE FOR PRESCRIBING
Less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet
CAUTIONARY AND ADVISORY LABELS 2
▶ METHOCARBAMOL (Non-proprietary)
Methocarbamol 750 mg Methocarbamol 750mg tablets | 100 tablet (£12.65) DT price = £12.65
Roibaxin (Almirall Ltd)
Methocarbamol 750 mg Methocarbamol 750 tablets | 100 tablet (£12.65) DT price = £12.65

4 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 354, but paracetamol is preferred, particularly in the elderly.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the inflammatory arthritides (e.g. rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice
Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 927 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Dextibuprofen p. 919 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:
Naproxen p. 934 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).
Fenoprofen p. 926 is as effective as naproxen, and flurbiprofen may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.
Ketoprofen p. 930 has anti-inflammatory properties similar to ibuprofen and has more side-effects. Dextketoifen p. 919, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.
Tiaprofenic acid p. 938 is as effective as naproxen; it has more side-effects than ibuprofen.
Drugs with properties similar to those of propionic acid derivatives:
Diclofenac sodium p. 921 and aceclofenac below are similar in efficacy to naproxen.
Etodolac p. 924 is comparable in efficacy to naproxen p. 934; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.
Indomethacin p. 929 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances.
Mefenamic acid p. 932 has minor anti-inflammatory properties. It has occasionally been associated with diarrohoea and haemolytic anaemia which require discontinuation of treatment.
Meloxicam p. 933 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.
Nabumetone p. 934 is comparable in effect to naproxen p. 934.
Phenytoin is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.
Piroxicam p. 936 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.
Sulindac p. 937 is similar in tolerance to naproxen. Tenoxicam p. 937 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.
Tolfenamic acid p. 381 is licensed for the treatment of migraine.
The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 925 and celecoxib p. 918, are as effective as non-selective NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.
Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.
Aspirin p. 104 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

**Dental and orofacial pain**
Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen p. 927, diclofenac sodium p. 921, and diclofenac potassium p. 920.

**Asthma**
Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

**NSAIDs and cardiovascular events**
All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of celecoxib, treatment advice has been updated in line with diclofenac, based on celecoxib’s structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

**NSAIDs and gastro-intestinal events**
All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam, ketorolac, and ketoprofen are associated with the highest risk; indomethacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred, to start at the lowest recommended dose and not to use more than one oral NSAID at a time.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with previous NSAID therapy, those with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatoid diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

**NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**

**Aceclofenac**

**INDICATIONS AND DOSE**

Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

**BY MOUTH**

> **Adult:** 100 mg twice daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal
ulceration (two or more distinct episodes) • ischaemic heart disease • mild heart failure • peripheral arterial disease • severe heart failure

- **CAUTIONS** Allergic disorders • avoid in Acute porphyrias p. 864 • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**
  - **Rare** Alveolitis • asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances
  - **Frequency not known** Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

- **SIDE-EFFECTS, FURTHER INFORMATION**

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Initially 100 mg daily.
  
  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution; avoid in moderate to severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment, monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - Adult: 75–150 mg daily in 2–3 divided doses

**Migraine**

- **BY MOUTH**
  - Adult: 50 mg, to be given at onset of migraine, then 50 mg after 2 hours if required, then 50 mg after 4–6 hours; maximum 200 mg per day

**Fever in ear, nose, or throat infection**

- **BY MOUTH**
  - Child 9-17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

**UNLICENSED USE** Voltarol® Rapid not licensed for use in children under 14 years or in fever.

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular disease • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • ischaemic heart disease • mild to severe heart failure • peripheral arterial disease

**CAUTIONS**

**GENERAL CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

**SPECIFIC CAUTIONS** Elderly (risk of serious side-effects and fatalities) (in adults)

**INTERACTIONS** → Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- **Rare** Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

**Frequency not known** Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

**ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING Use with caution during breast-feeding. Amount in milk too small to be harmful.

HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAI IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

PATIENT AND CARER ADVICE Medicines for Children leaflet: Diclofenac for pain and inflammation www.medicinesforchildren.org.uk/diclofenac-for-pain-and-inflammation

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

DICLOFENAC POTASSIUM (Non-proprietary)

Diclofenac potassium 25 mg Diclofenac potassium 25mg tablets | 28 tablet | £3.23

Diclofenac potassium 50 mg Diclofenac potassium 50mg tablets | 28 tablet | £6.18

Voltarol Rapid (Novartis Pharmaceuticals UK Ltd)

Diclofenac potassium 25 mg Voltarol Rapid 25mg tablets | 30 tablet | £3.46 DT price = £3.46

Diclofenac potassium 50 mg Voltarol Rapid 50mg tablets | 30 tablet | £6.62 DT price = £6.62

Diclofenac sodium

INDICATIONS AND DOSE

Pain and inflammation in musculoskeletal disorders | Acute gout

BY MOUTH

Adult: 75–150 mg daily in 2–3 divided doses

BY RECTUM

Adult: 75–150 mg daily in divided doses

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

BY MOUTH

Adult: 75–150 mg daily in 2–3 divided doses

BY RECTUM

Adult: 75–150 mg daily in divided doses

Postoperative pain

BY MOUTH

Adult: 75–150 mg daily in 2–3 divided doses

BY RECTUM

Adult: 75–150 mg daily in divided doses

VOLTAROL® RETARD

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

BY MOUTH

Adult: 1 tablet once daily

VOLTAROL® 75MG SR TABLETS

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

BY MOUTH

Adult: 1 tablet 1–2 times a day

DICLOMAX SR®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

BY MOUTH

Adult: 1 capsule 1–2 times a day, alternatively 2 capsules once daily

MOTIFENE®

Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders | Acute gout | Postoperative pain

BY MOUTH

Adult: 1 capsule once daily

DYLOJECT®

Acute exacerbations of pain and postoperative pain

BY DEEP INTRAMUSCULAR INJECTION

Adult: 75 mg once daily for maximum 2 days, to be administered into the gluteal muscle

Acute exacerbations of pain and postoperative pain (severe cases)

BY DEEP INTRAMUSCULAR INJECTION

Adult: 75 mg twice daily for maximum 2 days, to be administered into the gluteal muscle

Ureteric colic

BY DEEP INTRAMUSCULAR INJECTION

Adult: 75 mg, then 75 mg after 30 minutes if required

Acute postoperative pain (in supervised settings)

BY INTRAVENOUS INJECTION

Adult: 75 mg every 4–6 hours if required for maximum 2 days; maximum 150 mg per day

Prevention of postoperative pain

BY INTRAVENOUS INJECTION

Adult: 25–50 mg, to be given after surgery; further doses given after 4–6 hours if necessary; maximum 150 mg in 24 hours for 2 days

VOLTAROL® SOLUTION FOR INJECTION

Postoperative pain

BY DEEP INTRAMUSCULAR INJECTION

Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

Acute exacerbations of pain

BY DEEP INTRAMUSCULAR INJECTION

Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

Ureteric colic

BY DEEP INTRAMUSCULAR INJECTION

Adult: 75 mg, then 75 mg after 30 minutes if required

Acute postoperative pain (in hospital setting)

BY INTRAVENOUS INFUSION

Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day.

continued
Prevention of postoperative pain (in hospital setting)

**BY INTRAVENOUS INFUSION**

- **Adult:** Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

**VOLTAROL® EMULGEL**

Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

**TO THE SKIN**

- **Adult:** Apply 3–4 times a day, therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

**SOLARAZE®**

Actinic keratosis

**TO THE SKIN**

- **Adult:** Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

**VOLTAROL® GEL PATCH**

Ankle sprain

**TO THE SKIN**

- **Adult:** Apply 1 patch daily for up to 3 days

Epicondylitis

**TO THE SKIN**

- **Adult:** Apply 1 patch twice daily for up to 14 days

**CONTRA-INDICATIONS**

- **With systemic use** Active gastro-intestinal bleeding, active gastro-intestinal ulceration, avoid suppositories in proctitis, cerebrovascular disease, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes), history of recurrent gastro-intestinal ulceration (two or more distinct episodes), ischaemic heart disease, mild to severe heart failure, peripheral arterial disease

- **With intravenous use** Dehydration, history of asthma, history of confirmed or suspected cerebrovascular bleeding, history of haemorrhagic diathesis, hypovolaemia, operations with high risk of haemorrhage

**CAUTIONS**

- **With systemic use** Allergic disorders, cardiac impairment (NSAIDs may impair renal function), coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), history of cardiac failure, hypertension, left ventricular dysfunction, oedema, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated)

- **With topical use** Avoid contact with eyes, avoid contact with inflamed or broken skin, avoid contact with mucous membranes, not for use with occlusive dressings, topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**INTERACTIONS**

- **With intravenous use** Contra-indicated in concomitant NSAID use. Contra-indicated in concomitant anticoagulant use (including low-dose heparins).

**SIDE-EFFECTS**

- **Rare**

  - **With systemic use** Alveolitis, aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible), hepatic damage, interstitial fibrosis associated with NSAIDs can lead to renal failure, pancreatitis, papillary necrosis associated with NSAIDs can lead to renal failure, pulmonary eosinophilia, Stevens-Johnson syndrome, toxic epidermal necrolysis, visual disturbances

  - **Frequency not known**

    - With systemic use Angioedema, blood disorders, bronchospasm, colitis (induction of or exacerbation of), Crohn’s disease (induction of or exacerbation of), depression, diarrhoea, dizziness, drowsiness, fluid retention (rarely precipitating congestive heart failure), gastro-intestinal bleeding, gastro-intestinal discomfort, gastro-intestinal disturbances, gastro-intestinal ulceration, haematuria, headache, hearing disturbances, hypersensitivity reactions, insomnia, nervousness, photosensitivity, raised blood pressure, rashes, renal failure (especially in patients with pre-existing renal impairment), tinnitus, vertigo

    - With parenteral use Injection site reactions

    - With rectal use Suppositories may cause rectal irritation

    - With topical use Paraesthesia, photosensitivity, rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**ALLERGY AND CROSS-SENSITIVITY**

- Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**

- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in uterus and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy

**BREAST FEEDING**

- With systemic use Use with caution during breast-feeding. Amount in milk too small to be harmful.

**HEPATIC IMPAIRMENT**

- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

- With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- With intravenous use Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.

**DIRECTIONS FOR ADMINISTRATION**

- For **intravenous infusion** (Voltarol®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of
5 mg/hour. For topical preparations, apply with a gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Voltarol® dispensible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months). Caution—topical preparations not generally suitable for children.

- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity: Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary: Diclofenac Sodium Tablets may be prescribed.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (February 2008) that Dylloject® is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings.

- **EXCEPTIONS TO LEGAL CATEGORY** Various pack sizes of gel preparations may be available on sale to the public.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispensible tablet, oral suspension, oral solution.

- **Dispersible tablet** CAUTIONARY AND ADVISORY LABELS 13, 21
  - Voltarol® (Novartis Pharmaceuticals UK Ltd)
  - Diclofenac sodium 50 mg: Voltarol® 50mg dispensible tablets (sugar-free) | 21 tablet | P 6.19 DT price = £6.19

                - Adult: 1 tablet twice daily, take with food
                - **Arthrotec® 50/200**
                  - Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis
                    - Adult: 1 tablet 2–3 times a day, take with food
924 Pain and inflammation in musculoskeletal disorders

**ARTHROTEC® 75/200**

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

**BY MOUTH**

- Adult: 1 tablet twice daily, take with food

- **UNLICENSED USE** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the combination preparations of diclofenac and misoprostol.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **GASTRO-RESISTANT TABLET**

  **CAUTIONARY AND ADVISORY LABELS 21, 25**

Etoricoxib

**INDICATIONS AND DOSE**

**Pain and inflammation in osteoarthritis**

- **BY MOUTH**
  - Child 16-17 years: 30 mg once daily, then increased if necessary to 60 mg once daily
  - Adult: 30 mg once daily, then increased if necessary to 60 mg once daily

**Pain and inflammation in rheumatoid arthritis | Ankylosing spondylitis**

- **BY MOUTH**
  - Child 16-17 years: 90 mg once daily
  - Adult: 90 mg once daily
  - Acute gout
    - Child 16-17 years: 120 mg once daily for maximum 8 days
    - Adult: 120 mg once daily for maximum 8 days

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)

**CAUTIONS**

**GENERAL CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · dehydration · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

**SPECIFIC CAUTIONS** Elderly (risk of serious side-effects and fatalities)

**INTERACTIONS** → Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- **Common or very common** Ecchymosis · fatigue · influenza-like symptoms · palpitation
- **Uncommon** Anxiety · appetite change · arthralgia · atrial fibrillation · chest pain · cough · dry mouth · dyspnoea · electrolyte disturbance · epistaxis · flushing · mental acuity impaired · mouth ulcer · myalgia · paraesthesia · taste disturbance · transient ischaemic attack · weight change
- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Very rare** Confusion · hallucinations
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

**Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

**ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- With systemic use in adults Avoid if eGFR less than 30 mL/minute/1.73 m².
- With systemic use in children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Arcoxia** (Grunenthal Ltd)
  - Etoricoxib 30 mg Arcoxia 30 mg tablets | 28 tablet pack £13.99 DT price = £13.99
  - Etoricoxib 60 mg Arcoxia 60 mg tablets | 28 tablet pack £20.11 DT price = £20.11
  - Etoricoxib 90 mg Arcoxia 90 mg tablets | 5 tablet pack £4.10 |
  - 28 tablet pack £22.96 DT price = £22.96
  - Etoricoxib 120 mg Arcoxia 120 mg tablets | 7 tablet pack £6.03 |
  - 28 tablet pack £24.11 DT price = £24.11

Felbinac

**DRUG ACTION** Felbinac is an active metabolite of the NSAID fenbufen.

**INDICATIONS AND DOSE**

**Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

TO THE SKIN

- Adult: Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

**CAUTIONS** Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
Fenoprofen

**INDICATIONS AND DOSE**

Pain and inflammation in rheumatic disease and other musculoskeletal disease | Mild to moderate pain
---|---
**BY MOUTH**
* Adult: 300–600 mg 3–4 times a day; maximum 3 g per day

**CONTRA-INDICATIONS**

Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

**CAUTIONS**

Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

**SIDE-EFFECTS**

Rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

**Active gastro-intestinal bleeding** Related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

**MALIGNANT TUMOURS**

Carcinoma of the prostate; concurrent administration may increase the risk of bleeding due to antiplatelet effects

**RENAL IMPAIRMENT**

Deterioration in renal function has also been reported.

**SIDE-EFFECTS AND CROSS-SENSITIVITY**

**Rare** Allergic disorders · cardio-pulmonary disorders · haematological disorders · hepatic disorders · nervous system disorders · renal disorders · skin disorders · toxic epidermal necrolysis · uncontrolled hypertension

**SIDE-EFFECTS**

**Frequent** Rash (discontinue use if develops)

**BREAST FEEDING**

Use with caution during breast-feeding.

**PREPARING AND DISPENSING INFORMATION**

Caution—topical preparations not generally suitable for children.

**PATIENT AND CARER ADVICE**

For topical preparations patients and carers should be advised to wash hands immediately after use. Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

BY MOUTH
- Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
- Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

BY MOUTH
- Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
- Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

CONTRA-INDICATIONS
Active gastro-intestinal bleeding
- Active gastro-intestinal ulceration
- History of gastro-intestinal bleeding related to previous NSAID therapy
- History of gastro-intestinal perforation related to previous NSAID therapy
- History of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
- History of recurrent gastro-intestinal ulceration (two or more distinct episodes)
- Severe heart failure
- Ischaemic heart disease
- Peripheral arterial disease
- Risk factors for cardiovascular events
- Ulcerative colitis (may be exacerbated)
- Uncontrolled hypertension

INTERACTIONS
- Appendix 1 (NSAIDs).

SIDE-EFFECTS
- Common or very common
  - Stomatitis
- Uncommon
  - Confusion
  - Fatigue
  - Hallucinations
  - Parasomnia
- Rare
  - Alveolitis
  - Aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
  - Hepatic damage
  - Intestinal fibrosis associated with NSAIDs can lead to renal failure
  - Pancreatitis
  - Papillary necrosis
  - Pulmonary hypertension of the newborn
  - Stevens-Johnson syndrome
  - Stevens-Johnson syndrome in cases of severe heart failure
  - Toxic epidermal necrolysis
  - Vasculitis
  - Vasoconstriction
- Frequency not known
  - Angioedema
  - Blood disorders
  - Bronchospasm
  - Colitis (induction of or exacerbation of)
  - Cough
  - Depression
  - Dizziness
  - Drowsiness
  - Fluid retention (rarely precipitating congestive heart failure)
  - Gastro-intestinal bleeding
  - Gastro-intestinal discomfort
  - Gastro-intestinal disturbances
  - Haematuria
  - Headache
  - Hearing disturbances
  - Hypersensitivity reactions
  - Insomnia
  - Nausea
  - Nervousness
  - Photosensitivity
  - Raised blood pressure
  - Rash
  - Renal failure (especially in patients with pre-existing renal impairment)
  - Tinnitus
  - Vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects
For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

ALLERGY AND CROSS-SENSITIVITY

Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

Caution—Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY
Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

CREST FEEDING
Use with caution during breast-feeding.
Small amount present in milk—manufacturer advises avoid.

HEPATIC IMPAIRMENT
Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT
Avoid if possible or use with caution.
The lowest effective dose should be used for the shortest possible duration. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3-5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 6-11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 1-3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 4-6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- Child 7-9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- Child 10-11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day

continued →
Pain and inflammation in musculoskeletal disorders

- Child 12-17 years: Initially 300–400 mg 3–4 times a day; (by mouth) increased if necessary up to 600 mg 4 times a day; (by mouth) maintenance 200–400 mg 3 times a day, may be adequate

**Pain and inflammation**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Child 12-17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 3-months-17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

**Pain and inflammation in systemic juvenile idiopathic arthritis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 3-months-17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

**Post-immunisation pyrexia in infants** (on doctor's advice only)

**Side-effects**

- Rare
- With oral use Alveolitis - septic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

**Frequency not known**

- With oral use Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

**With topical use** Photosensitivity - rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

**With topical use in adults** Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

**Overdose** Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 1130 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour. For details on the management of poisoning, see Emergency treatment of poisoning p. 1123.

**ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**Pregnancy**

- With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

**Breast feeding**

- With oral use Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

**Hepatic impairment**

- With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**Renal impairment**

- With oral use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for
**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Ibuprofen for pain and inflammation www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation

For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity: For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

930 Pain and inflammation in musculoskeletal disorders

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg 1–2 times a day

Dysmenorrhoea
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Up to 75 mg daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 75 mg daily

UNLICENSED USE Use of indomethacin in premature labour is an unlicensed indication.

CONTRA-INDICATIONS Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

CAUTIONS

SPECIFIC SIDE-EFFECTS
- Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - epilepsy - ischaemic heart disease - parkinsonism - peripheral arterial disease - psychiatric disturbances - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

INTERACTIONS Appendix 1 (NSAIDs).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Rare Arthritis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - blood disorders - confusion - convulsions - hepatic damage - hyperglycaemia - interstitial fibrosis associated with NSAIDs can lead to renal failure - intestinal strictures - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - peripheral neuropathy - psychiatric disturbances - pulmonary eosinophilia - Stevens-Johnson syndrome - syncope - thrombocytopenia - toxic epidermal necrolysis - visual disturbances
- Frequency not known Angina - aseptic meningitis - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hyperkalaemia - hypersensitivity reactions - insomnia - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

SPECIFIC SIDE-EFFECTS
- With oral use Nausea
- With rectal use Suppositories may cause occasional bleeding - suppositories may cause rectal irritation

SIDE-EFFECTS, FURTHER INFORMATION
- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.
- ALLERGY AND CROSS-SENSITIVITY Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MONITORING REQUIREMENTS During prolonged therapy ophthalmic and blood examinations particularly advisable.

PATIENT AND CARER ADVICE Dizziness may affect performance of skilled tasks (e.g. driving).

Ketoprofen

INDICATIONS AND DOSE
Pain and mild inflammation in rheumatic disease
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 100–200 mg daily in 2–4 divided doses

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 100–200 mg once daily, dose to be taken with food

BY RECTUM
- Adult: 100 mg once daily, to be administered at bedtime, combined oral and rectal treatment, maximum total daily dose 200 mg

Pain in musculoskeletal disorders | Pain after orthopaedic surgery | Dysmenorrhoea | Acute gout
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 50 mg up to 3 times a day

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 100–200 mg once daily, dose to be taken with food
Relief of pain in musculoskeletal disorders | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

- Adult: Apply 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

POWERGEL®

Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

TO THE SKIN

- Adult: Apply 2–3 times a day for up to max. 10 days

- CONTRA-INDICATIONS
  - With systemic use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding - history of gastro-intestinal perforation - history of gastro-intestinal ulceration - severe heart failure

- CAUTIONS
  - With systemic use Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
  - With topical use Avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- INTERACTIONS → Appendix 1 (NSAIDs). Interactions do not generally apply to topical NSAIDs.

- SIDE-EFFECTS

  GENERAL SIDE-EFFECTS Photosensitivity

  SPECIFIC SIDE-EFFECTS

  Rare
  - With systemic use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
  - Frequency not known
  - With rectal use Suppositories may cause rectal irritation
  - With systemic use Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo
  - With topical use Rash (discontinue use if develops)

- SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915. Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- ALLERGY AND CROSS-SENSITIVITY Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRA CONCEPTION
  - With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY
  - With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

- BREAST FEEDING
  - With systemic use Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
  - With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- HEPATIC IMPAIRMENT
  - With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

- RENAL IMPAIRMENT
  - With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
  - With topical use Deterioration in renal function has also been reported after topical use.

- DIRECTIONS FOR ADMINISTRATION For topical preparations apply with gentle massage only.

- PRESCRIBING AND DISPENSING INFORMATION Caution—topical preparations not generally suitable for children. Flavours of oral liquid formulations may include strawberry.

- PATIENT AND CARER ADVICE For topical preparations, patients and their carers should be advised to wash hands immediately after use.
  - With topical use Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

- EXCEPTIONS TO LEGAL CATEGORY Smaller pack sizes of gel preparations may be available on sale to the public.

**INTERACTIONS**

- **CAUTIONS**
  - Acute porphyrias p. 864 - allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - epilepsy - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **SIDE-EFFECTS**
  - Common or very common Diarrhoea (withdraw treatment) - rashes (withdraw treatment) - stomatitis
  - Uncommon Fatigue - paraesthesia
  - Rare Alveolitis - aplastic anaemia - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - glucose intolerance - haemolytic anaemia (positive Coombs’ test) - hepatic damage - hypotension - interstitial fibrosis associated with NSAIDs can lead to renal failure - palpititations - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis - visual disturbances
  - Frequency not known Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

Overdose Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment. For details on the management of poisoning, see Emergency treatment of poisoning p. 1123, in particular, Convolutions.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water
retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**

**INDICATIONS AND DOSE**

Exacerbation of osteoarthritis (short-term)
- **BY MOUTH**
  - Child 16-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
  - Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

Pain and inflammation in rheumatic disease | Ankylosing spondylitis
- **BY MOUTH**
  - Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
  - Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
  - Elderly: 7.5 mg once daily

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs
- **BY MOUTH**
  - Child 16-17 years (body-weight up to 50 kg): 7.5 mg once daily
  - Child 16-17 years (body-weight 50 kg and above): 15 mg once daily

- **CONTRA-INDICATIONS**
  Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

- **CAUTIONS**
  Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension (in adults)

- **INTERACTIONS** → Appendix I (NSAIDs).

- **SIDE-EFFECTS**
  - Rare Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances
  - Frequency not known Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastrointestinal disturbances • gastro-intestinal ulceration • haematuria • headache • heart failure • hypertension • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

**Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY**
  Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONCEPTION**
  Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING**
  Use with caution during breast-feeding. Present in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT**
  Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
  - In adults Avoid if eGFR less than 25 mL/minute/1.73 m².
  - In children Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  - Brands may include Femina Ultra

**Naproxen with esomeprazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, esomeprazole p. 67, naproxen p. 934.

**INDICATIONS AND DOSE**

Patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective

**BY MOUTH**

- Adult: 1 tablet twice daily

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 22, 25**

- Esomeprazole with Naproxen (Non-proprietary)
  - Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg Naproxen 500mg / Esomeprazole 20mg modified-release tablets | 60 tablet | no price available
  - Vimovo (AstraZeneca UK Ltd)
  - Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg Vimovo 500mg/20mg modified-release tablets | 60 tablet | £14.95

**Naproxen with misoprostol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, misoprostol p. 709, naproxen p. 934.

**INDICATIONS AND DOSE**

Patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration

**BY MOUTH**

- Adult: 500 mg twice daily, naproxen and 200 micrograms twice daily, misoprostol, taken together with food

**PRESCRIBING AND DISPENSING INFORMATION**

The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the misoprostol with naproxen combination pack.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Tablet
- Napratec (Pfizer Ltd)
  Napratec OP tablets | 112 tablet £23.76 D7 price = £23.76

Piroxicam

INDICATIONS AND DOSE
Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)

BY MOUTH
- Adult: Up to 20 mg once daily

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN
- Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

Important safety information

CHMP ADVICE—PIROXICAM (JUNE 2007)
The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:
- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered. Topical preparations containing piroxicam are not affected by these restrictions.

CONTRA-INDICATIONS
- With systemic use Active gastro-intestinal bleeding | active gastro-intestinal ulceration | history of gastro-intestinal bleeding | history of gastro-intestinal perforation | history of gastro-intestinal ulceration | inflammatory bowel disease | severe heart failure
- WITH TOPICAL USE
- Frequency not known
- WITH TOPICAL USE
- ALLERGY AND CROSS-SENSITIVITY
- With systemic use Angioedema | blood disorders | bronchospasm | colitis (induction of or exacerbation of) | Crohn’s disease (induction of or exacerbation of) | depression | diarrhoea | dizziness | drowsiness | fluid retention (rarely precipitating congestive heart failure) | gastro-intestinal bleeding | gastro-intestinal discomfort | gastro-intestinal disturbances | gastro-intestinal ulceration | haematuria | headache | hearing disturbances | hypersensitivity reactions | insomnia | nausea | nervousness | photosensitivity | raised blood pressure | rash | renal failure (especially in patients with pre-existing renal impairment) | tinnitus | vertigo
- WITH TOPICAL USE
- Photosensitivity | rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects
- For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915. Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).
- ALLERGY AND CROSS-SENSITIVITY Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION
- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY
- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- WITH TOPICAL USE
- BREAST FEEDING
- With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- WITH TOPICAL USE
- PRESCRIBING AND DISPENSING INFORMATION
- Caution—topical preparations not generally suitable for children.
Sulindac

### INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders**  
*Acute gout*

**BY MOUTH**

- Adult: 200 mg twice daily for 7–10 days in peri-articular disorders; acute gout should respond within 7 days, dose may be reduced according to response; maximum 400 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders  
  - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - ensure adequate hydration - heart failure - history of renal stones - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS** → Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**
  - Rare: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRAINDICATION**
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**Tenoxicam**

### INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease**  
*By mouth*

- Adult: 20 mg daily

**BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

- Adult: 20 mg daily as initial treatment for 1–2 days if oral administration not possible

continued →
Pain and inflammation in acute musculoskeletal disorders

**BY MOUTH**
- Adult: 20 mg daily for 7 days; maximum duration of treatment 14 days (including treatment by intravenous or intramuscular injection)

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
- Adult: 20 mg daily as initial treatment for 1–2 days if oral administration not possible

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **SIDE-EFFECTS**
  - Rare: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
  - Frequency not known: Angioedema - blood disorders - bronchospasm - colitis (induction or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhea - dizziness - dryness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

- **INTERACTIONS**

- **SIDE-EFFECTS. FURTHER INFORMATION**
  - Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID - which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution - long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDIcular forms** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| CAUTIONARY AND ADVISORY LABELS 21 |
| TENOXICAM (Non-proprietary) |
| Tenoxicam 20 mg Tenoxicam 20mg tablet | 28 tablet £16.16 |
| DT price | £16.16 |

**Powder and solvent for solution for injection**

| TENOXICAM (Non-proprietary) |
| Tenoxicam 20 mg Tenoxicam 20mg powder and solvent for solution for injection vials | 1 vial £3.98 |

**Tiaprofenic acid**

**INDICATIONS AND DOSE**

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

**BY MOUTH**
- Adult: 300 mg twice daily

---

**Important safety information**

**CSM ADVICE**

Following reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

- **CONTRA-INDICATIONS** Active bladder disease (or symptoms) - active gastro-intestinal bleeding - active gastro-intestinal ulceration - active prostate disease (or symptoms) - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - history of recurrent urinary-tract disorders (if urinary symptoms develop) - interstitial fibrosis associated with NSAIDs can lead to renal failure - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS**

- **SIDE-EFFECTS**
  - Rare: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure -
Local inflammation of joints and soft tissue

5 Soft tissue and joint disorders

5.1 Local inflammation of joints and soft tissue

Corticosteroids, inflammatory disorders

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment.

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone p. 584 up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone p. 585 may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti- erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects. A modified-release preparation of prednisolone p. 586 is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and giant cell (temporal) arteritis are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarteritis nodosa and polymyositis are usually treated with corticosteroids.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 536 or hydroxychloroquine sulfate p. 894, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.
Local corticosteroid injections
Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.
Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected). Hydrocortisone p. 583 acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.
Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

Corticosteroids

Methylprednisolone with lidocaine
The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1116, methylprednisolone p. 584.

INDICATIONS AND DOSE
Local inflammation of joints
BY INTRA-ARTICULAR INJECTION
- Adult: 4–80 mg, dose adjusted according to size; where appropriate may be repeated at intervals of 7–35 days, for details consult product literature

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Suspension for injection
EXCIPIENTS: May contain Benzy alcohol
- TRIAMCINOLONE HEXACETONIDE (Non-proprietary) Triamcinolone hexacetonide 20 mg per 1 ml Triamcinolone hexacetonide 20mg/ml suspension for injection ampoules | 10 ampoule £12.00

5.2 Soft tissue disorders

Soft-tissue disorders
Extravasation
Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.
Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis. Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticogulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.
Prevention of extravasation
Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.
Patients should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation
If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.
Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 583 or dexamethasone p. 581 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.
The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dexrazoxane p. 782 is licensed for the treatment of anthracycline-induced extravasation.

**Enzymes**

**Collagenase**

Collagenase below are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren’s contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

*Hyaluronidase*

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

**Rubefacients, topical NSAIDs, capsaicin, and poultices**

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

**Topical NSAIDs**

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. *Topical NSAIDs* (e.g. felbinac p. 925, ibuprofen p. 927, ketoprofen p. 930, and piroxicam p. 936) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

**Capsaicin**

A preparation containing capsaicin p. 383 0.025% can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.
Hypodermoclysis
BY SUBCUTANEOUS INJECTION
▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid

Extravasation
BY LOCAL INFILTRATION
▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

Haematoma
BY LOCAL INFILTRATION
▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

Enhance permeation of ophthalmic local anaesthetic TO THE EYE
▶ Adult: 15 units/mL, to be mixed with the local anaesthetic solution

UNLICENSED USE Licensed for use in children, but age range not specified by the manufacturer.
CONTRA-INDICATIONS Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be used to reduce swelling of bites · not to be used to reduce swelling of stings

CAUTIONS Elderly (control speed and total volume and avoid overhydration especially in renal impairment) · infants (control speed and total volume and avoid overhydration especially in renal impairment)

SIDE-EFFECTS
▶ Common or very common Oedema
▶ Rare Bleeding · bruising · infection · local irritation
▶ Frequency not known Anaphylaxis · severe allergy

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
▶ HYALURONIDASE (Non-proprietary)
Hyaluronidase 1500 unit Hyaluronidase 1,500 unit powder for solution for injection ampoules | 10 ampoule £104.24

Eye

Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine mesilate, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product is not suitable for a patient’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local
Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is associated with ineffective lens cleaning and with disinfection, can result in complications including ulcerative keratitis or conjunctivitis. Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride and hydralazine hydrochloride). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolor lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. Topical corticosteroids are applied frequently for the first 2–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- A 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye.
- Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'Steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- A 'steroid cataract' can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 947 (Ozurdex®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 974 (Iluvien®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 946, and sodium cromoglicate p. 946.

Eye drops containing antihistamines, such as antazoline (with xylometazoline hydrochloride p. 983 as Otrivine-Antistin®), azelastine hydrochloride p. 945, epinastine hydrochloride p. 945, ketotifen p. 945, and olopatadine p. 946, can be used for allergic conjunctivitis.

Sodium cromoglicate p. 946 (sodium cromoglycate) and nedocromil sodium p. 946 eye drops can be useful for vernal
1.1 Allergic conjunctivitis

ANTIHISTAMINES

Antazoline with xylometazoline

**INDICATIONS AND DOSE**

**Allergic conjunctivitis**

TO THE EYE

- Child 12-17 years: Apply 2–3 times a day for maximum 7 days
- Adult: Apply 2–3 times a day for maximum 7 days

**SIDE-EFFECTS**

- Common or very common Transient stinging
- Frequency not known Blurred vision, eye irritation, mydriasis

**SIDE-EFFECTS, FURTHER INFORMATION**

Absorption of antazoline and xylometazoline may result in the possibility of interaction with other drugs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Otrivine Antistin (Spectrum Thea Pharmaceuticals Ltd)
  - Antazoline sulfate 5 mg per 1 ml, Xylometazoline hydrochloride 500 microgram per 1 ml
  - Otrivine Antistin 0.5%/0.05% eye drops | 10 ml £2.35 DT price = £2.35

Azelastine hydrochloride

**INDICATIONS AND DOSE**

**Seasonal allergic conjunctivitis**

TO THE EYE

- Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
- Adult: Apply twice daily, increased if necessary to 4 times a day

**PERENNIAL CONJUNCTIVITIS**

TO THE EYE

- Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

**SIDE-EFFECTS**

Bitter taste, mild transient irritation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Optilast (Meda Pharmaceuticals Ltd)
  - Azelastine hydrochloride 500 microgram per 1 ml Optilast 0.05% eye drops | 8 ml £6.40

**Emedastine**

**INDICATIONS AND DOSE**

**Seasonal allergic conjunctivitis**

TO THE EYE

- Child 3-17 years: Apply twice daily
- Adult: Apply twice daily

**SIDE-EFFECTS**

Blurred vision, corneal infiltrates (discontinue), corneal staining, dry eye, headache, irritation, keratitis, lacrimation, local oedema, photophobia, rhinitis, transient burning, transient stinging

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- Emadine (Alcon Laboratories (UK) Ltd)
  - Emadine (as Emedastine difumarate) 500 microgram per 1 ml
  - Emadine 0.5mg/ml eye drops | 5 ml £7.31 DT price = £7.31

**Epinastine hydrochloride**

**INDICATIONS AND DOSE**

**Seasonal allergic conjunctivitis**

TO THE EYE

- Child 12-17 years: Apply twice daily for maximum 8 weeks
- Adult: Apply twice daily for maximum 8 weeks

**SIDE-EFFECTS**

- Common or very common Burning
- Uncommon Conjunctival hyperaemia, dry eye, eye pain, eye pruritus, headache, increased lacrimation, nasal irritation, rhinitis, taste disturbance, visual disturbance

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Relestat (Allergan Ltd)
  - Epinastine hydrochloride 500 microgram per 1 ml Relestat 500micrograms/ml eye drops | 5 ml £9.90 DT price = £9.90

**Ketotifen**

**INDICATIONS AND DOSE**

**Seasonal allergic conjunctivitis**

TO THE EYE

- Child 3-17 years: Apply twice daily
- Adult: Apply twice daily

**INTERACTIONS**

→ Appendix 1 (antihistamines).

Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action.
Olopatadine

INDICATIONS AND DOSE
Seasonal allergic conjunctivitis
TO THE EYE
▶ Child 3–17 years: Apply twice daily for maximum 4 months
▶ Adult: Apply twice daily for maximum 4 months

SIDE-EFFECTS
▶ Common or very common Local irritation
▶ Uncommon Asthenia - dizziness - dry eye - headache - keratitis - local oedema - photophobia
▶ Frequency not known Dry nose

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Eye drops
EXCIPIENTS: May contain Benzalkonium chloride
▶ Zaditen (Spectrum Thea Pharmaceuticals Ltd)
Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml
Zaditen 250 micrograms/ml eye drops | 5 ml [P] £7.80 DT price = £7.80

Mast cell stabilisers

Lodoxamide

INDICATIONS AND DOSE
Allergic conjunctivitis
TO THE EYE
▶ Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
▶ Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

SIDE-EFFECTS
▶ Common or very common Blurred vision - burning - itching - ocular discomfort - stinging - tear production disturbance
▶ Uncommon Blepharitis - dizziness - drowsiness - flushing - headache - keratitis - nasal dryness

EXCEPTIONS TO LEGAL CATEGORY
Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Eye drops
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
▶ Alomide (Alcon Laboratories (UK) Ltd)
Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml
Lodoxamide 0.1% eye drops | 10 ml [P] £5.21 DT price = £5.21
Alomidone Allergy 0.1% eye drops | 5 ml [P] £1.12

Nedocromil sodium

INDICATIONS AND DOSE
Seasonal and perennial conjunctivitis
TO THE EYE
▶ Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day for maximum 12 weeks
Adapt: Apply twice daily, increased if necessary to 4 times a day for maximum 12 weeks

SIDE-EFFECTS
Distinctive taste - transient burning - transient stinging

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Eye drops
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
▶ Rapitil (Sanofi)
Nedocromil sodium 20 mg per 1 ml
Rapitil 2% eye drops | 5 ml [P] £2.86 DT price = £2.86

Sodium cromoglicate
(Sodium cromoglycate)

INDICATIONS AND DOSE
Allergic conjunctivitis | Seasonal keratoconjunctivitis
TO THE EYE
▶ Child: Apply 4 times a day
▶ Adult: Apply 4 times a day

SIDE-EFFECTS
Transient burning - transient stinging

EXCEPTIONS TO LEGAL CATEGORY
Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 ml) for treatment of acute seasonal and perennial allergic conjunctivitis.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
Eye drops
▶ SODIUM CROMOGLICATE (Non-proprietary)
Sodium cromoglicate 20 mg per 1 ml
Sodium cromoglicate 2% eye drops | 13.5 ml [P] £6.30 DT price = £1.86
Lloydspharmacy Allergy 2% eye drops | 10 ml [P] no price available
Numark Allergy 2% eye drops | 10 ml [P] £1.53
▶ Catacom (Moorfields Pharmaceuticals)
Sodium cromoglicate 20 mg per 1 ml
Catacom 2% eye drops 0.3 ml unit dose | 30 unit dose [P] £8.99 DT price = £8.99
Cromolux (Tubilux Pharma Ltd)
Sodium cromoglicate 20 mg per 1 ml
Sodium cromoglicate 2% eye drops | 13.5 ml [P] £3.20 DT price = £1.86
Opticrom (Sanofi)
Sodium cromoglicate 20 mg per 1 ml
Opticrom Allergy 2% eye drops | 5 ml [P] £2.74 | 10 ml [P] £3.35
Opticrom Aqueous 2% eye drops | 13.5 ml [P] £8.03 DT price = £1.86
▶ Optrex Allergy (Reckitt Benckiser Healthcare (UK) Ltd)
Sodium cromoglicate 20 mg per 1 ml
Optrex Allergy 2% eye drops | 10 ml [P] £3.88
▶ Pollenase (sodium cromoglicate) (Peach Ethical Ltd)
Sodium cromoglicate 20 mg per 1 ml
Pollenase Allergy 2% eye drops | 10 ml [P] £2.08
▶ Vividrin (Bausch & Lomb UK Ltd)
Sodium cromoglicate 20 mg per 1 ml
Vividrin 2% eye drops | 13.5 ml [P] £10.85 DT price = £1.86

Pollenase Allergy
(Pollenase (sodium cromoglicate))
1.2 Inflammatory eye conditions

CORTICOSTEROIDS

Betamethasone

INDICATIONS AND DOSE

Local treatment of inflammation (short term)
TO THE EYE USING EYE DROP
- Child: Apply every 1–2 hours until controlled then reduce frequency
- Adult: Apply every 1–2 hours until controlled then reduce frequency
TO THE EYE USING EYE OINTMENT
- Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops
- Adult: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

SIDE-EFFECTS
Adrenal suppression following prolonged use in neonates - corneal thinning - scleral thinning

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% eye/ear/nose drops | 5 ml | no price available
- Betnesol (Focus Pharmaceuticals Ltd)
- Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml | £2.32 DT price = £2.32
- Vistamethasone (Martindale Pharmaceuticals Ltd)
- Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% eye/ear/nose drops | 5 ml | £1.62 | 10 ml | £1.16 DT price = £2.32

Eye ointment
- Betnesol (Focus Pharmaceuticals Ltd)
- Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 1 gram | £1.41 DT price = £1.41

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 947.

INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)
TO THE EYE USING EYE DROP
- Adult: Apply up to 6 times a day

LESS SUITABLE FOR PRESCRIBING Betamethasone with neomycin eye-drops are less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Betnesol-N (Focus Pharmaceuticals Ltd)
- Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml | £2.39

Dexamethasone

INDICATIONS AND DOSE

Local treatment of inflammation (short term)
INITIALLY TO THE EYE USING EYE DROP
- Child: Apply 4–6 times a day
- Adult: Apply every 30–60 minutes until controlled, then (to the eye) reduced to 4–6 times a day

Short term local treatment of inflammation (severe conditions)
TO THE EYE USING EYE DROP
- Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only)
| Visual impairment due to diabetic macular oedema in adults who are pseudophoric, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only) |

BY INTRAVITREAL INJECTION
- Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pretreatment, administration and repeat dosing, consult product literature

CONTRA-INDICATIONS
- With intravitreal use active ocular herpes simplex - active or suspected ocular infection - active or suspected periocular infection - rupture of the posterior lens capsule in patients with aphakia, iris or transcleral fixed intra-ocular lens or anterior chamber intra-ocular lens - uncontrolled advanced glaucoma

CAUTIONS
- With intravitreal use history of ocular viral infection (including herpes simplex) - posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) - retinal vein occlusion with significant retinal ischaemia

INTERACTIONS
- With intravitreal use Caution with concomitant administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.

SIDE-EFFECTS
- With intravitreal use Eyelid pruritus - glaucoma - migraine - necrotising retinitis
- Frequency not known
- When used by eye Adrenal suppression following prolonged use in neonates - corneal thinning - scleral thinning
- With intravitreal use Blepharitis - cataract - headache - ocular hypertension - raised intra-ocular pressure - secondary ocular infection - visual disturbance

PREGNANCY
- With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

BREAST FEEDING
- With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
**MONITORING REQUIREMENTS**

- With intravitreal use: Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

**PRESCRIBING AND DISPENSING INFORMATION**

- **With intravitreal use**
  - **MONITORING REQUIREMENTS**
    - preservatives, preservative-free unit dose vials may be available.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - **Ozurdex**
  - **Maxidex**
  - **Dropodex**

**EXCIPIENTS:** May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin

**Eye ointment**

- **Dexafree** (Alcon Laboratories (UK) Ltd)
  - Dexamethasone 1 mg per 1 gram
  - framycetin 5 mg per 1 gram
  - neomycin 3.5 mg per 1 ml
  - polymyxin B 6000 unit per 1 ml

**Ear/eye drops solution**

- **Sofradex** (Sanofi)
  - Dexamethasone (as Dexamethasone sodium metasulphobezoate) 500 microgram per 1 ml
  - Framycetin sulfate 5 mg per 1 ml
  - Gramicidin 50 microgram per 1 ml

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 947, neomycin sulfate p. 451.

**INDICATIONS AND DOSE**

- Local treatment of inflammation (short-term)
  - **TO THE EYE USING EYE OINTMENT**
    - Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
    - Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

**INDICATIONS AND DOSE**

- **Local treatment of inflammation (short-term)**
  - **TO THE EYE USING EYE DROPS**
    - Adult: Apply every 30–60 minutes until controlled then reduce frequency to, 4–6 times a day
  - Local treatment of inflammation (short-term)

**Dexamethasone with framycetin sulfate and gramicidin**

The properties listed below are those particular to the combination only. For the properties of the components please consider dexamethasone p. 947.

**INDICATIONS AND DOSE**

- Local treatment of inflammation (short-term)
  - **TO THE EYE USING EYE DROPS**
    - Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

**LESS SUITABLE FOR PRESCRIBING**

- **Sofradex** is less suitable for prescribing.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Ear/eye drops solution**
    - EXCIPIENTS: May contain Polysorbates
  - **Sofradex**
    - Dexamethasone (as Dexamethasone sodium metasulphobezoate) 500 microgram per 1 ml
    - Framycetin sulfate 5 mg per 1 ml
    - Gramicidin 50 microgram per 1 ml
  - **Sofradex®** ear/eye drops 10 ml

**Dexamethasone with tobramycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 947, tobramycin p. 957.
Fluorometholone

**INDICATIONS AND DOSE**
Local treatment of inflammation (short term)

**TO THE EYE**
- Child 2-17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day
- Adult: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

**SIDE-EFFECTS**
Adrenal suppression following prolonged use in neonates • corneal thinning • scleral thinning

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
*EXCIPIENTS*: May contain Benzalkonium chloride, disodium edetate, polysorbates

▸ **FML Liquifilm** (Allergan Ltd)
  Fluorometholone 1 mg per 1 ml FML Liquifilm 0.1% ophthalmic suspension | 5 ml (Pom) £1.71 DT price = £3.75

**Prednisolone**

**INDICATIONS AND DOSE**
Local treatment of inflammation (short-term)

**TO THE EYE**
- Child: Apply every 1–2 hours until controlled then reduce frequency
- Adult: Apply every 1–2 hours until controlled then reduce frequency

**UNLICENSED USE**
*Pred Forte®* not licensed for use in children (age range not specified by manufacturer).

**SIDE-EFFECTS**
Adrenal suppression following prolonged use in neonates • corneal thinning • scleral thinning

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose prednisolone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Ear/eye drops solution**
*EXCIPIENTS*: May contain Benzalkonium chloride, disodium edetate

▸ **Predsol** (Focus Pharmaceuticals Ltd)
  Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 10 ml (Pom) £2.00 DT price = £2.00

**Eye drops**
*EXCIPIENTS*: May contain Benzalkonium chloride, disodium edetate, polysorbates

▸ **PREDNISOLONE (Non-proprietary)**
  Prednisolone sodium phosphate 300 microgram per 1 ml Prednisolone sodium phosphate 0.03% eye drops preservative free | 10 ml (Pom) £33.24
  Prednisolone sodium phosphate 1 mg per 1 ml Prednisolone sodium phosphate 0.1% eye drops preservative free | 10 ml (Pom) £30.41
  Prednisolone sodium phosphate 3 mg per 1 ml Prednisolone sodium phosphate 0.3% eye drops preservative free | 10 ml (Pom) £28.03

▸ **Pred Forte** (Allergan Ltd)
  Prednisolone acetate 10 mg per 1 ml Pred Forte 1% eye drops | 5 ml (Pom) £1.82 DT price = £1.82 | 10 ml (Pom) £3.66 DT price = £3.66

**Rimexolone**

**INDICATIONS AND DOSE**
Local treatment of postoperative inflammation (short term use)

**TO THE EYE**
- Adult: Apply 4 times a day for a week, treatment to begin 24 hours after surgery

Local treatment of steroid-responsive inflammation (short term use)

**TO THE EYE**
- Adult: Apply at least 4 times a day for up to 4 weeks

**Uveitis (short term use)**

**TO THE EYE**
- Adult: Apply every 1 hour during the day time for week 1, then apply every 2 hours for week 2, then apply 4 times a day for a week 3, then apply twice daily for the first 4 days of week 4, then apply once daily for the remaining 3 days of week 4

**SIDE-EFFECTS**
Corneal thinning • scleral thinning

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
*EXCIPIENTS*: May contain Benzalkonium chloride, disodium edetate, polysorbates

▸ **Vexol** (Alcon Laboratories (UK) Ltd)
  Rimexolone 10 mg per 1 ml Vexol 10mg/ml eye drops | 5 ml (Pom) £3.37 DT price = £3.37

**1.3 Uveitis, anterior**

**ANTIMUSCARINICS**

**Antimuscarinics (eye)**

**CAUTIONS**
Darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage • mydriasis can precipitate acute angle-closure glaucoma (usually in those aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber)

**SIDE-EFFECTS**
Conjunctivitis (on prolonged administration) • contact dermatitis • eye oedema (on prolonged administration) • hyperaemia (on prolonged administration) • local irritation (on prolonged administration)
administration) - raised intraocular pressure - transient stinging

**PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

### Cyclopentolate hydrochloride

#### INDICATIONS AND DOSE

**Cycloplegia**

- **Adult:** (consult product literature)
- **Anterior uveitis**

**TO THE EYE USING EYE DROP**

- Adult: 10 mg (consult product literature)

#### SIDE-EFFECTS

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic side-effects can occur, particularly in children and the elderly.

#### MEDICINAL FORMS

- **Eye drops**
  - **ATROPINE SULFATE (Non-proprietary)**
    - Atropine sulfate 10 mg per 1 ml (Intrapharm Laboratories Ltd)
      - Minims atropine sulfate 1% eye drops 0.5ml unit dose £15.10
      - Atropine 1% eye drops 10 ml (BNF) £13.36

- **Cyclopentolate hydrochloride**

**INDICATIONS AND DOSE**

**Cycloplegia**

- **Child 3 months–11 years:** Apply 1 drop 30–60 minutes before examination, using 1% eye drops
- **Child 12–17 years:** Apply 1 drop 30–60 minutes before examination, using 0.5% eye drops

**Uveitis**

- **Child 3 months–17 years:** Apply 1 drop 2–4 times a day, using 0.5% eye drops (1% for deeply pigmented eyes)

**Adult:** (consult product literature)

#### SIDE-EFFECTS

**SIDE-EFFECTS, FURTHER INFORMATION**

Toxic systemic reactions can occur in children. Systemic side-effects can occur, particularly in children and the elderly.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose cyclopentolate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - May contain Benzalkonium chloride

- **Cyclopentolate hydrochloride 5 mg per 1 ml**
  - Minims cyclopentolate hydrochloride 0.5% eye drops 0.5ml unit dose £10.97
  - Cyclopentolate hydrochloride 0.5% eye drops 5 ml unit dose £11.23

- **Cyclopentolate hydrochloride 10 mg per 1 ml**
  - Minims cyclopentolate hydrochloride 1% eye drops 0.5ml unit dose £10.97
  - Cyclopentolate hydrochloride 1% eye drops 5 ml unit dose £11.23

### Homatropine hydrobromide

#### INDICATIONS AND DOSE

**Anterior uveitis**

- **Adult:** (consult product literature)

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

### Dry eye conditions

#### Dry eye

**Tear deficiency, ocular lubricants, and astringents**

- Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren’s syndrome) often responds to tear replacement therapy or pilocarpine p. 988 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

- Hypromellose p. 952 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose p. 952 with a mucolytic such as acetylcysteine below can be helpful.

- The ability of carbomers to cling to the eye surface may help reduce frequency of application to 4 times daily.

- Polyvinyl alcohol p. 952 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

- Sodium hyaluronate p. 953 eye drops are also used in the management of tear deficiency.

- Sodium chloride p. 953 0.9% drops are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. They are also used to irritate the eye. Special presentations of sodium chloride p. 953 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride p. 953 5% eye drops are used for the short-term treatment of corneal oedema in adults.

- Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleeping. Ointments should not be used during contact lens wear.

#### Ocular lubricants

**Acetylcysteine**

#### INDICATIONS AND DOSE

**Tear deficiency | Impaired or abnormal mucus production**

- **TO THE EYE**

- **Adult:** Apply 3–4 times a day
■ MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Ilube (Moorfields Pharmaceuticals)
  Acetylcysteine 50 mg per 1 ml I Ilube 5% eye drops | 10 ml [P/PA]
  £14.93 DT price = £10.09

Carbomers (Polyacrylic acid)

INDICATIONS AND DOSE
Dry eyes including keratoconjunctivitis sicca, unstable tear film

TO THE EYE
- Child: Apply 3–4 times a day or when required
- Adult: Apply 3–4 times a day or when required

■ UNLICENSED USE
Some preparations not licensed for use in children.

■ PRESCRIBING AND DISPENSING INFORMATION
Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol.

■ MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

  **Tear-Lac** (Scope Ophthalmics Ltd)
  
  Hypromellose 3 mg per 1 ml Tear-Lac 0.3% eye drops preservative free | 10 ml | £0.75

  **Xalilin Hydrate** (Nicox Pharma)
  
  Hypromellose 3 mg per 1 ml Xalilin Hydrate 0.3% eye drops preservative free | 10 ml | £4.60

---

**Hypromellose with dextran 70**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypromellose above.

**INDICATIONS AND DOSE**

**Tear deficiency**

- **TO THE EYE**
  
  - Child: Apply as required
  
  - Adult: Apply as required

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Tears Naturale (Alcon Laboratories (UK) Ltd)
  
  Dextran 70 1 mg per 1 ml Hypromelose 3 mg per 1 ml Tears Naturale eye drops | 15 ml | £1.89

  Tears Naturale eye drops 0.4ml unit dose | 28 unit dose | £13.26

---

**Polyvinyl alcohol**

**INDICATIONS AND DOSE**

**Tear deficiency**

- **TO THE EYE**
  
  - Child: Apply as required
  
  - Adult: Apply as required

---

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose polyvinyl alcohol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **POLYVINYL ALCOHOL (Non-proprietary)**
  
  Polyvinyl alcohol 14 mg per 1 ml PVA 1.4% eye drops | 15 ml | £1.63

  Polyvinyl alcohol 1.4% eye drops 0.4ml unit dose preservative free | 30 unit dose | no price available

  Polyvinyl alcohol 1.4% eye drops | 10 ml | no price available | 15 ml | no price available

  **Liquifilm Tears** (Allergan Ltd)
  
  Polyvinyl alcohol 14 mg per 1 ml Liquifilm Tears 1.4% eye drops | 15 ml | £1.93

  Liquifilm Tears 1.4% eye drops 0.4ml unit dose preservative free | 30 unit dose | £3.35

  Refresh Ophthalmic (Allergan Ltd)
  
  Polyvinyl alcohol 14 mg per 1 ml Refresh Ophthalmic 1.4% eye drops 0.4ml unit dose | 30 unit dose | £2.25

  Sno Tears (Bausch & Lomb UK Ltd)
  
  Polyvinyl alcohol 14 mg per 1 ml Sno Tears 1.4% eye drops | 10 ml | £1.06

---

**Retinol palmitate with white soft paraffin and light liquid paraffin and liquid paraffin and wool**

**INDICATIONS AND DOSE**

**Dry eye conditions**

- **TO THE EYE**
  
  - Adult: (consult product literature)

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Sodium chloride

**INDICATIONS AND DOSE**
Irrigation, including first-aid removal of harmful substances TO THE EYE
- Child: Apply as required
- Adult: Apply as required

Tear deficiency | Ocular lubricants and astringents | Irrigation of the eye | Intra-ocular or topical irrigation during surgical procedures | Corneal oedema TO THE EYE
- Child: Apply as required
- Adult: Apply as required

*PRESCRIBING AND DISPENSING INFORMATION*  Although multi-dose sodium chloride eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

*MEDICINAL FORMS*
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment

**Eye drops**
- **SODIUM CHLORIDE (Non-proprietary)**
  - Sodium chloride 9 mg per 1 ml
  - Sodium chloride 50 mg per 1 ml
  - Sodium chloride 5% eye drops preservative free
  - Sodium chloride 5% eye drops
  - Sodium chloride 0.45ml unit dose preservative free
  - Sodium chloride 5% eye drops
  - Sodium chloride 10 ml
- **Hylo-Comod** (Scope Ophthalmics Ltd)
  - Hylo-Comod 0.2% eye drops preservative free
- **Vismed** (TRB Chemidica (UK) Ltd)
  - Vismed Multi 0.18% eye drops preservative free
  - Vismed Multi 0.18% eye drops preservative free
- **Xailin HA** (Nicot Pharma)
  - Xailin HA 0.2% eye drops preservative free

*Eye ointment*
- **SODIUM CHLORIDE (Non-proprietary)**
  - Sodium chloride 5% eye ointment preservative free
  - Sodium chloride 5 gram

Sodium hyaluronate

**INDICATIONS AND DOSE**
Dry eye conditions TO THE EYE
- Adult: Apply as required

*PRESCRIBING AND DISPENSING INFORMATION*  Some preparations are contained in units which are resealable and may be used for up to 12 hours. Although multi-dose sodium hyaluronate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

*MEDICINAL FORMS*
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Artefac Rebalance** (Bausch & Lomb UK Ltd)
  - Artefac Rebalance 0.15% eye drops
- **Artelac Splash** (Bausch & Lomb UK Ltd)
  - Artelac Splash 0.2% eye drops
- **Blink Intensive** (AMO UK Ltd)
  - Blink Intensive Tears 0.2% eye drops
- **Clinitas** (AltaCor Ltd)
  - Clinitas Multi 0.4% eye drops preservative free
  - Clinitas 0.4% eye drops 0.5ml unit dose

**Soybean oil**

**INDICATIONS AND DOSE**
Dry eye conditions TO THE EYE
- Child: Apply up to 4 times a day
- Adult: Apply up to 4 times a day

*MEDICINAL FORMS*
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Emustil** (Moorfields Pharmaceuticals)
  - Emustil eye drops 0.3ml unit dose preservative free

**Paraffins**

**Liquid paraffin with white soft paraffin and wool alcohols**

**INDICATIONS AND DOSE**
Dry eye conditions TO THE EYE
- Child: Apply as required, best suited for application before sleep
- Adult: Apply as required, best suited for application before sleep

*MEDICINAL FORMS*
There can be variation in the licensing of different medicines containing the same drug.
Eye infections

Eye infections are broadly categorized into:
- Bacterial
- Viral
- Fungal
- Allergic
- Other conditions

**Bacterial infections**

- **Staphylococcal infections**
  - Treated with antibiotics such as cephalosporins, clindamycin, or methicillin.
  - Tetracyclines are also active against a wide variety of bacteria.
- **Gonococcal conjunctivitis**
  - Treated with penicillin or cephalosporins.
- **Bacterial endophthalmitis**
  - Requires immediate treatment, often with intravitreal injection.
- **Ocular cicatricial pemphigoid**
  - Treated with corticosteroids and immunosuppressants.

**Viral infections**

- **Herpes simplex**
  - Treated with aciclovir, if infection is localized.
  - May require oral or intravenous aciclovir for severe cases.
- **Herpes zoster**
  - Treated with aciclovir, often with corticosteroids to reduce complications.
- **CMV retinitis**
  - Treated with antiviral agents such as ganciclovir or foscarnet.

**Fungal infections**

- **Epidermophyton**
  - Treated with oral griseofulvin.
- **Cryptococcus**
  - Treated with amphotericin B or fluconazole.
- **Aspergillus**
  - Treated with voriconazole or caspofungin.

**Allergic conditions**

- **Allergic conjunctivitis**
  - Treated with antihistamines and topical corticosteroids.

**Other conditions**

- **Trachoma**
  - A blinding bacterial infection caused by Chlamydia trachomatis.
  - Treated with doxycycline or azithromycin.
- **Acute conjunctivitis**
  - Usually viral in origin and self-limiting.
  - Treat with cold compresses or artificial tears.

**Systemic treatment**

- **Intravitreal injection** for some conditions such as endophthalmitis.
- **Corticosteroids** for severe inflammatory conditions.

**Antibacterial eye preparations**

- **Chloramphenicol**
  - Well tolerated and effective against a wide range of bacteria.
- **Gentamicin**
  - Used for more severe bacterial infections.
- **Moxifloxacin**
  - Effective against most bacterial strains.
- **Chlorhexidine**
  - Used for antiseptic wound care.

**Antifungal eye preparations**

- **Miconazole**
  - Used for fungal infections of the cornea.
- **Fluconazole**
  - Used for more severe fungal infections.

**Antiviral eye preparations**

- **Ganciclovir**
  - Used for CMV retinitis.
- **Aciclovir**
  - Used for herpes simplex infections.
- **Foscarnet**
  - Used for severe herpes zoster.

**Ophthalmic preparations**

- **Eye ointments**
  - Used for conditions requiring prolonged application.
- **Eye drops**
  - Used for conditions requiring frequent application.

**Indications and dosage**

- **Eye surface lubrication**
  - Apply every 2 hours as required.
  - For conditions such as dry eye syndrome.
- **Antibacterial eye ointment**
  - Apply every 2 hours as required.
  - For conditions requiring prolonged application.

**Patient and carer advice**

- **Contact lens wear**
  - Avoid using contact lenses during eye infections.
- **Wound care**
  - Cleanse wounds gently to avoid infection.

**Medicinal forms**

- **Ointment**
  - Available in various forms such as paraffin, yellow, soft.
- **Lacri-Lube**
  - A preservative-free eye drops.
- **Propamidine isetionate**
  - Used for treatment of corneal ulcer.

**Administration**

- **Frequency of application**
  - Adjusted based on severity and response.
  - For conditions such as corneal ulcer.

**References**

- **Chloramphenicol**
  - Available on a named-patient basis from specialist centres.
- **Moxifloxacin**
  - Used for treatment of bacterial infections.

**Further reading**

- **British National Formulary**
  - Provides detailed information on medications.
- **Moorfields Eye Hospital**
  - Offers specialist advice and treatment.

**Note**

- **Caution**
  - Avoid using eye medications if there is a history of allergy.
  - Discontinue medications if there is no improvement.

---

**Key points**

- **Bacterial infections**
  - Treated with antibiotics.
  - Systemic treatment may be required.
- **Viral infections**
  - Treated with antiviral agents.
  - Systemic treatment may be needed.
- **Fungal infections**
  - Treated with antifungal agents.
  - Systemic treatment may be used.
- **Allergic conditions**
  - Treated with antihistamines and topical corticosteroids.
  - Systemic treatment may be used.
- **Other conditions**
  - Treated with specific medications.
  - Systemic treatment may be used.

**Further information**

- **Moorfields Eye Hospital**
  - Provides specialist advice and treatment.
- **British National Formulary**
  - Provides detailed information on medications.
3.1 Bacterial eye infection

Azithromycin

**INDICATIONS AND DOSE**

Trachomatous conjunctivitis caused by *Chlamydia trachomatis* | Purulent bacterial conjunctivitis

TO THE EYE

- **Child:** Apply twice daily for 3 days, review if no improvement after 3 days of treatment
- **Adult:** Apply twice daily for 3 days, review if no improvement after 3 days of treatment

**SIDE-EFFECTS**

- **Common or very common** Blurred vision - ocular burning - ocular discomfort - ocular pruritus
- **Uncommon** Conjunctival hyperaemia - eyelid eczema - eyelid erythema - eyelid oedema - keratitis

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **Azityer** (Spectrum Thea Pharmaceuticals Ltd)
  - Azithromycin dihydrate 15 mg per 1 gram
  - Azityer 15mg/g eye drops 0.25g unit dose | 6 unit dose [P] £6.99 DT price = £6.99

Cefuroxime

**INDICATIONS AND DOSE**

**APROKAM** INTRACAMERAL INJECTION

Prophylaxis of endophthalmitis after cataract surgery

**B**Y **IN**TRACAMERAL **I**NJECTION

- **Adult:** 1 mg, dose to be injected into the anterior chamber of the eye at the end of cataract surgery

**CAUTIONS**

- **APROKAM** INTRACAMERAL INJECTION
  - Combined operations with cataract surgery - complicated cataracts - reduced corneal endothelial cells (less than 2000) - severe risk of infection - severe thyroid disease
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Aprokam** (Spectrum Thea Pharmaceuticals Ltd)
  - Cefuroxime (as Cefuroxime sodium) 50 mg
  - Aprokam 50mg powder for solution for injection vials | 10 vial [P] £73.50

Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

**TO THE EYE USING EYE DROP**

- **Child:** Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
- **Adult:** Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for

48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

**TO THE EYE USING EYE OINTMENT**

- **Child:** Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone
- **Adult:** Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

**UNLICENSED USE** Oral azithromycin not licensed for trachoma which results from chronic infection with *Chlamydia trachomatis*.

**SIDE-EFFECTS** Transient stinging

**PREGNANCY** Avoid unless essential—no information on topical use but risk of ‘neonatal grey-baby syndrome’ with oral use in third trimester.

**BREAST FEEDING** Avoid unless essential—theoretical risk of bone-marrow toxicity.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**EXCEPTIONS TO LEGAL CATEGORY** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Phenylmercuric acetate

- **CHLORAMPHENICOL (Non-proprietary)**
  - Chloramphenicol 5 mg per 1 ml
  - Chloramphenicol Antibiotic 0.5% eye drops | 10 ml [P] £1.70 DT price = £1.50
  - Golden Eye Antibiotic 0.5% eye drops | 10 ml [P] £3.26 DT price = £1.50

- Minims chloramphenicol 0.5% eye drops 0.5ml unit dose | 20 unit dose [P] £10.99 DT price = £10.99

- Chloramphenicol 0.5% eye drops | 10 ml [P] £2.68 DT price = £1.50

- Tubilux Infected Eyes 0.5% eye drops | 10 ml [P] £2.75 DT price = £1.50

- **Brochlor** (Sanofi)
  - Chloramphenicol 5 mg per 1 ml
  - Brochlor 0.5% eye drops | 10 ml [P] £2.83 DT price = £1.50

- **Chloromycetin (AMCo)**
  - Chloramphenicol 5 mg per 1 ml
  - Chloromycetin Redidrops 0.5% | 5 ml [P] £1.65 | 10 ml [P] £9.90 DT price = £1.50

- **Optrex Infected Eyes** (Reckitt Benckiser Healthcare (UK) Ltd)
  - Chloramphenicol 5 mg per 1 ml
  - Optrex Infected Eyes 0.5% eye drops | 10 ml [P] £3.75 DT price = £1.50

**Eye ointment**

- **CHLORAMPHENICOL (Non-proprietary)**
  - Chloramphenicol 10 mg per 1 gram
  - Chloramphenicol 1% eye ointment | 4 gram [P] £4.26 DT price = £1.95

- Golden Eye Antibiotic 1% eye ointment | 4 gram [P] £3.49 DT price = £1.95

- **Brochlor** (Sanofi)
  - Chloramphenicol 10 mg per 1 gram
  - Brochlor 1% eye ointment | 4 gram [P] £2.95 DT price = £1.95

- **Chloromycetin (AMCo)**
  - Chloramphenicol 10 mg per 1 gram
  - Chloromycetin 1% eye ointment | 4 gram [P] £4.97 DT price = £1.95

- **Optrex Infected Eyes** (Reckitt Benckiser Healthcare (UK) Ltd)
  - Chloramphenicol 10 mg per 1 gram
  - Optrex Infected Eyes 1% eye ointment | 4 gram [P] £3.88 DT price = £1.95
Ciprofloxacin

**INDICATIONS AND DOSE**

**Superficial bacterial eye infection**

**TO THE EYE USING EYE DROP**

- **Child:** Apply 4 times a day for maximum duration of treatment 21 days
- **Adult:** Apply 4 times a day for maximum duration of treatment 21 days

**TO THE EYE USING EYE OINTMENT**

- **Child 1-17 years:** Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
- **Adult:** Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

**Superficial bacterial eye infection (severe infection)**

**TO THE EYE USING EYE DROP**

- **Child:** Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
- **Adult:** Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

**TO THE EYE USING EYE OINTMENT**

- **Child 1-17 years:** Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night
- **Adult:** Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

**Corneal ulcer**

**TO THE EYE USING EYE DROP**

- **Child:** Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- **Adult:** Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night

**TO THE EYE USING EYE OINTMENT**

- **Child 1-17 years:** Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night
- **Adult:** Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

**UNLICENSED USE**

Eye ointment not licensed for use in children under 1 year.

**SIDE-EFFECTS**

- **Common or very common** Corneal deposits (reversible after completion of treatment) · ocular discomfort · ocular hyperaemia · taste disturbance
- **Uncommon** Blurred vision · conjunctival hyperaemia · corneal infiltrates · corneal staining · eye dryness · eye irritation · eye pain · eye pruritus · eye swelling · eyelid disorders · eyelid erythema · eyelid exfoliation · eyelid oedema · headache · increased lacrimation · keratopathy · nausea · photophobia
- **Rare** Abdominal pain · asthenopia · corneal disorders · corneal epithelium defect · dermatitis · diarrhoea · diplopia · diziness · ear pain · eye hypoesthesia · keratitis · paranasal sinus hyperssecretion · rhinitis

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- **Ciloxan** (Alcon Laboratories (UK) Ltd)
  - **Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml**
  - **Gentamicin (as Gentamicin sulfate) 0.3% eye drops | 5 ml (PVP) £4.70 DT price = £4.70**

**Eye ointment**

- **Ciloxan** (Alcon Laboratories (UK) Ltd)
  - **Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 gram**
  - **Gentamicin (as Gentamicin sulfate) 0.3% eye drops | 3.5 gram (PVP) £3.22**

**Fusidic acid**

**INDICATIONS AND DOSE**

Staphylococcal eye infections

**TO THE EYE**

- **Child:** Apply twice daily
- **Adult:** Apply twice daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Medicines not identified.

**Gentamicin**

**INDICATIONS AND DOSE**

Bacterial eye infections

**TO THE EYE**

- **Child:** Apply 1 drop every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient
- **Adult:** Apply 1 drop every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Ear/eye drops solution**

EXCIPIENTS: May contain Benzalkonium chloride

- **GENTAMICIN (Non-proprietary)**
  - **Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml**
  - **Gentamicin 0.3% eye/ear drops | 10 ml (PVP) £2.13 DT price = £2.13**
  - **Gentamicin 0.3% eye/ear drops | 10 ml (PVP) £2.13 DT price = £2.13**
  - **Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml**

**Levofloxacin**

**INDICATIONS AND DOSE**

Local treatment of eye infections

**TO THE EYE**

- **Child 1-17 years:** Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days
- **Adult:** Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days
Moxifloxacin

**INDICATIONS AND DOSE**
Local treatment of infections

**TO THE EYE**
- Child: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days
- Adult: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days

**CAUTIONS**
- Not recommended for neonates

**SIDE-EFFECTS**
- **Common or very common** Ocular burning - visual disturbances
- **Uncommon** Conjunctival follicles - headache - lid erythema - lid oedema - ocular discomfort - ocular dryness - ocular itching - ocular pain - photophobia - rhinitis

**PREGNANCY**
Manufacturer advises avoid unless benefit outweighs risk.

**BREAST FEEDING**
Manufacturer advises avoid.

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
- **EXCIPIENTS:** May contain Benzalkonium chloride
  - **Oftaquix** (Santen)
    - Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml
    - Oftaquix Smg/ml eye drops 0.5ml unit dose | 30 unit dose | DT price = £17.95
  - Oftaquix Smg/ml eye drops | 5 ml | DT price = £6.95

Ofloxacin

**INDICATIONS AND DOSE**
Local treatment of infections

**TO THE EYE**
- Child 1-17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment
- Adult: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

**CAUTIONS**
- Corneal ulcer (risk of corneal perforation) - epithelial defect (risk of corneal perforation)

**SIDE-EFFECTS**
- **Common or very common** Eye irritation - ocular discomfort
- **Frequency not known** Dry eyes - facial oedema - increased lacrimation - keratitis - ocular hyperaemia - ocular oedema - photophobia - visual disturbances

**PREGNANCY**
Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in animal studies).

**BREAST FEEDING**
Manufacturer advises avoid.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
- **EXCIPIENTS:** May contain Benzalkonium chloride
  - **Exocin** (Allergan Ltd)
    - Ofloxacin 3 mg per 1 ml
    - Exocin 0.3% eye drops | 5 ml | DT price = £2.17
    - DT price = £2.17

Propamidine isetionate

**INDICATIONS AND DOSE**
*Acanthamoeba keratitis* infections (specialist use only)
Local treatment of eye infections

**TO THE EYE USING EYE OINTMENT**
- Adult: Apply 1–2 times a day
- Child: Apply twice daily for first day, then apply up to 4 times a day

**UNLICENSED USE**
Not licensed for *Acanthamoeba keratitis* infections.

**SIDE-EFFECTS**
- Eye irritation - eye pain

**PREGNANCY**
Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING**
Manufacturer advises avoid unless essential—no information available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
- **EXCIPIENTS:** May contain Benzalkonium chloride
  - **PROPAMIDINE ISETIONATE (Non-proprietary)**
    - Propamidine isetionate 1 mg per 1 ml
    - Golden Eye 0.1% drops | 10 ml | DT price = £3.26
    - Brolene (Propamidine) (Sanofi)
      - Propamidine isetionate 1 mg per 1 ml
      - Brolene 0.1% eye drops | 10 ml | DT price = £2.80
  - **PROPAMIDINE ISETIONATE (Non-proprietary)**
    - Dibrompropamidine isetionate 1.5 mg per 1 gram
    - Golden Eye 0.15% ointment | 5 gram | DT price = £3.49
    - Brolene (Dibrompropamide) (Sanofi)
    - Dibrompropamide isetionate 1.5 mg per 1 gram
    - Brolene 0.15% eye ointment | 5 gram | DT price = £2.92

Eye ointment
- **PROPAMIDINE ISETIONATE (Non-proprietary)**
  - Dibrompropamidine isetionate 1.5 mg per 1 gram
  - Golden Eye 0.15% ointment | 5 gram | DT price = £3.49

Tobramycin

**INDICATIONS AND DOSE**
Local treatment of infections

**TO THE EYE**
- Child 1-17 years: Apply twice daily for 6–8 days
- Adult: Apply twice daily for 6–8 days

Local treatment of infections (severe infection)

**TO THE EYE**
- Child 1-17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days
- Adult: Apply 4 times a day for first day, then apply twice daily for 5–7 days
3.2 Herpes simplex infection

Aciclovir

(Acyliclovir)

**INDICATIONS AND DOSE**

Herpes simplex infection (local treatment) TO THE EYE USING EYE OINTMENT
- Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing
- Adult: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

**SIDE-EFFECTS**
- Common or very common Local inflammation - local irritation - superficial punctate keratopathy
- Rare Blepharitis
- Very rare Angioedema - hypersensitivity reactions

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**
- **Zovirax** (GlaxoSmithKline UK Ltd)
  - Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram £6.13 70 DT price = £9.34

Ganciclovir

**INDICATIONS AND DOSE**

Local treatment of herpes simplex infections TO THE EYE
- Adult: Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days

**SIDE-EFFECTS**
- Burning sensation - superficial punctate keratitis - tingling

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye gel**
- **EXCipients**: May contain Benzalkonium chloride
- **Tobravir (Spectrum Thea Pharmaceuticals Ltd)**
  - Ganciclovir 1.5 mg per 1 gram Tobravir 0.15% eye gel | 5 gram £19.99 DT price = £19.99

4 Eye procedures

Mydriatics and cycloplegics

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action. Short-acting, relatively weak mydriatics, such as tropicamide below 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride p. 950 1% (action up to 24 hours) or atropine sulfate p. 950 (action up to 7 days).

Phenylephrine hydrochloride p. 959 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate p. 950 is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride p. 950 or homatropine hydrobromide p. 950 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**Drugs used for Eye procedures not listed below:**
*Fluorescein with lidocaine, p. 960

ANTIMUSCARINICS

Tropicamide

The properties listed below are those particular to the drug only. For the properties common to the class, see Antimuscarinics (eye) p. 949.

**INDICATIONS AND DOSE**

Funduscopy TO THE EYE
- Child: 0.5% eye drops to be applied 20 minutes before examination
- Adult: (consult product literature)

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCipients**: May contain Benzalkonium chloride, edet acid (edta)
  - TROPICAMIDE (Non-proprietary)
    - Tropicamide 5 mg per 1 ml Tropicamide 5% drops 0.5ml unit dose | 20 unit dose | £10.75
    - Tropicamide 10 mg per 1 ml Tropicamide 10% drops 0.5ml unit dose | 20 unit dose | £10.77
  - **Mydriacyl** (Alcon Laboratories (UK) Ltd)
    - Tropicamide 5 mg per 1 ml Mydriacyl 0.5% eye drops | 5 ml | £1.29
    - Tropicamide 10 mg per 1 ml Mydriacyl 1% eye drops | 5 ml | £1.60

Phenylephrine with tropicamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 959, tropicamide above.
INDICATIONS AND DOSE
Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient
TO THE EYE
  ▶ Adult: One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

DIRECTIONS FOR ADMINISTRATION
Patients with severe dry eyes may require a drop of saline to improve insert tolerance.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
  ▶ Mydriaser (Spectrum Thea Pharmaceuticals Ltd)
    Phenylephrine hydrochloride 5.4 mg, Tropicamide 0.28 mg
    Mydriaser 5.4mg / 0.28mg ophthalmic inserts | 20 insert (PM) £84.00

DIAGNOSTIC DYES
Fluorescein sodium

INDICATIONS AND DOSE
Detection of lesions and foreign bodies
TO THE EYE USING EYE DROP
  ▶ Adult: Use sufficient amount to stain damaged areas

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
  ▶ FLUORESCIN SODIUM (Non-proprietary)
    Fluorescein sodium 10 mg per 1 ml Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose (P) £8.89
    Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose (P) £18.89

MIOTICS
Acetylcholine chloride

INDICATIONS AND DOSE
Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis
TO THE EYE
  ▶ Adult: (consult product literature)

CAUTIONS
Asthma - gastro-intestinal spasm - heart failure - hyperthyroidism - parkinsonism - peptic ulcer - urinary-tract obstruction
SIDE-EFFECTS
Rare Bradycardia - breathing difficulty - flushing - hypotension - sweating
PREGNANCY
Avoid unless potential benefit outweighs risk—no information available.
BREAST FEEDING
Avoid unless potential benefit outweighs risk—no information available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
  ▶ Irrigation
    Miochol-E (Bausch & Lomb UK Ltd)
    Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial (PM) £7.28
    Miphtel (Alain Pharmaceuticals)
    Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule (PM) £6.55 (Hospital only)

SYMPATHOMIMETICS (VASOCONSTRICTOR)
Phenylephrine hydrochloride

INDICATIONS AND DOSE
Mydriasis
TO THE EYE
  ▶ Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
  ▶ Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

CONTRA-INDICATIONS
Hypertension - 10% strength eye drops in neonates, children and the elderly - aneurysms - cardiovascular disease - thyrotoxicosis

CAUTIONS
Asthma - cerebral arteriosclerosis (in adults) - corneal epithelial damage - darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. - diabetes (avoid eye drops in long standing diabetes) - mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted) or children, who are predisposed to the condition because of a shallow anterior chamber - mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber - ocular hyperaemia - susceptibility to angle-closure glaucoma
INTERACTIONS
→ Appendix 1 (sympathomimetics). Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.
SIDE-EFFECTS
Arrhythmias - blurred vision - conjunctivitis on prolonged administration - coronary artery spasm - extrasystoles - hyperaemia on prolonged administration - hypertension - local irritation on prolonged administration - myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) - oedema on prolonged administration - palpitation - photophobia - raised intraocular pressure - tachycardia - transient stinging
PREGNANCY
Use only if potential benefit outweighs risk.
BREAST FEEDING
Use only if potential benefit outweighs risk—no information available.
PRESCRIBING AND DISPENSING INFORMATION
Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
PATIENT AND CARER ADVICE
Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

EXCipients: May contain Dismodium edetate, sodium metabisulfite

Eye drops
  ▶ PHENYLEPHRINE HYDROCHLORIDE (Non-proprietary)
    Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose (P) £11.41
    Phenylephrine hydrochloride 100 mg per 1 ml Minims phenylephrine hydrochloride 10% eye drops 0.5ml unit dose | 20 unit dose (P) £11.41
4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Cefuroxime p. 955, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 961, flurbiprofen p. 961, ketorolac trometamol p. 961, and nepafenac p. 961, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 961 is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac sodium p. 961 and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine p. 963, an alpha,-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylecholine chloride p. 959, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 953 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

Local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine p. 961 are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride below or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 961 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 196, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

CORTICOSTEROIDS

Loteprednol etabonate

INDICATIONS AND DOSE

Treatment of post-operative inflammation following ocular surgery

TO THE EYE

Adult: Apply 4 times a day for maximum duration of treatment of 14 days, to be started 24 hours after surgery

SIDE-EFFECTS

Corneal thinning, scleral thinning

LOCAL ANAESTHETICS

Fluorescein with lidocaine

INDICATIONS AND DOSE

Local anaesthesia

TO THE EYE

Adult: Apply as required

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Lotemax (Bausch & Lomb UK Ltd)

Loteprednol etabonate 5 mg per 1 ml Lotemax 0.5% eye drops

5 ml (Disp) £5.50 QT price = £5.50

Oxybuprocaine hydrochloride (Benoxinate hydrochloride)

INDICATIONS AND DOSE

Local anaesthetic

TO THE EYE

Adult: As required

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

FLUORESEE WITH LIDOCAINE (Non-proprietary)

Fluorescein sodium 2.5 mg per 1 ml Lidocaine hydrochloride 40 mg per 1 ml Minims lidocaine and fluorescein eye drops 0.5ml unit dose 20 unit dose (Disp) £11.24

Proxymetacaine hydrochloride

INDICATIONS AND DOSE

Local anaesthetic

TO THE EYE

Adult: As required

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

PROXYMETACAINE HYDROCHLORIDE (Non-proprietary)

Proxymetacaine hydrochloride 4 mg per 1 ml Minims proxymetacaine hydrochloride 0.4% eye drops 0.5ml unit dose 20 unit dose (Disp) £10.15

Proxymetacaine hydrochloride

INDICATIONS AND DOSE

Local anaesthetic

TO THE EYE

Adult: As required

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

PROXYMETACAINE HYDROCHLORIDE (Non-proprietary)

Proxymetacaine hydrochloride 5 mg per 1 ml Minims proxymetacaine 0.5% eye drops 0.5ml unit dose 20 unit dose (Disp) £11.54
**Bromfenac**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **TETRACAINE (Non-proprietary)**
  - Tetracaine hydrochloride 5 mg per 1 ml Minims tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [Pom] £10.16
  - Tetracaine hydrochloride 10 mg per 1 ml Minims tetracaine hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [Pom] £10.16
- **BROMOCAINO (Amethocaine)**
  - Yellox 0.5% eye drops | 5 ml [Pom] £3.64
- **Tetracaine**
  - Minims Tetracaine 0.5% eye drops 0.5 ml unit dose | 20 unit dose [Pom] £5.20

**Diclofenac sodium**

**INDICATIONS AND DOSE**
Inhibition of intra-operative miosis during cataract surgery | Postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty | Pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma | Seasonal allergic conjunctivitis

**TO THE EYE**
- Adult: (consult product literature)

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **VOLTAROL OPHTHA MULTIDOSE (Spectrum Thea Pharmaceuticals Ltd)**
  - Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha Multidose 0.1% eye drops | 5 ml [Pom] £4.00 | 40 unit dose [Pom] £32.00

**Flurbiprofen**

**INDICATIONS AND DOSE**
Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

**TO THE EYE**
- Adult: (consult product literature)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **OCUFEN (Allergan Ltd)**
  - Flurbiprofen sodium 300 microgram per 1 ml Ocufen 0.03% eye drops 0.4ml unit dose | 40 unit dose [Pom] £37.15

**Ketorolac trometamol**

**INDICATIONS AND DOSE**
Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

**TO THE EYE**
- Adult: (consult product literature)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **ACULAR (Allergan Ltd)**
  - Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml [Pom] £3.00 DT price = £3.00

**Nepafenac**

**INDICATIONS AND DOSE**
Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery | Reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients

**TO THE EYE**
- Adult: (consult product literature)

**CAUTIONS**
Avoid sunlight - corneal epithelial breakdown (if evidence of, then discontinue immediately)

**SIDE-EFFECTS**
- **Common or very common** Punctate keratitis
- **Uncommon** Allergic conjunctivitis - blurred vision - choroidal effusion - conjunctival hyperaemia - corneal deposits - corneal epithelial defect - dry eye - eye pruritus - headache - increased lacrimation - iritis - keratitis - nausea - ocular discomfort - photophobia
- **Frequency not known** Corneal opacity - dermatochalasis - dizziness - eye swelling - impaired corneal healing - reduced visual acuity

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Eye drops
EXCIPIENTS: May contain benzalkonium chloride, disodium edetate
▶ Nevanan (Alcon Laboratories (UK) Ltd)
Nepafenac 1 mg per 1 ml Nevanan 1mg/ml eye drops | 5 ml £14.52

IODINE PRODUCTS
Povidone-iodine
INDICATIONS AND DOSE
Cutaneous peri-ocular and conjunctival antisepsis before surgical procedure
TO THE EYE
▶ Adult: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

CONTRA-INDICATIONS
Concomitant use of ocular antimicrobial drugs - concomitant use of ocular formulations containing mercury-based preservatives - preterm neonates
SIDE-EFFECTS
▶ Rare Conjunctival hyperaemia - superficial punctate keratitis
▶ Frequency not known Cytotoxicity on deep tissue - cytotoxicity on mucous membranes - hypothyroidism in neonates - residual yellow coloration of the conjunctiva

PRESCRIBING AND DISPENSING INFORMATION
Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye lotion
Eye drops
▶ Povidone-iodine (Non-proprietary)
Povidone-iodine 50 mg per 1 ml Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose (Pod) £16.00

5 Glaucoma and ocular hypertension

Glaucoma
Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Acute angle-closure glaucoma
Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

Beta-blockers
Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol p. 964, carteolol hydrochloride p. 964, levobunolol hydrochloride p. 964, and timolol maleate p. 965.

Prostaglandin analogues and prostamides
The prostaglandin analogues latanoprost p. 969, tafroprost p. 969 and travoprost p. 970, and the synthetic prostamide, bimatoprost p. 968, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

Sympathomimetics
Brimonidine tartrate p. 963, a selective alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other anti-glaucoma therapy.

Apraclonidine p. 963 is another alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine p. 963 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Apraclonidine may not provide additional benefit in patients already using two drugs that suppress the production of aqueous humour.

Carbonic anhydrase inhibitors and systemic drugs
The carbonic anhydrase inhibitors, acetazolamide p. 965, brinzolamide p. 966, and dorzolamide p. 967, reduce intra-ocular pressure by reducing aqueous humour production.

Systemic use of acetazolamide also produces weak diuresis. Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure.

Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic...
absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The osmotic diuretics, intravenous hypertonic mannitol p. 202 or glycerol by mouth are useful short-term ocular hypotensive drugs.

Miotics
Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

Pilocarpine p. 967, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

**ALPHA₂-ADRENOCEPTOR AGONISTS**

**Apraclonidine**

**DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

**INDICATIONS AND DOSE**
Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

→ **TO THE EYE**
  → Adult: Apply 1 drop 1 hour before laser procedure, then 1 drop immediately after completion of procedure, 1% eye drops to be administered
  → Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

→ **TO THE EYE**
  → Adult: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease

**CAUTIONS** Cerebrovascular disease • depression • heart failure • history of angina • hypertension • loss of effect may occur over time • Parkinson’s syndrome • Raynaud’s syndrome • recent myocardial infarction • reduction in vision in end-stage glaucoma (suspend treatment) • severe coronary insufficiency • thromboangiitis obliterans • vasovagal attack

**INTERACTIONS** → Appendix 1 (apraclonidine).

**SIDE-EFFECTS**
- Common or very common Conjunctivitis • dry eye • ocular intolerance • rhinitis • taste disturbance
- Uncommon Asthma • blepharitis • blepharospasm • chest pain • conjunctival vascular disorders • corneal erosion and infiltrates • dysphoria • eyelid ptosis or retraction • impaired co-ordination • irritability • keratitis • keratopathy • myalgia • mydriasis • nervousness • parosmia • photophobia • rhinorrhoea • throat irritation • visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION**
Ocular intolerance Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

Systemic effects Since absorption may follow topical application, see clonidine hydrochloride p. 137.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Use with caution in chronic renal failure.

**MONITORING REQUIREMENTS**
- Monitor intra-ocular pressure and visual fields.
- Monitor for excessive reduction in intra-ocular pressure following peri-operative use.

**PATIENT AND CARER ADVICE**
Drowsiness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCipients: May contain Benzalkonium chloride

- **Iopidine** (Alcon Laboratories (UK) Ltd)
  - Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml
  - Iopidine 5mg/ml eye drops | 5 ml (POSt) £10.88 DT price = £10.88
  - Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml
  - Iopidine 2% eye drops 0.25ml unit dose | 24 unit dose (POSt) £77.85 DT price = £77.85

**Brimonidine tartrate**

**DRUG ACTION** Brimonidine, an alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

**INDICATIONS AND DOSE**
Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate | Ocular hypertension in patients for whom beta-blockers are inappropriate | Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy

→ **TO THE EYE**
  → Adult: Apply twice daily

**CONTRA-INDICATIONS** Neonates and children under 2 years (risk of severe systemic side-effects)

**CAUTIONS** Cerebral insufficiency • children 2–12 years (increased risk of drowsiness) • coronary insufficiency • depression • postural hypotension • Raynaud’s syndrome • severe cardiovascular disease • thromboangiitis obliterans

**INTERACTIONS** → Appendix 1 (brimonidine).

**SIDE-EFFECTS**
- Common or very common Burning sensation at application site • conjunctival blanching • conjunctival disturbances • conjunctival follicles • conjunctival infection • corneal erosion • corneal staining • dizziness • drowsiness • dry mouth • eyelid inflammation • gastro-intestinal disturbances • headache • malaise • ocular disturbances • ocular dryness • ocular hyperaemia • ocular pain • ocular pruritus • photophobia • stinging at application site • taste disturbances • upper respiratory symptoms • visual disturbances
- Uncommon Arrhythmia • bradycardia • depression • nasal dryness • palpitation • tachycardia
- Rare Dyspnoea
- Very rare Hypertension • hypotension • insomnia • irritis • miosis • syncope

**PREGNANCY** Limited information available; manufacturer advises use only if benefit outweighs risk (eye drops).

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises use with caution.

**RENAL IMPAIRMENT** Manufacturer advises use with caution.
**Brimonidine with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bromidine tartrate p. 963, timolol maleate p. 965.

### INDICATIONS AND DOSE

Raised intraocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate

**TO THE EYE**

- **Adult:** Apply twice daily

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

**EXCIPIENTS:** May contain Benzalkonium chloride

- Bromonidine tartrate 2 mg per 1 ml Bromonidine 2% eye drops 5 ml £8.65 DT price = £2.32
- Alphagan (Allergan Ltd)
- Bromonidine tartrate 2 mg per 1 ml Alphagan 2% eye drops 5 ml £8.65 DT price = £2.32
- Brymont (Blumont Pharma Ltd)
- Bromonidine tartrate 2 mg per 1 ml Brymont 2mg/ml eye drops 5 ml £6.55 DT price = £2.32

---

**Carteolol hydrochloride**

### INDICATIONS AND DOSE

Primary open-angle glaucoma

**TO THE EYE**

- **Adult:** Apply twice daily

#### CONTRA-INDICATIONS

Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

#### CAUTIONS

Patients with corneal disease

### CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

#### INTERACTIONS

→ Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

#### SIDE-EFFECTS

Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - dry eyes - erythema - itching - ocular stinging - pain

### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

#### PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose betaxolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops 5 ml £1.90 DT price = £1.90
- Betoptic (Alcon Laboratories (UK) Ltd)
- Betaxolol 0.25% suspension eye drops 5 ml £2.66 DT price = £2.66
- Betoptic 0.25% eye drops suspension 0.25ml unit dose 50 unit dose £11.77
- Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops 5 ml £1.90 DT price = £1.90

---

**Betaxolol**

### INDICATIONS AND DOSE

Primary open-angle glaucoma

**TO THE EYE**

- **Adult:** Apply twice daily

#### CONTRA-INDICATIONS

Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

#### CAUTIONS

Patients with corneal disease

### CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

#### INTERACTIONS

→ Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

#### SIDE-EFFECTS

Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - dry eyes - erythema - itching - ocular stinging - pain

### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

#### PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose betaxolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

**EXCIPIENTS:** May contain Benzalkonium chloride

- Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops 5 ml £1.90 DT price = £1.90
- Betoptic (Alcon Laboratories (UK) Ltd)
- Betaxolol 0.25% suspension eye drops 5 ml £2.66 DT price = £2.66
- Betoptic 0.25% eye drops suspension 0.25ml unit dose 50 unit dose £11.77
- Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops 5 ml £1.90 DT price = £1.90

---

**Levobunolol hydrochloride**

### INDICATIONS AND DOSE

Primary open-angle glaucoma

**TO THE EYE**

- **Adult:** Apply 1–2 times a day

#### CONTRA-INDICATIONS

Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

#### CAUTIONS

Patients with corneal disease

### CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

#### INTERACTIONS

→ Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

#### SIDE-EFFECTS

Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - dry eyes - erythema - itching - ocular stinging - pain

### SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

#### PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose betaxolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
CAUTIONS, FURTHER INFORMATION
Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

• INTERACTIONS → Appendix 1 (beta-blockers).
  Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

• SIDE-EFFECTS
  Anaphylaxis, anterior uveitis, blepharoconjunctivitis, burning, corneal disorders, dry eyes, erythema, itching, ocular stinging, pain

SIDE-EFFECTS, FURTHER INFORMATION
Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

• PRESCRIBING AND DISPENSING INFORMATION
  Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

• MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Eye drops
  EXCIPENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabsulphite
  ▶ Betagan (Allergan Ltd)
  Levobunol hydrochloride 5 mg per 1 ml
  Betagan 0.5% eye drops | 5 ml (£1.85 DT price = £1.85)
  Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose (£1.98)

Timolol maleate

INDICATIONS AND DOSE
Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE
  ▶ Adult: Apply twice daily

TIMOPTOL-LA
Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE
  ▶ Adult: Apply once daily

TIOPLEX
Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE
  ▶ Adult: Apply once daily, to be applied in the morning

• CONTRA-INDICATIONS
  Also consider contra-indications listed for systemically administered beta blockers
  bradycardia, heart block

• CAUTIONS
  Also consider cautions listed for systemically administered beta blockers

• INTERACTIONS → Appendix 1 (beta-blockers).
  Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

• SIDE-EFFECTS
  Anaphylaxis, blepharoconjunctivitis, burning, corneal disorders, dry eyes, erythema, itching, ocular stinging, pain

SIDE-EFFECTS, FURTHER INFORMATION
Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

• PRESCRIBING AND DISPENSING INFORMATION
  Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

• NATIONAL FUNDING/ACCESS DECISIONS
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (February 2014) that timolol gel eye drops (Tiopex®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

• MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Forms available from special-order manufacturers include: eye drops

Eye drops
  EXCIPENTS: May contain Benzalkonium chloride
  ▶ TIMOLOL MALEATE (Non-proprietary)
  Timolol (as Timolol maleate) 2.5 mg per 1 ml
  Timolol 0.25% eye drops | 5 ml (£1.80 DT price = £1.36)
  Timolol (as Timolol maleate) 5 mg per 1 ml
  Timolol 0.5% eye drops | 5 ml (£1.95 DT price = £1.33)
  ▶ Timoptol (Merck Sharp & Dohme Ltd)
  Timolol (as Timolol maleate) 5 mg per 1 ml
  Timolol 0.25% eye drops | 5 ml (£3.12 DT price = £1.36)
  Timoptol Unit Dose 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose (£8.45)
  Timolol (as Timolol maleate) 5 mg per 1 ml
  Timolol 0.5% eye drops | 5 ml (£3.12 DT price = £1.33)
  Timoptol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose (£9.65 DT price = £6.65)
  ▶ Tiopex (Spectrum Thea Pharmaceuticals Ltd)
  Timolol (as Timolol maleate) 1 mg per 1 gram
  Timolol 0.01% eye gel 0.4g unit dose | 30 unit dose (£7.40 DT price = £7.40)

Eye gel
  EXCIPENTS: May contain Benzozodecinum bromide
  ▶ Timoptol-LA (Merck Sharp & Dohme Ltd)
  Timolol (as Timolol maleate) 2.5 mg per 1 ml
  Timolol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml (£3.12 DT price = £3.12)
  Timolol (as Timolol maleate) 5 mg per 1 ml
  Timolol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml (£3.12 DT price = £3.12)

Also available in combination with Bimatoprost, p. 968: Brimonidine, p. 964: Brinzolamide, p. 966: Dorzolamide, p. 967: Latanoprost, p. 969: Travoprost, p. 970

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

INDICATIONS AND DOSE
Reduction of intra-ocular pressure in open-angle glaucoma | Reduction of intra-ocular pressure in secondary glaucoma | Reduction of intra-ocular pressure in angle-closure glaucoma

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES OR BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION
  Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

Glaucma

BY MOUTH USING MODIFIED-RELEASE MEDICINES
  Adult: 1–2 capsules daily

• CONTRA-INDICATIONS
  Adrenocortical insufficiency, hyperchloraemic acidosis, hypokalaemia, hyponatraemia, long-term administration in chronic angle-closure glaucoma

• CAUTIONS
  Avoid extravasation at injection site (risk of necrosis), diabetes mellitus, elderly, impaired alveolar ventilation (risk of acidosis), not generally recommended for long-term use, pulmonary obstruction (risk of acidosis), renal calculi

• INTERACTIONS → Appendix 1 (diuretics).

• SIDE-EFFECTS
  ▶ Common or very common
  Ataxia, depression, diarrhoea, dizziness, excitement, fatigue, flushing, headache, irritability, loss of appetite, nausea, paraesthesia...
### Glaucoma and ocular hypertension

**INDICATIONS AND DOSE**
Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

**TO THE EYE**
- Adult: Apply twice daily, then increased if necessary up to 3 times a day

**CONTRA-INDICATIONS**
- Hyperchloaraemic acidosis

**CAUTIONS**
- Renal tubular immaturity or abnormality - systemic absorption follows topical application

**INTERACTIONS**
- Appendix 1 (brinzolamide)

Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.

---

### Brinzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide above, timolol maleate p. 965.

**INDICATIONS AND DOSE**
Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate

**TO THE EYE**
- Adult: Apply twice daily

---

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Diameter:** May contain Benzalkonium chloride, disodium edetate

- **BRINZOLAMIDE (Non-proprietary)**
  - **Brinzolamide 10 mg per 1 ml**
  - Brinzolamide 10 mg/ml eye drops | 5 ml [PO](PO) £6.92 DT price + £6.92
  - **Azopt (Alcon Laboratories (UK) Ltd)**
  - **Azopt 10 mg per 1 ml**
  - Azopt 10mg/ml eye drops | 5 ml [PO](PO) £6.92 DT price + £6.92

---

### Brinzolamide

**INDICATIONS AND DOSE**
Reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate

**TO THE EYE**
- Adult: Apply twice daily

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Dorzolamide

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in ocular hypertension used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Open-angle glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Pseudo-exfoliative glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

TO THE EYE

Adult: Apply 3 times a day

Raised intra-ocular pressure in ocular hypertension as adjunct to beta-blocker | Open-angle glaucoma as adjunct to beta-blocker | Pseudo-exfoliative glaucoma as adjunct to beta-blocker

TO THE EYE

Adult: Apply twice daily

**CONTRA-INDICATIONS**

Hyperchlorhaemic acidosis

**CAUTIONS**

Chronic corneal defects - history of intra-ocular surgery - history of renal calculus - low endothelial cell count - systemic absorption follows topical application

**INTERACTIONS**

Appendix 1 (dorzolamide).

Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.

**SIDE-EFFECTS**

- **Common or very common**
  - Asthenia
  - Bitter taste
  - Blurred vision
  - Conjunctivitis
  - Eyelid crusting
  - Epistaxis
  - Eyelid inflammation
  - Eyelid oedema
  - Lacrimation
  - Nausea
  - Ocular irritation
  - Superficial punctate keratitis

- **Uncommon**
  - Iridocyclitis

- **Rare**
  - Contact dermatitis
  - Corneal oedema
  - Dizziness
  - Dry mouth
  - Epistaxis
  - Eyelid crusting
  - Paraesthesia
  - Stevens-Johnson syndrome
  - Throat irritation
  - Toxic epidermal necrolysis
  - Transient myopia
  - Urolithiasis

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of sulfonamide hypersensitivity.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution—no information available.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 30 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- **DORZOLAMIDE (Non-proprietary)**
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Dorzolamide 2% eye drops | 5 ml [P] £6.33 DT price = £2.33
  - Trusopt (Merck Sharp & Dohme Ltd)
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Trusopt 2% eye drops | 5 ml [P] £6.33 DT price = £2.33
  - Trusopt 2% eye drops 0.2ml unit dose preservative free | 60 unit dose [P] £24.18 DT price = £24.18

**Dorzolamide with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate p. 965, dorzolamide above.

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in ocular hypertension when beta-blockers alone not adequate | Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate | Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate

TO THE EYE

Adult: Apply twice daily

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose dorzolamide with timolol eye drops contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- **DORZOLAMIDE WITH TIMOLOL (Non-proprietary)**
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Dorzolamide 2% / Timolol 0.5% eye drops | 5 ml [P] £27.16 DT price = £2.58
  - Dorzolamide 2% / Timolol 0.5% eye drops 0.2ml unit dose preservative free | 60 unit dose [P] £27.16 DT price = £28.59
  - Cosopt (Merck Sharp & Dohme Ltd)
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Cosopt eye drops 0.2ml unit dose preservative free | 60 unit dose [P] £28.59 DT price = £28.59
  - Cosopt eye drops | 5 ml [P] £10.05 DT price = £2.58

**PARASYMPATHOMIMETICS**

Pilocarpine

**DRUG ACTION**

Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

**INDICATIONS AND DOSE**

Primary angle-closure glaucoma | Some secondary glaucomas

TO THE EYE

Adult: Apply up to 4 times a day

**CONTRA-INDICATIONS**

Acute inflammatory disease of the anterior segment - acute iritis - anterior uveitis - conditions where pupillary constriction is undesirable - some forms of secondary glaucoma (where pupillary constriction is undesirable)

**CAUTIONS**

A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage - asthma - cardiac disease - care in conjunctival damage - care in corneal damage - epilepsy - gastrointestinal spasm - hypertension - hyperthyroidism - hypotension - marked vasomotor instability - Parkinson’s disease - peptic ulceration - retinal detachment has occurred in susceptible individuals and those with retinal disease - urinary-tract obstruction

**INTERACTIONS**

Appendix 1 (parasympathomimetics).

Systemic effects rare after following application to the eye.

**SIDE-EFFECTS**

- **Rare**
  - Parasympathomimetics systemic side effects

- **Frequency not known**
  - Blurred vision - ciliary spasm (leads to headache and browache which may be more severe in

- **Pilocarpine**

- **TRUSOPT**

- **GLAUCOMA AND OCULAR HYPERTENSION**

- **BNF**

- **30%**
968 Glaucoma and ocular hypertension

the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) • conjunctival vascular congestion • lens changes (with chronic use) • myopia • ocular burning • ocular itching • pupillary block • smarting • vitreous haemorrhage

- PREGNANCY Avoid unless the potential benefit outweighs risk—limited information available.
- BREAST FEEDING Avoid unless the potential benefit outweighs risk—no information available.
- PRE-TREATMENT SCREENING Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- MONITORING REQUIREMENTS Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- PATIENT AND CARER ADVICE Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Eye drops**

  **EXCipients:** May contain Benzalkonium chloride

  - Pilocarpine (Non-proprietary)
    - Pilocarpine hydrochloride 10 mg per 1 ml
      - Pilocarpine hydrochloride 1% eye drops | 10 ml (Pst) £3.15 DT price = £2.92
    - Pilocarpine hydrochloride 20 mg per 1 ml
      - Pilocarpine hydrochloride 2% eye drops | 10 ml (Pst) £3.63 DT price = £3.63
    - Pilocarpine nitrate 20 mg per 1 ml
      - Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose (Pst) £11.99
    - Pilocarpine hydrochloride 40 mg per 1 ml
      - Pilocarpine hydrochloride 4% eye drops | 10 ml (Pst) £5.40 DT price = £4.35

**PROSTAGLANDIN ANALOGUES AND PROSTAMIDES**

**Bimatoprost**

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension TO THE EYE

- Adult: Apply once daily, to be administered preferably in the evening

- **CAUTIONS** Angle-closure glaucoma (no experience of use) • aphakia - astigmatism - chronic obstructive pulmonary disease • compromised respiratory function • congenital glaucoma (no experience of use) • contact lens wearers • history of significant ocular viral infections • inflammatory ocular conditions (no experience of use) • narrow-angle glaucoma (no experience of use) • neovascular glaucoma (no experience of use) • predisposition to bradycardia • predisposition to hypotension • pseudophakia with torn posterior lens capsule or anterior chamber lenses • risk factors for cystoid macular oedema • risk factors for iritis • risk factors for uveitis

- **SIDE-EFFECTS**

  - Common or very common Blepharitis • blood pressure changes • brown pigmentation particularly in those with mixed-colour irides • conjunctival disorders • corneal erosion • darkening, thickening and lengthening of eye lashes • eyelash and vellus hair changes • headache • ocular discomfort • photophobia • pigmentation of periocular skin • punctate keratitis • reduced visual acuity • transient punctate epithelial erosion

  - Uncommon Asthenopia • diziness • skin rash

  - Rare Arthralgia • darkening of palpebral skin • facial oedema • iritis • macular oedema • myalgia • uveitis

  - Very rare Chest pain • exacerbation of angina • palpitation • periorbital changes resulting in deepening of the eyelid sulcus

  - Frequency not known Asthma • blepharospasm • bradycardia • dyspnoea • exacerbation of asthma • exacerbation of COPD • eyelid retraction • malaise • nausea • ocular infection • reactivation of previous corneal infiltrates • retinal haemorrhage

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Use with caution in moderate to severe impairment—no information available.
- RESPIRATORY IMPAIRMENT Use with caution—no information available.
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available
- PATIENT AND CARER ADVICE Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised (March 2013) that bimatoprost 300 micrograms/ml preservative-free eye drops (Lumigan® single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**

  **EXCipients:** May contain Benzalkonium chloride

  - Lumigan (Allergan Ltd)
    - Bimatoprost 100 microgram per 1 ml
      - Bimatoprost 100 microgram per 1 ml eye drops | 3 ml (Pst) £11.71 DT price = £11.71 | 9 ml (Pst) £35.13
    - Bimatoprost 300 microgram per 1 ml
      - Bimatoprost 300 microgram per 1 ml eye drops | 3 ml (Pst) £10.30 DT price = £10.30 | 9 ml (Pst) £30.90
      - Lumigan 300micrograms/ml eye drops 0.4ml unit dose | 30 unit dose (Pst) £13.75 DT price = £13.75

**Bimatoprost with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost above, timolol maleate p. 965.

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate TO THE EYE

- Adult: Apply once daily
Glucoma and ocular hypertension

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    The Scottish Medicines Consortium has advised (October 2013) that Ganfort® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patents with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - **EXCIPIENTS**: May contain Benzalkonium chloride
        - Ganfort (Allergan Ltd)
          - Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml
            - 3 ml (£31.95 DT price = £13.95) 9 ml (£87.59)
            - Ganfort 0.3mg/ml / 5mg/ml eye drops 0.4ml unit dose | 30 unit dose (£87.59)

- **Latanoprost**
  - **INDICATIONS AND DOSE**
    - Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension
      - TO THE EYE
        - Adult: Apply daily, to be administered preferably in the evening
    - **CONTRA-INDICATIONS**
      - Active herpes simplex keratitis - history of recurrent herpetic keratitis associated with prostaglandin analogues
    - **CAUTIONS**
      - Angle-closure glaucoma (no experience of use)
    - **SIDE-EFFECTS**
      - Common or very common: Blepharitis - blood pressure changes - brown pigmentation particularly in those with mixed-colour irides - conjunctival disorders - corneal erosion - darkening, thickening and lengthening of eye lashes - eyelash and vellus hair changes - headache - ocular discomfort - photophobia - pigmentation of periorical skin - punctate keratitis - reduced visual acuity - transient punctate epithelial erosion
      - Uncommon: Asthenopia - dizziness - skin rash
    - **Rare**
      - Arthralgia - darkening of palpebral skin - facial oedema - iritis - macular oedema - myalgia - uveitis
    - **Very rare**
      - Breast pain - exacerbation of angina - palpitation - periorbital changes resulting in deepening of the eyelid sulcus
    - **Frequency not known**
      - Asthma - dysphoena - exacerbation of asthma - exacerbation of COPD - iritis - nasopharyngitis - pyrexia
  - **PREGNANCY**
    - Manufacturer advises avoid.
  - **BREAST FEEDING**
    - May be present in milk—manufacturer advises avoid.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available

- **PATIENT AND CARER ADVICE**
  - Changes in eye colour: Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigmen in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    The Scottish Medicines Consortium has advised (June 2013) that Monopost® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

            - Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml
              - Xalacom eye drops | 2.5 ml (£14.32 DT price = £3.88)

- **Tafluprost**
  - **INDICATIONS AND DOSE**
    - Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension
      - TO THE EYE
        - Adult: Apply daily, to be administered preferably in the evening
Travoprost

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

TO THE EYE

Adult: Apply daily, to be administered preferably in the evening

Travoprost

INDICATIONS AND DOSE

Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

TO THE EYE

Adult: Apply once daily
6 Retinal disorders

6.1 Macular degeneration

Subfoveal choroidal neovascularisation

Aflibercept below, pegaptanib sodium p. 972 and ranibizumab p. 973 are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion, and diabetic macular oedema; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion.

PHOTOSENSITISERS

Verteportin

DRUG ACTION Following intravenous infusion, verteportin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

INDICATIONS AND DOSE
Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)

BY INTRAVENOUS INFUSION
Adult: 6 mg/m², dose to be given over 10 minutes

CONTRA-INDICATIONS Acute porphyria

CAUTIONS Avoid extravasation · biliary obstruction · photosensitivity

INTERACTIONS Caution on concomitant use with other photosensitising drugs.

SIDE-EFFECTS
Common or very common Back pain · flashing lights · hypercholesterolaemia · malaise · nausea · photosensitivity · reduced visual acuity · visual disturbances · visual-field defects

Uncommon Hyperaesthesia · hypertension · pyrexia · retinal detachment · subretinal, retinal or vitreous haemorrhage

Rare Retinal or choroidal vessel non-perfusion

Frequency not known Chest pain · macular oedema · myocardial infarction · retinal oedema · vasovagal reactions

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies).

Macular degeneration 971

Breastfeeding No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.

Hepatic impairment Use with caution in moderate hepatic impairment. Avoid in severe hepatic impairment.

DIRECTIONS FOR ADMINISTRATION For information on administration and light activation, consult product literature. For intravenous infusion (Visudyne®), give intermittently in Glucose 5%· reconstitute each 15 mg with 7 ml water for injections to produce a 2 mg/ml solution then dilute requisite dose with infusion fluid to a final volume of 30 ml. Give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.

PATIENT AND CARER ADVICE Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
Verteportin photodynamic therapy for wet age-related macular degeneration (September 2003) NICE TA68
Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.
Photodynamic therapy is not recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation except in clinical studies. www.nice.org.uk/TA68

MEDICINAL FORMS

There can be variation in the licencing of different medicines containing the same drug.

Powder for solution for infusion
EXCipients: May contain Butylated hydroxytoluene
Verteportin 15 mg Visudyne 15mg powder for solution for infusion vials | 1 vial (PMS) £85.00 (Hospital only)

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

DRUG ACTION Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

INDICATIONS AND DOSE
Neovascular (wet) age-related macular degeneration (specialist use only)

BY INTRAVITREAL INJECTION
Adult: Initially 2 mg once a month for 3 months, to be injected into the affected eye, then 2 mg every 2 months, review treatment frequency after 12 months

Macular oedema secondary to central retinal vein occlusion (specialist use only)

BY INTRAVITREAL INJECTION
Adult: Initially 2 mg once a month, to be injected into the affected eye, monitor visual and anatomic outcomes monthly; continue treatment until visual and anatomic outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomic outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart
Diabetic macular oedema (specialist use only)

**BY INTRAVITREAL INJECTION**

- Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, to be injected into the affected eye, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

- **CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss - ocular or periocular infection - severe intra-ocular inflammation

- **CAUTIONS** Active systemic infection - diabetic patients with uncontrolled hypertension - discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details - discontinue treatment in the event of a retinal break—consult product literature for full details - discontinue treatment in the event of retinal detachment - consult product literature for full details - patients at risk of retinal pigment epithelial tear - poorly controlled glaucoma - recent history of myocardial infarction - recent history of stroke - recent history of transient ischaemic attack

- **SIDE-EFFECTS**

  **SPECIFIC SIDE-EFFECTS**

  - Common or very common
  - **With intravitreal use** anterior chamber flare - blindness - corneal epithelium defect - eyelid irritation - iridocyclitis - iritis - lenticular opacities - retinal detachment - retinal tear - uveitis
  - Rare
  - **With intravitreal use** hypopyon - vitritis

  **CONCEPTION AND CONTRACEPTION**

  Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

- **PREGNANCY**

  Manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING**

  Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**

  Monitor intra-ocular pressure following injection.

- **DIRECTIONS FOR ADMINISTRATION**

  For further information on administration, consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**

  - Afibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294

  Afibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:

  - it is used in accordance with the recommendations for ranibizumab in NICE TA 155

  - the manufacturer provides afibercept solution for injection with the discount agreed in the patient access scheme www.nice.org.uk/TA294

  - **Afibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305**

---

**Pegaptanib sodium**

**INDICATIONS AND DOSE**

Treatment of neovascular (wet) age-related macular degeneration (specialist use only)

**BY INTRAVITREAL INJECTION**

- Adult: 300 micrograms every 6 weeks, to be administered into the affected eye, review treatment if no benefit after 2 consecutive injections

- **CONTRA-INDICATIONS** Ocular or periocular infection

- **CAUTIONS**

  **CONATIONS, FURTHER INFORMATION**

  Pegaptanib is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **SIDE-EFFECTS**

  - Common or very common Anterior chamber inflammation - conjunctival hemorrhage - conjunctival hyperaemia - corneal abrasion or oedema - corneal erosion - eye pain - eyelid oedema - foreign body sensation in eye - increased lacrimation - injection-site haemorrhage - injection-site pain - ocular hyperaemia - punctate keratitis - raised intraocular pressure - reduced visual acuity - retinal degeneration - retinal pigment epithelium detachment - retinal pigment epithelium tear - vitreous detachment - vitreous floaters - vitreous haemorrhage

  - Uncommon

  - **With intravitreal use** anterior chamber flare - blindness - corneal epithelium defect - eyelid irritation - iridocyclitis - iritis - lenticular opacities - retinal detachment - retinal tear - uveitis

  - Rare

  - **With intravitreal use** hypopyon - vitritis

  **CONCEPTION AND CONTRACEPTION**

**INDICATIONS AND DOSE**

Neovascular (wet) age-related macular degeneration (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months, thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

Diabetic macular oedema / Macular oedema secondary to retinal vein occlusion (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: Initially 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections), thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

Choroidal neovascularisation secondary to pathologic myopia (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: Initially 500 micrograms, to be administered as a single injection into the affected eye, monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required, if necessary subsequent doses may be given at least 1 month apart

Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: 500 micrograms, to be administered at least 30 minutes after laser photocoagulation

**CONTRA-INDICATIONS**

- Ocular or periocular infection
- Severe intra-ocular inflammation
- Signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

**CAUTIONS**

- Active systemic infection
- Diabetic macular oedema due to type 1 diabetes (limited information available)
- Diabetic patients with HbA1c over 12%
- History of stroke
- History of transient ischaemic attack
- Patients at risk of retinal pigment epithelial tear
- Previous intravitreal injections
- Proliferative diabetic retinopathy
- Retinal detachment or macular hole
- Uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

6.2 Macular oedema

**Fluocinolone acetonide**

**INDICATIONS AND DOSE**

Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)

**BY INTRAVITREAL INJECTION**

- Adults: 190 micrograms, to be administered into the affected eye

- **CONTRA-INDICATIONS**

  - Active or suspected ocular infection
  - Active or suspected peri-ocular infection
  - Pre-existing glaucoma

- **CAUTIONS**

  - Raised baseline intra-ocular pressure

- **INTERACTIONS**

  - Caution with concomitant administration of anticoagulant or antithrombotic agents (higher incidence of conjunctival haemorrhage).

- **SIDE-EFFECTS**

  - Common or very common:
    - Blurred vision
    - Conjunctival haemorrhage
    - Iris adhesions
    - Iris neovascularisation
    - Maculopathy
    - Hypoesthesia
    - Optic atrophy
    - Optic nerve disorder
    - Retinal detachment
    - Retinal vascular occlusion
    - Sclera thinning
    - Vitreous degeneration
    - Vitreous haemorrhage

  - Uncommon:
    - Conjunctival ulcer
    - Endophthalmitis
    - Eye discharge
    - Eye pruritus
    - Headache
    - Iris atrophy
    - Iris neovascularisation
    - Maculopathy
    - Hypoesthesia
    - Optic atrophy
    - Optic nerve disorder
    - Retinal detachment
    - Retinal vascular occlusion
    - Sclera thinning
    - Vitreous degeneration
    - Vitreous haemorrhage
    - Sclera thinning
    - Vitreous detachment

  - Rare:
    - Active or suspected peri-ocular infection
    - Retinal detachment

- **PREGNANCY**

  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**

  - Manufacturer advises avoid unless essential.

- **MONITORING REQUIREMENTS**

  - Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.

- **DIRECTIONS FOR ADMINISTRATION**

  - Concurrent administration to both eyes not recommended. Further information on administration and repeat dosing, consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - NICE technology appraisals (TAs)

    - Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013) NICE TA301

    - Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:
      - the implant is to be used in an eye with an intra-ocular (pseudophakic lens) and
      - the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme. [www.nice.org.uk/TA301](http://www.nice.org.uk/TA301)

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2014) that fluocinolone acetonide intravitreal implant (Iluvien®) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with...
fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Implant**

- **Iluvien (Alimera Sciences Ltd)**
  - Fluocinolone acetonide 190 microgram
  - ILUVIEN 190 microgram intravitreal implant in applicator | 1 device £5,500.00

**6.3 Vitreomacular traction**

**RECOMBINANT PROTEOLYTIC ENZYMES**

**Ocriplasmin**

**INDICATIONS AND DOSE**

Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)

**BY INTRAVITREAL INJECTION**

- Adult: 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

**CONTRA-INDICATIONS**

Active or suspected ocular or periocular infection · aphakia · exudative age-related macular degeneration · high myopia · history of rhegmatogenous retinal detachment · ischaemic retinopathies · large diameter macular hole (> 400 microns) · lens zonule instability · proliferative diabetic retinopathy · recent intra-ocular injection (including laser therapy) · recent ocular surgery · retinal vein occlusions · vitreous haemorrhage

**CAUTIONS**

History of uveitis (including severe active inflammation) · non-proliferative diabetic retinopathy · significant eye trauma

**SIDE-EFFECTS**

- Common or very common Abnormal retinograph · anterior chamber cell or flare · chromatopsia · conjunctival disorders · eyelid oedema · iritis · macular degeneration · macular hole · macular oedema · metamorphopsia · ocular discomfit · ocular hyperaemia · photophobia · photopsia · raised intra-ocular pressure · reduced visual acuity · retinal disorders · retinal pigment epitheliopathy · vitreous disorders

- Uncommon Anterior chamber inflammation · corneal abrasion · diplopia · eye inflammation · hyphaema · lens subluxation · miosis · scotoma · transient blindness · unequal pupils · visual field defect

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**

Manufacturer advises use only if potential benefit outweighs risk—no information available.

**MONITORING REQUIREMENTS**

Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.

**DIRECTIONS FOR ADMINISTRATION**

For further information on administration, consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ocriplasmin for treating vitreomacular traction (October 2013) NICE TA297
  Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:
  - they have a stage II full-thickness macular hole with a diameter of 400 microns or less and/or
  - they have severe symptoms. [www.nice.org.uk/TA297](http://www.nice.org.uk/TA297)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2014) that ocriplasmin (Jetrea®) is accepted for restricted use within NHS Scotland for the treatment of patients with vitreomacular traction plus macular hole, regardless of whether they have epiretinal membrane formation, and in patients with vitreomacular traction alone (no epiretinal membrane and no macular hole).

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Jetrea (Alcon Laboratories (UK) Ltd)**
  - Ocriplasmin 2.5 mg per 1 ml Jetrea 0.5mg/0.2ml concentrate for solution for injection vials | 1 vial | £2,500.00

  1.2 Removal of ear wax
2 Nose
  2.1 Nasal congestion
  2.2 Nasal inflammation, nasal polyps and rhinitis
  2.3 Nasal staphylococcal infection
3 Oropharynx

1 Ear

Otitis externa
Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution p. 451. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 451 or chlortetracycline) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate p. 979 ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 955 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical aminoglycosides or polymyxins in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurrative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an antiinflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 354 or ibuprofen p. 927, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present, treatment should be for no longer than 2 weeks; when a resistant staphylococcal infection (a boil) is present, treatment should be for no longer than 2 weeks; when a resistant staphylococcal infection (a boil) is present, treatment should be for no longer than 2 weeks; a systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell.

Otitis media
Acute otitis media
Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol p. 354, may be sufficient. In children without systemic features, a systemic antibacterial may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.
Otitis media with effusion
Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media
Opportunist organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate p. 979 solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 482 (or erythromycin p. 471 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 956 or ofloxacin p. 957 eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in patients with chronic suppurrative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibacterials;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax
Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate p. 979 ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docosate sodium p. 980 or urea hydrogen peroxide p. 980 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to cooperate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

1.1 Otitis externa

ANTI-INFECTIVES

Chloramphenicol
- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

**Bacterial infection in otitis externa**

- Exterol 9% ear drops | 8 ml | £1.75
- Otex (Dendron Ltd)
- Urea hydrogen peroxide 50 mg per 1 gram
- Otex 9% ear drops | 8 ml | £2.89

---

**Nose**

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution may be used as a douche or ‘sniff’ following endonasal surgery.
Drugs used in nasal allergy

Mild allergic rhinitis is controlled by antihistamines (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 241) or topical nasal corticosteroids; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids. The topical antihistamine azelastine hydrochloride p. 945 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than Cromolyn. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 233 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhea.

Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the ‘head down’ position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 984, budesonide p. 984, or fluticasone p. 985 may be considered.

Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride p. 982 nasal drops is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 983 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhea often responds well to treatment with the antimuscarinic ipratropium bromide p. 983.

Sinusitis and oral pain

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride p. 982 nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 446).

Nasal preparations for infection

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Noseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population. A nasal ointment containing mupirocin p. 987 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant Staphylococcus aureus (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.
2.1 Nasal congestion

**SYMPATHOMIMETICS (VASOCONSTRICTOR)**

**Ephedrine hydrochloride**

**INDICATIONS AND DOSE**

- Nasal congestion: Sinusitis affecting the maxillary antrum
- Intranasal administration

- **Child 12–17 years**: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
- **Adult**: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

**CAUTIONS**

- Avoid excessive or prolonged use.
- Cardiovascular disease (in children).
- Diabetes mellitus.
- Elderly.
- Hypertension.
- Hypothyroidism.
- Ischaemic heart disease (in adults).
- Prostatic hypertrophy (risk of acute urinary retention) (in adults).

**INTERACTIONS**

- Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- **Common or very common**
  - Headache.
  - Nausea.
- **Frequency not known**
  - After excessive use, tolerance with diminished effect.
  - Cardiovascular effect.
  - Local irritation.
  - Rebound congestion.

**PREGNANCY**

- Manufacturer advises avoid.

**BREAST FEEDING**

- Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

**PRESCRIBING AND DISPENSING INFORMATION**

- For nasal drops, the BP directs that if no strength is specified, 0.5% drops should be supplied.

**PROFESSION SPECIFIC INFORMATION**

- **Dental practitioners’ formulary**
  - Ephedrine nasal drops may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

- Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: spray, nasal drops.

**Nasal drops**

- **EPHEDRINE HYDROCHLORIDE (Non-proprietary)**
  - Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml | £1.53 DT price = £1.53
  - Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml | £1.58 DT price = £1.58

**Pseudoephedrine hydrochloride**

**INDICATIONS AND DOSE**

- Congestion of mucous membranes of upper respiratory tract
- **By mouth**
  - Child 6–11 years: 30 mg 3–4 times a day
  - Child 12–17 years: 60 mg 3–4 times a day

**Important safety information**

MHRA/CHM Advice (March 2008 and February 2009): Over-the-Counter Cough and Cold Medicines for Children

- Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS**
  - Diabetes.
  - Heart disease.
  - Hypertension.
  - Hyperthyroidism.
  - Ischaemic heart disease (in adults).
  - Prostatic hypertrophy (in adults).
  - Raised intra-ocular pressure (in children).
  - Susceptibility to angle-closure glaucoma (in adults).

- **INTERACTIONS**
  - Appendix 1 (sympathomimetics).
  - Contra-indicated in patients taking monoamine oxidase inhibitors within the previous 2 weeks.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Anxiety.
    - Headache.
    - Hypertension.
    - Insomnia.
    - Nausea.
    - Restlessness.
    - Tachycardia.
    - Vomiting.
  - **Rare**
    - Hallucinations - rash.
  - **Very rare**
    - Angle-closure glaucoma.
    - Urinary retention.

- **PREGNANCY**
  - Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.

- **BREAST FEEDING**
  - May suppress lactation; avoid if lactation not well established or if milk production insufficient.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises use with caution in severe impairment.

- **RENAL IMPAIRMENT**
  - Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.

- **LESS SUITABLE FOR PRESCRIBING**
  - Pseudoephedrine hydrochloride is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Galpseud® and Sudafed® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Galpseud** (Thornton & Ross Ltd)
  - Pseudoephedrine hydrochloride 60 mg Galpseud 60 mg tablets | 24 tablet | £2.25 | 100 tablet | £5.42 DT price = £5.42
- **Sudafed Non-Drowsy Decongestant** (sudafed®) (McNeil Products Ltd)
  - Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60 mg tablets | 12 tablet | £2.04

**Oral solution**

- **Galpseud** (Thornton & Ross Ltd)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30 mg/5 ml linctus (sugar-free) | 2000 ml | £4.00
- **Sudafed Non-Drowsy Decongestant** (pseudophedrine) (McNeil Products Ltd)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30 mg/5 ml liquid | 100 ml | £1.92
Xylometazoline hydrochloride

**DRUG ACTION** Xylometazoline is a sympathomimetic.

### INDICATIONS AND DOSE

**Nasal congestion**
- **BY INTRanasAL ADMINISTRATION USING NASAL DROPS**
  - Child 6-11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
  - Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
  - Adult: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

**BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
- Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
- Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

### Important safety information
The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

### CAUTIONS
- Angle-closure glaucoma
- Avoid excessive or prolonged use
- Cardiovascular disease (in children)
- Diabetes mellitus
- Elderly
- Hypertension
- Hyperthyroidism
- Icaemic heart disease (in adults)
- Prostatic hypertrophy (risk of acute retention) (in adults)

### SIDE-EFFECTS
- Cardiovascular effects
- Hallucinations in small children
- Headache
- Local irritation
- Nausea
- Rebound congestion
- Restlessness in small children
- Sleep disturbances in small children
- Tolerance with diminished effect (after excessive use)
- Transient visual disturbances

### SIDE-EFFECTS, FURTHER INFORMATION
- Hallucinations (in small children)

### CAUTIONS, FURTHER INFORMATION
- **Rebound congestion** Symptomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- **SIDE-EFFECTS** Cardiovascular effects
- Hallucinations in small children
- Headache
- Local irritation
- Nausea
- Rebound congestion
- Restlessness in small children
- Sleep disturbances in small children
- Tolerance with diminished effect (after excessive use)
- Transient visual disturbances

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Spray
- **Otrivine** (Novartis Consumer Health UK Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml (Novartis Consumer Health UK Ltd)
  - Xylometazoline hydrochloride 500 microgram per 1 ml

### CAUTIONS
- Avoid excessive or prolonged use
- Cardiovascular disease (in children)
- Diabetes mellitus
- Elderly
- Hypertension
- Hyperthyroidism
- Icaemic heart disease (in adults)

### SIDE-EFFECTS
- Cardiovascular effects
- Hallucinations (in small children)

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Spray
- **Otrivine** (Novartis Consumer Health UK Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml
  - Xylometazoline hydrochloride 500 microgram per 1 ml

### CAUTIONS
- Avoid spraying near eyes
- Bladder outflow obstruction
- Cystic fibrosis
- Prostatic hyperplasia (in adults)
- Risk of glaucoma (in children)
- Susceptibility to angle-closure glaucoma (in adults)

### SIDE-EFFECTS
- Common or very common
  - Epistaxis
  - Nasal dryness
  - Nasal irritation
- Uncommon
  - Headache
  - Nausea
  - Pharyngitis (in children)
- Very rare
  - Gastro-intestinal motility disturbances
  - Palpitations
  - Urinary retention

## ANTISMUSCARINICS

### Ipratropium bromide

### INDICATIONS AND DOSE
- Rhinorrhea associated with allergic and non-allergic rhinitis
- **BY INTRANASAL ADMINISTRATION**
  - Child 12-17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
  - Adult: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

### Dose equivalence and conversion
- 1 metered spray of nasal spray = 21 micrograms.
CAUTIONS, FURTHER INFORMATION
Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

SIDE-EFFECTS
- Rare Glaucoma - raised intra-ocular pressure
- Very rare Nasal septal perforation
- Frequency not known Aggression (particularly in children) - anxiety (particularly in children) - bronchospasm - depression (particularly in children) - dryness - epistaxis - headache - hyperactivity (particularly in children) - hypersensitivity reactions - nasal irritation - nasal ulceration - sleep disturbances (particularly in children) - smell disturbances - taste disturbances - throat irritation

SIDE-EFFECTS, FURTHER INFORMATION
Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

Medicinal forms

Beclometasone dipropionate (Beclometasone dipropionate)

INDICATIONS AND DOSE
Prophylaxis and treatment of allergic and vasomotor rhinitis

BY INTRANASAL ADMINISTRATION
- Child 6–17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

EXCEPTIONS TO LEGAL CATEGORY Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Spray
EXCIPIENTS: May contain Benzalkonium chloride, polysorbates
- BECLOMETASONE DIPROPIONATE (Non-proprietary)
Beclometasone dipropionate 50 microgram per 1 dose Numark Hayfever Relief 50micrograms/dose nasal spray | 100 dose £3.84 | 200 dose £3.31 2.10
Beclometasone Hayfever Relief 50micrograms/dose nasal spray | 200 dose £3.56 DT price = £2.30
Beclometasone 50micrograms/dose nasal spray | 180 dose no price available | 200 dose £2.55 no price available DT price = £2.30 | 200 dose £2.10

Betamethasone

INDICATIONS AND DOSE
BETNESOL®
Non-infected inflammatory conditions of nose
BY INTRANASAL ADMINISTRATION
- Adult: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

VISTAMETHASONE®
Non-infected inflammatory conditions of nose
BY INTRANASAL ADMINISTRATION
- Adult: Apply 2–3 drops twice daily, dose to be applied into each nostril

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ear, eye/nose drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- BETAMETHASONE (Non-proprietary)
Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% eye/ear/nose drops | 5 ml £3.65 no price available
Betnesol (Focus Pharmaceuticals Ltd)
Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml £3.22 DT price = £2.12
Vistamethasone (Martindale Pharmaceuticals Ltd)
Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% eye/ear/nose drops | 5 ml £2.12 | 10 ml £4.16 DT price = £2.32

Budesonide

INDICATIONS AND DOSE
Prophylaxis and treatment of allergic and vasomotor rhinitis
BY INTRANASAL ADMINISTRATION
- Child 12-17 years: Initially 200 micrograms daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms daily, dose to be administered into each nostril, dose can be reduced when control achieved
- Adult: Initially 200 micrograms daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms daily, dose to be administered into each nostril, dose can be reduced when control achieved

Nasal polyps
BY INTRANASAL ADMINISTRATION
- Child 12-17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril
- Adult: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

RHINOCORT AQUA®
Rhinitis
BY INTRANASAL ADMINISTRATION
- Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning,
Fluticasone

**INDICATIONS AND DOSE**

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

**BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**

- **Child 4-11 years:** 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- **Child 12-17 years:** 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
- **Adult:** 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, to be administered into each nostril, dose to be reduced when control achieved

Nasal polyps

**BY INTRANASAL ADMINISTRATION USING NASAL DROPS**

- **Child 12-17 years:** 200 micrograms 1–2 times a day, to be administered into each nostril, dose of 200 micrograms approximately 6 drops, alternative treatment should be considered if no improvement after 4–6 weeks
- **Adult:** 200 micrograms 1–2 times a day, to be administered into each nostril, dose of 200 micrograms approximately 6 drops, alternative treatment should be considered if no improvement after 4–6 weeks

**AVAMYS® SPRAY**

Prophylaxis and treatment of allergic rhinitis

**BY INTRANASAL ADMINISTRATION**

- **Adult:** 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

Dose equivalence and conversion

1 spray equivalent to 27.5 micrograms.

- **SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Nasal ulceration

Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

**EXCEPTIONS TO LEGAL CATEGORY**

Preparations of budesonide can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to maximum single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPENTS: May contain Benzalkonium chloride, polysorbates, potassium sorbate

- FLUTICASONE (Non-proprietary)
  - Budesonide 64 microgram per 1 dose
  - Fluticasone furoate 27.5 microgram per 1 dose
    - Avamys 27.5 micrograms/dose nasal spray | 120 dose [P] £6.44 DT price = £6.44
  - Fluticasone propionate 50 microgram per 1 dose
    - Boots Pharmacy
      - Hayfever and Allergy 50 microgram/dose nasal spray | 60 dose [P] no price available
    - Fluticasone propionate 50 microgram/dose nasal spray
      - Flixonase 100 micrograms/dose nasal spray | 150 dose [P] £9.50 DT price = £11.01
    - Flixonase (GlaxoSmithKline UK Ltd)
      - Flixonase propionate 50 microgram per 1 dose
        - Flixonase 50 micrograms/dose nasal spray | 150 dose [P] £11.01 DT price = £11.01

**Fluticasone with azelastine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, azelastine hydrochloride p. 945, fluticasone above.

**INDICATIONS AND DOSE**

Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate

**BY INTRANASAL ADMINISTRATION**

- **Child 12-17 years:** 1 spray twice daily, dose to be administered into each nostril
- **Adult:** 1 spray twice daily, dose to be administered into each nostril

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPENTS: May contain Benzalkonium chloride, polysorbates

- Dymista (Meda Pharmaceuticals Ltd)
  - Azelastine hydrochloride 137 microgram per 1 actuation,
    - Fluticasone propionate 50 microgram per 1 actuation
      - Dymista 137 micrograms/dose nasal spray | 50 micrograms/dose nasal spray | 120 dose [P] £14.80
Mometasone furoate

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic rhinitis**

**BY INTRANASAL ADMINISTRATION**

- Child 6–11 years: 50 micrograms daily, dose to be sprayed into each nostril
- Child 12–17 years: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril
- Adult: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

**Nasal polyps**

**BY INTRANASAL ADMINISTRATION**

- Adult: Initially 100 micrograms daily for 5–6 weeks, dose to be sprayed into each nostril, then increased if necessary to 100 micrograms twice daily, dose to be sprayed into each nostril, consider alternative treatment if no improvement after further 5–6 weeks, reduce to the lowest effective dose when control achieved

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

**Nasal ulceration** Nasal ulceration occurs commonly with preparations containing mometasone furoate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

**EXCIPIENTS:** May contain Benzalkonium chloride, polysorbates

**MOMETASONE FUROATE** (Non-proprietary)

- Mometasone furoate 50 microgram per 1 dose
  - Mometasone 50 micrograms/dose nasal spray | 140 dose [P] £7.30 DT price = £4.74
  - Nasonex (Merck Sharp & Dohme Ltd)
  - Mometasone furoate 50 microgram per 1 dose
  - Nasonex 50 micrograms/dose nasal spray | 140 dose [P] £7.68 DT price = £4.74

Triamcinolone acetonide

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic rhinitis**

**BY INTRANASAL ADMINISTRATION**

- Child 6–11 years: 55 micrograms once daily (sprayed into each nostril), increased if necessary to 110 micrograms once daily (sprayed into each nostril) when control achieved; max. duration 3 months
- Child 12–17 years: 110 micrograms once daily (sprayed into each nostril), reduced to 55 micrograms once daily (sprayed into each nostril) when control achieved; max. duration 3 months
- Adult: 110 micrograms once daily (sprayed into each nostril), reduced to 55 micrograms once daily (sprayed into each nostril) when control achieved

**EXCEPTIONS TO LEGAL CATEGORY** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to maximum daily dose of 110 micrograms per nostril for maximum 3 months, and a pack size of 3.75 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

**Spray**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate, polysorbates

- Nasonex [P] 55 micrograms/dose nasal spray | 30 dose [P] £3.01
- Nasonex 55 micrograms/dose nasal spray | 120 dose [P] £7.39 DT price = £7.39

**MAST CELL STABILISERS**

**Sodium cromoglicate**

(Sodium cromoglicate)

**INDICATIONS AND DOSE**

**Prophylaxis of allergic rhinitis**

**BY INTRANASAL ADMINISTRATION**

- Child: 1 spray 2–4 times a day, to be administered into each nostril
- Adult: 1 spray 2–4 times a day, to be administered into each nostril

**SIDE-EFFECTS**

- Rare: Transient bronchospasm
- Frequency not known: Local irritation

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Unlikely to be present in milk.

**MEDICINAL FORMS**

Medicines not identified.

2.3 **Nasal staphylococcal infection**

**ANTI-INFECTIVES**

**Betamethasone with neomycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 984, neomycin sulfate p. 451.

**INDICATIONS AND DOSE**

**Nasal infection**

**BY INTRANASAL ADMINISTRATION USING NASAL DROPS**

- Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril
- Adult: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

**LESS SUITABLE FOR PRESCRIBING**

Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Drops solution**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- Betnesol-N ear/eye/nose drops (Focus Pharmaceuticals)
  - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 mL, Neomycin sulfate 5 mg per 1 mL | 10 mL [P] £2.39

**NTS**

- Neosporin 10 mL [P] £7.45

- Neosporin Otic Solution 1000 mL [P] £7.45
many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Aquoral®, Biotène Oralbalance® gel or Xerolin® can be used for any condition giving rise to a dry mouth. BioXtra®, Glandosane®, Saliva Orthana®, and Salivex®, have ACBS approval for dry mouth associated only with radiotherapy or sicsa syndrome. Salivix® pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine p. 988 tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

### Artificial saliva products

- **ARTIFICIAL SALIVA PRODUCTS**
  - **AS SALIVA ORTHANA® LOZENGES**
    - Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral
  - **INDICATIONS AND DOSE**
    - Dry mouth as a result of having (or having undergone) radiotherapy | Sicsa syndrome
      - **BY MOUTH**
        - Adult: 1 lozenge as required, allow to dissolve slowly in the mouth
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - Lozenges do not contain fluoride.
    - **AS Saliva Orthana lozenges (A S Pharma Ltd)**
      - 30 lozenge (ACBS) • NHS indicative price = £3.50
  - **AS SALIVA ORTHANA® SPRAY**
    - Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral
  - **INDICATIONS AND DOSE**
    - Symptomatic treatment of dry mouth
      - **BY MOUTH**
        - Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary
      - **AS Saliva Orthana® Oral Spray may be prescribed.**

### BioXtra Gel

- **INDICATIONS AND DOSE**
  - **Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)**
    - **BY MOUTH**
      - Adult: Apply as required, apply to oral mucosa
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary
      - BioXtra® Gel may be prescribed.
INDICATIONS AND DOSE
Symptomatic treatment of dry mouth
BY MOUTH
- Adult: Apply as required, apply to gums and tongue

PATIENT AND CARER ADVICE
Avoid use with toothpastes containing detergents (including foaming agents).

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary

Glandosane®
Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

INDICATIONS AND DOSE
Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Sicca syndrome (ACBS)
BY MOUTH
- Adult: Apply as required, spray onto oral and pharyngeal mucosa

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary

Salivation spray lemon (Fresenius Kabi Ltd)
50 ml (ACBS) - NHS indicative price = £5.52

Salivation spray natural (Fresenius Kabi Ltd)
50 ml (ACBS) - NHS indicative price = £5.52

Salivation spray peppermint (Fresenius Kabi Ltd)
50 ml (ACBS) - NHS indicative price = £5.52

SST®
Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

INDICATIONS AND DOSE
Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts
BY MOUTH
- Adult: 1 tablet as required, allow tablet to dissolve slowly in the mouth

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary

May be prescribed as Saliva Stimulating Tablets.

SST saliva stimulating tablets (Sinclair IS Pharma Plc)
100 tablet - NHS indicative price = £4.86

Parasympathomimetics

Pilocarpine

INDICATIONS AND DOSE
Xerostomia following irradiation for head and neck cancer
BY MOUTH
- Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

Dry mouth and dry eyes in Sjögren’s syndrome
BY MOUTH
- Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

CONTRA-INDICATIONS
Acute iritis | chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) | uncontrolled asthma (increased bronchial secretions and increased airways resistance) | uncontrolled cardiorenal disease
Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 980, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetiform stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

#### SIDE-EFFECTS

Anaphylaxis - hypersensitivity - mucosal irritation - parotid gland swelling - reversible brown staining of composite restorations - reversible brown
Chlorhexidine with chlorobutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 389.

**INDICATIONS AND DOSE**

**Oral hygiene and plaque inhibition by mouth**
- Child 6–17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided.
- Adult: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided.

**Dental practitioners’ formulary**
- Chlorhexidine gluconate 2 mg per 1 mL Corsodyl® 0.2% oral spray (sugar-free) 60 mL £4.28 DT price = £4.28

**Mouthwash**
- Corsodyl® (GlaxoSmithKline Consumer Healthcare)
  - Chlorhexidine gluconate 2 mg per 1 mL Corsodyl® 0.2% mouthwash | 300 mL GSS £2.50 DT price = £3.46
  - Chlorhexidine gluconate 0.2% mouthwash | 300 mL GSS £1.99–£2.09
  - Chlorhexidine gluconate 0.2% mouthwash plain | 300 mL GSS £3.46
  - Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 mL GSS £3.46 DT price = £3.46
  - Chlorhexidine gluconate 0.2% mouthwash original | 300 mL GSS £3.48 DT price = £3.46

**Flavours of mouthwash may include mint.**

**Mouthwash**
- Eludril (Pierre Fabre Ltd)
  - Chlorhexidine gluconate 1 mg per 1 mL, Chlorobutanol 5 mg per 1 mL Eludril mouthwash (sugar-free) 90 mL GSS £1.36 (sugar-free) 250 mL GSS £2.83 (sugar-free) 500 mL GSS £5.06

**SIDE-EFFECTS, FURTHER INFORMATION**

- If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.
- **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; Corsodyl® mouthwash may be prescribed as Chlorhexidine Dental Gel, Corsodyl® oral spray may be prescribed as Chlorhexidine Oral Spray.

**MOUTHWASH**

**Chlorhexidine (Non-proprietary)**

**Chlorhexidine gluconate 2 mg per 1 mL**
- Chlorhexidine gluconate 0.2% mouthwash natural | 300 mL GSS £2.50 DT price = £3.46
- Chlorhexidine gluconate 0.2% mouthwash | 300 mL GSS £1.99–£2.09
- Chlorhexidine gluconate 0.2% mouthwash plain | 300 mL GSS £3.46
- Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 mL GSS £3.46 DT price = £3.46
- Chlorhexidine gluconate 0.2% mouthwash original | 300 mL GSS £3.48 DT price = £3.46
- Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 mL GSS no price available DT price = £3.46 500 mL GSS no price available
- Brands may include Corsodyl, Curasept

**Flavours of mouthwashes may include mint.**

**Mouthwash**
- Oraldene (McNeil Products Ltd)
  - Hexetidine 1 mg per 1 mL Oraldene (cermint 0.1% mouthwash (sugar-free) 200 mL GSS £2.21 DT price = £2.21
  - Oraldene 0.1% mouthwash peppermint (sugar-free) 100 mL GSS £1.43 (sugar-free) 200 mL GSS £2.21 DT price = £2.21

**SIDE-EFFECTS**
- Very rare: Taste disturbance; transient anaesthesia
- Frequency not known: Local irritation

**PRESCRIBING AND DISPENSING INFORMATION**

**Flavours of mouthwashes may include mint.**

**ANTI-INFECTION**

**Hexetidine**

**INDICATIONS AND DOSE**

**Oral hygiene**
- By mouth
  - Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
  - Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

**SIDE-EFFECTS**
- Hypertrophy of papillae of tongue on prolonged use.

**PRESCRIBING AND DISPENSING INFORMATION**

- The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.
- Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions.
- When prepared extemporaneously, the BP states that hydrogen peroxide mouthwash, BP consists of hydrogen peroxide 6% solution (+ approx. 20 volume) BP.

**HANDLING AND STORAGE**

- Hydrogen Peroxide Mouthwash may be prescribed.
Sodium bicarbonate with sodium chloride

**INDICATIONS AND DOSE**

**Oral hygiene**

**BY MOUTH USING MOUTHWASH**
- Adult: (consult product literature)

**DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary
  - Compound sodium chloride mouthwash may be prescribed.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash

3.3 Oral hygiene, dental caries

**Dental caries**

**Fluoride**

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplementation. Systemic fluoride supplements should not be prescribed until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

**FLUORIDE**

**Sodium fluoride**

**INDICATIONS AND DOSE**

Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion

**BY MOUTH USING TABLETS**
- Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F-)
- Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F-)
- Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F-)
- Adult: 1 mg daily, doses expressed as fluoride ion (F-)

Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3-0.7 parts per million) of fluoride ion

**BY MOUTH USING TABLETS**
- Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F-)
- Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F-)
- Adult: 500 micrograms daily, doses expressed as fluoride ion (F-)

Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion

**Child 6 months-7 years**: Supplements not advised
- **Adult**: Supplements not advised

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

**BY MOUTH USING TABLETS**
- Child 6-17 years: Rinse or gargle 10 mL daily
- Adult: Rinse or gargle 10 mL daily

**Dose equivalence and conversion**

Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.

These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7).

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**

**BY MOUTH USING PASTE**
- Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
- Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**

**BY MOUTH USING PASTE**
- Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
- Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

**EN-DE-KAY® FLUORIRINSE**

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**

**INITIALLY BY MOUTH USING MOUTHWASH**
- Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively (by mouth) 20 drops once daily, dilute 20 drops to 10 mL

**CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated

**SIDE-EFFECTS**
- **Uncommon** Occasional white flecks on teeth with recommended doses
- **Rare** Yellowish-brown discoloration if recommended doses are exceeded

**Ear, nose and oropharynx**
**DIRECTIONS FOR ADMINISTRATION**

- With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
- With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**
Brush teeth for 1 minute before spitting out.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**
Brush teeth for 3 minutes before spitting out.

**PRESCRIBING AND DISPENSING INFORMATION**

- **Flavours of oral tablet formulations may include orange.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
  - With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**
Brush teeth for 1 minute before spitting out.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**
Brush teeth for 3 minutes before spitting out.

**PROFESSION SPECIFIC INFORMATION**

- **Dental practitioners’ formulary** Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops. Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.
- **Dental information**
  - Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales). There are also arrangements for health authorities to supply fluoride tablets in the course of preschool dental schemes, and they may also be supplied in school dental schemes.
  - Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).
- **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**
  - Patients or carers should be given advice on how to administer Sodium Fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.
- **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**
  - Patients or carers should be given advice on how to administer Sodium Fluoride toothpaste.

**Oral ulceration and inflammation**

**Ulcercation and inflammation**

Ulcercation of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy induced mucositis and myelosuppression under Cytotoxic drugs p. 744). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes**

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes**

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 989 is often beneficial and may accelerate healing of recurrent aphthae.

**Corticosteroids**

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

**Hydrocortisone oromucosal tablets** p. 993 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

**Beclometasone dipropionate inhaler** p. 993 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 993 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

**Systemic corticosteroid therapy** (see under Corticosteroids, inflammatory disorders p. 939), is reserved for severe conditions such as pemphigus vulgaris.

**Local anaesthetics**

Local anaesthetics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that anaesthesia cannot be maintained continuously throughout the day. The main indication for a topical local anaesthetic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% p. 994 ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% p. 994 solution as spray can be applied...
thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Preparations on sale to the public:** many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzydamine hydrochloride below and flurbiprofen p. 994 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine hydrochloride below mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillitis and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 994 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

**Other preparations**

Doxycycline p. 995 rinsed in the mouth may be of value for recurrent aphthous ulceration.

**Periodontitis**

Low-dose doxycycline p. 995 (Periostar®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharynx infections, bacterial p. 995. See also Mouthwashes and other preparations for oropharyngeal use p. 989 for mouthwashes used for oral hygiene and plaque inhibition.

**CORTICOSTEROIDS**

**Beclometasone dipropionate**

*(Beclomethasone dipropionate)*

**INDICATIONS AND DOSE**

Management of oral ulceration

**BY BUCCAL ADMINISTRATION**

- Adult: 50–100 micrograms twice daily, use inhaler device to spray dose on to the oral mucosa

**UNLICENSED USE**

Use of soluble tablets and inhaler unlicensed in oral ulceration.

**MEDICINAL FORMS**

For preparations see inhaled beclomethasone p. 228.

**Betamethasone**

**INDICATIONS AND DOSE**

Oral ulceration

**BY MOUTH USING SOLUBLE TABLETS**

- Child 12–17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

**UNLICENSED USE**

Betamethasone soluble tablets not licensed for use as mouthwash or oral ulceration.

**CONTRA-INDICATIONS**

Untreated local infection

**SIDE-EFFECTS**

Candidal infection • exacerbation of local infection

**PATIENT AND CARER ADVICE**

Patient counselling is advised for betamethasone soluble tablets (administration).

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

**Hydrocortisone**

**INDICATIONS AND DOSE**

Oral and perioral lesions

**BY BUCCAL ADMINISTRATION**

- Child 1 month–11 years: Only on medical advice
- Child 12–17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

**UNLICENSED USE**

Hydrocortisone mucosalhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).

**CONTRA-INDICATIONS**

Untreated local infection

**SIDE-EFFECTS**

Candidal infection • exacerbation of local infection

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Mucosalhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

**Benzydamine hydrochloride**

**INDICATIONS AND DOSE**

Painful inflammatory conditions of oropharynx

**BY MOUTH USING MOUTHWASH**

- Child 12–17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
- Adult: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs

**ORAL ULCERATION 993**
**Medicinal Forms**

**Lidocaine hydrochloride** (Lignocaine hydrochloride)

**Indications and Dose**

Relief of pain in oral lesions

**To the lesion using ointment**

- Adult: Apply as required, rub sparingly and gently on affected areas

**Xylocaine**

Relief of pain in oral lesions

**To the lesion**

- Adult: Apply thinly to the ulcer using a cotton bud

**Local Anaesthetics**

**Choline salicylate**

**Indications and Dose**

Mild oral and perioral lesions

**To the lesion**

- Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

**Contra-indications**

Children under 16 years

**Contra-indications, Further Information**

Reye’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.

**SALICYLATES**

**INDICATIONS AND DOSE**

Mild oral and perioral lesions

**To the lesion**

- Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

**Contra-indications**

Children under 16 years

**Contra-indications, Further Information**

Reye’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.

**Flurbiprofen**

**Indications and Dose**

Relief of sore throat

**By mouth using lozenges**

- Child 12–17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day
- Adult: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

**Interactions**

See Appendix 1 (NSAIDs).

**Side-effects**

Mouth ulcers (move lozenge around mouth) - taste disturbance

**Allergy and Cross-sensitivity**

Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID — which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**Renal Impairment**

Deterioration in renal function has also been reported after topical use.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Lozenges**

- Streffen (Beckitt Benckier Healthcare (UK) Ltd)

| Flurbiprofen 8.75 mg | Streffen 8.75 mg lozenges | 16 lozenge P | £2.58 DT price = £2.58

**LOCAL ANAESTHETICS**

**Lidocaine hydrochloride**

**Medicinal Forms**

**Spray**

- Benzydamine mouthwash may be prescribed as Benzydamine hydrochloride 1.5 mg per 1 ml

| Streffen 8.75 mg | Streffen 8.75 mg lozenges | 16 lozenge P | £2.58 DT price = £2.58

**Contra-indications**

Children under 16 years

**Contra-indications, Further Information**

Reye’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
3.5 Oropharyngeal bacterial infections

Oropharyngeal bacterial infections

Antibacterial therapy for pericoronitis
Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.
- Metronidazole p. 475, or alternatively, amoxicillin
  Suggested duration of treatment 3 days or until symptoms resolve.

Antibacterial therapy for gingivitis: acute necrotising ulcerative
Antibacterial required only if systemic features of infection.
- Metronidazole p. 475, or alternatively, amoxicillin
  Suggested duration of treatment 3 days or until symptoms resolve.

Antibacterial therapy for periapical or periodontal abscess
Antibacterial required only in severe disease with cellulitis or if systemic features of infection.
- Amoxicillin p. 482, or alternatively, metronidazole
  Suggested duration of treatment 5 days.

Antibacterial therapy for periodontitis
Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.
- Metronidazole p. 475, or alternatively in adults and children over 12 years, doxycycline below

Antibacterial therapy for throat infections
Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.
- Phenoxymethylpenicillin
  In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 480, then oral therapy with phenoxymethylpenicillin p. 481 or amoxicillin p. 482 (or ampicillin p. 483). Avoid amoxicillin if possibility of glandular fever.
  Suggested duration of treatment 10 days.
- If penicillin-allergic, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  Suggested duration of treatment 10 days

Doxycycline

INDICATIONS AND DOSE
Treatment of recurrent aphthous ulceration
BY MOUTH USING SOLUBLE TABLETS
- Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed
- Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed
Ear, nose and oropharynx

Unlicensed use
Not licensed for severe recurrent aphthous ulceration.

Cautions
Alcohol dependence

Interactions
The metabolism of doxycycline may be influenced by antiepileptics.

Side-effects
Anorexia - anxiety - dry mouth - flushing - fungal superinfection (when used for periodontitis) - tinnitus

Renal impairment
Use with caution (avoid excessive doses).

Monitoring requirements
When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

Patient and carer advice
Photosensitivity Patients should be advised to avoid exposure to sunlight or sunlamps.

Profession specific information
Dental practitioners’ formulary
Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.
Tablets may be prescribed as Doxycycline Tablets 20 mg.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 6, 11, 27
- Periostat (Alliance Pharmaceuticals Ltd)
- Doxycycline (as Doxycycline hyclate) 20 mg Periostat 20mg tablets
  | 56 tablet (PO) £17.30 DT price = £17.30
Dispersible tablet
CAUTIONARY AND ADVISORY LABELS 6, 9, 11, 13
- Vibramycin-D (Pfizer Ltd)
- Doxycycline (as Doxycycline monohydrate) 100 mg Vibramycin-D 100mg dispersible tablets (sugar-free) | 8 tablet (PO) £4.91 DT price = £4.91

3.6 Oropharyngeal fungal infections

Oropharyngeal fungal infections
Fungal infections of the mouth are usually caused by Candida spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush
Acute pseudemembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 997 or miconazole p. 1011 may be needed. Fluconazole p. 518 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

Acute erythematous candidiasis
Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole p. 518.

Denture stomatitis
Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole p. 1011 oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

Chronic hyperplastic candidiasis
Chronic hyperplastic candidiasis (candidal leucoplaquia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole p. 518 to eliminate candidal overlay. Patients should avoid the use of tobacco.

Angular cheilitis
Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to oro-facial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole p. 1011 cream or fusidic acid p. 1008 ointment; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole p. 1011 cream or ointment can be used.

Immunocompromised patients
See advice on prevention of fungal infections in Immunocompromised patients under Antifungals, systemic use p. 512.

Drugs used in oropharyngeal candidiasis
Nystatin p. 997 is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole p. 1011 is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole p. 518 is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 519 can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient’s partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.
**IMIDAZOLE ANTIFUNGALS**

**Miconazole**

**INDICATIONS AND DOSE**
Prevention and treatment of oral candidiasis

**BY MOUTH USING ORAL GEL**
- Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

**Prevention and treatment of intestinal candidiasis**
- Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg (10 mL) 4 times a day), treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
- Adult: 5 mg/kg 4 times a day (max. per dose 250 mg (10 mL) 4 times a day), treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

**SIDE-EFFECTS**
- Common or very common Nausea, rash, vomiting
- Very rare diarrhoea (usually on long term treatment), hepatitis, rash (in children), Stevens-Johnson syndrome, toxic epidermal necrolysis
- **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in animal studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.
- **PROFESSION SPECIFIC INFORMATION** Dental practitioners’ formulary Miconazole Oromucosal Gel may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

**CONTRA-INDICATIONS** Infants with impaired swallowing reflex

**CAUTIONS** Avoid in Acute porphyrias p. 864

**INTERACTIONS** Appendix 1 (antifungals, imidazole).

**POLYENE ANTIFUNGALS**

**Nystatin**

**INDICATIONS AND DOSE**
Oral and perioral fungal infections

**BY MOUTH**
- Child: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved, to be administered after food
- Adult: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved, to be administered after food

**SIDE-EFFECTS** Local irritation, local sensitisation, nausea

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Nystatin for Candida infection www.medicinesforchildren.org.uk/nystatin-for-candida-infection

Counselling advised with oral suspension (use of pipette, hold in mouth, after food).

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary Nystatin Oral Suspension may be prescribed.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Ethanol

**NYSTATIN (Non-proprietary)**
- Nystatin 100 000 unit per 1 ml Nystatin 100,000 units/ml oral suspension | 30 ml (sach) £22.44 DT price = £3.35
- Nystan (Bristol-Myers Squibb Pharmaceuticals Ltd) Nystatin 100 000 unit per 1 ml Nystan 100,000 units/ml oral suspension (ready mixed) | 30 ml (sach) £1.80 DT price = £3.35

**3.7 Oropharyngeal viral infections**

**Oropharyngeal viral infections**

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzylamine hydrochloride p. 993. The use of chlorhexidine p. 989 mouthwash will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 550 is required. Valaciclovir p. 552 and famciclovir p. 552 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.
Skin conditions, management

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

<table>
<thead>
<tr>
<th>Area of body</th>
<th>Creams and Ointments</th>
<th>Lotions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face</td>
<td>15–30 g</td>

</tr>
<tr>
<td>Trunk</td>
<td>400 g</td>
<td>500 ml</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15–25 g</td>
<td>100 ml</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table on p. 1021.
Excipients and sensitisation
Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polyethylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances
The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated.

Emollients
Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

Emollient and barrier preparations

Emollient bath and shower preparations
Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

Barrier preparations
Barrier preparations often contain water-repellent substances such as dimeticone p. 1014 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash
The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole p. 1010 cream can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

BARRIER PREPARATIONS

Emollients

Emollients

Dry and scaling skin disorders

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 1014 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash
The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole p. 1010 cream can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

## Emollient bath and shower products, antimicrobial-containing

**INDICATIONS AND DOSE**

**DERMOL® 200 SHOWER EMOLLIENT**

Dry and pruritic skin conditions including eczema and dermatitis

**TO THE SKIN**

- **Adult:** To be applied to the skin or used as a soap substitute

**DERMOL® 600® BATH EMOLLIENT**

Dry and pruritic skin conditions including eczema and dermatitis

**TO THE SKIN**

- **Child 1-23 months:** 5–15 mL/bath, not to be used undiluted
- **Adult:** 15–30 mL/bath, not to be used undiluted

**DERMOL® WASH EMULSION**

Dry and pruritic skin conditions including eczema and dermatitis

**TO THE SKIN**

- **Adult:** To be applied to the skin or used as a soap substitute

**EMULSIDERM®**

Dry skin conditions including eczema and ichthyosis

**TO THE SKIN**

- **Adult:** 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

**OILATUM® PLUS**

Topical treatment of eczema, including eczema at risk from infection

**TO THE SKIN**

- **Child 6-11 months:** 1 mL/bath, not to be used undiluted
- **Adult:** 1–2 capfuls/bath, not to be used undiluted

### Important safety information

**FIRE HAZARD WITH PARAFFIN-BASED EMOLLIENTS**

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient. These preparations make skin and surfaces slippery—particular care is needed when bathing.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**PRESCRIBING AND DISPENSING INFORMATION**

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication. When prepared extemporaneously, the BP states Aqueous Cream, BP consists of emulsifying ointment 30%, phenoxyethanol 1% in freshly boiled and cooled purified water. Hydros Ointment, BP consists of dried magnesium sulfate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water.

### Medicinal forms

Bath additive
EXCIPIENTS: May contain Beeswax, fragrances
- EMOLLIENT BATH AND SHOWER PRODUCTS, COLLOIDAL OATMEAL-CONTAINING (Non-proprietary) 250 ml (ACBS) £4.49
- Brands may include Aveeno bath oil

Emollient bath and shower products, paraffin-containing

INDICATIONS AND DOSE

AQUAMAX® WASH
Dry skin conditions
TO THE SKIN
- Adult: To be applied to wet or dry skin and rinse

CETRABEN® BATH
Dry skin conditions, including eczema
TO THE SKIN
- Child 1 month-11 years: 0.5–1 capful/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse

DERMALO®
Dermatitis | Dry skin conditions including eczema
TO THE SKIN
- Child 1 month-11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse
- Adult: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly
TO THE SKIN
- Elderly: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

DOUBLEBASE® EMOLLIENT BATH ADDITIVE
Dry skin conditions including dermatitis and ichthyosis
TO THE SKIN
- Child 1 month-11 years: 5–10 mL/bath
- Child 12-17 years: 15–20 mL/bath
- Adult: 15–20 mL/bath

Pruritus of the elderly
TO THE SKIN
- Elderly: 15–20 mL/bath

DOUBBLEBASE® EMOLLIENT SHOWER GEL
Dry, chapped, or itchy skin conditions
TO THE SKIN
- Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering
- Adult: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

E45® WASH CREAM
Endogenous and exogenous eczema, xeroderma, and ichthyosis
TO THE SKIN
- Child: To be used as a soap substitute
- Adult: To be used as a soap substitute

Pruritus of the elderly associated with dry skin

TO THE SKIN
- Elderly: To be used as a soap substitute

E45® BATH OIL
Endogenous and exogenous eczema, xeroderma, and ichthyosis
TO THE SKIN
- Elderly: 15 mL/bath, alternatively, to be applied to wet skin and rinse

HYDROMOL® BATH AND SHOWER EMOLLIENT
Dry skin conditions | Eczema | Ichthyosis
TO THE SKIN
- Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

Pruritus of the elderly
TO THE SKIN
- Elderly: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

LPL 63.4®
Dry skin conditions
TO THE SKIN
- Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM® EMOLLIENT BATH ADDITIVE
Dry skin conditions including dermatitis, and ichthyosis
TO THE SKIN
- Child 1 month-11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly

Emollient creams and ointments, paraffin-containing

INDICATIONS AND DOSE

Dry skin conditions | Eczema | Psoriasis | Ichthyosis | Pruritus

Adult: (consult product literature)

Important safety information

FIRE HAZARD WITH PARAFFIN-BASED EMOLLIENTS

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

- DIRECTIONS FOR ADMINISTRATION Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Paraffin, Yellow Soft, BP consists of yellow petroleum jelly. Paraffin White Soft, BP consists of white petroleum jelly. Emulsifying ointment, BP consists of emulsifying wax 30%, white soft paraffin 50% and liquid paraffin 20%.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emollients, urea-containing

- **DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

**INDICATIONS AND DOSE**

AQUADRATETM

Dry, scaling and itching skin

**TO THE SKIN**

- Child: Apply twice daily, to be applied thinly
- Adult: Apply twice daily

BALNEUM® CREAM

Dry skin conditions

**TO THE SKIN**

- Child: Apply twice daily
- Adult: Apply twice daily

BALNEUM® PLUS CREAM

Dry, scaling and itching skin

**TO THE SKIN**

- Child: Apply twice daily
- Adult: Apply twice daily

CALMURID®

Dry, scaling and itching skin

**TO THE SKIN**

- Child: Apply twice daily, to be applied a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs
- Adult: Apply twice daily, to apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

DERMATONICS ONCE HEEL BALM®

Dry skin on soles of feet

**TO THE SKIN**

- Child 12–17 years: Apply daily
- Adult: Apply daily

---

**E45®ITCH RELIEF CREAM**

Dry, scaling, and itching skin

**TO THE SKIN**

- Child: Apply twice daily
- Adult: Apply twice daily

EUCERIN® INTENSIVE CREAM

Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

**TO THE SKIN**

- Child: Apply twice daily, to be applied thinly and rubbed into area
- Adult: Apply twice daily, to be applied thinly and rubbed into area

EUCERIN® INTENSIVE LOTION

Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

**TO THE SKIN**

- Child: Apply twice daily, to be applied sparingly and rubbed into area
- Adult: Apply twice daily, to be applied sparingly and rubbed into area

FLEXITOL®

Dry skin on soles of feet and heels

**TO THE SKIN**

- Child 12–17 years: Apply 1–2 times a day
- Adult: Apply 1–2 times a day

HYDROMOL® INTENSIVE

Dry, scaling and itching skin

**TO THE SKIN**

- Child: Apply twice daily, to be applied thinly
- Adult: Apply twice daily, to be applied thinly

NUTRAPLUS®

Dry, scaling and itching skin

**TO THE SKIN**

- Child: Apply 2–3 times a day
- Adult: Apply 2–3 times a day

**DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

EXCIPIENTS: May contain Benzyl alcohol, isopropyl palmitate

- Eucerin (Beiersdorf UK Ltd)
- Urea 100 mg per 1 gram Eucerin Intensive 10% lotion | 250 ml | £7.93

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), isopropyl palmitate, polysorbates, propylene glycol, wool fat and related substances including lanolin

2 Infections of the skin

Skin infections

Antibacterial preparations

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute impetigo on small areas of the skin may be treated by short-term topical application of mupirocin or fusidic acid p. In the community, acute impetigo on small areas of the skin may be treated by short-term topical application of mupirocin or fusidic acid p. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of the hands.

Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

Dermatophytes

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1010, econazole nitrate p. 1011, ketoconazole p. 1011, and miconazole p. 1011 are all effective. Terbinafine p. 1013 cream is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1012 and the undecenoates. Compound benzoic acid ointment (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1012 or tioconazole p. 1012 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.
Pityriasis versicolor
Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 1011. Alternatively, selenium sulfide shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole p. 1010, econazole nitrate p. 1011, ketoconazole p. 1011, and miconazole p. 997, or topical terbinafine p. 514 are alternatives, but large quantities may be required. If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis
Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole p. 1010, econazole nitrate p. 1011, ketoconazole p. 1011, or miconazole p. 1011; topical terbinafine p. 1013 is an alternative. Topical application of nystatin p. 997 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 518; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

Angular cheilitis
Miconazole p. 1011 cream is used in the fissures of angular cheilitis when associated with Candida.

Compound topical preparations
Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 993) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole antifungal, such as clotrimazole p. 1011 or miconazole p. 1011; topical terbinafine p. 1013 is an alternative. Topical application of nystatin p. 997 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 518; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

Antiviral preparations
Aciclovir p. 1016 is licensed for the treatment of initial and recurrent labial and genital herpes simplex infections; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for herpes zoster (shingles).

Herpes labialis
Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

Parasitical preparations

</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for single application.

Scabies
Permethrin p. 1015 is used for the treatment of scabies (Sarcoptes scabiei); malathion p. 1015 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1014 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 1015 (available on a named patient basis from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone; further doses may be required.

Application
Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching
The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1040 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine at night may also be useful.

Head lice
Dimeticone p. 1014 is effective against head lice (Pediculus humanus capititis). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion p. 1015, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate p. 1014 is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present.

Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

Wet combing methods
Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 20 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no
lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process. Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice

Permethrin p. 1015 and malathion p. 1015 are used to eliminate crab lice (Phthirus pubis). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrow and other facial hair). A different insecticide should be used if a course of treatment fails.

2.1 Bacterial skin infections

Bacitracin with polymyxin B

**INDICATIONS AND DOSE**

**Bacterial skin infections**

**TO THE SKIN**

- **Child:** Apply twice daily, can be applied more frequently if required
- **Adult:** Apply twice daily, can be applied more frequently if required

**CAUTIONS** Nephrotoxicity · neurotoxicity

**CAUTIONS, FURTHER INFORMATION**

If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment.

**SIDE-EFFECTS**

- Frequent not known Contact sensitisation

**RENAI IMPAIRMENT**

Renal impairment increases the risk of nephrotoxicity and neurotoxicity.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- **Polyfax** (Teva UK Ltd)
  - Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate 10000 unit per 1 gram Polyfax ointment | 4 gram £0.92 | 20 gram £4.62 DT price = £4.62

Fusidic acid

**DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**

**TO THE SKIN**

- **Child:** Apply 3–4 times a day usually for 7 days
- **Adult:** Apply 3–4 times a day

**CAUTIONS** Avoid contact of cream or ointment with eyes
## Mupirocin

### INDICATIONS AND DOSE

**Bacterial skin infections**, particularly those caused by Gram-positive organisms (except pseudomonal infection) **TO THE SKIN**

- **Child:** Apply up to 3 times a day for up to 10 days
- **Adult:** Apply up to 3 times a day for up to 10 days

### SIDE-EFFECTS

- Burning sensation
- Local reactions
- Pruritus
- Rash
- Urticaria

### MEDICATION FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: gel, cream

**Cream**

- **EXCIPIENTS:** May contain Benzyl alcohol, isopropyl palmitate, propylene glycol
- **Rosedo (Pierre Fabre Dermo-Cosmetique)**
  - Metronidazole 7.5 mg per 1 gram Rosedo 0.75% cream | 30 gram (PDT) £15.00 DT price = £6.60

### CONTRA-INDICATIONS

- Neonates

### CAUTIONS

Large areas

- If large areas of skin are being treated

- Ototoxicity may be a hazard, particularly in children and the elderly, and in those with renal impairment.

### SIDE-EFFECTS

- Sensitisation (cross sensitivity with other aminoglycosides may occur)

### LESS SUITABLE FOR PRESCRIBING

- Neomycin sulfate cream is less suitable for prescribing.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

**Tablet**

- **NEOMYCIN SULFATE (Non-proprietary)**
  - Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet (PDT) £34.69

### Retapamulin

**INDICATIONS AND DOSE**

**Superficial bacterial skin infection caused by Staphylococcus aureus and Streptococcus pyogenes (if resistant to first line topical antibacterials)**

**TO THE SKIN**

- **Child 9 months-17 years:** Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days
- **Adult:** Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 100 cm² or lesion length 10 cm, review treatment if no response within 2–3 days

### CONTRA-INDICATIONS

- Contact with eyes
- Contact with mucous membranes

### SIDE-EFFECTS

- Contact dermatitis
- Localised erythema
- Localised irritation
- Localised pain
- Pruritus

### NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2008) that retapamulin (Altargo®) is not recommended
for use within NHS Scotland for the treatment of superficial skin infections.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- **CAUTIONARY AND ADVISORY LABELS**
  - **28**
  - **Altargo** (GlaxoSmithKline UK Ltd)
  - **Retapamulin** 10 mg per 1 gram
  - **Altargo** 10 mg/g ointment | 5 gram (P) £7.89

### Silver sulfadiazine

#### INDICATIONS AND DOSE
**Prophylaxis and treatment of infection in burn wounds**
- **To the skin**
  - **Child:** Apply daily, may be applied more frequently if very exudative
  - **Adult:** Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries
- **To the skin**
  - **Child:** Apply every 2–3 days, consult product literature for details
  - **Adult:** Apply every 2–3 days, consult product literature for details

**Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions**
- **To the skin**
  - **Adult:** (consult product literature)

**Adjunct to short-term treatment of infection in pressure sores**
- **To the skin**
  - **Adult:** Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg ulcers
- **To the skin**
  - **Adult:** Apply once daily or on alternate days, not recommended if ulcer is very exudative

### CONTRA-INDICATIONS
Not recommended for neonates with severe PD deficiency.

### CAUTIONS
**G6PD deficiency**

**FURTHER INFORMATION**

**Large areas** Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.

### INTERACTIONS
→ Appendix 1 (sulfonamides)—if large amounts given. May inactivate enzymatic debriding agents—concomitant use may be inappropriate.

### SIDE-EFFECTS
Allergic reactions - argyria (following treatment of large areas of skin or prolonged use) - burning - itching - leucopenia - rash

**SIDE-EFFECTS, FURTHER INFORMATION**

**Severe blood and skin disorders** Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop. Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

### ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with sensitivity to sulfonamides.

### PREGNANCY
Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

### BREAST FEEDING
Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

### HEPATIC IMPAIRMENT
Manufacturer advises caution if significant impairment.

### RENAL IMPAIRMENT
Manufacturer advises caution if significant impairment.

### MONITORING REQUIREMENTS
Monitor for leucopenia.

### DIRECTIONS FOR ADMINISTRATION
Apply with sterile applicator.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol
- **Flamazine** (Smith & Nephew Healthcare Ltd)
  - **Sulfadiazine silver 10 mg per 1 gram** Flamazine 1% cream | 20 gram (P) £2.91 | 50 gram (P) £3.85 DT price = £3.85 | 250 gram (P) £10.32 DT price = £10.32 | 500 gram (P) £18.27 DT price = £18.27

### 2.2 Fungal skin infections

#### IMIDAZOLE ANTIFUNGALS

**Clotrimazole**

#### INDICATIONS AND DOSE
**Fungal skin infections**
- **To the skin**
  - **Child:** Apply 2–3 times a day
  - **Adult:** Apply 2–3 times a day

#### CAUTIONS
Contact with eyes and mucus membranes should be avoided.

#### SIDE-EFFECTS
Local irritation - erythema - hypersensitivity reactions - itching - mild burning sensation

#### SIDE-EFFECTS, FURTHER INFORMATION
Treatment should be discontinued if side-effects are severe.

#### PREGNANCY
Minimal absorption from skin; not known to be harmful.

#### PRESCRIBING AND DISPENSING INFORMATION
Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- **Canesten (clotrimazole)** (Bayer Plc)
  - **Clotrimazole 10 mg per 1 ml** Canesten 1% solution | 20 ml (P) £2.30 DT price = £2.30

**Cream**
- **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
  - **CLOTRIMAZOLE (Non-proprietary)**
    - **Clotrimazole 10 mg per 1 gram** Clotrimazole 1% cream | 20 gram (P) £2.18 DT price = £2.18 | 50 gram (P) £3.50 DT price = £3.40
    - **Canesten Antifungal 1% cream** | 20 gram (P) £1.85 DT price = £1.85
    - **Clotrimazole 20 mg per 1 gram** Canesten 2% thrush cream | 10 gram (P) no price available | 20 gram (P) £4.46 DT price = £4.46
    - **Clotrimazole 100 mg per 1 gram** Canesten Internal 10% cream | 5 gram (P) £6.23 DT price = £6.23
      - **Canesten 10% VC cream** | 5 gram (P) £4.50 DT price = £6.23
Econazole nitrate

**INDICATIONS AND DOSE**

**Fungal skin infections**

**TO THE SKIN**

- Child: Apply twice daily
- Adult: Apply twice daily

**Fungal nail infections**

**BY TRANSGING NAIL APPLICATION**

- Child: Apply once daily, applied under occlusive dressing
- Adult: Apply once daily, applied under occlusive dressing

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side-effects are severe.

**PREGNANCY**

Minimal absorption from skin; not known to be harmful.

**EXCIPIENTS**

May contain Butylated hydroxyanisole, fragrances.

There can be variation in the licensing of different medicines containing the same drug.

Ketoconazole

**INDICATIONS AND DOSE**

**Tinea pedis**

**TO THE SKIN USING CREAM**

- Adult: Apply 1–2 times a day

**Treatment of seborrhoeic dermatitis and dandruff**

**TO THE SKIN**

- Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
- Adult: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing

**Prophylaxis of seborrhoeic dermatitis and dandruff**

**TO THE SKIN**

- Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
- Adult: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing

**Treatment of pityriasis versicolor**

**TO THE SKIN**

- Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side-effects are severe.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions**

- Ketoconazole cream is not prescribable on the NHS except for seborrhoeic dermatitis and pityriasis versicolor endorsed ‘SLS’.

**EXCEPTIONS TO LEGAL CATEGORY**

- For Fungal skin infections in adults A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo.
- For Seborrhoeic dermatitis and dandruff Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

**EXCIPIENTS**

- May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol.
- May include Gyno-Pevaryl 1% cream.

Miconazole

**INDICATIONS AND DOSE**

**Fungal skin infections**

**TO THE SKIN**

- Child: Apply twice daily continuing for 10 days after lesions have healed
- Adult: Apply twice daily continuing for 10 days after lesions have healed

**Fungal nail infections**

**TO THE SKIN**

- Child: Apply 1–2 times a day
- Adult: Apply 1–2 times a day

**CAUTIONS**

Avoid in Acute porphyrias p. 664 - contact with eyes and mucous membranes should be avoided.
OTHER ANTIFUNGALS

**Amorolfin**

**INDICATIONS AND DOSE**

Fungal nail infections

**BY TRANSUNGUAL APPLICATION**

- **Child:** Apply 1–2 times a week for 6 months to treat finger nail and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- **Adult:** Apply 1–2 times a week for 6 months to treat finger nail and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

**SIDE-EFFECTS**

- **Frequency not known**
  - Common or very common: Nausea, rash, vomiting
  - Frequency not known: Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side effects are severe.

**PREGNANCY**

Absorbed from the skin in small amounts; manufacturer advises caution.

**BREAST FEEDING**

Manufacturer advises caution—no information available.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulation

Miconazole cream may be prescribed.

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions: Miconazole nitrate 2% powder is not prescribable on the NHS.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **Excipients:** May contain Butylated hydroxyanisole
  - **Daktarin** (McNeil Products Ltd, Janssen-Cilag Ltd)
    - Miconazole nitrate 20 mg per 1 gram
      - Daktarin 2% cream
        - 15 gram [P] £2.14 | 30 gram [P] £1.82 DT price = £1.62
      - Brands may include Gyno-Daktarin 2% vaginal cream

**Spray**

- **CAUTIONARY AND ADVISORY LABELS** 15
  - **Daktarin** (McNeil Products Ltd)
    - Miconazole nitrate 1.6 mg per 1 gram
      - Daktarin Aktiv 0.16% spray powder
        - 100 gram [GSS] £3.17 DT price = £3.17

**Powder**

- **Daktarin** (McNeil Products Ltd)
  - Miconazole nitrate 20 mg per 1 gram
    - Daktarin 2% powder
      - 20 gram [P] £2.58

**Tioconazole**

**INDICATIONS AND DOSE**

Fungal nail infection

**BY TRANUNGUAL APPLICATION**

- **Child:** Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin
- **Adult:** Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

**SIDE-EFFECTS**

- **Common or very common:** Nausea, rash, vomiting
- **Frequency not known:** Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side effects are severe.

**PREGNANCY**

Manufacturer advises avoid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Paint**

- **Tioconazole 283 mg per 1 ml**
  - Trosyl 283mg/ml nail solution
    - 12 ml [P] £27.38 DT price = £27.38

**Griseofulvin**

**INDICATIONS AND DOSE**

Tinea pedis

**TO THE SKIN**

- **Adult:** Apply 400 micrograms once daily, apply to an area approximately 13 cm², increased if necessary to 1.2 mg once daily for maximum treatment duration of 4 weeks, allow each spray to dry between application
SID Ef ECT S, FURTHER INFORMATION

Treatment should be discontinued if side-effects are severe.

• PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

• BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Benzyl alcohol

Griseofulvin 10 mg per 1 gram Grisol AF 1% spray | 20 ml

£1.35

Terbinafine

INDICATIONS AND DOSE

Tinea pedis

TO THE SKIN USING CREAM

• Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly

Tinea corporis

TO THE SKIN USING CREAM

• Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

Tinea cruris

TO THE SKIN USING CREAM

• Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

Cutaneous candidiasis | Pityriasis versicolor

TO THE SKIN USING CREAM

• Adult: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

• CAUTIONS Contact with eyes and mucous membranes should be avoided

• SIDE-EFFECTS Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side effects are severe.

• PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects.

• BREAST FEEDING Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother’s chest.

• EXCEPTIONS TO LEGAL CATEGORY Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Benzoic acid with salicylic acid

INDICATIONS AND DOSE

Ringworm (tinea)

TO THE SKIN

• Child: Apply twice daily

• Adult: Apply twice daily

• CAUTIONS Avoid broken or inflamed skin · avoid contact with eyes · avoid contact with mucous membranes

CAUTIONS, FURTHER INFORMATION

Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin.

SIDE-EFFECTS Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side effects are severe.

• PRESCRIBING AND DISPENSING INFORMATION Benzoic Acid Ointment, Compound, BP (a preparation containing benzoic acid and salicylic acid) has also been referred to as Whitfield’s ointment. When prepared extemporaneously, the BP states Benzoic Acid Ointment, Compound BP (Whitfield’s ointment) consists of benzoic acid 6%, salicylic acid 3%, in emulsifying ointment.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, cream

---

Boric acid with salicylic acid and tannic acid

INDICATIONS AND DOSE

Fungal nail infection, particularly tinea

BY TRANSUNGUAL APPLICATION

• Child 5–17 years: Apply twice daily, and after washing

• Adult: Apply twice daily, and after washing

• CAUTIONS Avoid broken or inflamed skin · contact with eyes and mucous membranes should be avoided · use with caution in children likely to suck affected digits

CAUTIONS, FURTHER INFORMATION

Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin.

SIDE-EFFECTS Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side effects are severe.

• PREGNANCY Avoid.

• LESS SUITABLE FOR PRESCRIBING Phytex® is less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
Chlorhexidine with nystatin

**INDICATIONS AND DOSE**

Skin infections due to Candida spp.

**TO THE SKIN**
- **Child:** Apply 2–3 times a day, continuing for 7 days after lesions have healed
- **Adult:** Apply 2–3 times a day, continuing for 7 days after lesions have healed

**SIDE-EFFECTS**
- Avoid contact with eyes and mucous membranes
- Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- Excipients: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
- Nystaform (Typharm Ltd)
  - Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram
  - Nystaform cream | 30 gram GSK £2.62 OT price = £2.62

**Undecenoic acid with zinc undecenoate**

**INDICATIONS AND DOSE**

Treatment of athlete’s foot

**TO THE SKIN**
- **Child:** Apply twice daily, continue use for seven days after lesions have healed
- **Adult:** Apply twice daily, continue use for seven days after lesions have healed

**PREVENTION OF ATHLETE’S FOOT**
- **Child:** Apply once daily
- **Adult:** Apply once daily

**SIDE-EFFECTS**
- Avoid broken skin - contact with eyes should be avoided - contact with mucous membranes should be avoided
- Erythema, hypersensitivity reactions, itching, local irritation, mild burning sensation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- Excipients: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances
- UNDECENOIC ACID WITH ZINC UNDECENOATE (Non-proprietary)
  - Undecenoic acid 50 mg per 1 gram, Zinc undecenoate 200 mg per 1 gram
  - Brands may include Mycota

2.3 Parasitic skin infections

**PARASITICIDES**

**Benzyl benzoate**

**INDICATIONS AND DOSE**

Scabies

**TO THE SKIN**
- **Child:** Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

**SIDE-EFFECTS**
- Avoid contact with eyes and mucous membranes - children (not recommended) - do not use on broken or secondarily infected skin
- Burning sensation (especially on genitalia and excoriations) - rashes - skin irritation
- BREAST FEEDING: Suspend feeding until product has been washed off.

**PRESCRIBING AND DISPENSING INFORMATION**
Not recommended for children — dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears. When prepared extemporaneously, the BP states Benzyl Benzoate Application, BP consists of benzyl benzoate 25% in an emulsion basis.

**LESS SUITABLE FOR PRESCRIBING**
Benzyl benzoate is less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Dimeticone**

**INDICATIONS AND DOSE**

Head lice

**TO THE SKIN**
- **Child:** Apply once weekly for 2 doses, rub into hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)
- **Adult:** Apply once weekly for 2 doses, rub into hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

**UNLICENSED USE**
Not licensed for use in children under 6 months except under medical supervision.

**SIDE-EFFECTS**
- Skin irritation
- **PATIENT AND CARER ADVICE**
- Patients should be told to keep hair away from fire and flames during treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Parasitic skin infections 1015

Malathion

INDICATIONS AND DOSE

Head lice

TO THE SKIN

> Child: Apply once weekly for 2 doses, apply 0.5% preparation over whole body, wash off after 12 hours or overnight

> Adult: Apply once weekly for 2 doses, apply 0.5% preparation over whole body, wash off after 12 hours or overnight

Crab lice

TO THE SKIN

> Child: Apply once weekly for 2 doses, apply 0.5% preparation over whole body, wash off after 12 hours or overnight

> Adult: Apply once weekly for 2 doses, apply 0.5% preparation over whole body, wash off after 12 hours or overnight

Scabies

TO THE SKIN

> Child: Apply once weekly for 2 doses, apply 0.5% preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

> Adult: Apply once weekly for 2 doses, apply 0.5% preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires emollients applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1019) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See Wound management products and elasticated garments p. 1294 for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 1017 for the role of topical pimecrolimus p. 1019 and tacrolimus p. 1020 in atopic eczema.

Infection

Bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) can exacerbate eczema and requires treatment with topical or systemic antibacterial drugs. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertrigenous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

Management of other features of eczema

Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol paste p. 1019 (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar and ichthammol can be useful in some cases of chronic eczema.

A non-sedating antihistamine may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine can be used if itching causes sleep disturbance.

Exudative (weeping) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate p. 1052 solution (1 in 10,000) can be used in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1033 is licensed for...
the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

**Seborrhoeic dermatitis**

*Seborrhoeic dermatitis* (seborrhoeic eczema) is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 1011 and coal tar) and combinations of mild corticosteroids with suitable antimicrobials are used.

### Eczema and psoriasis, drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

**Pimecrolimus** p. 1019 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 1020 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

**Ciclosporin** p. 717 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 716 or mycophenolate mofetil p. 725 are used for severe refractory eczema [unlicensed indication].

**Methotrexate** p. 762 can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 836 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

**Etanercept** p. 903, adalimumab p. 901, and infliximab p. 906 inhibit the activity of tumour necrosis factor (TNFα). They are used for severe plaque psoriasis either refractory to at least 2 standard systemic treatments and phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Ustekinumab p. 899 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and phototherapy, or when these treatments cannot be used because of intolerance or contra-indications. Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis.

### Psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

**Emollients**, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in *inflammatory psoriasis* and in *plaque psoriasis of palms and soles*, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatments.

More specific topical treatment for *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar p. 1018, and the retinoid tazarotene p. 1034. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

**Scalp psoriasis** is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

**Facial, flexural and genital psoriasis** can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcipotriol p. 1037 or tacalcitol p. 1037 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroid is inadequate; calcipotriol p. 1036 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1019 or tacrolimus p. 1020 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, calcitriol and calcipotriol are less likely to irritate.

**Coal tar** has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of

Dithranol

(Anthralin)

**INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**

**TO THE SKIN**

- Adult: (consult product literature)

**DITHROCREAM**

- Subacute and chronic psoriasis

**TO THE SKIN**

- Adult: For application to skin or scalp. 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**MICANOL**

- Subacute and chronic psoriasis

**TO THE SKIN**

- Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **CONTRA-INDICATIONS** Acute and pustular psoriasis - hypersensitivity

- **CAUTIONS** Avoid sensitive areas of skin - avoid use near eyes

- **SIDE-EFFECTS** Local burning sensation - local irritation - stains hair - stains skin

- **PREGNANCY** No adverse effects reported.

- **BREAST FEEDING** No adverse effects reported.
**DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.

**Micanol®** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

**PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. When prepared extemporaneously, the BP states Dithranol Paste, BP consists of dithranol in zinc and salicylic acid (Lassar’s) paste. Usual strengths 0.1–1% of dithranol. Dithranol Ointment BP, consists of dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required.

**PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, cream, paste. The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol above.

**INDICATIONS AND DOSE**

**Adult:**
- Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)
- Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

**Child:**
- Subacute and chronic psoriasis
- Ichthammol: 1 mg per 1 mg
- Ichthammol 1 mg per 1 mg

**SIDE-EFFECTS** Skin irritation

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Ichthammol Ointment, BP 1980 consists of ichthammol 10%, white soft paraffin 45% and wool fat 45%.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste, ointment

**Liquid**
- Ichthammol (Non-proprietary)
- Ichthammol 1 mg per 1 mg: Ichthammol liquid | 100 gram £11.42
- Ichthammol 1 mg per 1 mg: Ichthammol liquid | 500 gram £34.27

**Ichthammol with zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

**INDICATIONS AND DOSE**

**Adult:** (consult product literature)

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Ichthammol Cream, BP consists of ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, cream

**Impregnated dressing**
- Ichthammol with zinc oxide (Non-proprietary)
- Ichthammol with zinc oxide

**CALCINEURIN INHIBITORS AND RELATED DRUGS**

**Pimecrolimus**

**INDICATIONS AND DOSE**

**Adult:** Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

**TO THE SKIN**
- Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

**Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)**

**TO THE SKIN**
- Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

**UNLICENSED USE** Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.
Tacrolimus

**DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to or intolerant of conventional therapy

**TO THE SKIN**

- Adult: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

**SIDE-EFFECTS**

Common or very common: Burning sensation, erythema, folliculitis, pruritus, skin infections

Uncommon: Herpes simplex, herpes zoster, impetigo, molluscum contagiosum

Rare: Dryness, local reactions including pain, oedema, papilloma, paraesthesia, peeling, skin discoloration, worsening of eczema

**CONTRA-INDICATIONS**

- Topical tacrolimus is recommended for moderate to severe atopic eczema on the face (particularly skin atrophy).
- Topical pimecrolimus is an option for atopic eczema not responding to initial treatment with topical tacrolimus.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82
  
  Tacrolimus is an option for atopic eczema not controlled by topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy). Topical pimecrolimus is recommended for moderate to severe atopic eczema on the face and neck of children aged 2–16 years. Pimecrolimus should be used within its licensed indications.

**CORTICOSTEROIDS**

**Topical corticosteroids**

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). See the role of topical corticosteroids in the treatment of psoriasis.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus,* and *palmoplantar pustulosis.* Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *lichen scars, hypertrophic lichen planus,* or localised alopecia areata.

**Perioral lesions**

Hydrocortisone cream 1% p. 993 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole p. 1031 cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

**Choice of formulation**

Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. **Lotions** may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. **Oclusive polythene or hydrocolloid dressings** increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’; the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

**Absorption through the skin**

*Mild and moderately potent* topical corticosteroids are associated with few side-effects but care is required in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment.

Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

---

**Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body**

These amounts are usually suitable for an adult for a single daily application for 2 weeks.

**Compound preparations**

The advantages of including other substances (such as antibiotics or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1057 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid p. 1057 may cause salicylism.

**Topical corticosteroid preparation potencies**

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

Eczema and psoriasis 1021
Skin corticosteroid such as betamethasone condition. A mild corticosteroid such as hydrocortisone well as possible; inadequate treatment will perpetuate the being undertreated. The aim is to control the condition as corticosteroids in children should not result in the child

Children, especially infants, are particularly susceptible to

Use in children

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 993 is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% p. 993 applied intermittently. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Corticosteroids (topical)

CONTRA-INDICATIONS Acne • periocular dermatitis • potent corticosteroids in widespread plaque psoriasis • rosacea • untreated bacterial, fungal or viral skin lesions

CAUTIONS Avoid prolonged use (particularly on the face) - cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use - infection - keep away from eyes - use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity)

SIDE-EFFECTS

Rare Adrenal suppression - Cushing’s syndrome

Frequency not known Acne - contact dermatitis - hypertrichosis - irreversible striae atrophicae - irreversible telangiectasia - mild depigmentation (may be reversible) - periocular dermatitis - side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use - spread and worsening of untreated infection - thinning of the skin (may be restored over a period after stopping treatment but the original structure may never return) - worsening of acne - worsening of rosacea

SIDE-EFFECTS, FURTHER INFORMATION

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

DIRECTIONS FOR ADMINISTRATION Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

PRESCRIBING AND DISPENSING INFORMATION The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer corticosteroid creams andointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

Alclometasone dipropionate

INDICATIONS AND DOSE

Inflammatory skin disorders such as eczemas

TO THE SKIN

Child: Apply 1–2 times a day, to be applied thinly
Adult: Apply 1–2 times a day, to be applied thinly
Beclometasone dipropionate
(Beclometasone dipropionate)

INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

TO THE SKIN
▶ Child 1–7 years: Apply 1–2 times a day, thin layer to be applied
▶ Adult: Apply 1–2 times a day, thin layer to be applied

Potency
Beclometasone dipropionate cream 0.05%: potent.

Chemical Name
Beclometasone dipropionate

PATIENT AND CARER ADVICE
Patients or carers should be counselled on the application of alclometasone dipropionate cream.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

  Betamethasone (as Betamethasone valerate) 1 mg per 1 gram Betnovate 0.1% scalp application | 100 ml [POT] £4.99 DT price = £3.19
  Betnovate 0.1% lotion | 100 ml [POT] £4.58 DT price = £4.58

● Diprosone (Merck Sharp & Dohme Ltd)
  Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 ml Diprosone 0.05% lotion | 30 ml [POT] £2.73 DT price = £2.73 | 100 ml [POT] £7.80 DT price = £7.80

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

● Betacap (Dermal Laboratories Ltd)
  Betamethasone (as Betamethasone valerate) 1 mg per 1 gram Betacap 0.1% scalp application | 100 ml [POT] £3.19 DT price = £3.19

● Betnovate (GlaxoSmithKline UK Ltd)
  Betamethasone (as Betamethasone valerate) 1 mg per 1 gram Betnovate 0.1% scalp application | 100 ml [POT] £4.99 DT price = £3.19
  Betnovate 0.1% lotion | 100 ml [POT] £4.58 DT price = £4.58

● Diprosone (Merck Sharp & Dohme Ltd)
  Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 ml Diprosone 0.05% lotion | 30 ml [POT] £2.73 DT price = £2.73 | 100 ml [POT] £7.80 DT price = £7.80

UNLICENSED USE
Betacap®, Betnovate® and Betnovate-RD® are not licensed for use in children under 1 year.
Betamethasone with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 993.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis TO THE SKIN
- Child 1-17 years: (consult product literature)
- Adult: (consult product literature)
**Potency**
Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

- **PATIENT AND CARER ADVICE** Stains clothing. Patients or carers should be counselled on application of betamethasone with clioquinol preparations.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  CAUTIONARY AND ADVISORY LABELS 28
  EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol
  - BETAMETHASONE WITH CLIQUINOL (Non-proprietary)
    Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram Betamethasone valerate 0.1% / Clioquinol 3% cream | 30 gram [PTX] £18.88 DT price = £18.88
  **Ointment**
  CAUTIONARY AND ADVISORY LABELS 28
  - BETAMETHASONE WITH CLIQUINOL (Non-proprietary)
    Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram Betamethasone valerate 0.1% / Clioquinol 3% ointment | 30 gram [PTX] £18.88 DT price = £18.88

Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 993, clotrimazole p. 1010.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis TO THE SKIN
- Child 12-17 years: (consult product literature)
- Adult: (consult product literature)
**Potency**
Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  CAUTIONARY AND ADVISORY LABELS 28
  EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol
  - Lotriderm (Lerva UK Ltd)
    Betamethasone dipropionate 640 microgram per 1 gram, Clotrimazole 10 mg per 1 gram Lotriderm cream | 30 gram [PTX] £6.34 DT price = £6.34
  **Ointment**
  CAUTIONARY AND ADVISORY LABELS 28
  - BETAMETHASONE WITH NEOMYCIN (Non-proprietary)
    Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Betamethasone valerate 0.1% / Neomycin 0.5% cream | 30 gram [PTX] £18.88 DT price = £18.88 | 100 gram [PTX] £38.00 DT price = £38.00

Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 993, fusidic acid p. 1009.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis TO THE SKIN
- Child 6-17 years: (consult product literature)
- Adult: (consult product literature)
**Potency**
Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  CAUTIONARY AND ADVISORY LABELS 28
  EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, hydroxybenzoates (parabens)
  - Fucibet (LEO Pharma)
    Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram Fucibet cream | 30 gram [PTX] £6.38 DT price = £6.38 | 60 gram [PTX] £12.75 DT price = £12.75
    Fucibet Lipid cream | 30 gram [PTX] £6.74 DT price = £6.38

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 993, neomycin sulfate p. 1009.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis TO THE SKIN USING OINTMENT OR TO THE SKIN USING CREAM
- Child 2-17 years: Apply 1–2 times a day, to be applied thinly
- Adult: Apply 1–2 times a day, to be applied thinly
**Potency**
Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  CAUTIONARY AND ADVISORY LABELS 28
  EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol
  - BETAMETHASONE WITH NEOMYCIN (Non-proprietary)
    Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Betamethasone valerate 0.1% / Neomycin 0.5% cream | 30 gram [PTX] £18.88 DT price = £18.88 | 100 gram [PTX] £38.00 DT price = £38.00
  **Ointment**
  CAUTIONARY AND ADVISORY LABELS 28
  - BETAMETHASONE WITH NEOMYCIN (Non-proprietary)
    Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Betamethasone valerate 0.1% / Neomycin 0.5% ointment | 30 gram [PTX] £18.88 DT price = £18.88 | 100 gram [PTX] £38.00 DT price = £38.00
Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 993, salicylic acid p. 1057.

INDICATIONS AND DOSE

DIPROSALIC® OINTMENT

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis

▶ TO THE SKIN

Child: Apply 1–2 times a day, max. 60 g per week

Adult: Apply 1–2 times a day, max. 60 g per week

Potency

Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

DIPROSALIC® SCALP APPLICATION

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis

▶ TO THE SKIN

Child: Apply 1–2 times a day, apply a few drops

Adult: Apply 1–2 times a day, apply a few drops

Potency

Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

PATIENT AND CARER ADVICE

Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Foam

CAUTIONARY AND ADVISORY LABELS 15, 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

Clarelux (Pierre Fabre Dermo-Cosmetique)

Clobetasol propionate 500 microgram per 1 gram Clarelux

500micrograms/g foam | 100 gram (PFS) £11.06

Liquid

CAUTIONARY AND ADVISORY LABELS 15, 28

▶ Dermovate (GlaxoSmithKline UK Ltd)

Clobetasol propionate 500 microgram per 1 gram Dermovate

0.05% scalp application | 30 ml (PFS) £3.07 DT price = £3.07 | 100 ml (PFS) £10.42 DT price = £10.42

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

CLOBETASOL PROPIONATE (Non-proprietary)

Clobetasol propionate 500 microgram per 1 gram Clobetasol

0.05% cream | 30 gram (PFS) no price available DT price = £2.69 | 100 gram (PFS) no price available DT price = £7.90

Dermovate (GlaxoSmithKline UK Ltd)

Clobetasol propionate 500 microgram per 1 gram Dermovate

0.05% cream | 30 gram (PFS) £2.69 DT price = £2.69 | 100 gram (PFS) £7.90 DT price = £7.90

Brands may include ClobaDerm 0.05% cream

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol

CLOBETASOL PROPIONATE (Non-proprietary)

Clobetasol propionate 500 microgram per 1 gram Clobetasol

0.05% ointment | 30 gram (PFS) no price available DT price = £2.69 | 100 gram (PFS) no price available DT price = £7.90

Dermovate (GlaxoSmithKline UK Ltd)

Clobetasol propionate 500 microgram per 1 gram Dermovate

0.05% ointment | 30 gram (PFS) £2.69 DT price = £2.69 | 100 gram (PFS) £7.90 DT price = £7.90

Brands may include ClobaDerm 0.05% ointment

Shampoo

CAUTIONARY AND ADVISORY LABELS 28

▶ Etrivex (Gelderma (UK) Ltd)

Clobetasol propionate 500 microgram per 1 gram Etrivex

500micrograms/g shampoo | 125 ml (PFS) £10.29 DT price = £10.29

Clobetasol propionate with neomycin sulfate and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate above, neomycin sulfate p. 1009.

INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas associated with infection and unresponsive to less potent corticosteroids / Psoriasis associated with infection

▶ TO THE SKIN

Adult: (consult product literature)
Clobetasone butyrate with nystatin and oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate above, oxytetracycline p. 498.

**INDICATIONS AND DOSE**
Steroid-responsive dermatoses where candidal or bacterial infection is present

**TO THE SKIN**
- **Adult:** (consult product literature)
- **Potency**
  - Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

**MEDICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
**CAUTIONARY AND ADVISORY LABELS 28**
- **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**
  - Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100,000 unit per 1 gram
  - Clobetasol 500 microgram / Neomycin 5 mg / Nystatin 100,000 units / g ointment | 30 gram ($P30) $64.00

**Ointment**
**CAUTIONARY AND ADVISORY LABELS 28**
- **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**
  - Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100,000 unit per 1 gram
  - Clobetasol 500 microgram / Neomycin 5 mg / Nystatin 100,000 units / g ointment | 30 gram ($P30) $64.00

Clotetasone butyrate

**INDICATIONS AND DOSE**
Eczemas and dermatitis of all types | Maintenance between courses of more potent corticosteroids |

**TO THE SKIN**
- **Child:** Apply 1–2 times a day, to be applied thinly
- **Adult:** Apply 1–2 times a day, to be applied thinly

**Potency**
Clobetasone butyrate 0.05% cream and ointment: moderate.

**PATIENT AND CARER ADVICE**
Patients or carers should be advised on application of clobetasone butyrate containing preparations.

**EXCEPTIONS TO LEGAL CATEGORY**
Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g.

**MEDICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Cream**
**CAUTIONARY AND ADVISORY LABELS 28**
- **Trimovate** (GlaxoSmithKline Consumer Healthcare, GlaxoSmithKline UK Ltd)
  - Clobetasone butyrate 500 microgram per 1 gram, Nystatin 100,000 unit per 1 gram, Oxytetracycline (as Oxytetracycline calcium) 30 mg per 1 gram
  - Trimovate cream | 30 gram ($P30) £3.29

**Diflucortolone valerate**

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.3% diflucortolone valerate) | Short-term treatment of severe exacerbations (using 0.3% diflucortolone valerate) | Psoriasis (using 0.3% diflucortolone valerate)

**TO THE SKIN**
- **Child:** Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60 g per week
- **Adult:** Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60 g per week

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.1% diflucortolone valerate) | Psoriasis (using 0.1% diflucortolone valerate)

**TO THE SKIN**
- **Child:** Apply 1–2 times a day for up to 4 weeks, to be applied thinly
- **Adult:** Apply 1–2 times a day for up to 4 weeks, to be applied thinly

**Potency**
Diflucortolone valerate 0.1% cream and ointment: potent.
Diflucortolone valerate 0.3% cream and ointment: very potent.

**PATIENT AND CARER ADVICE**
Patients or carers should be advised on application of diflucortolone valerate containing preparations.

**MEDICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
**CAUTIONARY AND ADVISORY LABELS 28**
- **Trimovate** (GlaxoSmithKline Consumer Healthcare, GlaxoSmithKline UK Ltd)
  - Diflucortolone valerate containing preparations.
Fludroxycortide (Flurandrenolone)

**INDICATIONS AND DOSE**
Inflammatory skin disorders such as eczemas

TO THE SKIN
- Child: Apply 1–2 times a day, to be applied thinly
- Adult: Apply 1–2 times a day, to be applied thinly

**Potency**
Fludroxycortide 0.0125% cream and ointment: moderate

HAELEN® TAPE
Chronic localised recalcitrant dermatoses (but not acute or weeping)

TO THE SKIN
- Child: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily
- Adult: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

**PATIENT AND CARER ADVICE**
Patients or carers should be counselled on application of fludroxycortide cream and ointment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS**
- **EXCIPENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polyethylene glycol
- **Nerisone (Meadow Laboratories Ltd)**
  - Fluocinolone acetonide 25 microgram per 1 gram Nerisone 1 in 10
    - Dilution 0.0025% cream | 50 gram (POD) £4.58 DT price = £4.58
  - Fluocinolone acetonide 62.5 microgram per 1 gram Nerisone 1 in 4
    - Dilution 0.00625% cream | 50 gram (POD) £4.84 DT price = £4.84
  - Fluocinolone acetonide 250 microgram per 1 gram Nerisone 0.025% cream | 30 gram (POD) £14.14 DT price = £14.14
    - 100 gram (POD) £11.75 DT price = £11.75

**Ointment**

**CAUTIONARY AND ADVISORY LABELS**
- **EXCIPENTS:** May contain Propylene glycol, wool fat and related substances including lanolin
- **Synalar (Derma UK Ltd)**
  - Fluocinolone acetonide 62.5 microgram per 1 gram Synalar 1 in 4
    - Dilution 0.00625% ointment | 50 gram (POD) £4.84 DT price = £4.84
  - Fluocinolone acetonide 250 microgram per 1 gram Synalar 0.025% ointment | 30 gram (POD) £14.14 DT price = £14.14
    - 100 gram (POD) £11.75 DT price = £11.75

**Gel**

**CAUTIONARY AND ADVISORY LABELS**
- **EXCIPENTS:** May contain Hydroxybenzoates (parabens), propylene glycol
- **Synalar (Derma UK Ltd)**
  - Fluocinolone acetonide 25 microgram per 1 gram Synalar 1 in 10
    - Dilution 0.0025% cream | 50 gram (POD) £2.60 DT price = £2.60

**Fluocinolone acetonide with clioquinol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide above.

**INDICATIONS AND DOSE**
Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection

**TO THE SKIN**
- Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**Potency**
Fluocinolone acetonide 0.025% cream, gel, and ointment: potent

**Fluocinolone acetonide**

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas | Psoriasis

**TO THE SKIN**
- Child 1–17 years: Apply 1–2 times a day, to be applied thinly, reduce strength as condition responds
- Adult: Apply 1–2 times a day, to be applied thinly, reduce strength as condition responds

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS**
- **EXCIPENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polyethylene glycol
Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1027, neomycin sulfate p. 1009.

**INDICATIONS AND DOSE**

Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection

**TO THE SKIN**

- Child 1-17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**Potency**

Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

| CAUTIONARY AND ADVISORY LABELS | 28 |
| EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol |

**Flucortolone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

**TO THE SKIN**

- Child 1-17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**Potency**

Flucortolone hexanoate 0.25% cream and ointment; flucortolone pivalate 0.25% cream and flucortolone 0.25% ointment: moderate.

**PRESCRIBING AND DISPENSING INFORMATION**

Patients or carers should be counselled on the application of flucortolone preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

| CAUTIONARY AND ADVISORY LABELS | 28 |
| EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, fragrances, hydroxybenzoates (parabens) |
| **Ultralanum Plain** (Flucortolone hexanoate / Flucortolone pivalate) (Meadow Laboratories Ltd) |
| Flucortolone hexanoate 2.5 mg per 1 gram, Flucortolone pivalate 2.5 mg per 1 gram | **Ultralanum Plain cream** | 50 gram | **PBM** | £2.95 |

**Ointment**

| CAUTIONARY AND ADVISORY LABELS | 28 |
| EXCIPIENTS: May contain Fragrances, wool fat and related substances including lanolin |
| **Ultralanum Plain** (Flucortolone / Flucortolone hexanoate) (Meadow Laboratories Ltd) |
| Flucortolone 2.5 mg per 1 gram, Flucortolone hexanoate 2.5 mg per 1 gram | **Ultralanum Plain ointment** | 50 gram | **PBM** | £2.95 |

**Fluticasone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids | Psoriasis

**TO THE SKIN**

- Child 3 months–17 years: Apply 1–2 times a day, to be applied thinly
- Adult: Apply 1–2 times a day, to be applied thinly

**Potency**

Fluticasone cream 0.05%: potent. Fluticasone ointment 0.005%: potent.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on application of fluticasone creams and ointments.
**Hydrocortisone**

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

**TO THE SKIN**
- Child: Apply 1–2 times a day, to be applied thinly
- Adult: Apply 1–2 times a day, to be applied thinly

**Nappy rash**
- Child: Apply as required for no more than 1 week, discontinued as soon as the inflammation subsides

**Potency**
- Hydrocortisone cream and ointment 0.5 to 2.5%: mild
- Hydrocortisone cream and ointment 1%: moderate
- Hydrocortisone cream and ointment 0.1%: high

**PRESCRIBING AND DISPENSING INFORMATION**

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied.

**DIODERM**

Although Dioderm® contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.

**PATIENT AND CARER ADVICE**

Medicines for children leaflet: Hydrocortisone (topical) for eczema

- www.medicinesforchildren.org.uk
  - Hydrocortisone-topical-for-eczema

Patient counselling is advised for hydrocortisone cream and ointment (application).

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary: Hydrocortisone Cream 1% 15g may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

- Over-the-counter hydrocortisone preparations: Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).
Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dimeticone p. 1014, hydrocortisone p. 993.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly
  - Adult: Apply 1–2 times a day, to be applied thinly

**Potency**

Benzalkonium with dimeticone, hydrocortisone acetate 1%, and nystatin cream: mild.

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **CAUTIONARY AND ADVISORY LABELS 2B**
  - **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
  - **Locoid (Astellas Pharma Ltd)**
    - Hydrocortisone butyrate 1 mg per 1 gram
    - Locoid 0.1% Lipocream | 30 gram £1.69 DT price = £1.60 | 100 gram £5.17 DT price = £4.93
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS 2B**
    - **Locoid (Astellas Pharma Ltd)**
      - Hydrocortisone butyrate 1 mg per 1 gram
      - Locoid 0.1% ointment | 30 gram £1.60 DT price = £1.60 | 100 gram £4.93 DT price = £4.93

Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 993.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

- **TO THE SKIN**
  - Child: To be applied thinly (consult product literature)
  - Adult: To be applied thinly (consult product literature)

**Potency**

Chlorhexidine hydrochloride 1% with hydrocortisone 0.5% and nystatin cream: mild

Chlorhexidine hydrochloride 1% with hydrocortisone 1% and nystatin ointment: mild

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **CAUTIONARY AND ADVISORY LABELS 2B**
  - **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
  - **Locoid (Astellas Pharma Ltd)**
    - Chlorhexidine hydrochloride 10 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Nystatin 100000 iu per 1 gram
    - Nystaform HC cream | 30 gram £6.66
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS 2B**
    - **Nystaform HC (Thypharm Ltd)**
      - Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram
      - Nystaform HC ointment | 30 gram £2.66

Hydrocortisone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, clotrimazole p. 1010, hydrocortisone p. 993.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas (associated with fungal infection)

- **TO THE SKIN**
  - Child: (consult product literature)
  - Adult: (consult product literature)

**Potency**

Clotrimazole with hydrocortisone 1% cream: mild

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.

**EXCEPTIONS TO LEGAL CATEGORY**

A 1.5-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **CAUTIONARY AND ADVISORY LABELS 2B**
  - **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)
  - **Canesten HC (Bayer Plc)**
    - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram
    - Canesten HC cream | 30 gram £2.42 DT price = £2.42
  - **Brands may include Canesten Hydrocortisone cream**

Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fusidic acid p. 956, hydrocortisone p. 993.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

- **TO THE SKIN**
  - Child: To be applied thinly (consult product literature)
  - Adult: To be applied thinly (consult product literature)

**Potency**

Hydrocortisone with fusidic acid cream: mild

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Hydrocortisone with miconazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 993, miconazole p. 1011.

**INDICATIONS AND DOSE**
Mild inflammatory skin disorders such as eczemas associated with infections

TO THE SKIN

- Adult: (consult product literature)
  - Potency
    - Hydrocortisone 1% with miconazole cream and ointment: mild

**INTERACTIONS** → Appendix 1 (antifungals, imidazole).

**PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with miconazole preparations.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary

May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 7 days.

**EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete's foot and candidal intertrigo.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS  28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, potassium sorbate

- Fucidin H (Fusidic acid / Hydrocortisone) (LEO Pharma)
  - Fusidic acid 20 mg per 1 gram, Hydrocortisone acetate 10 mg per 1 gram Fucidin H cream | 30 gram [POD] £5.02 DT price = £5.02 | 60 gram [POD] £10.04 DT price = £10.04

**Ointment**

CAUTIONARY AND ADVISORY LABELS  28

- Terra-Cortril (Intrapharm Laboratories Ltd)
  - Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram [POD] £5.01

Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 993, oxytetracycline p. 498.

**INDICATIONS AND DOSE**
Mild inflammatory skin disorders such as eczemas

TO THE SKIN

- Child 12-17 years: (consult product literature)
- Adult: (consult product literature)

**Potency**
Hydrocortisone 1% with oxytetracycline ointment: mild.

**CONTRA-INDICATIONS** Children under 12 years

**PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child's teeth.

**BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

**PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS  28

- Alphaderm (Alliance Pharmaceuticals Ltd)
  - Hydrocortisone 10 mg per 1 gram, Urea 100 mg per 1 gram Alphaderm 1% / 10% cream | 30 gram [POD] £2.38 DT price = £2.38 | 100 gram [POD] £7.03 DT price = £7.03

Mometasone furoate

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

TO THE SKIN

- Child 2-17 years: Apply once daily, to be applied thinly (to scalp in case of lotion)
- Adult: Apply once daily, to be applied thinly (to scalp in case of lotion)

**Potency**
Mometasone furoate 0.1% cream, ointment, and scalp lotion: potent.

**PATIENT AND CARER ADVICE** Patients and carers should be advised on application of topical mometasone.
Triamcinolone with chlortetracycline

INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (associated with infection) | Psoriasis (associated with infection)

TO THE SKIN
- Child: 8-17 years: To be applied thinly (consult product literature)
- Adult: To be applied thinly (consult product literature)

Potency
Triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3% ointment: potent.

PATIENT AND CARER ADVICE
Stains clothing. Patients or carers should be counselled on the application of chlortetracycline with triamcinolone products.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ointment
CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Wool fat and related substances including lanolin
- Aureocort (AMCo)
  Chlortetracycline hydrochloride 30.9 mg per 1 gram, Triamcinolone acetonide 1 mg per 1 gram Aureocort ointment | 15 gram POM £3.51

Severe Darier’s disease (keratosis follicularis) (under expert supervision)

BY MOUTH
- Adult: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

CONTRA-INDICATIONS
Hyperlipidaemia

CAUTIONS
Avoid excessive exposure to sunlight and unsupervised use of sunlamps—diabetes (can alter glucose tolerance—initial frequent blood glucose checks) - do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) - investigate atypical musculoskeletal symptoms

INTERACTIONS
Appendix 1 (retinoids).
Avoid concomitant use of keratolytics.

SIDE-EFFECTS
- Common or very common Abdominal pain - abnormal hair texture - alopecia (reversible on withdrawal) - arthralgia - brittle nails - dermatitis - diarrhoea - dryness and inflammation of mucous membranes - dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses) - epidermal fragility - erythema - headache - myalgia - nausea - paronychia - peripheral oedema - pruritus - reversible increase in serum-cholesterol (with high doses) - reversible increase in serum-triglyceride concentrations (with high doses) - skin exfoliation - sticky skin - vomiting
- Uncommon Dizziness - hepatitis - photosensitivity - visual disturbances
- Rare Peripheral neuropathy
- Very rare Benign intracranial hypertension - bone pain - exostosis - night blindness - ulcerative keratitis
- Frequently not known Drowsiness - dry skin - flushing - granulomatous lesions - impaired hearing - initial worsening of psoriasis - malaise - rectal haemorrhage - sweating - taste disturbance - tinnitus

SIDE-EFFECTS, FURTHER INFORMATION
Exostosis Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which Acitretin is a metabolite) and premature epiphyseal closure in children.

Benign intracranial hypertension Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

CONCEPTION AND CONTRACEPTION
Effective contraception must be used.

Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

PREGNANCY
Avoid—teratogenic.

BREAST FEEDING
Avoid.

HEPATIC IMPAIRMENT
Avoid in severe impairment—risk of further impairment.
Alitretinoin

INDICATIONS AND DOSE

Severe chronic hand eczema refractory to potent topical corticosteroids

BY MOUTH

- Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease

BY MOUTH

- Adult (prescribed by or under supervision of a consultant dermatologist): Initially 10 mg once daily, increased if necessary up to 30 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

CONTRA-INDICATIONS Hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism

CAUTIONS Avoid blood donation during treatment and for at least 1 month after stopping treatment · dry eye syndrome · history of depression

INTERACTIONS → Appendix 1 (retinoids).

SIDE-EFFECTS

- Common or very common Alopecia · anaemia · arthralgia · changes in thyroid function tests · cheilitis · conjunctivitis · dry eyes · dryness of lips · dryness of skin · erythema · eye irritation · flushing · headache · myalgia · raised creatine kinase · raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre)

- Uncommon Ankylosing spondylitis · asteyotic eczema · blurred vision · cataracts · epistaxis · hyperostosis · pruritus

- Rare Benign intracranial hypertension · vasculitis

- Frequency not known Decreased tolerance to contact lenses · depression · impaired night vision · keratitis · mood changes · suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Dry eyes Dry eyes may respond to lubricating eye ointment or tear replacement therapy.

Benign intracranial hypertension Discontinue treatment if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur.

CONCEPTION AND CONTRACEPTION Effective contraception must be used.

Pregnancy prevention In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- BREAST FEEDING: Manufacturer advises avoid.

- HEPATIC IMPAIRMENT: Manufacturer advises avoid—no information available.

- RENAL IMPAIRMENT: Manufacturer advises avoid in severe impairment—no information available.

- MONITORING REQUIREMENTS: Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.

PRESCRIBING AND DISPENSING INFORMATION

Prescribing for women of child-bearing potential. Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription. Alitretinoin is teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

PATIENT AND CARER ADVICE A patient information leaflet should be provided. Females of child-bearing potential must be advised on pregnancy prevention.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009) NICE TA177

Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks. www.nice.org.uk/TA177

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
1034 Inflammatory skin conditions

Salicylic Acid Paste, BP (Lassar’s Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

> MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

### TARS

#### Coal tar

**INDICATIONS AND DOSE**
Psoriasis | Seborrhoeic dermatitis | Scaling | Itching
TO THE SKIN
> Adult: Apply 2–3 times a day

**CONTRA-INDICATIONS**
Avoid broken or inflamed skin • avoid eye area • avoid genital area • avoid mucosal areas • avoid rectal area • infection • sore, acute, or pustular psoriasis

> MEDICATION FORMS
Application to face • application to skin flexures

**SIDE-EFFECTS**
Acne-like eruptions • photosensitivity • skin irritation

**PRESCRIBING AND DISPENSING INFORMATION**
When prepared extemporaneously, the BP states Coal Tar Solution: BP contains coal tar 20%; Strong Coal Tar Solution: BP contains coal tar 40%.

**HANDLING AND STORAGE**
Use suitable chemical protection gloves for extemporaneous preparation. May stain skin, hair and fabric.

> PATIENT AND CARER ADVICE
May stain skin, hair and fabric.

> MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste, cream, ointment

#### Bath additive
COAL TAR (Non-proprietary)
Coal tar distilled 400 mg per 1 ml Psoriderm Emulsion 40% bath additive | 200 ml £2.74

#### Shampoo
EXCIPIENTS: May contain Fragrances, hydroxybenzoates (parabens)
COAL TAR (Non-proprietary)
Coal tar extract 20 mg per 1 gram Coal tar extract 2% shampoo
125 ml GSK no price available
250 ml GSK no price available

Brands may include Alphosyl 2 in 1, Neutrogena T/Gel Therapeutic
**Cutaneous emulsion**

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- Exorex (Forest Laboratories UK Ltd)
  - Coal tar solution 50 mg per 1 gram. Exorex lotion | 100 ml £8.11  250 ml £16.24

**Coal tar with cade oil, arachis oil extract of coal tar, light liquid paraffin and tar**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1034.

*INDICATIONS AND DOSE*

Psoriasis | Eczema | Atopic dermatoses | Pruritic dermatoses

TO THE SKIN

- Child: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes (proportionally less for a child’s bath)
- Adult: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes (proportionally less for a child’s bath)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Bath additive**

EXCIPIENTS: May contain Isopropyl palmitate

- Polytar (GlaxoSmithKline Consumer Healthcare)
  - Arachis oil extract of crude coal tar 75 mg per 1 gram, Cade oil 75 mg per 1 gram, Coal tar solution 25 mg per 1 gram, Liquid paraffin light 350 mg per 1 gram, Pine tar 75 mg per 1 gram Polytar Emollient | 500 ml £5.78

**Coal tar with calamine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1034.

*INDICATIONS AND DOSE*

Psoriasis | Chronic atopic eczema (occasionally)

TO THE SKIN

- Adult: Apply 1–2 times a day

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment, BP consists of calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Coal tar with coconut oil and salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid p. 1057, coal tar p. 1034.

*INDICATIONS AND DOSE*

Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap

TO THE SKIN USING SHAMPOO

- Child: Apply daily as required
- Adult: Apply daily as required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Shampoo**

- Capasal (Dermal Laboratories Ltd)
  - Coal tar distilled 10 mg per 1 gram, Coconut oil 10 mg per 1 gram, Salicylic acid 5 mg per 1 gram Capasal Therapeutic shampoo | 250 ml £4.69

**Coal tar with dithranol and salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol p. 1018, salicylic acid p. 1057, coal tar p. 1034.

*INDICATIONS AND DOSE*

Subacute and chronic psoriasis

TO THE SKIN

- Child: Apply up to twice daily
- Adult: Apply up to twice daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Coal tar with lecithin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1034.

*INDICATIONS AND DOSE*

PSORIDERM® CREAM

Psoriasis

TO THE SKIN

- Child: Apply 1–2 times a day, cream to be applied to the skin or scalp
- Adult: Apply 1–2 times a day, cream to be applied to the skin or scalp

PSORIDERM® SCALP LOTION

Scalp psoriasis

TO THE SKIN

- Child: Apply as required
- Adult: Apply as required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Isopropyl palmitate, propylene glycol

- COAL TAR WITH LECITHIN (Non-proprietary)
  - Coal tar distilled 60 mg per 1 gram, Lecithin 4 mg per 1 gram Psoriderm cream | 225 ml £9.42

**Shampoo**

EXCIPIENTS: May contain Disodium edetate

- COAL TAR WITH LECITHIN (Non-proprietary)
  - Coal tar distilled 25 mg per 1 mL, Lecithin 3 mg per 1 mL Psoriderm scalp lotion | 250 ml £4.74

**Coal tar with salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid p. 1057, coal tar p. 1034.

*INDICATIONS AND DOSE*

Psoriasis | Chronic atopic eczema

TO THE SKIN USING OINTMENT

- Child: Apply 1–2 times a day
**Coal tar with salicylic acid and precipitated sulfur**

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid p. 1034.

**INDICATIONS AND DOSE**

**COCOIS® OINTMENT**

Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff

**INITIALLY TO THE SKIN USING SCALP OINTMENT**
- Child 6–11 years: Medical supervision required
- Child 12–17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- Adult: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

**SEBCO® OINTMENT**

Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff

**INITIALLY TO THE SKIN USING SCALP OINTMENT**
- Adult: Apply as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste, liquid, shampoo, solution.

**Extract of coal tar with arachis oil**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1034.

**INDICATIONS AND DOSE**

**Scalp disorders** | **Psoriasis** | **Seborrhoea** | **Eczema** | **Pruritus** | **Dandruff**
--- | --- | --- | --- | --- | ---
**TO THE SKIN**
- Child: Apply 1–2 times a week, to the scalp
- Adult: Apply 1–2 times a week, to the scalp

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Shampoo**
- **Polytar** (GlaxoSmithKline Consumer Healthcare)
  - Arachis oil extract of crude coal tar 3 mg per 1 gram, Cade oil
  - Coal tar solution 1 mg per 1 gram, Pine tar
  - Polytar Plus (GlaxoSmithKline Consumer Healthcare)
  - Arachis oil extract of crude coal tar 3 mg per 1 gram, Cade oil
  - Coal tar solution 1 mg per 1 gram, Pine tar

**VITAMIN D AND ANALOGUES**

**Calcipotriol**

**INDICATIONS AND DOSE**

**Plaque psoriasis**

**TO THE SKIN USING OINTMENT**
- Adult: Apply 1–2 times a day, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 ml with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 100 g per week

**Scalp psoriasis**

**TO THE SKIN USING SCALP LOTION**
- Adult: Apply twice daily, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 ml with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 60 mL per week

**CONTRA-INDICATIONS**

Calcium metabolism disorders

**CAUTIONS**

Avoid excessive exposure to sunlight and sunlamps: avoid use on face · erythrodemic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)

**SIDE-EFFECTS**
- **Common or very common** Burning · dermatitis · erythema · itching · local skin reactions · paraesthesia
- **Rare** Facial dermatitis · perioral dermatitis
- **Frequency not known** Aggravation of psoriasis · dry skin · photosensitivity

**PREGNANCY**

Manufacturers advise avoid unless essential.

**BREAST FEEDING**

No information available.
Calcipotriol with betamethasone

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 993, calcipotriol p. 1036.

INDICATIONS AND DOSE

DOVOBET® GEL

Scalp psoriasis

TO THE SKIN

► Adult: Apply 1–4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcipotriol used together, maximum total calcipotriol 5 mg in any one week

Mild to moderate plaque psoriasis

TO THE SKIN

► Adult: Apply once daily for 8 weeks; if necessary, treatment may be continued beyond 8 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week; maximum 15 g per day

DOVOBET® OINTMENT

Stable plaque psoriasis

TO THE SKIN

► Adult: Apply once daily for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to a maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week; maximum 15 g per day

Calcitriol

(1,25-Dihydroxycholecalciferol)

INDICATIONS AND DOSE

Mild to moderate plaque psoriasis

TO THE SKIN

► Adult: Apply twice daily, not more than 35% of body surface to be treated daily; maximum 30 g per day

CONTRA-INDICATIONS

Do not apply under occlusion - patients with calcium metabolism disorders

CAUTIONS

Erythrodermic exfoliative psoriasis (enhanced risk of hypercalcemia) - generalised pustular psoriasis (enhanced risk of hypercalcemia)

SIDE-EFFECTS

► Common or very common Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia

► Frequency not known Aggravation of psoriasis

PREGNANCY

Manufacturer advises use in restricted amounts only if clearly necessary. Monitor urine- and serum-calcium concentration in pregnancy.

BREAST FEEDING

Manufacturer advises avoid.

HANDLING AND STORAGE

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

► Dovobet (LEO Pharma)

Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram, Calcipotriol (as Calcipotriol monohydrate) 50 microgram per 1 gram Dovobet ointment | 30 gram (£8.99) £10.20 DT price = £10.95 | 60 gram (£8.26) £19.84 | 120 gram (£7.38) £37.86

Tacalcitol

INDICATIONS AND DOSE

Plaque psoriasis

TO THE SKIN

► Adult: Apply once daily, preferably at bedtime, maximum 10 g ointment or 10 mL lotion daily, when lotion and ointment used together, maximum total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

CONTRA-INDICATIONS

Calcium metabolism disorders

CAUTIONS

Avoid eyes - erythrodermic exfoliative psoriasis (enhanced risk of hypercalcemia) - generalised pustular psoriasis (enhanced risk of hypercalcemia) - if used in conjunction with UV treatment

CAUTIONS, FURTHER INFORMATION

UV treatment If tacalcitol is used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime.

SIDE-EFFECTS

► Common or very common Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia

► Frequency not known Aggravation of psoriasis
4 Perspiration

Antiperspirants

Aluminium chloride hexahydrate below is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use glycopyrronium bromide as a 0.05% solution below in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. *Botox*® contains botulinum toxin type A complex p. 322 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.

4.1 Hyperhidrosis

Aluminium chloride hexahydrate

**INDICATIONS AND DOSE**

Hyperhidrosis affecting axillae, hands or feet

**TO THE SKIN**

- Adult: Apply once daily, apply liquid formulation at night to dry skin, wash off the following morning, reduce frequency as condition improves—do not bathe immediately before use

Hyperhidrosis | Bromidrosis | Intertrigo | Prevention of tinea pedis and related conditions

**TO THE SKIN**

- Adult: Apply powder to dry skin

**SIDE-EFFECTS**

- Skin irritation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- **Aluminium chloride hexahydrate (Non-proprietary)**
  - Aluminium chloride 200 mg per 1 ml
  - **Spray**
    - Driclor
    - Anhydrol

**Spray**

- **Aluminium chloride hexahydrate (Non-proprietary)**
  - Aluminium chloride 200 mg per 1 ml

**Ointment**

- **Curatoderm (Almirall Ltd)**
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram
  - **Liquid**

      - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram

**Powder**

- **Odaban** (Bracey’s Pharmaceuticals Ltd)
  - Aluminium chloride 200 mg per 1 ml Odaban 20% spray | 30 ml | £6.69

**EXCEPTIONS TO LEGAL CATEGORY**

A 30 mL pack of aluminium chloride hexahydrate 20% is on sale to the public.

**CAUTIONS**

- Monitor serum calcium if the possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

**SIDE-EFFECTS**

- Tingling at administration site

**CONTRA-INDICATIONS, FURTHER INFORMATION**

The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

**PATIENT AND CARER ADVICE**

Avoid contact with clothing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

5 Photodamage

Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium p. 521 is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 761 is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil and salicylic acid is available for the treatment of low or moderately thick keratosis; a solution containing fluorouracil and salicylic acid is effective against most types of non-hypertrophic actinic keratosis. Imiquimod p. 1057 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac but lesions resolve faster. A short course of ingenol mebutate below is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix, available from Galderma) or 5-aminolevulinic acid gel (Ameluz, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis; when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas where other treatments are unsuitable.

ANTIMETABOLITES

Fluorouracil

INDICATIONS AND DOSE

Superficial malignant and pre-malignant skin lesions

TO THE SKIN USING CREAM

Adult: Apply 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm² (e.g. 23 cm x 23 cm) treated at one time, alternative regimens may be used in some settings.

• CAUTIONS Avoid contact with eyes and mucous membranes - do not apply to bleeding lesions
• SIDE-EFFECTS Erythema multiforme - local irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) - photosensitivity
• PREGNANCY Manufacturers advise avoid (teratogenic).
• BREAST FEEDING Manufacturers advise avoid.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

Efudix (Meda Pharmaceuticals Ltd)

Fluorouracil 50 mg per 1 gram Efudix 5% cream | 40 gram (£22.90, 750 mg/gram (£32.50))

Fluorouracil with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil p. 761, salicylic acid p. 1057.

INDICATIONS AND DOSE

Low or moderately thick hyperkeratotic actinic keratosis

TO THE SKIN

• Adult: Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. 5 cm x 5 cm)

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cutaneous solution

CAUTIONARY AND ADVISORY LABELS 15

• Actikerall (Almirall Ltd)

Fluorouracil 5 mg/g, Salicylic acid 100 mg/g Actikerall 5mg/g / 100mg/g cutaneous solution | 25 ml (P)£38.30

PROTEIN KINASE C ACTIVATORS

Ingenol mebutate

INDICATIONS AND DOSE

Actinic keratosis on face and scalp

TO THE SKIN

• Adult: Apply once daily for 3 days, use the 150 microgram/g gel (Picato)

Actinic keratosis on trunk and extremities

TO THE SKIN

• Adult: Apply once daily for 2 days, use the 500 microgram/g gel (Picato)

• CAUTIONS Avoid contact with broken skin - avoid contact with inside of ears - avoid contact with inside of nostrils - avoid contact with lips - avoid occlusive dressings on treated area

• SIDE-EFFECTS

• Common or very common Blistering - crusting - erosion - erythema - exfoliation - headache - infection - local reactions - oedema - pain - pruritus

• Uncommon Local ulceration - paraesthesia

• PREGNANCY Not absorbed from skin, but manufacturer advises avoid.

• BREAST FEEDING Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

• DIRECTIONS FOR ADMINISTRATION One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 15

• Picato (LEO Pharma)

Ingenol mebutate 150 microgram per 1 gram Picato 150micrograms/g gel | 1.41 gram (P)£65.00

Ingenol mebutate 500 microgram per 1 gram Picato 500micrograms/g gel | .94 gram (P)£65.00
6 Pruritus

Topical local antipruritics

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An emollient may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient.

Levomenthol cream below can be used to relieve pruritus; it exerts a cooling effect on the skin. Local antipruritics have a role in the treatment of pruritus in palliative care.

Preparations containing crotamiton below are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% below is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 173 is the treatment of choice.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites and are no longer widely available.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

Antipruritics

Crotamiton

INDICATIONS AND DOSE
Pruritus (including pruritus after scabies)

TO THE SKIN

▶ Child 1 month–2 years (on doctor’s advice only): Apply once daily
▶ Child 3–17 years: Apply 2–3 times a day
▶ Adult: Apply 2–3 times a day

CONTRA-INDICATIONS Acute exudative dermatoses

CAUTIONS Avoid use in buccal mucosa · avoid use near eyes · avoid use on broken skin · avoid use on very inflamed skin · use on doctor’s advice for children under 3 years

PREGNANCY Manufacturer advises avoid, especially during the first trimester—no information available.

BREAST FEEDING No information available; avoid application to nipple area.

MENDELC FORMS
There can be variation in the licensing of different medicines containing the same drug.

Doxepin

INDICATIONS AND DOSE
Pruritus in eczema

TO THE SKIN

▶ Child 12–17 years: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day
▶ Adult: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

CAUTIONS Avoid application to large areas · cardiac arrhythmias · mania · severe heart disease · susceptibility to angle-closure glaucoma · urinary retention

SIDE-EFFECTS

▶ Common or very common Dizziness · drowsiness
▶ Frequency not known Antimuscarinic effects · fever · gastro-intestinal disturbances · headache · irritation · local burning · rash · stinging · tingling

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe liver disease.

PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced. A patient information leaflet should be provided.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 2, 10

EXCIPIENTS: May contain Benzyl alcohol

▶ Xepin (Cambridge Healthcare Supplies Ltd)

Doxepin hydrochloride 50 mg per 1 gram Xepin 5% cream 14 g

Menthyl and derivatives

Levomenthol

INDICATIONS AND DOSE
Pruritus

TO THE SKIN

▶ Adult: Apply 1–2 times a day

PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Levomenthol cream, BP (Menthol in Aqueous Cream) consists of levomenthol 0.5%.

MENDELC FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream
Rosacea and acne

7 Rosacea and acne

Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

Mild to moderate acne is generally treated with topical preparations. Systemic treatment with oral antibiotics is generally used for moderate to severe acne or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindiol (cyproterone acetate with ethinylestradiol p. 1042); it is for women only.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1045 for administration by mouth.

Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1044 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erythromycin p. 1043 or clindamycin p. 467 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide p. 1044 is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1043 has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin p. 1043 and clindamycin p. 467 are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of Propionibacterium acnes is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

Topical retinoids and related preparations for acne

Topical tretinoin p. 765, its isomer isotretinoin p. 1045, and adapalene p. 1045 (a retinoid-like drug) are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

Other topical preparations for acne

Preparations containing aluminium oxide p. 1042 are not considered beneficial in acne. A topical preparation of nicotinamide p. 1048 is available for inflammatory acne.

Oral preparations for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomendonal treatment (e.g. with topical benzoyl peroxide p. 1044) may also be required. Either oxytetracycline p. 498 or tetracycline p. 498 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 995 and lymecycline p. 497 are alternatives to tetracycline.

Although minocycline p. 498 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin p. 1043 in a twice daily dose is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 462 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists. Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol p. 1042) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not...
responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

**Oral retinoid for acne**

The retinoid isotretinoin p. 1045 reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 15 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must not be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

**Rosacea**

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1048 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical metronidazole p. 1008 or to topical azelaic acid p. 1043. Alternatively oral administration of oxytetracycline p. 498 or tetracycline p. 498, or erythromycin p. 1043, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 995 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin p. 1045 is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

### 7.1 Acne

**ABRASIVE AGENTS**

**Aluminium oxide**

**INDICATIONS AND DOSE**

**Acne vulgaris**

**To the skin**

- **Adult:** Apply 1–3 times a day, to be used instead of soap

**SIDE-EFFECTS** Skin irritation (discontinue use temporarily)

**TREATMENT CESSATION** Discontinue use temporarily if skin becomes irritated.

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (not considered beneficial).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Paste**

EXCIPIENTS: May contain Fragrances, n-(3-chloroallyl)hexaminium chloride (quaternium 15).

- Brasivol (GliaxSmithKline Consumer Healthcare)
  - Aluminium oxide 380 mg per 1 gram Brasivol Fine No.1 38% paste | 7 ggram Dice 12.76

**ANTI-ANDROGENS**

**Co-cyprindiol**

**INDICATIONS AND DOSE**

Moderate to severe acne in women of child-bearing age refractory to topical therapy or oral antibacterials

**Moderately severe hirsutism**

**BY MOUTH**

- Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7–day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

**CONTRA-INDICATIONS** Acute porphyria · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease or for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding

**CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia—seek specialist advice · inflammatory bowel disease including Crohn’s disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

**CAUTIONS, FURTHER INFORMATION**

**Venous thromboembolism** There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

**INTERACTIONS** → Appendix 1 (oestrogens).
**SIDE-EFFECTS**

- **Rare** Rarely gallstones - systemic lupus erythematosus
- **Very rare** Photosensitivity
- **Frequency not known** Abdominal cramps - absence of withdrawal bleeding - amenorrhoea after discontinuation - breast enlargement - breast secretion - breast tenderness - cervical erosion - changes in libido - changes in lipid metabolism - changes in vaginal discharge - chloasma - cholesterolemia - contact lenses may irritate - depression - fluid retention - headache - hepatic tumours - hypertension - irritability - leg cramps - liver impairment - nausea - nervousness - reduced menstrual loss - skin reactions - thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB - visual disturbances - vomiting - 'spotting' in early cycles
- **PREGNANCY** Avoid—risk of feminisation of male fetus by cyproterone.
- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CD-CYPROPRINDOL (Non-proprietary)

**SKINOREN®**

- **Acne vulgaris** 
  TO THE SKIN
  - Adult: Apply twice daily, to be applied thinly

**CAUTIONS** Avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes

**SIDE-EFFECTS**

- **Common or very common** Local irritation (reduce frequency or discontinue temporarily)
- **Uncommon** Skin discoloration
- **Frequency not known** Worsening of asthma

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- EXCIPIENTS: May contain Propylene glycol 
  - Skinoren (Bayer Plc) 
  Azelaic acid 200 mg per 1 gram 
    Skinoren 200% cream | 30 gram [PFA] £3.74 DT price = £3.74
- Gel
  - EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol 
    - Finacea (Bayer Plc) 
    Azelaic acid 150 mg per 1 gram 
      Finacea 15% gel | 30 gram [PFA] £7.48 DT price = £7.48

**ANTI-INFECTIVES**

**Erythromycin**

The properties listed below are those particular to the drug only. For properties common to the class, see macrolides, p. 469.

**INDICATIONS AND DOSE**

**Rosacea**

- **BY MOUTH**
  - Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently
- **Acne**
  - **BY MOUTH**
    - Adult: 500 mg twice daily
- **STIEMYCIN®**
  - **Acne vulgaris** 
    - **TO THE SKIN**
      - Child 12-17 years: Apply twice daily, to be applied thinly
      - Adult: Apply twice daily, to be applied thinly

**CAUTIONS**

- With systemic use avoid in acute porphyrias p. 864
- **STIEMYCIN®**
  Some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

**INTERACTIONS**

- Appendix 1 (macrolides). 
  Caution with concomitant use of drugs that prolong the QT interval.
  - With topical use Interactions do not apply to small amounts of erythromycin used topically.

**PREGNANCY**

- With systemic use Not known to be harmful.

**BREAST FEEDING**

- With systemic use Only small amounts in milk—not known to be harmful.

**HEPATIC IMPAIRMENT**

- With systemic use May cause idiosyncratic hepatotoxicity.

**RENAL IMPAIRMENT**

- With systemic use in adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
  - With systemic use in children Reduce dose in severe renal impairment (ototoxicity).

**PRESCRIBING AND DISPENSING INFORMATION**

- With oral use Flavours of oral liquid formulations may include banana

Erythromycin 40 mg per 1 ml, Zinc acetate 12 mg per 1 ml Zineryt lotion | 30 ml (POD) £7.71 DT price = £7.71 | 90 ml (POD) £16.68 DT price = £16.68

PEROXIDES

Benzoyl peroxide

INDICATIONS AND DOSE
Acne vulgaris
TO THE SKIN
▶ Child 12-17 years: Apply 1–2 times a day, preferably after applying with soap and water, start treatment with lower-strength preparations
▶ Adult: Apply 1–2 times a day, preferably after applying with soap and water, start treatment with lower-strength preparations

CAUTIONS
Avoid contact with broken skin • avoid contact with eyes • avoid contact with mouth • avoid contact with mucous membranes • avoid excessive exposure to sunlight

SIDE-EFFECTS
Skin irritation

SIDE-EFFECTS, FURTHER INFORMATION
Skin irritation Reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency.

PATIENT AND CARER ADVICE
May bleach fabrics and hair.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, isopropyl palmitate, propylene glycol
▶ Brevoxyl (GlaxoSmithKline Consumer Healthcare)
Benzoyl peroxide 40 mg per 1 gram Brevoxyl 4% cream | 50 gram | £4.13 DT price = £4.13
▶ PanOxyl (GlaxoSmithKline Consumer Healthcare)
Benzoyl peroxide 50 mg per 1 gram PanOxyl 5 cream | 40 gram | £1.89 DT price = £1.89

Gel
EXCIPIENTS: May contain Fragrances, propylene glycol
▶ Acnecide (Galdenra (UK) Ltd)
Benzoyl peroxide 50 mg per 1 gram Acnecide 5% gel | 30 gram | £5.44 DT price = £5.44 | 60 gram | £12.56
▶ Acnecide Wash 5% gel | 50 gram | £5.44
▶ Brands may include PanOxyl Acnegel, PanOxyl Aquegel

Wash
EXCIPIENTS: May contain Imidurea
▶ PanOxyl (GlaxoSmithKline Consumer Healthcare)
Benzoyl peroxide 100 mg per 1 gram PanOxyl 10 wash | 150 ml | £4.00 DT price = £4.00

Benzoyl peroxide with clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, benzoyl peroxide above, clindamycin p. 467.

INDICATIONS AND DOSE
Acne vulgaris
TO THE SKIN
▶ Child 12-17 years: Apply once daily, dose to be applied in the evening
▶ Adult: Apply once daily, dose to be applied in the evening

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
PATIENT AND CARER ADVICE

Gel may bleach clothing and hair.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2014) that Epiduo™ should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

MEDISET FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol

Epiduo (Galderma (UK) Ltd)

Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram Epiduo 0.1%/2.5% gel | 45 gram £17.91

Isotretinoin

INDICATIONS AND DOSE

Topical treatment of mild to moderate acne

TO THE SKIN

Adult: Apply 1–2 times a day, to be applied thinly

Severe acne (under expert supervision): Acne which is associated with psychological problems (under expert supervision). Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision). Acne with scarring (under expert supervision). Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision).

BY MOUTH

Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

CONTRA-INDICATIONS

With oral use: hyperlipidaemia, hypervitaminosis A

With topical use: perioral dermatitis, rosacea

CAUTIONS

With oral use: avoid blood donation during treatment and for at least 1 month after treatment; diabetes; dry eye syndrome (associated with risk of keratitis); history of depression; monitor for depression.

With topical use: allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid; alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application); avoid accumulation in angles of the nose; avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin; avoid exposure to UV light (including sunlight, solariums); avoid in severe acne involving large areas; avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics; monitor for depression.

INTERACTIONS

With oral use: Appendix 1 (retinoids). Avoid keratolytics.

SIDE-EFFECTS

Common or very common

With oral use: anaemia, arthralgia, dryness of eyes (with blepharitis and conjunctivitis); dryness of lips (sometimes chelitis); dryness of nasal mucosa (with epiphactitis); dryness of pharyngeal mucosa (with hoarseness); dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus); epidermal fragility (trauma may cause...
blistering), haematuria, headache, myalgia, neutropenia, proteinuria, raised blood-glucose concentration, raised plasma-triglyceride concentration, raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration), raised serum-transaminase concentration, thrombocytopenia, thrombocytosis.

With oral use

Conception and contraception

Frequency not known

Very rare

With oral use

aggressive behaviour, alopecia, anxiety, depression, mood changes, skin reactions.

Rare

With oral use

Haemorrhagic diarrhoea develops.

Psychiatric side-effects require expert referral.

SIDE-EFFECTS, FURTHER INFORMATION

Management of side-effects

Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Psychiatric side-effects require expert referral.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Conception and contraception

With oral use

Effective contraception must be used. In women of child-bearing age, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are considered ineffective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or fixed prescriptions are not acceptable.

Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

With topical use

Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered sufficiently effective).

Pregnancy

Contra-indicated in pregnancy (teratogenic).

Breast feeding

Avoid.

Hepatic impairment

With oral use

Avoid—further impairment may occur.

Renal impairment

With oral use

In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

Monitoring requirements

With oral use

Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

Prescribing and dispensing information

Isotretinoin is an isomer of tretinoin.

Patient and carer advice

With oral use

Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment. Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

With topical use

Patients should be warned that some redness and skin peeling may occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Gel

Isotretinoin 500 microgram per 1 gram

EXCIPIENTS: May contain Butylated hydroxytoluene

Isotrex (Stiefel Laboratories (UK) Ltd)

Isotrex 500 microgram per 1 gram
Isotretinoin with erythromycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, erythromycin p. 1043, isotretinoin p. 1045.

**INDICATIONS AND DOSE**

Topical treatment of mild to moderate acne

**TO THE SKIN**

- **Adult:** (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

CAUTIONARY AND ADVISORY LABELS 11

**EXCIPIENTS:** May contain Butylated hydroxytoluene

- **Isotrexin** (Stiefel Laboratories (UK) Ltd)

  Erythromycin 20 mg per 1 gram, isotretinoin 500 microgram per 1 gram isotrexin gel | 30 gram (£10.08) DT price = £747

- **Treclin** (Meda Pharmaceuticals Ltd)

  Tretinoin 250 microgram per 1 gram Tretcin 1%/0.025% gel | 30 gram (£5.49) £11.94

**Tretinoin with clindamycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, clindamycin p. 467, tretinoin p. 769.

**INDICATIONS AND DOSE**

Facial acne

**TO THE SKIN**

- **Child 12-17 years:** Apply daily, (to be applied thinly at bedtime)
- **Adult:** Apply daily, (to be applied thinly at bedtime)

**CONTRA-INDICATIONS**

Perioral dermatitis · personal or familial history of non-melanoma skin cancer · rosacea

**CAUTIONS**

Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck

**SIDE-EFFECTS**

Blistering of skin · burning · crusting of skin · dry or peeling skin (discontinue if severe) · erythema · eye irritation · increased sensitivity to UVB light or sunlight · oedema · pruritus · stinging · temporary changes of skin pigmentation

**CONCEPTION AND CONTRACEPTION**

Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered sufficiently effective).

**PREGNANCY**

Contra-indicated in pregnancy.

**BREAST FEEDING**

Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.

**PATIENT AND CARER ADVICE**

Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Nicotinamide

INDICATIONS AND DOSE
Inflammatory acne vulgaris

TO THE SKIN
- Adult: Apply twice daily, reduced if not tolerated to once daily or on alternate days, reduced if irritation occurs

CAUTIONS
- Avoid contact with eyes - avoid contact with mucous membranes (including nose and mouth) - reduce frequency of application if excessive dryness, irritation or peeling

SIDE-EFFECTS
- Burning - dry skin - erythema - irritation - pruritus

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Gel
- Nicam (Derma Laboratories Ltd)
  Nicotinamide 40 mg per 1 gram Nicam 4% gel | 60 gram [P] £10.10
- Brands may include Freederm

7.2 Rosacea

Brimonidine tartrate

INDICATIONS AND DOSE
Facial erythema in rosacea

TO THE SKIN
- Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks; maximum 5 mg per day

CAUTIONS
- Cerebral insufficiency - coronary insufficiency - depression - postural hypotension - Raynaud’s syndrome - severe cardiovascular disease - thromboangiitis obliterans

INTERACTIONS
- Appendix 1 (brimonidine).

SIDE-EFFECTS
- Common or very common - burning sensation at application site - stinging at application site
- Uncommon - dry mouth, headache, paraesthesia, skin irritation, dry skin
- PREGNANCY
  - Limited information available; manufacturer advises avoid.
- BREAST FEEDING
  - Manufacturer advises avoid — no information available.
- HEPATIC IMPAIRMENT
  - Manufacturer advises use with caution.
- RENAL IMPAIRMENT
  - Manufacturer advises use with caution.

DIRECTIONS FOR ADMINISTRATION
- Avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.

PATIENT AND CARER ADVICE
- Drowsiness may affect performance of skilled tasks (e.g. driving). Patients should be advised on administration of gel.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that brimonidine (Mirvaso®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe persistent facial erythema associated with rosacea in adult patients.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Gel
- Nicam (Dermal Laboratories Ltd)
  Nicotinamide 40 mg per 1 gram Nicam 4% gel | 60 gram [P] £10.10
- Brimonidine (as Brimonidine tartrate) 3 mg per 1 gram Mirvaso
  3mg/g gel | 30 gram [P] £33.69

8 Scalp and hair conditions

Scalp and hair conditions

Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium p. 1049 may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo p. 1011 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1035 may also be useful. A cream or an ointment containing coal tar with salicylic acid p. 1035 is very helpful in psoriasis p. 1017 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with coconut oil or olive oil applications followed by shampooing.

Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1049, corticosteroids, anabolic steroids, androgens, danazol p. 636, and progestogens.

Weight loss can reduce hirsutism in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Efollinithine p. 1050 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical efollinithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1042 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 594 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

Androgenetic alopecia

Finasteride p. 676 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil p. 1049 may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.
**ANTISEPTICS AND DISINFECTANTS**

**Benzalkonium chloride**

**INDICATIONS AND DOSE**

Seborrhoeic scalp conditions associated with dandruff and scaling  
**TO THE SKIN**  
▶ Child: Apply as required  
▶ Adult: Apply as required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Shampoo**

- Dermax (Dermal Laboratories Ltd)
  - Benzalkonium chloride 5 mg per 1 ml  
  - Dermax Therapeutic 0.5% shampoo | 250 ml £5.69

**Cetrimide with undecenoic acid**

**INDICATIONS AND DOSE**

Scalp psoriasis | Seborrhoeic dermatitis | Dandruff  
**TO THE SKIN**  
▶ Child: Apply 3 times a week for 1 week, then apply twice weekly  
▶ Adult: Apply 3 times a week for 1 week, then apply twice weekly

**MEDITCINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Shampoo**

- Ceanel (Alliance Pharmaceuticals Ltd)
  - Cetrimide 100 mg per 1 ml, Phenylethyl alcohol 75 mg per 1 ml, Undecenoic acid 10 mg per 1 ml  
  - Ceanel Concentrate shampoo | 150 ml £3.40 | 500 ml £9.80

**ESSENTIAL TRACE ELEMENTS**

**Selenium**

**INDICATIONS AND DOSE**

Seborrhoeic dermatitis | Dandruff  
**TO THE SKIN**  
▶ Child 5-17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required  
▶ Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

**Pityriasis versicolor**  
**TO THE SKIN**  
▶ Adult: Apply daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

**UNLICENSED USE**

The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

**PATIENT AND CARER ADVICE**  
Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

**Shampoo**

**EXCIPIENTS:** May contain Fragrances  
- Selsun (Chattem (U.K.) Ltd)  
  - Selenium sulfide shampoo 25 mg per 1 ml  
  - Selsun 2.5% shampoo | 50 ml £1.44 | 100 ml £1.96 | 150 ml £2.75  
  - DT price = £1.96

---

**8.1 Alopecia**

**PERIPHERAL VASODILATORS**

**Minoxidil**

**INDICATIONS AND DOSE**

**REGAINE® FOR MEN EXTRA STRENGTH FOAM**  
Androgenetic alopecia  
**TO THE SKIN**  
▶ Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

**REGAINE® FOR MEN EXTRA STRENGTH SOLUTION**  
Androgenetic alopecia  
**TO THE SKIN**  
▶ Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

**REGAINE® FOR WOMEN REGULAR STRENGTH**  
Androgenetic alopecia  
**TO THE SKIN**  
▶ Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

**CONTRA-INDICATIONS**

Phaeochromocytoma

**CAUTIONS**

Avoid contact with broken, infected, shaved, or inflamed skin - avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes - avoid inhalation of spray mist - avoid occlusive dressings

**CAUTIONS, FURTHER INFORMATION**

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

**INTERACTIONS**

Caution—avoid topical drugs which enhance absorption.

**SIDE-EFFECTS**

▶ Common or very common  
  - Headache  
  - Local irritation

▶ Uncommon  
  - Changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks) - hypotension

**SIDE-EFFECTS, FURTHER INFORMATION**

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

**PREGNANCY**

Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

**BREAST FEEDING**

Present in milk but not known to be harmful.

**PATIENT AND CARER ADVICE**

Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
8.2 Hirsutism

Eflornithine

- **Drug action**: An antiparasitic drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

**Indications and Dose**

Adjunct to laser therapy for facial hirsutism in women

- **Adult**: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment.

**Side-effects**

- **Common or very common**: Acne, burning at application site, rash, stinging at application site.
- **Uncommon**: Abnormal hair growth, abnormal hair texture.
- **Pregnancy**: Toxicity in animal studies—manufacturer advises avoid.
- **Breast Feeding**: Manufacturer advises avoid—no information available.
- **Patient and Carer Advice**: Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflornithine, do not wash treated area for 4 hours after application.

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **Excipients**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)
  - **Vaniqa** (Almirall Ltd)
    - Eflornithine (as Eflornithine monohydrate chloride) 115 mg per 1 gram
      - Vaniqa 11.5% cream [60 gram (£19.84)] 180 ml (£39.71)

9 Skin cleansers, antiseptics and desloughing agents

**Skin cleansers, antiseptics and desloughing agents**

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1051 or povidone-iodine p. 1053, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a deterrent effect is also required.

Hydrogen peroxide p. 1052, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10000 p. 1052, a mild antiseptic with astrigent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

**Desloughing agents**

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMondé) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulphate p. 1009 or lanolin.

**Alcohols**

**Industrial methylated spirit**

(Alcohol)

**Indications and Dose**

Skin preparation before injection

- **Child**: Apply as required
- **Adult**: Apply as required

**Contra-Indications**

- Neornates

**Caution**

- Avoid broken skin, flammable - patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants.

**Interactions**

For the interactions following the ingestion of alcohol, see Appendix 1 (alcohol).

**Side-Effects**

- Features of acute alcohol intoxication include ataxia, dysarthria, nyctagmus and drowsiness, which may progress to coma, with hypotension and acidosis.
For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1123.

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Surgical Spirit, BP consists of methyl salicylate 0.5 mL, diethylene phthalate 2%, castor oil 2.5%, in industrial methylated spirit.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- **ALCOHOL (Non-proprietary)**
- Industrial methylated spirit 70% | 600 mL £5.71
- Ethanol 950 mL per 1 litre, Wood naphtha 50 mL per 1 litre Industrial methylated spirit 95% | 600 mL £5.82 | 1000 mL £4.29-£6.02

**ANTISEPTICS AND DISINFECTANTS**

**Chlorhexidine**

**INDICATIONS AND DOSE**

**CEPTON® LOTION**
- For skin disinfection in acne
  - TO THE SKIN
    - Child: (consult product literature)
    - Adult: (consult product literature)

**CEPTON® SKIN WASH**
- For use as skin wash in acne
  - TO THE SKIN
    - Child: (consult product literature)
    - Adult: (consult product literature)

**Profavine**

**INDICATIONS AND DOSE**
- **Infected wounds | Infected burns**
  - Adult: (consult product literature)

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Potassium permanganate**

**INDICATIONS AND DOSE**
- **Cleansing and deodorising suppurating eczematous reactions and wounds**
  - Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Tablet for cutaneous solution**
- **POTASSIUM PERMANGANATE (Non-proprietary)**
  - Potassium permanganate 400 mg
    - Permivas 400mg tablets for cutaneous solution | 100 tablet £16.47
  - Potassium permanganate 800 mg
    - Permivas 800mg tablets for cutaneous solution | 50 tablet £31.95

**Prescribing and dispensing information**
- The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed. Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions. When prepared extemporaneously, the BP states Hydrogen Peroxide Solution, BP consists of hydrogen peroxide 6% (20 vols) or hydrogen peroxide 3% (10 vols).

**Handling and storage**
- Hydrogen peroxide bleaches fabric.
IODINE PRODUCTS

Povidone-iodine

INDICATIONS AND DOSE
Skin disinfection
TO THE SKIN
▶ Child: (consult product literature)
▶ Adult: (consult product literature)

BETADINE® DRY POWDER SPRAY
Skin disinfection, particularly minor wounds and infections
TO THE SKIN
▶ Adult: Not for use in serous cavities (consult product literature)

SAVLON® DRY
Skin disinfection of minor wounds
TO THE SKIN
▶ Adult: (consult product literature)

VIDENE® SOLUTION
Skin disinfection
TO THE SKIN
▶ Child: Apply undiluted in pre-operative skin disinfection and general antisepsis
▶ Adult: Apply undiluted in pre-operative skin disinfection and general antisepsis

VIDENE® SURGICAL SCRUB®
Skin disinfection
TO THE SKIN
▶ Child: Use as a pre-operative scrub for hand and skin disinfection
▶ Adult: Use as a pre-operative scrub for hand and skin disinfection

VIDENE® TINCTURE
Skin disinfection
TO THE SKIN
▶ Adult: Apply undiluted in pre-operative skin disinfection

CONTRA-INDICATIONS Avoid regular use in patients with thyroid disorders • concomitant use of lithium • corrected gestational age under 32 weeks • infants body-weight under 1.5 kg • regular use in neonates

CAUTIONS Broken skin • large open wounds

CAUTIONS, FURTHER INFORMATION
Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

VIDENE® TINCTURE
Procedures involving hot wire cautery and diathermy

SIDE-EFFECTS
▶ Rare: Sensitivity

PREGNANCY Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

BREAST FEEDING Avoid regular or excessive use.

RENAI IMPAIRMENT Avoid regular application to inflamed or broken skin or mucosa.

EFFECT ON LABORATORY TESTS May interfere with thyroid function tests.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Liquid

25 unit dose • NHS indicative price = £7.90 • Drug Tariff (Part IXa)
9.1 Minor cuts and abrasions

Minor cuts and abrasions

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and profalvine p. 1052 may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1052 is used to clean minor cuts and abrasions. When prepared extemporaneously, the BP states CETRIMIDE Cream 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, consists of liquid paraffin 50% in freshly boiled and cooled purified water.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

ANTISEPTICS AND DISINFECTANTS

Cetrimide with chlorhexidine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1051.

INDICATIONS AND DOSE

Skin disinfection such as wound cleansing and obstetrics

TO THE SKIN

Child: To be used undiluted

Adult: To be used undiluted

MAGNESIUM

Glycerol with magnesium sulfate and phenol

INDICATIONS AND DOSE

Treat carbuncles and boils

TO THE SKIN

Adult: To be applied under dressing

Skin adhesives

Skin adhesives

- DermaFlex skin adhesive (Chemence Ltd)
- Dermabond ProPen skin adhesive (Ethicon Ltd)
- Histoacryl L skin adhesive (B. Braun Medical Ltd)
- LiquiBand flow control tissue adhesive (MedLogic Global Ltd)
- Indermil skin adhesive (Covidien (UK) Commercial Ltd)

COLLIDIIONS

Castor oil with collodion and colophony

INDICATIONS AND DOSE

Used to seal minor cuts and wounds that have partially healed

TO THE SKIN

Child: (consult product literature)

Adult: (consult product literature)
10 Skin disfigurement

Camouflagers

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked ‘ACBS’ cannot be prescribed on the NHS for postoperative scars and other deformities except as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

- **CAMOUFLAGES**
  - Covermark classic foundation (Derma UK Ltd)
    - 15 ml (ACBS) - NHS indicative price = £11.86 (22 shades)

    - 19 gram (ACBS) - NHS indicative price = £22.42/gram (ACBS) - NHS indicative price = £33.35/gram (ACBS) - NHS indicative price = £42.10 (40 shades)
  - Veil finishing powder (Thomas Blake Cosmetic Creams Ltd)
    - 35 gram (ACBS) - NHS indicative price = £24.58 (2 shades)

11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

12 Warts and calluses

Warts and calluses

Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1057, formaldehyde, glutaraldehyde or silver nitrate p. 1056 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin (the major active ingredient of podophyllum) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream p. 1057 is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis.

Inosine pranobex p. 550 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.
ALDEHYDES AND DERIVATIVES

Formaldehyde

INDICATIONS AND DOSE
Warts, particularly plantar warts
TO THE SKIN
- Child: Apply twice daily
- Adult: Apply twice daily

CAUTIONS
- Impaired peripheral circulation - not suitable for application to anogenital region - not suitable for application to face - not suitable for application to large areas - patients with diabetes at risk of neuropathic ulcers - protect surrounding skin and avoid broken skin - significant peripheral neuropathy

SIDE-EFFECTS
- Skin irritation - skin ulceration (with high concentrations)

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid
- FORMALDEHYDE (Non-proprietary)
  - Formaldehyde 40 mg per 1 ml
  - Formaldehyde (Buffered) 4% solution | 1000 ml £3.56-£3.90

Gel
- Veracur (Typharm Ltd)
  - Formaldehyde 7.5 mg per 1 gram
  - Veracur 0.75% gel | 15 gram | £2.41

Glutaraldehyde

INDICATIONS AND DOSE
Warts, particularly plantar warts
TO THE SKIN
- Child: Apply twice daily
- Adult: Apply twice daily

CAUTIONS
- Not for application to anogenital areas - not for application to face - not for application to mucosa - protect surrounding skin

SIDE-EFFECTS
- Rashes - skin irritation (discontinue if severe) - stains skin brown

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Paint
  - Glutarol (Dermal Laboratories Ltd)
  - Glutaraldehyde 100 mg per 1 ml
    - Glutaral 10% cutaneous solution | 10 ml | £2.07

ANTIMITOTICS

Podophyllotoxin

INDICATIONS AND DOSE
CONDYLONE®
Condylomata acuminata affecting the penis or the female external genitalia
TO THE SKIN
- Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²

WARTICON® CREAM
Condylomata acuminata affecting the penis or the female external genitalia
TO THE SKIN
- Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications (‘loops’) per session (consult product literature)

CAUTIONS
- Avoid normal skin - avoid open wounds - keep away from face - very irritant to eyes

SIDE-EFFECTS
- Local irritation

PREGNANCY
- Avoid.

BREAST FEEDING
- Avoid.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Liquid
  - CONDYLINE (Takeda UK Ltd)
    - Podophyllotoxin 5 mg per 1 ml
      - Podophyllotoxin 5 mg per 1 ml | 3.5 ml | £14.49
  - WARTICON (Stiefel Laboratories (UK) Ltd)
    - Podophyllotoxin 5 mg per 1 ml
      - Warticon 0.5% solution | 3 ml | £14.86

Cream
- EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid
  - WARTICON (Stiefel Laboratories (UK) Ltd)
    - Podophyllotoxin 1.5 mg per 1 gram
      - Warticon 0.15% cream | 5 gram | £17.83

CAUSTIC DRUGS

Silver nitrate

INDICATIONS AND DOSE
Common warts
TO THE SKIN
- Child: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- Adult: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

Verrucas
TO THE SKIN
- Child: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- Adult: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes.
Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.

**Umbilical granulomas**

**TO THE SKIN**

- **Child:** Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin.
- **Adult:** Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin.

**CAUTIONS** Avoid broken skin · not suitable for application to ano-genital region · not suitable for application to face · not suitable for application to large areas · protect surrounding skin.

**SIDE-EFFECTS** Chemical burns on surrounding skin · stains skin.

**PATIENT AND CARER ADVICE** Patients should be advised that silver nitrate may stain fabric.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid stick.

- **Avoca** (Bray Group Ltd)
  - Silver nitrate 400 mg per 1 gram Avoca 40% silver nitrate pencils | 1 applicator | £1.01.
  - Silver nitrate 750 mg per 1 gram Avoca 75% silver nitrate applicators | 100 applicator | £43.73.
  - Avoca 75% silver nitrate applicators with thick handles | 50 applicator | £42.49.
  - Silver nitrate 950 mg per 1 gram Avoca 95% silver nitrate applicators | 100 applicator | £43.73.
  - Avoca 95% silver nitrate pencils | 1 applicator | £1.96 DT price = £2.44 | 12 applicator | £23.04.
  - Avoca wart and verruca treatment set | 1 applicator | £2.44 DT price = £2.44 | 6 applicator | £14.37.

**IMMUNE RESPONSE MODIFIERS**

**Imiquimod**

**INDICATIONS AND DOSE**

**ALDARA**

**Warts (external genital and perianal)**

**TO THE SKIN**

- **Adult:** Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night.

**Superficial basal cell carcinoma**

**TO THE SKIN**

- **Adult:** Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment.

**Actinic keratosis**

**TO THE SKIN**

- **Adult:** Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses.

**ZYCLARA**

**Actinic keratosis**

**TO THE SKIN**

- **Adult:** Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day.

**CAUTIONS** Autoimmune disease · avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with nostrils · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin).

**SIDE-EFFECTS**

- **Common or very common** Burning sensation · erosion · erythema · excoriation · headache · influenza-like symptoms · itching · local reactions · myalgia · oedema · scabbing.
- **Uncommon** Alopecia · local ulceration.
- **Rare** Cutaneous lupus erythematosus-like effect · Stevens-Johnson syndrome.
- **Very rare** Dysuria.
- **Frequency not known** Permanent hyperpigmentation · permanent hypopigmentation.

**CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.

**PREGNANCY** No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

**BREAST FEEDING** No information available.

**DIRECTIONS FOR ADMINISTRATION**

**ALDARA**

**Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

**ZYCLARA**

**Important** Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid stick.

- **Aldara** (Meda Pharmaceuticals Ltd)
  - Imiquimod 50 mg per 1 gram Aldara 5% cream 250mg sachets | 12 sachet | £48.60 DT price = £48.60.
  - Zyclara (Meda Pharmaceuticals Ltd)
  - Imiquimod 37.5 mg per 1 gram Zyclara 3.75% cream 250mg sachets | 28 sachet | £113.00.

**SALICYLATES**

**Salicylic acid**

**INDICATIONS AND DOSE**

**OCCULARSAL**

**Common and plantar warts**

**TO THE SKIN**

- **Child:** Apply daily, treatment may need to be continued for up to 3 months.
- **Adult:** Apply daily, treatment may need to be continued for up to 3 months.

**VERRUGON**

**For plantar warts**

**TO THE SKIN**

- **Child:** Apply daily, treatment may need to be continued for up to 3 months.
- **Adult:** Apply daily, treatment may need to be continued for up to 3 months.

**UNLICENSED USE** Not licensed for use in children under 2 years.

**CAUTIONS** Avoid broken skin · impaired peripheral circulation · not suitable for application to ano-genital...
Skin

PRESCRIBING AND DISPENSING INFORMATION

Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid p. 1057.

INDICATIONS AND DOSE

CUPLEX®
Plantar and mosaic warts | Corns | Calluses
TO THE LESION
> Adult: Apply twice daily

DUOFILM®
Plantar and mosaic warts
TO THE LESION
> Adult: Apply daily

SALATAC®
Warts | Verrucas | Corns | Calluses
TO THE LESION
> Adult: Apply daily

SALACTOL®
Warts (particularly plantar warts) | Verrucas | Corns | Calluses
TO THE LESION
> Adult: Apply daily

PRESCRIBING AND DISPENSING INFORMATION

CUPLEX® AND SALACTOL®
Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation.
Chapter 14

Vaccines

1 Immunoglobulin therapy

Immunoglobulins

Passive immunity

Immunoglobulins are available from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antisera is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Further information on the use of immunoglobulins is included in Public Health England’s Immunoglobulin Handbook www.gov.uk/phe, and in the Department of Health’s publication, Immunisation against Infectious Disease, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1065 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1064 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1062 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin p. 1063 (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin p. 1063 (containing 10%–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin p. 1063 (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 1081 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin p. 1063 is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV
infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine p. 1081 can be given at the same time, but it should be given at a separate injection site.

**Measles**

Intravenous or subcutaneous normal immunoglobulin p. 1063 may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868). Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1087 for prophylaxis following exposure to measles.

**Rubella**

Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin p. 1063 should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1087.

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1063 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

**Hepatitis B immunoglobulin**

Disease-specific hepatitis B immunoglobulin p. 1062 ('HBIG') is available for use in association with hepatitis B vaccine p. 1083 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Rabies immunoglobulin**

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1064 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination). Rabies vaccine p. 1090 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin p. 1064, it should be given within 7 days of starting the course of rabies vaccine.

**Tetanus immunoglobulin**

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1065 should be used in addition to wound cleaning and, when appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 1008 and wound cleansing, should also be used for the treatment of established cases of tetanus.

**Varicella-zoster immunoglobulin**

Varicella-zoster immunoglobulin p. 1065 (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone: children 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; adults about 40 mg daily for more than 1 week.

**Important:** for full details consult Immunisation against Infectious Disease. Varicella-zoster vaccine p. 1092 is available.

**Anti-D (Rh(D)) immunoglobulin**

Anti-D (Rh(D)) immunoglobulin p. 1061 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh(D)) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh(D)) immunoglobulin p. 1061 should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh(D)) immunoglobulin p. 1061 is also given when significant feto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-
D (Rh\(_D\)) immunoglobulin below is determined according to the level of exposure to rhesus-positive blood.

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh\(_D\)) immunoglobulin below is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine
Measles, mumps and rubella vaccine, live p. 1087 may be given in the postpartum period with anti-D (Rh\(_D\)) immunoglobulin below injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

IMMUNOGLOBULINS

Anti-D (Rh\(_D\)) immunoglobulin

### INDICATIONS AND DOSE

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following birth of rhesus-positive infant

**BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks’ gestation

**BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks’ gestation

**BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, antenatal prophylaxis

**BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 34 weeks gestation

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following Rh\(_D\) incompatible blood transfusion

**BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 100–125 units/mL, dose per mL transfused rhesus-positive red cells given, subcutaneous route used for patients with bleeding disorders

**RHOPHYLAC\(^\text{®}\)**

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following birth of rhesus-positive infant

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks’ gestation

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh\(_D\) sensitisation, following Rh\(_D\) incompatible blood transfusion

**BY INTRAVENOUS INJECTION**
- Females of childbearing potential: 50 units/mL, dose per mL of transfused rhesus-positive blood, alternatively 100 units/mL, dose per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients • treatment of idiopathic thrombocytopenia purpura in splenectomised patients

- **CAUTIONS** Immunoglobulin A deficiency • possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION
MMR vaccine may be given in the postpartum period with anti-D (Rh\(_D\)) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

- **INTERACTIONS** → Appendix 1 (immunoglobulins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Rare Anaphylaxis • dyspnoea • hypotension • tachycardia • urticaria
- Frequency not known Abdominal pain • arthralgia • asthenia • back pain • diarrhoea • dizziness • drowsiness •
fever • headache • hypertension • hypotension • injection site pain • malaise • myalgia • nausea • pruritus • rash • sweating • vomiting

SPECIFIC SIDE-EFFECTS
- With intravenous use abdominal distension • abdominal pain • blood pressure fluctuations • deep vein thrombosis • haemolytic anaemia • injection site reactions • myocardial infarction • pulmonary embolism • stroke • thromboembolic events

HANDLING AND STORAGE Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156

Vaccines

14

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- D-Gam (Bio Products Laboratory Ltd)
  - Anti-D (RHO) immunoglobulin 250 unit solution for injection vials 1 vial £33.75
  - Anti-D (RHO) immunoglobulin 500 unit solution for injection vials 1 vial £68.00
  - Anti-D (RHO) immunoglobulin 1500 unit solution for injection vials 1 vial £156
- Rhophylac (CSL Behring UK Ltd)
  - Anti-D (RHO) immunoglobulin 750 unit per 1 ml solution for injection pre-filled syringes 1 vial £39.52

Hepatitis B immunoglobulin

INDICATIONS AND DOSE
Prophylaxis against hepatitis B infection

BY INTRAMUSCULAR INJECTION
- Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material

BY INTRAVENOUS INFUSION
- Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

Prevention of hepatitis B in haemodialysed patients

BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Prophylaxis against re-infection of transplanted liver

BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients

BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
- Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

CAUTIONS
- IgA deficiency • interference with live virus vaccines

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common or very common Injection site reactions
- Uncommon Abdominal pain • anaphylaxis • arthralgia • buccal ulceration • chest pain • dizziness • dyspnoea • glossitis • headache • tremor

SPECIFIC SIDE-EFFECTS
- With intravenous use abdominal distension • abdominal pain • blood pressure fluctuations • deep vein thrombosis • haemolytic anaemia • injection site reactions • myocardial infarction • pulmonary embolism • stroke • thromboembolic events

PRESCRIBING AND DISPENSING INFORMATION
Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

HANDLING AND STORAGE Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- HEPATITIS B IMMUNOGLOBULIN (Non-proprietary)
  - Hepatitis B immunoglobulin human 200 unit solution for injection vials 1 vial £122.44
  - Hepatitis B immunoglobulin human 500 unit solution for injection vials 1 vial £266.33
- Zutecra (Biotest (UK) Ltd)
  - Zutecra 500units/1ml solution for injection pre-filled syringes 5 syringe no price available

Solution for infusion
- Hepact CP (Biotest (UK) Ltd)
  - Hepatitis B immunoglobulin human 50 unit per 1 ml solution for infusion vials 1 vial no price available

BNF 70
Normal immunoglobulin

INDICATIONS AND DOSE

To control outbreaks of hepatitis A
By deep intramuscular injection
- Adult: 500 mg
Rubella in pregnancy, prevention of clinical attack
By deep intramuscular injection
- Females of childbearing potential: 750 mg
Antibody deficiency syndromes
By subcutaneous infusion
- Adult: (consult product literature)

SUBGAM®
Hepatitis A prophylaxis in outbreaks
By intramuscular injection
- Adult: 750 mg

UNLICENSED USE

SUBGAM® Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against hepatitis A or rubella.

CONTRA-INDICATIONS
Patients with selective IgA deficiency who have known antibody against IgA

FLEBOGAMMA® DIF SOLUTION FOR INFUSION
Hereditary fructose intolerance (contains sorbitol)

GAMMAPLEX® SOLUTION FOR INFUSION
Hereditary fructose intolerance (contains sorbitol)

HIZENTRA® SOLUTION FOR INFUSION
Hyperprolinaemia (contains L-proline)

PRIVIGEN® SOLUTION FOR INFUSION
Hyperprolinaemia (contains L-proline)

CAUTIONS

GENERAL CAUTIONS
Agammaglobulinaemia with or without IgA deficiency - hypogammaglobulinaemia with or without IgA deficiency - interference with live virus vaccines

SPECIFIC CAUTIONS
- With intravenous use: ensure adequate hydration - obesity - renal insufficiency - risk factors for arterial thromboembolic events - risk factors for venous thromboembolic events - thrombophilic disorders

OCTAGAM® SOLUTION FOR INFUSION
Falsely elevated results with blood glucose testing systems (contains maltose)

CAUTIONS, FURTHER INFORMATION
Interference with live virus vaccines Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

INTERACTIONS
- Appendix 1 (immunoglobulins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Rare: Acute renal failure - anaphylaxis - aseptic meningitis - cutaneous skin reactions - hypotension
- Frequency not known: Arthralgia - chills - diarrhoea - dizziness - fever - headache - low back pain - muscle spasms - myalgia - nausea

SPECIFIC SIDE-EFFECTS
- With intravenous use: abdominal distension - abdominal pain - blood pressure fluctuations - deep vein thrombosis - haemolytic anaemia - injection site reactions - myocardial infarction - pulmonary embolism - stroke - thromboembolic events

SIDE-EFFECTS, FURTHER INFORMATION

Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

MONITORING REQUIREMENTS
Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

DIRECTIONS FOR ADMINISTRATION
Preparations for subcutaneous use may be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.

KIOVIC® SOLUTION FOR INFUSION
Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

GAMUNEX® SOLUTION FOR INFUSION
Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

PRESCRIBING AND DISPENSING INFORMATION
Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

With intramuscular use
Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

HANDLING AND STORAGE
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

**EXCipients:** May contain Glucose, maltose, sorbitol, sucrose

- **NORMAL IMMUNOGLOBULIN (Non-proprietary)**
  - Normal immunoglobulin human 100 mg per 1 ml | Octaplas 100 mg/5 ml solution for infusion vials | 1 vial (Pfz) no price available
  - Normal immunoglobulin 2.5g/25ml solution for infusion vials | 1 vial (Pfz) no price available
  - Normal immunoglobulin human 20g/200ml solution for infusion vials | 1 vial (Pfz) no price available
  - Normal immunoglobulin human 100/100ml solution for infusion vials | 1 vial (Pfz) no price available
  - Normal immunoglobulin human 30g/300ml solution for infusion vials | 1 vial (Pfz) no price available

- **Aragram (Oxbridge Pharma Ltd)**
  - Normal immunoglobulin human 50 mg per 1 ml | Aragram 5g/100ml solution for infusion vials | 1 vial (Pfz) no price available
  - Aragram 2.5g/50ml solution for infusion vials | 1 vial (Pfz) no price available

- **Flebogammadif (Grifols UK Ltd)**
  - Normal immunoglobulin human 50 mg per 1 ml | Flebogamma DIF 10g/200ml solution for infusion vials | 1 vial (Pfz) £112.50
  - Flebogamma DIF 2.5g/50ml solution for infusion vials | 1 vial (Pfz) £27.50
  - Flebogamma DIF 5g/100ml solution for infusion vials | 1 vial (Pfz) £25.50
  - Flebogamma DIF 500mg/10ml solution for infusion vials | 1 vial (Pfz) £30.00
  - Flebogamma DIF 20g/400ml solution for infusion vials | 1 vial (Pfz) £1,020.00

- **Gammaplex (Bioproducts Laboratories Ltd)**
  - Normal immunoglobulin human 50 mg per 1 ml | Gammaplex 10g/200ml solution for infusion vials | 1 vial (Pfz) £48.00
  - Gammaplex 1g/10ml solution for infusion vials | 1 vial (Pfz) £42.50
  - Gammaplex 10g/100ml solution for infusion vials | 1 vial (Pfz) £425.00
  - Gamunex 10g/200ml solution for infusion vials | 1 vial (Pfz) £1,020.00
  - Gamunex 10g/100ml solution for infusion vials | 1 vial (Pfz) £50.00
  - Gamunex 10g/100ml solution for infusion vials | 1 vial (Pfz) £122.50

- **Hizentra (CSL Behring UK Ltd)**
  - Normal immunoglobulin human 200 mg per 1 ml | Hizentra 2g/10ml solution for infusion vials | 1 vial (Pfz) £91.80
  - Hizentra 1g/5ml solution for infusion vials | 1 vial (Pfz) £45.90
  - Hizentra 4g/20ml solution for infusion vials | 1 vial (Pfz) £183.60
  - Intratect (Biotest (UK) Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml | Intratect 5g/100ml solution for infusion vials | 1 vial (Pfz) £22.50
  - Intratect 1g/20ml solution for infusion vials | 1 vial (Pfz) £45.00
  - Intratect 2.5g/50ml solution for infusion vials | 1 vial (Pfz) £112.50
  - Intratect 10g/200ml solution for infusion vials | 1 vial (Pfz) £450.00

- **Kiovig (Baxter Healthcare Ltd)**
  - Normal immunoglobulin human 100 mg per 1 ml | Kiovig 5g/50ml solution for infusion vials | 1 vial (Pfz) no price available
  - Kiovig 20g/200ml solution for infusion vials | 1 vial (Pfz) no price available
  - Kiovig 5g/50ml solution for infusion vials | 1 vial (Pfz) no price available
  - Kiovig 2.5g/25ml solution for infusion vials | 1 vial (Pfz) no price available
  - Kiovig 1g/10ml solution for infusion vials | 1 vial (Pfz) no price available

### Indications and Dose

**Post-exposure prophylaxis against rabies infection by local infiltration or by intramuscular injection**

- **Child:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

- **Adult:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

- **CAUTIONS** Iga deficiency - interference with live virus vaccines

- **SIDE-EFFECTS**
  - Rare: Anaphylaxis - arthralgia - buccal ulceration - chest tightness - dizziness - dysphoeea - glossitis - tremor
  - Frequency not known: Facial oedema - injection site pain - injection site swelling

**PRESCRIBING AND DISPENSING INFORMATION** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose. Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

**HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. *Refrigerated storage* is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
2 Post-exposure prophylaxis

ANTITOXINS

Botulinum antitoxin

- **Drug Action** A preparation containing the specific antitoxin globulins that have the power of neutralising the toxins formed by types A, B, and E of Clostridium botulinum.

- **Indications and Dose**

  - **Post exposure prophylaxis of botulism**

  - **By Intramuscular Injection**

  - Adult: (consult product literature)

- **Side-effects** Hypersensitivity reactions

- **Further Information**

  - **Hypersensitivity reactions** It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **Pre-treatment Screening** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

- **Prescribing and Dispensing Information** Available from local designated centres, for details see TOXBASE (requires registration) [www.toxbase.org](http://www.toxbase.org). For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

  - The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

- **Medicinal Forms**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**

    - **Botulinum Antitoxin (Non-proprietary)**

      - Botulinum antitoxin type A 750 unit per 1 ml, Botulinum antitoxin type B 500 unit per 1 ml, Botulinum antitoxin type E
3 Tuberculosis diagnostic test

DIAGNOSTICS

Tuberculin purified protein derivative (Tuberculin PPD)

INDICATIONS AND DOSE

Mantoux test
BY INTRADERMAL INJECTION
- Child: 2 units for one dose
- Adult: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)
BY INTRADERMAL INJECTION
- Child: 10 units for 1 dose
- Adult: 10 units for 1 dose

Dose equivalence and conversion
2 units is equivalent to 0.1 mL of 20 units/mL strength. 10 units is equivalent to 0.1 mL of 100 units/mL strength.

CAUTIONS
Mantoux test Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Mantoux testing should not be carried out within 4 weeks of receiving a live viral vaccine.

PRESCRIBING AND DISPENSING INFORMATION
Available from ImmForm (SSI brand). The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

4 Vaccination

Vaccines

Active immunity
Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:
- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook Immunisation against Infectious Disease (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook are available at www.immunisation.dh.gov.uk

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Immunisation schedule
Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales). For most up to date immunisation schedule consult The complete routine immunisation schedule available at (www.gov.uk)

Preterm birth
Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against Haemophilus influenzae type b, meningococcal C, and hepatitis B after primary immunisation.
### Immunisation Guidelines for HIV-Infected Adults

#### Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella—zoster immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus; and the following inactivated vaccines:
  - anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should not receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought)

The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by British HIV Association (BHIVA) are available at [www.bhiva.org](http://www.bhiva.org)

#### Vaccines and asplenia

The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

- haemophilus influenzae type b; influenza; pneumococcal A, C, W135, and Y conjugate; pneumococcal.

#### Vaccines and antiseras availability

- Anthrax vaccine p. 1078 and yellow fever vaccine, live p. 1092, botulism antitoxin p. 1065, diphtheria antitoxin p. 1066, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see *Emergency treatment of poisoning p. 1123.*

Enquiries for vaccines not available commercially can also be made to:

</table>
| Neonates at risk only | Bacillus Calmette-Guérin vaccine p. 1078  
Hepatitis B vaccine p. 1083  
Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1079 First dose  
Pneumococcal vaccine p. 1089 First dose  
Rotavirus vaccine p. 1090 First dose |
| 2 months | Influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy)  
Meningococcal group C vaccine p. 1088 First dose  
Pneumococcal vaccine p. 1089 Second dose |
| 3 months | Meningococcal group C vaccine p. 1088 First dose  
Pneumococcal vaccine p. 1089 Second dose |
| 4 months | Meningococcal group C vaccine p. 1088 Single booster dose  
Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1079 Third dose  
Pneumococcal vaccine p. 1089 Second dose |
| 12-13 months | Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1080 Single booster dose  
Measles, mumps and rubella vaccine, live p. 1087 First dose  
Pneumococcal vaccine p. 1089 First dose  
Haemophilus influenzae type b with meningococcal group C vaccine p. 1080 Single booster dose |
| Between 3 years and 4 months, and 5 years | Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1080 Single booster dose  
Note: Preferably allow interval of at least 3 years after completing primary course  
Measles, mumps and rubella vaccine, live p. 1087 Second dose |
| 11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-14 years of age in Scotland. | Human papillomavirus vaccines p. 1085 If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed. The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, for those females who started the schedule with Cervarix® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil®. |
| 13-15 years | Meningococcal group C vaccine p. 1088 Single booster dose |
| 13-18 years | Diphtheria with poliomyelitis and tetanus vaccine p. 1080 Single booster dose. Note: Can be given at the same time as the booster dose of meningococcal group C conjugate vaccine at 13-15 years of age. |
| During adult life, women of child-bearing age susceptible to rubella | Measles, mumps and rubella vaccine, live p. 1087 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation. |
| During adult life, those entering or being at university who are at risk of meningococcal group C disease | Meningococcal group C vaccine p. 1088 Single dose. Note: Should be offered to those of any age entering or being at university who have never been vaccinated against meningococcal group C disease, or those born after September 1995 who are entering university and only received meningococcal group C vaccine under the age of 10 years |
| During adult life, if not previously immunised | Diphtheria with poliomyelitis and tetanus vaccine p. 1080 |
| 70 years | Varicella-zoster vaccine p. 1092 Single dose |
In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

University Hospital of Wales

rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine
Anthrax vaccine p. 1078 is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *B. anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis. Advice on the use of anthrax vaccine p. 1078 for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

BCG vaccine
BCG (Bacillus Calmette-Guérin) vaccine p. 1078 should be given intradermally by operators skilled in the technique. The expected reaction to successful BCG vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculin protein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 2 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/phe.

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 501 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

Tuberculosis Diagnostic Agents
The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tubercul purified protein derivative p. 1066 (PPD).

The Heaf test (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: QuantiFERON® TB Gold and T-Spot®. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.gov.uk/phe.

Botulism antitoxin
A polyvalent botulism antitoxin p. 1065 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Cholera vaccine
Cholera vaccine p. 1079 (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel. Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

Diphtheria vaccine
Diphtheria-containing vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary
immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive either adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and adults

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

Haemophilus influenzae type B conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing Haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), and poliomyelitis (inactivated). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive H. influenzae type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

Invasive Haemophilus influenzae type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 508 in the prevention of secondary cases of Haemophilus influenzae type b disease.

Individuals diagnosed with asplenia, splenic dysfunction, or complement deficiency at:

- under 2 years of age should be vaccinated according to the Immunisation Schedule. The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12–13 months of age, should be followed at least 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;

- over 2 years of age should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

Hepatitis A vaccine

Hepatitis A vaccine p. 1081 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:
Vaccines

However, children nappy changing are vaccinated against hepatitis A.

Hepatitis B vaccine

Hepatitis B vaccine is recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B. For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin p. 1063 is recommended for use in addition to hepatitis A vaccine p. 1081 for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unless they are unimmunised]. In these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

Hepatitis B vaccine

Hepatitis B vaccine p. 1083 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- Laboratory staff who work directly with the virus;
- Staff and residents of homes for those with severe learning difficulties;
- Workers at risk of exposure to untreated sewage;
- Individuals who work with primates;
- Patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- Individuals who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- Laboratory staff who handle material that may contain the virus;
- Other occupational risk groups such as morticians and embalmers;
- Staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- Staff and inmates of custodial institutions;
- Those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- Families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- Foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances. Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis.

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation against Infectious Disease. Specific hepatitis B immunoglobulin p. 1062 (‘HBIG’) is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection.

A combined hepatitis A and B vaccine p. 1082 is also available.

Human papillomavirus vaccine

Human papillomavirus vaccines p. 1085 is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by the vaccine papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.
Human papillomavirus vaccines will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first (see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more. Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination has been started before September 2014, then where possible this should be completed; if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. Under the national programme in England, females remain eligible to receive the human papillomavirus vaccines p. 1085 up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccines should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course. As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1085 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization. Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine p. 1085 is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action. Unless contra-indicated, the live influenza vaccine p. 1085, Fluzeq Tetra®, is preferred in children aged 2–18 years because it provides a higher level of protection than inactivated influenza vaccine p. 1085. From 1 September 2014, seasonal influenza vaccine will also be offered to all children aged 2–4 years (i.e. those born between 2 September 2009 and 1 September 2012).

Information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.gov.uk/phe.

Japanese encephalitis vaccine

Japanese encephalitis vaccine p. 1086 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org).

Measles, Mumps and Rubella vaccine

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine, live p. 1087 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 2 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in seronegative women of child-bearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live—vaccination a few days after delivery...
is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged under 13 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measeles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live p. 1087 immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Meningococcal vaccine

Almost all childhood meningococcal disease in the UK is caused by Neisseria meningitidis serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal (not currently available in the UK).

A meningococcal group B vaccine, Bexsero®, is licensed in the UK against infection caused by Neisseria meningitidis serogroup B. Bexsero® contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation

Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of Neisseria meningitidis. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second at 13–15 years of age (see Immunisation Schedule).

Unimmunised children aged 4–12 months should be given 1 dose of meningococcal group C conjugate vaccine and then they should be vaccinated according to the Immunisation Schedule. Unimmunised children aged 1–10 years should be given 1 dose of meningococcal group C conjugate vaccine, followed by a booster dose at 13–15 years of age. Unimmunised individuals aged 10–25 years should be given 1 dose of meningococcal group C conjugate vaccine, but a booster dose is not required.

From August 2014 there will be a catch-up programme for individuals aged under 25 years who are attending university for the first time and who did not receive a dose of meningococcal group C conjugate vaccine at 13–15 years of age.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal school outbreaks and infection are reported.

Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org)

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine p. 1089 is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with Neisseria meningitidis should be considered.

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough)
requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

**Vaccination of pregnant women against pertussis**

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis [acellular, component] and poliomyelitis [inactivated] vaccine; *Boostrix*-IPV®) between 28 to 38 weeks of pregnancy; the optimal time for vaccination is between 28–32 weeks of pregnancy. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 28–38 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

**Contacts**

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

**Side-effects**

Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

**Pneumococcal vaccine**

Pneumococcal vaccine p. 1089 protects against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. Pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococci, whereas pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either 10 capsular types (*Synflorix®*) or 13 capsular types (*Prevenar 13®*) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13®*) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–18 months (see Immunisation Schedule).

Pneumococcal vaccine is recommended for individuals at increased risk of pneumococcal infection as follows:
- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease;
- at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine**

Children under 2 years at increased risk of pneumococcal infection (see list) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).
Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination
In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine
Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel
Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

Information about countries with a high incidence of poliomyelitis can be obtained from www.gov.uk or from the National Travel Health Network and Centre (www.nathnac.org).

Rabies vaccine
Rabies vaccine p. 1090 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis
Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine p. 1090, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management
Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6686), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997 / (028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin p. 1064 is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation
course can be discontinued if it is proved that the individual was not at risk.

**Rotavirus vaccine**

Rotavirus vaccine p. 1090 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine p. 1090 virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**Smallpox vaccine**

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8280 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/jphe.

**Tetanus vaccine**

Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines). When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary. Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

**Wounds**

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Tick-borne encephalitis vaccine**

Tick-borne encephalitis vaccine, inactivated p. 1091 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

**Typhoid vaccine**

Typhoid vaccine p. 1091 is available as Vi capsular polysaccharide (from Salmonella typhi) vaccine for injection and as live attenuated Salmonella typhi for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular polysaccharide typhoid vaccine p. 1091 is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.
Vaccines

Oral typhoid vaccine p. 1091 is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

Varicella-zoster vaccine

The live varicella-zoster vaccine p. 1092, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine p. 1092 virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;
- Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and patients until the lesions have crusted. Those who develop a varicella-zoster vaccine p. 1092, Zostavax®, is recommended for the prevention of herpes zoster (shingles) in adults who are, or were, 70 years of age on 1 September 2014. The 2014-15, catch-up programme with Zostavax® will be offered to all who are, or were, 78 or 79 years of age on 1 September 2014. A single dose of Zostavax® is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although Zostavax® is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella-zoster immunoglobulin p. 1065 is used to protect susceptible individuals at increased risk of varicella infection.

Yellow fever vaccine

Yellow fever vaccine, live p. 1092, is indicated for those travelling or living in areas where infection is endemic and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Travel vaccinations

See advice on Malaria, treatment p. 529.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world.

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunological response is more likely if no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against typhoid is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on diphtheria, on Japanese encephalitis, and on tick-borne encephalitis is included in Health Information for Overseas Travel.
Food hygiene
In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers
Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org. The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or the Department of Health, Social Services and Public Safety, National Travel Health Network and Centre, Castle Buildings, 2nd Floor Central, 250 Euston Road, London NW1 2PG (for healthcare professionals only)

VACCINES

Vaccines

- Contra-indications
  - Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

- Caution
  - Acute illness • minor illnesses

Caution, Further Information
Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

Immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 2 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

Predisposition to neurological problems
When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule. When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

- Interactions → Appendix 1 (vaccines).

- Side-effects

General Side-effects
- Common or very common
  - Fatigue • fever • gastro-intestinal disturbances • headache • irritability • loss of appetite • lymphangitis • malaise • myalgia
  - Very rare
    - Anaphylaxis (can be fatal) • angioedema (can be fatal) • bronchospasm (can be fatal) • hypersensitivity reactions (can be fatal) • urticaria (can be fatal)
  - Frequency not known
    - Arthralgia • asthenia • dizziness • drowsiness • influenza-like symptoms • lymphadenopathy • paraesthesia • rash

Specific Side-effects
- Common or very common
  - With intradermal use or intramuscular use or subcutaneous use
    - Induration may develop at the injection site
    - Pain • redness • sterile abscess may develop at the injection site

Side-effects, Further Information
Occasionally serious adverse reactions can occur—these should always be reported to the CHM.

Post-immunisation pyrexia in infants
The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, paracetamol can be given. Ibuprofen can be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

Allergy and Cross-sensitivity
Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).
PREGNANCY Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

BREAST FEEDING Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

DIRECTIONS FOR ADMINISTRATION If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines. When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart.

HANDLING AND STORAGE Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopathy, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

Refrigerated storage is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light.

CONTRA-INDICATIONS Generalised septic skin conditions neonate in household contact with known or suspected case of active tuberculosis
CONTRA-INDICATIONS, FURTHER INFORMATION A lesion-free site should be used to administer BCG vaccine to patients with eczema.

Indications and dose

- anthrax vaccine
- BCG vaccine

Pre-exposure immunisation against anthrax | Post-exposure immunisation

**BY INTRAMUSCULAR INJECTION**
- Adult: Initially 1 dose every 3 weeks for 3 doses, followed by 1 dose after 6 months, to be administered in the deltoid region, 1 dose is equivalent to 0.5 mL
- Booster
- Adult: 1 dose every 12 months, to be administered in deltoid region, 1 dose is equivalent to 0.5 mL

PRESCRIBING AND DISPENSING INFORMATION

- There can be variation in the licensing of different medicines containing the same drug.
- Suspension for injection

EXCIPIENTS: May contain Thiomersal
- ANTHRAX VACCINE (Non-proprietary)
  Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5ml ampoules | 5 ampoule (Pack) no price available

**INDICATIONS AND DOSE**

Immunisation against tuberculosis

**BY INTRADERMAL INJECTION**
- Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- Child 1-7 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided
- Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided

**SIDE-EFFECTS**
- Rare: Disseminated complications - osteitis - osteomyelitis
- Frequency not known: Prolonged ulceration at the injection site - subcutaneous abscess at the injection site

**PRE-TREATMENT SCREENING**
Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculinprotein (see tuberculin purified protein derivative p. 1066). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has had no contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

**DIRECTIONS FOR ADMINISTRATION**

Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb ≡ 0.1 mL injection, 3 mm bleb ≡ 0.05 mL injection; if considerable
resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

**PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**
- **Bacillus Calmette-Guerin Vaccine (Non-proprietary)**
  
  Bacillus Calmette-Guerin vaccine powder and solvent for suspension for injection vials | 10 vial [P] no price available

---

### Cholera vaccine

**INDICATIONS AND DOSE**

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

**BY MOUTH**

- Child 2-5 years: 1 dose every 1–6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- Child 6-17 years: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
- Adult: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

**Booster**

**BY MOUTH**

- Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
- Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
- Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**CONTRA-INDICATIONS** Acute gastro-intestinal illness

**SIDE-EFFECTS**

- Rare Cough - respiratory symptoms - rhinitis
- Very rare Insomnia - sore throat
- Frequency not known Abdominal pain and cramps - diarrhoea - nausea - vomiting

**DIRECTIONS FOR ADMINISTRATION**

- In children: Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–6 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- In adults: Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Local reactions do not usually occur.
- The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.
- The vaccine should not be withheld from children with a history to a preceding dose of:
  - Fever, irrespective of severity;
  - Persistent crying or screaming for more than 3 hours;
  - Severe local reaction, irrespective of extent.

**UNLICENSED USE** Infanrix-IPV + Hib™ not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

**SIDE-EFFECTS** Atopic dermatitis - hypotonia - restlessness - sleep disturbances - unusual crying in infants

**SPECIAL CONDITIONS**

- Local reactions do not usually occur.

---

### Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

**INDICATIONS AND DOSE**

Primary immunisation

**BY INTRAMUSCULAR INJECTION**

- Child 2 months-4 years: 0.5 mL every month for 3 doses
- Child 4-10 years: 0.5 mL every 6 months for 3 doses
- Child 11 years-17 years: A single booster dose can be given 6 weeks for 1 dose
- Adult: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated

**UNLICENSED USE** Infanrix-IPV + Hib™ not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

**SIDE-EFFECTS** Atopic dermatitis - hypotonia - restlessness - sleep disturbances - unusual crying in infants

**SPECIAL CONDITIONS**

- Local reactions do not usually occur.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Infanrix-IPV + Hib** (GlaxoSmithKline UK Ltd)
  
  Infanrix-IPV + Hib vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [P] no price available

---

**PATIENT AND CARER ADVICE**

Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.
Diphtheria with pertussis, poliomyelitis vaccine and tetanus

**INDICATIONS AND DOSE**

**Primary immunisation**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL every month for 3 doses
  - Adult: 0.5 mL every month for 3 doses

**Booster doses**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
  - Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine

**SIDE-EFFECTS** Restlessness • sleep disturbances • unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**

**Side effects of vaccines containing pertussis** The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- • fever, irrespective of severity;
- • persistent crying or screaming for more than 3 hours;
- • severe local reaction, irrespective of extent.

**PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmunForm. Available for vaccination of pregnant women from ImmunForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin

- **Revaxis (sanofi pasteur MSD Ltd)**
  - Revaxis vaccine suspension for injection 0.5ml pre-filled disposable injection | 1 pre-filled disposable injection (POD) £17.56

Haemophilus influenzae type b with meningococcal group C vaccine

**INDICATIONS AND DOSE**

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component)

**BY INTRAMUSCULAR INJECTION**
- **Child 12-13 months:** 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenzae* type b) | Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

**BY INTRAMUSCULAR INJECTION**
- **Child 1-9 years:** 0.5 mL for 1 dose
- **Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)**
- **BY INTRAMUSCULAR INJECTION**
  - **Child 1-7 years:** 0.5 mL for 1 dose
  - **Adult:** 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

**BY INTRAMUSCULAR INJECTION**
- **Child 12-13 months:** 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine, followed by 0.5 mL for 1 dose, the second dose should be given after the second birthday

Diphtheria with poliomyelitis and tetanus vaccine

**INDICATIONS AND DOSE**

**Primary immunisation**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL every month for 3 doses
  - Adult: 0.5 mL every month for 3 doses

**Booster doses**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the
Hepatitis A vaccine

INDICATIONS AND DOSE

AVAXIM®

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

- Child 2-17 years: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine
- Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine

VAQTA®

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

- Child 2-17 years: 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- Adult: 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

VAQTA® ADULT

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

- Adult: Initially 1 mL for 1 dose, then 1 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

EPAXAL®

Immunisation against hepatitis A infection

BY INTRAMUSCULAR INJECTION

- Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Immunisation against hepatitis A infection (splenectomised patients)

BY INTRAMUSCULAR INJECTION

- Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 1–6 months, dose given as booster; booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders
- Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 1–6 months, dose given as booster; booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

- ALLERGY AND CROSS-SENSITIVITY

Epaxal® contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contraindicated in those hypersensitive to eggs or chicken proteins.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
Hepatitis A and B vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1081, hepatitis B vaccine p. 1083.

**INDICATIONS AND DOSE**

**TWINRIX® PAEDIATRIC**

Immunisation against hepatitis A and hepatitis B infection

BY INTRAMUSCULAR INJECTION

- Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® ADULT**

Immunisation against hepatitis A and hepatitis B infection

BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

- Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders but (immune response may be reduced)

Immunisation against hepatitis A and hepatitis B infection (accelerated schedule for travellers departing within 1 month)

BY INTRAMUSCULAR INJECTION

- Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**VACCINES**

Hepatitis A and B vaccine

**PRESCRIBING AND DISPENSING INFORMATION**

**AMBIRIX®**

Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose).

**TWINRIX® PREPARATIONS**

Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Ambirix®** (GlaxoSmithKline UK Ltd)
- **Twinrix®** (Janssen-Cilag Ltd)

**Hepatitis A with typhoid vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1081, typhoid vaccine p. 1091.

**INDICATIONS AND DOSE**

**VIATIM®**

Immunisation against hepatitis A and typhoid infection (primary course)

BY INTRAMUSCULAR INJECTION

- Child 16-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
- Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

Important safety information

Ambirix® and Twinrix® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.
route may be used for patients with bleeding disorders, booster dose given using single component vaccines

**Hepatix**

Immunisation against hepatitis A and typhoid infection (primary course)

**By intramuscular injection**

- Child 15-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
- Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

**Indications and dose**

**Engerix B**

Immunisation against hepatitis B infection

**By intramuscular injection**

- Neonate: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 20 micrograms every month for 3 months, followed by 20 micrograms after 9 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 months, followed by 20 micrograms after 9 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)

**By intramuscular injection**

- Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms after 11 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (for neonates born to hepatitis B surface antigen positive mother)

**By intramuscular injection**

- Neonate: 10 micrograms once a month for 3 months, first dose to be given at birth with hepatitis B immunoglobulin injection (separate site), followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

**By intramuscular injection**

- Neonate: 10 micrograms every month for 2 months, first dose to be given at birth with hepatitis B immunoglobulin injection (separate site), followed by 10 micrograms after 5 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

**By intramuscular injection**

- Neonate: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 20 micrograms every month for 3 months, followed by 20 micrograms after 9 months for 1 dose, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
Vaccination

**Immunisation against hepatitis B infection (accelerated schedule)**

**BY INTRAMUSCULAR INJECTION**

- **Neonate**: 5 micrograms every month for 3 months, followed by 5 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).
- **Child 16-17 years**: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced).
- **Adult**: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced).

**HBVAXPRO**

**Immunisation against hepatitis B infection**

**BY INTRAMUSCULAR INJECTION**

- **Neonate**: 10 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- **Child 15-17 years**: 20 micrograms every month for 3 months, followed by 20 micrograms after 4 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced).

**HBVAXPRO**

**Immunisation against hepatitis B infection**

**BY INTRAMUSCULAR INJECTION**

- **Neonate**: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- **Child 1 month-15 years**: 5 micrograms every month for 3 months, followed by 5 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced).
- **Adult**: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced).
- **Child 16-17 years**: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced).
- **Adult**: 10 micrograms every month for 3 months, followed by 10 micrograms after 9 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced).

**FENDRIX**

**Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)**

**BY INTRAMUSCULAR INJECTION**

- **Child 15-17 years**: 20 micrograms every month for 3 months, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced).
Human papillomavirus vaccines

**INDICATIONS AND DOSE**

**GARDASIL**

Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

**BY INTRAMUSCULAR INJECTION**

- **Child 9-17 years (female):** 0.5 mL for 1 dose, followed by 0.5 mL after 1 month for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL after 3 months, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

- **Adult (female):** 0.5 mL for 1 dose, followed by 0.5 mL after 1 month for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL after 3 months, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

- **Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)**

**BY INTRAMUSCULAR INJECTION**

- **Child 9-13 years (female):** 0.5 mL for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

**CERVARIX**

Prevention of premalignant genital lesions and cervical cancer

**BY INTRAMUSCULAR INJECTION**

- **Child 9-14 years (female):** 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- **Child 15–17 years (female):** 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

- **Adult (female):** 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**PRESCRIPTION AND DISPENSING INFORMATION**

To avoid confusion, prescribers should specify the brand to be dispensed.

**PREGNANCY**

Not known to be harmful, but vaccination should be postponed until completion of pregnancy.

**Vaccines**

**INFLUENZA VACCINE**

Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)

**BY INTRAMUSCULAR INJECTION**

- **Child 6 months–9 years:** 0.5 mL for 1 dose, followed by 0.5 mL after at least 4 weeks for 1 dose

**BY INTRanasal ADMINISTRATION**

- **Child 2–9 years:** 0.1 mL for 1 dose, followed by 0.1 mL after at least 4 weeks for 1 dose, 0.1 mL dose to be administered into each nostril

**Annual immunisation against seasonal influenza**

**BY INTRAMUSCULAR INJECTION**

- **Child 6 months–17 years:** 0.5 mL for 1 dose

- **Adult:** 0.5 mL for 1 dose
BY INTRADERMAL INJECTION
- Adult 18–59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
- Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region

BY INTRanasal ADMINISTRATION
- Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

UNLICENSED USE
Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

FLUENZ TETRA® SUSPENSION FOR INJECTION
Not licensed for use in children under 3 years of age.

OPTAFLU® SUSPENSION FOR INJECTION
Not licensed for use in children and adolescents under 18 years.

FLUvin® SUSPENSION FOR INJECTION
Not licensed for use in children under 4 years.

CONTRA-INDICATIONS
Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions.

FLUENZ TETRA® SPRAY
Severe asthma, active wheezing, concomitant use with antiviral therapy for influenza

CONTRA-INDICATIONS, FURTHER INFORMATION

FLUENZ TETRA® SPRAY
Concomitant use with antivirals. Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.

CAUTIONS
Increased risk of fever in child 5–9 with preparations marketed by Pfizer or CSL Biotherapies

ENZIRA® SUSPENSION FOR INJECTION
Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
- Uncommon Epistaxis
- Frequency not known Febrile convulsions - transient thrombocytopenia - vasculitis (in adults)

SPECIFIC SIDE-EFFECTS
- With intranasal use Rhinitis

ALLERGY AND CROSS-SENSITIVITY
Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL, facilities should be available to treat anaphylaxis. Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

PREGNANCY
Inactivated vaccines not known to be harmful.

FLUENZ TETRA® SPRAY
Avoid in pregnancy.

BREAST FEEDING
Inactivated vaccines not known to be harmful.

FLUENZ TETRA® SPRAY
Avoid in breast-feeding.

PRESCRIBING AND DISPENSING INFORMATION

FLUARIX TETRA® SUSPENSION FOR INJECTION
Ovalbumin content less than 100 nanograms/mL.

PATIENT AND CARER ADVICE
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

FLUENZ TETRA® SPRAY
Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
EXCIPIENTS: May contain Gentamicin, kanamycin, neomycin penicillins, polymyxin b, thiomersal

INFLUENZA VACCINE (Non-proprietary)
Influenza vaccine (split virion, inactivated) suspension for injection 0.5m1 pre-filled syringes | 1 pre-filled disposable injection £5.55–6.59 | 10 pre-filled disposable injection £65.90
Influenza vaccine (surface antigen, inactivated) suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection £61.50

Agrippal (Novartis Vaccines and Diagnostics Ltd)
Agrippal vaccine suspension for injection 0.5m1 pre-filled syringes | 10 pre-filled disposable injection £58.50

Enzira (Pfizer Ltd)
Enzira vaccine suspension for injection 0.5m1 pre-filled syringes | 1 pre-filled disposable injection £5.25 | 10 pre-filled disposable injection £52.50

Fluarix Tetra (GlaxoSmithKline UK Ltd)
Fluarix Tetra suspension for injection 0.5m1 pre-filled syringes | 1 pre-filled disposable injection £99.40

Fluvirin (Novartis Vaccines and Diagnostics Ltd)
Fluvirin vaccine suspension for injection 0.5m1 pre-filled syringes | 10 pre-filled disposable injection £55.50

Imvac (BGP Products Ltd)
Imvac vaccine suspension for injection 0.5m1 pre-filled syringes | 1 pre-filled disposable injection £65.90 | 10 pre-filled disposable injection £659.00

Influvac Sub-unit (BGP Products Ltd)
Influvac Sub-unit vaccine suspension for injection 0.5m1 pre-filled syringes | 1 pre-filled disposable injection £65.90 | 10 pre-filled disposable injection £659.00

Intanza (sanofi pasteur MSD Ltd)
Intanza 15microgram strain vaccine suspension for injection 0.1ml pre-filled syringes | 1 pre-filled disposable injection £3.05 | 10 pre-filled disposable injection £30.50
Intanza 9microgram strain vaccine suspension for injection 0.1ml pre-filled syringes | 1 pre-filled disposable injection £3.05

Optaflu (Novartis Vaccines and Diagnostics Ltd)
Optaflu vaccine suspension for injection 0.5m1 pre-filled syringes | 1 pre-filled disposable injection £6.59

Emulsion and suspension for emulsion for injection

Pandemrix H1N1 (GlaxoSmithKline UK Ltd)
Pandemrix vaccine emulsion and suspension for emulsion for injection | 500 dose £50 no price available

Spray
EXCIPIENTS: May contain Gelatin, gentamicin

Fluenz Tetra (AstraZeneca UK Ltd)
Fluenz Tetra nasal suspension 0.2ml unit dose | 10 unit dose £180.00

Japanese encephalitis vaccine

INDICATIONS AND DOSE
Immunisation against Japanese encephalitis

BY INTRamuscular INJECTION
- Child 2 months-2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders.
- Child 3-17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders.
- Adults: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders.
Measles, mumps and rubella vaccine, live

**INDICATIONS AND DOSE**

Primary immunisation against measles, mumps, and rubella (first dose)
- **BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 12-13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)
- **BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 40 months-5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)
- **BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION**
  - Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose)
- **Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course** | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation

**BY INTRAMUSCULAR INJECTION OR BY DEEP SUBCUTANEOUS INJECTION**
- Child 6 months-17 years: (consult product literature or local protocols)
- Adult: (consult product literature or local protocols)

**SIDE-EFFECTS**

- **Uncommon**
  - Cough (in children), migraine (in adults), vertigo (in adults)

- **Rare**
  - Dyspnoea (in adults), neuritis (in adults), palpititation (in adults), tachycardia (in adults), thrombocytopenia (in adults)

**PREGNANCY**

Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- Ixiaro (Novartis Vaccines and Diagnostics Ltd)
- Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PDM) £59.50

**VACCINATION AND BOWEL DISEASE OR AUTISM**

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

**CAUTIONS**

Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation

**CAUTIONS, FURTHER INFORMATION**

Administration with other vaccines

MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

**SIDE-EFFECTS**

- **Uncommon**
  - Parotid swelling (usually in the third week) • sleep disturbances • unusual crying in infants

- **Rare**
  - Arthropathy (2 to 3 weeks after immunisation) • idiopathic thrombocytopenic purpura

- **Frequency not known**
  - Optic neuritis • peripheral neuritis

**SIDE-EFFECTS, FURTHER INFORMATION**

Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Feverile seizures—occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection)

**Idiopathic thrombocytopenic purpura**

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR.

**Aseptic meningitis**

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

**Frequency of side effects**

Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

**ALLERGY AND CROSS-SENSITIVITY**

MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat eggs, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**UNLICENSED USE**

Not licensed for use in children under 9 months.
Meningococcal group C vaccine

INDICATIONS AND DOSE
Primary immunisation against Neisseria meningitidis
BY INTRAMUSCULAR INJECTION
- Child 3 months: 0.5 mL for 1 dose, the primary immunisation dose is followed by a booster dose of meningococcal group C conjugate vaccine combined with haemophilus influenzae type b vaccine at 12–15 months of age
Second booster dose for immunisation against Neisseria meningitidis
BY INTRAMUSCULAR INJECTION
- Child 13–15 years: 0.5 mL for 1 dose
Immunisation against Neisseria meningitidis in an unimmunised patient
BY INTRAMUSCULAR INJECTION
- Child 4–11 months: 0.5 mL for 1 dose, the primary immunisation dose is followed by a booster dose of meningococcal group C conjugate vaccine combined with haemophilus influenzae type b vaccine at 12–15 months of age, then 0.5 mL for 1 dose, this second booster dose to be given at 13–15 years of age
- Child 1–9 years: 0.5 mL for 1 dose, then 0.5 mL for 1 dose, this booster dose to be given at 13–15 years of age
- Child 10–17 years: 0.5 mL for 1 dose, booster dose is not required
- Adult 18–24 years: 0.5 mL for 1 dose
Patients attending university for the first time (who did not receive second booster dose at 13–15 years)
BY INTRAMUSCULAR INJECTION
- Adult 18–24 years: 0.5 mL for 1 dose
Patients with confirmed serogroup C disease (who have previously been immunised)
BY INTRAMUSCULAR INJECTION
- Child 1–7 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital
- Adult 18–24 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

SIDE-EFFECTS
- Rare Symptoms of meningitis (but no evidence that vaccine causes meningococcal C meningitis)
- DIRECTIONS FOR ADMINISTRATION Menjugate Kit® may be used via subcutaneous route in children with bleeding disorders.
- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from www.immform.dh.gov.uk.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection
- Menjugate (Novartis Vaccines and Diagnostics Ltd)
Menjugate vaccine powder and solvent for suspension for injection 0.5mL vials | 1 vial £4.33 | 10 vial no price available

Suppression for injection
- Meningitec (Nuron Biotech B.V.)
Meningitec vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £4.33 | 10 pre-filled disposable injection £43.30
- NeisVac-C (Pfizer Ltd)
NeisVac-C vaccine suspension for injection 0.5mL pre-filled syringes | 10 disposable pre-filled injection £187.50

Meningococcal group B vaccine (rDNA, component, adsorbed)

INDICATIONS AND DOSE
Immunisation against Neisseria meningitidis, primary immunisation
BY DEEP INTRAMUSCULAR INJECTION
- Child 2–5 months: 0.5 mL at least every month for 3 doses, injected preferably into deltoid region (or anterolateral thigh in infants)
Immunisation against Neisseria meningitidis, primary immunisation booster dose
BY DEEP INTRAMUSCULAR INJECTION
- Child 1–2 years: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)
Immunisation against Neisseria meningitidis, primary immunisation (in unimmunised patients)
BY DEEP INTRAMUSCULAR INJECTION
- Child 6–11 months: 0.5 mL at least every 2 months for 2 doses, booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- Child 12–23 months: 0.5 mL at least every 2 months for 2 doses, booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
- Child 2–10 years: 0.5 mL at least every 2 months for 2 doses, injected preferably into deltoid region (or anterolateral thigh in infants)
- Child 11–17 years: 0.5 mL at least every month for 2 doses, injected preferably into deltoid region
- Adult: 0.5 mL at least every month for 2 doses, injected preferably into deltoid region

SIDE-EFFECTS
- Rare Kawasaki disease (in children) - symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known Unusual crying (in children)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
EXCIPIENTS: May contain Gelatin, neomycin
- M-M-RVAXPRO (sanofi pasteur MSD Ltd)
 M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £11.00

CONCEPTION AND CONTRACEPTION
Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.
Meningococcal groups A with C and W135 and Y vaccine

**INDICATIONS AND DOSE**

**MENVEO**
Immunisation against *Neisseria meningitidis*

**BY INTRAMUSCULAR INJECTION**
- Child 3–11 months: 0.5 mL for 1 dose
- Child 1–7 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

**SIDE-EFFECTS**

- **UNLICENSED USE**
  - **MENVEO**: Menveo® is not licensed for use in children under 2 years.

- **SIDE-EFFECTS**
  - **Rare**: Symptoms of meningitis reported (but no evidence under 2 years that the vaccine causes meningococcal C meningitis)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - **Menveo** (Novartis Vaccines and Diagnostics Ltd)
    - Menveo vaccine powder and solvent for solution for injection 0.5mL vials | 1 vial [POM] £30.00
  - **Nimenrix** (GliaSanoSmithKline UK Ltd)
    - Nimenrix vaccine powder and solvent for solution for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [POM] £30.00

Pneumococcal vaccine

**INDICATIONS AND DOSE**

Immunisation against pneumococcal infection

**BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**
- Child 2–17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

Immunisation in patients at increased risk of pneumococcal disease

**BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**
- Child 2–4 years: 0.5 mL for 1 dose
- Child 5–17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

**PREVENAR 13®**

Primary immunisation against pneumococcal infection (first dose)

**BY INTRAMUSCULAR INJECTION**
- Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (second dose)

**BY INTRAMUSCULAR INJECTION**
- Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (third dose)

**BY INTRAMUSCULAR INJECTION**
- Child 12-13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)

**BY INTRAMUSCULAR INJECTION**
- Child 12 months-4 years: 0.5 mL for 1 dose, Deltoide muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)

**BY INTRAMUSCULAR INJECTION**
- Child 12 months-4 years: 0.5 mL every 2 months for 2 doses

**SYNFLORIX®**

Immunisation against pneumococcal infection

**BY INTRAMUSCULAR INJECTION**
- Child 6 weeks-5 years: Deltoide muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

**UNLICENSED USE**

**PREVENAR 13®**

The dose in BNF publications may differ from that in product literature.

**CONTRA-INDICATIONS**
Concomitant use of high potency varicella-zoster vaccine (Zostavax®) with pneumococcal polysaccharide vaccine (in adults)

**PRESCRIBING AND DISPENSING INFORMATION**

**PREVENAR 13®**
Available as part of childhood immunisation schedule from Immform www.immform.dh.gov.uk

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **PNEUMOCOCCAL VACCINE (Non-proprietary)**
  - Pneumococcal polysaccharide vaccine solution for injection 0.5mL vials | 1 vial [POM] £8.32

**Suspension for injection**

- **Prevenar** (Pfizer Ltd)
  - Prevenar 13 vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [POM] £49.10 | 10 pre-filled disposable injection [POM] £491.00
- **Synflorix** (GliaSanoSmithKline UK Ltd)
  - Synflorix vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [POM] £27.60
Rabies vaccine

INDICATIONS AND DOSE
Pre-exposure prophylaxis
BY INTRAMUSCULAR INJECTION
- Child: 1 mL every week for 2 doses (on days 0 and 7), followed by 1 mL after 21 days for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL; final dose may be given from day 21, if insufficient time before travel
- Adult: 1 mL every week for 2 doses (on days 0 and 7), followed by 1 mL after 21 days for 1 dose (on day 28), to be administered in deltoid region, for those at continuous risk, measure plasma-concentration of antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL; final dose may be given from day 21, if insufficient time before travel
Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)
BY INTRAMUSCULAR INJECTION
- Child: 1 mL after 1 year for 1 dose, then 1 mL every 3–5 years for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antibodies
- Adult: 1 mL after 1 year for 1 dose, then 1 mL every 3–5 years for 1 dose, to be administered in deltoid region, the frequency of booster doses may alternatively be determined according to plasma-concentration of antibodies
Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)
BY INTRAMUSCULAR INJECTION
- Child: 1 mL after 10 years for 1 dose, to be administered in deltoid region or anterolateral thigh in infants
- Adult: 1 mL after 10 years for 1 dose, to be administered in deltoid region
Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)
BY INTRAMUSCULAR INJECTION
- Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary
- Adult (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary
Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)
BY INTRAMUSCULAR INJECTION
- Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

- Adult (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

SIDE-EFFECTS
- Paresis
- PREGNANCY Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
EXCIPIENTS: May contain Neomycin
Rabipur vaccine powder and solvent for solution for injection 1mL vials | 1 vial (BNF) £28.80

Powder and solvent for suspension for injection
EXCIPIENTS: May contain Neomycin
RABIES VACCINE (Non-proprietary)
Rabies vaccine powder and solvent for suspension for injection 1mL vials | 1 vial (BNF) £33.90

Rotavirus vaccine

DRUG ACTION
Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

INDICATIONS AND DOSE
Immunisation against gastro-enteritis caused by rotavirus
BY MOUTH
- 6–24 weeks: 1.5 mL at least every 4 weeks for 2 doses, first dose must be given between 6–15 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

CONTRA-INDICATIONS
- History of intussusception • predisposition to intussusception • severe combined immunodeficiency
CONTRA-INDICATIONS, FURTHER INFORMATION
Immunosuppression With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

CAUTIONS
- Diarrhoea (postpone vaccination) • immunosuppressed close contacts • vomiting (postpone vaccination)

CAUTIONS, FURTHER INFORMATION
The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

SIDE-EFFECTS
- Abdominal cramps • abdominal pain • diarrhoea • nausea • vomiting

PATIENT AND CARER ADVICE
The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; thus, people who become unwell while taking the vaccine should be advised to avoid close contact with young children, according to the rotavirus vaccine manufacturers’ leaflet.
contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
- **Oral suspension**
  - **Rotarix** (GlaxoSmithKline UK Ltd)
  - Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose (£34.76)

### Tick-borne encephalitis vaccine, inactivated

#### INDICATIONS AND DOSE

**Initial immunisation against tick-borne encephalitis**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–5 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  - Child 6–17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  - Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- **BY MOUTH**
  - Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Immunisation against tick-borne encephalitis, booster doses**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–7 years: First dose to be given within 3 years after initial course completed and then every 3–5 years (consult product literature)
  - Adult: First dose to be given within 3 years after initial course completed and then every 3–5 years (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY**
  - Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

### Typhoid vaccine

#### INDICATIONS AND DOSE

**Immunisation against typhoid fever**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 0.5 mL for 1 dose, should be given at least 2 weeks before potential exposure to typhoid infection

- **BY MOUTH**
  - Adult: 1 capsule every 2 days for 3 doses

- **CONTRA-INDICATIONS**
  - With oral use acute gastro-intestinal illness

- **INTERACTIONS**
  - Appendix 1 (vaccines)
  - Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:
    - antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
    - **Mefloquine** should be avoided for at least 12 hours before or after oral typhoid;
    - For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

- **SIDE-EFFECTS**
  - With oral use abdominal cramps • abdominal pain • diarrhoea • nausea • vomiting

- **DIRECTIONS FOR ADMINISTRATION**
  - Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

- **HANDLING AND STORAGE**
  - With oral use It is important to store capsules in a refrigerator.

- **PATIENT AND CARER ADVICE**
  - With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

- **CAUTIONARY AND ADVISORY LABELS**
  - 25
- **Vivotif** (Pasteur MSD Ltd)
  - Vivotif® gastro-resistant capsules | 3 capsule (£14.77)

#### Solution for injection

- **Typhim Vi** (GlaxoSmithKline UK Ltd)
  - Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 mL Typhim Vi 25micrograms/0.5mL vaccine solution for injection pre-filled syringes | 1 pre-filled disposable injection (£9.93) | 10 pre-filled disposable injection (£93.32)

- **Typhim Vi** (SanofiPasteur MSD Ltd)
  - Salmonella typhi Vi capsular polysaccharide 50 microgram per 1 mL Typhim Vi 25micrograms/0.5mL vaccine solution for injection pre-filled syringes | 1 pre-filled disposable injection (£9.30) | 10 pre-filled disposable injection (£93.00)
Varicella-zoster vaccine

**INDICATIONS AND DOSE**

**VARILRIX®**

Prevention of varicella infection (chickenpox)

*BY SUBCUTANEOUS INJECTION*
- Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region
- Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region

**VARIVAX®**

Prevention of varicella infection (chickenpox)

*BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION*
- Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh)
- Child 13-17 years: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region (or higher anterolateral thigh)
- Adult: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region

Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection

*BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION*
- Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh)

**ZOSTAVAX®**

Prevention of herpes zoster (shingles)

*BY SUBCUTANEOUS INJECTION*
- Adult 70-79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region

**CAUTIONS**

Post-vaccination close contact with susceptible individuals

**CAUTIONS, FURTHER INFORMATION**

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the patients until the lesions have crusted. Those who develop a varicella-like rash on vaccination should avoid contact with varicella-susceptible patients until the lesions have crusted. Those who develop a varicella-like rash on vaccination should avoid contact with patients at high risk of severe varicella.

**Administration with MMR vaccine**

Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

**SIDE-EFFECTS**

- Thrombocytopenia
- Frequency not known: Conjunctivitis, varicella-like rash
- CONCEPTION AND CONTRACEPTION: Avoid pregnancy for 3 months after vaccination.

**PRESCRIBING AND DISPENSING INFORMATION**

**ZOSTAVAX®**

Advice in the BNF may differ from that in product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Yellow fever vaccine, live**

**INDICATIONS AND DOSE**

Immunisation against yellow fever

*BY DEEP SUBCUTANEOUS INJECTION*
- Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
- Child 9 months–17 years: 0.5 mL for 1 dose
- Adult: 0.5 mL for 1 dose

**CONTRA-INDICATIONS**

Children under 6 months—history of thymus dysfunction

**CAUTIONS**

Individuals over 60 years—greater risk of vaccine-associated adverse effects (in adults)

**CAUTIONS, FURTHER INFORMATION**

Administration with MMR vaccine

Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

**SIDE-EFFECTS**

Neurotropic disease, viscerotropic disease

**SIDE-EFFECTS, FURTHER INFORMATION**

Vaccine-associated adverse effects

Very rare adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

**ALLERGY AND CROSS-SENSITIVITY**

Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.

**PREGNANCY**

Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

**BREAST FEEDING**

Avoid; seek specialist advice if exposure to virus cannot be avoided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

EXCIPIENTS: May contain Neomycin
- Varilrix (GlaxoSmithKline UK Ltd) Varilrix vaccine powder and solvent for solution for injection 0.5mL vials | 1 vial £27.31

**Powder and solvent for suspension for injection**

EXCIPIENTS: May contain Gelatin, Neomycin
- Varivax (sanofi pasteur MSD Ltd) Varivax vaccine powder and solvent for suspension for injection 0.5mL vials | 1 vial £30.28
- Zostavax (sanofi pasteur MSD Ltd) Zostavax powder and solvent for suspension for injection 0.65mL pre-filled syringes | 1 pre-filled disposable injection £99.96
Chapter 15
Anaesthesia

CONTENTS

1 General anaesthesia

1.1 Anaesthetic adjuvants
1.2 Malignant hyperthermia
1.3 Neuromuscular blockade

1.4 Neuromuscular blockade reversal
1.5 Peri-operative analgesia
1.6 Peri-operative sedation
2 Local anaesthesia

1 General anaesthesia

General anaesthesia
Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics
Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’); lower doses may be required in premedicated patients.

Total intravenous anaesthesia
This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia
Propofol p. 1095, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental sodium p. 412 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1095 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1110 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 267 or midazolam p. 414.

Inhalational anaesthetics
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1096 is being administered.

Volatile liquid anaesthetics
Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 1098 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients.
Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics. Desflurane p. 1097 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritating to the upper respiratory tract. Sevoflurane p. 1098 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide
Nitrous oxide p. 1096 is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1102 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1101 is used in the treatment of malignant hyperthermia.

Surgery and long-term medication
The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients.

Patients taking antplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives; for advice on hormone replacement therapy. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride. Tricyclic antidepressants need not be stopped, but may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

Anaesthesia, sedation, and resuscitation in dental practice
Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 267 and temazepam p. 420 are effective anxiolytics for dental treatment in adults.

For details of anaesthesia, sedation, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Conscious Sedation in the Provision of Dental Care; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003.

Guidance is also included in Conscious Sedation in Dentistry: Dental Clinical Guidance, Scottish Dental Clinical Effectiveness Programme, June 2012 (www.sdcep.org.uk).
ANAESTHETICS (GENERAL, INTRAVENOUS)

Etomidate

**INDICATIONS AND DOSE**

**Induction of anaesthesia**

- By slow intravenous injection
  - Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (over 60 seconds in patients in whom hypotension might be hazardous)
  - Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (over 60 seconds in patients in whom hypotension might be hazardous)

**SIDE-EFFECTS**

- Common or very common: Extraneous muscle movement (high incidence) • pain on injection • respiratory depression • seizures • shivering • Stevens-Johnson syndrome

**INTERACTIONS**

- Appendix 1 (anaesthetics, general).

**CAUTIONS AND FURTHER INFORMATION**

- Adrenal insufficiency: Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pain on injection: Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.

- Extraneous muscle movement: Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

**PREGNANCY**

- May depress neonatal respiration if used during delivery.

**BREAST FEEDING**

- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**HEPATIC IMPAIRMENT**

- Reduce dose in liver cirrhosis.

**DIRECTIONS FOR ADMINISTRATION**

- To be administered over 30–60 seconds (over 60 seconds in patients in whom hypotension might be hazardous).

**PATIENT AND CARER ADVICE**

- Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**MEDICINAL FORMS**

- There can be a variation in the licensing of different medicines containing the same drug.

---

**Solution for injection**

**EXCIPIENTS:** May contain Propylene glycol

- **Hypnomidate** (Janssen-Cilag Ltd)
  - Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoules | £6.90

- **Emulsion for injection**
  - **ETOMIDATE (Non-proprietary)**
    - Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoules | £15.62

**Propofol**

**INDICATIONS AND DOSE**

- Induction of anaesthesia using 0.5% or 1% injection
  - By slow intravenous injection or by intravenous infusion
    - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over.
    - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response.

**Maintenance of anaesthesia using 1% injection**

- Initially by intravenous infusion
  - Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly.
  - Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response.

**Maintenance of anaesthesia using 2% injection**

- By intravenous infusion
  - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over.
  - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response.

**Induction of anaesthesia using 2% injection**

- By intravenous infusion
  - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over.
  - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response.

**Maintenance of anaesthesia using 1% injection**

- Initially by intravenous infusion
  - Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly.
  - Elderly: Usual dose 3–6 mg/kg/hour.

**Sedation of ventilated patients in intensive care using 1% or 2% injection**

- By continuous intravenous infusion
  - Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response.

**Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection**

- By slow intravenous injection
  - Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response.

**Maintenance of sedation for surgical and diagnostic procedures using 0.5% or 1% injection**

- Initially by intravenous infusion
  - Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, if rapid increase in sedation required, patients over 55 years or debilitated may require lower initial dose and rate of administration.
Maintenance of sedation for surgical and diagnostic procedures using 2% injection

INITIALLY BY INTRAVENOUS INFUSION

- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration.

Important safety information

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS Acute circulatory failure (shock) · cardiac impairment · cardiovascular disease · elderly · epilepsy · fixed cardiac output · hypotension · hypovolaemia · raised intracranial pressure · respiratory impairment
- INTERACTIONS → Appendix 1 (anaesthetics, general).
- SIDE-EFFECTS
  - Common or very common Headache · hypotension · tachycardia · transient apnoea
  - Uncommon Phlebitis · thrombosis
  - Rare Anaphylaxis · arrhythmia · convulsions (onset can be delayed) · delayed recovery from anaesthesia · euphoria
  - Very rare Discoloration of urine · pancreatitis · pulmonary oedema · sexual disinhibition
- Frequency not known Bradycardia · pain on intravenous injection · propofol infusion syndrome · significant extraneous muscle movements

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia Bardycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.

Extrinsic muscle movement

Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Pain on injection Can be reduced by intravenous lidocaine.

Propofol infusion syndrome

Prolonged infusion of propofol doses exceeding 4 mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

Pregnancy

Max. dose for maintenance of anaesthesia is 6 mg/kg/hour. May depress neonatal respiration if used during delivery.

Breast Feeding

Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

Hepatic impairment

Use with caution.

Renal Impairment

Use with caution.

Monitoring requirements

Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.

Directions for administration

Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

Patient and carer advice

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for injection

- PROPFOFL (Non-proprietary)
  - Propofol 5 mg per 1 ml Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoules (P) £14.71
  - Diprivan (AstraZeneca UK Ltd)
  - Propofol 10 mg per 1 ml Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoules (P) £15.36 (Hospital only)

Emulsion for infusion

- Diprivan (AstraZeneca UK Ltd)
  - Propofol 10 mg per 1 ml Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (P) £10.68
  - Propofol 20 mg per 1 ml Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (P) £15.16

Anaesthetics (volatile liquid)

Nitrous oxide

INDICATIONS AND DOSE

Maintenance of anaesthesia in conjunction with other anaesthetic agents

By inhalation

- Adult: 50–66 %, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia

By inhalation

- Adult: Up to 50 %, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs

Important safety information

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS Entrapped air following recent underwater dive · pneumothorax · presence of intracranial air after head injury · recent intra-ocular gas injection

CAUTIONS, FURTHER INFORMATION

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

INTERACTIONS → Appendix 1 (anaesthetics, general).

SIDE-EFFECTS

Depression of white cell formation · hypoxia · megaloblastic anaemia · neurological toxic effects

SIDE-EFFECTS, FURTHER INFORMATION

Hypoxia

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Prolonged exposure

Exposure of patients to nitrous oxide should be avoided whenever possible.

Important safety information

Be aware of the risk of hypoxia in patients with lung disease or at risk of lung injury.

- Monitor arterial oxygen saturation continuously.
  - Do not administer nitrous oxide to patients with an indication of hypoxia.
Volatile halogenated anaesthetics

**Important safety information**
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia

**CAUTIONS** Can trigger malignant hyperthermia - raised intracranial pressure (can increase cerebrospinal pressure)

**SIDE-EFFECTS**
- Common or very common Arrhythmias - cardiorespiratory depression - hypotension
- Frequency not known Convulsions - mood changes (that can last several days)

**ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.

**DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.

**PATIENT AND CARER ADVICE** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**Desflurane**

**INDICATIONS AND DOSE**
- Induction of anaesthesia (but not recommended)
  - **BY INHALATION**
    - Adult: 4–11%, to be inhaled through specifically calibrated vapouriser

- Maintenance of anaesthesia (in nitrous oxide–oxygen)
  - **BY INHALATION**
    - Adult: 2–6%, to be inhaled through a specifically calibrated vapouriser

- Maintenance of anaesthesia (in oxygen or oxygen-enriched air)
  - **BY INHALATION**
    - Adult: 2.5–8.5%, to be inhaled through a specifically calibrated vapouriser

**Important safety information**
Desflurane should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**INTERACTIONS** → Appendix 1 (anaesthetics, general).

**SIDE-EFFECTS** Apnoea - breath-holding - cough - increased secretions - laryngospasm

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation gas**
- **NITROUS OXIDE (Non-proprietary)**
  - Nitrous oxide 1 ml per 1 ml
    - Nitrous oxide cylinders size E | 1800 litre [p] no price available
    - Medical Nitrous Oxide cylinders size D | 900 litre [p] no price available
    - Medical Nitrous Oxide cylinders size G | 9000 litre [p] no price available
    - Nitrous oxide cylinders size F | 3600 litre [p] no price available
    - Nitrous oxide cylinders size J | 18000 litre [p] no price available
    - Nitrous oxide cylinders size G | 9000 litre [p] no price available
    - Nitrous oxide cylinders size C | 450 litre [p] no price available
    - Medical Nitrous Oxide cylinders size F | 3600 litre [p] no price available
    - Nitrous oxide cylinders size D | 900 litre [p] no price available
    - Medical Nitrous Oxide cylinders size E | 1800 litre [p] no price available

**Volatile liquid**
- Suprane volatile liquid | 240 ml [p] no price available (Hospital only)
  - **BY INHALATION**
    - Adult: 4–11%, to be inhaled through specifically calibrated vapouriser

**BNF 70**

**General anaesthesia 1097**
Isoflurane

**INDICATIONS AND DOSE**

**Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)**

- BY INHALATION
  - Adult: Initially 0.5–1 %, adjusted according to response, to be administered using specifically calibrated vaporiser

**Maintenance of anaesthesia (in nitrous oxide-oxygen)**

- BY INHALATION
  - Adult: 1–2.5 %, to be administered using specifically calibrated vaporiser; an additional 0.5–1 % may be required when given with oxygen alone

**Maintenance of anaesthesia in caesarean section (in nitrous oxide-oxygen)**

- BY INHALATION
  - Adult: 0.5–0.75 %, to be administered using specifically calibrated vaporiser

**Important safety information**

- Isoflurane should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**INTERACTIONS** → Appendix 1 (anaesthetics, general).

**SIDE-EFFECTS**

- Breath-holding
- Cough
- Irritate mucous membrane · laryngospasm

**PREGNANCY**

- May depress neonatal respiration if used during delivery.

**BREAST FEEDING**

- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**PATIENT AND CARER ADVICE**

- Patients given sedatives and analgesics during minor outpatient procedures should be carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**

- **ISOFLURANE (Non-proprietary)**
  - Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour
  - 250 ml (£123.00 Hospital only)
  - **AErrane** (Baxter Healthcare Ltd)
  - Isoflurane 1 ml per 1 ml AErrane volatile liquid
  - 250 ml (£123.00 Hospital only)

Sevoflurane

**INDICATIONS AND DOSE**

**Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)**

- BY INHALATION
  - Adult: Initially 0.5–1 %, adjusted according to response, then increased to up to 8 %, to be administered using specifically calibrated vaporiser

**Maintenance of anaesthesia (in oxygen or nitrous oxide-oxygen)**

- BY INHALATION
  - Adult: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser

**Important safety information**

- Sevoflurane should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**CAUTIONS**

- Susceptibility to QT-interval prolongation

**INTERACTIONS** → Appendix 1 (anaesthetics, general).

- Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

**SIDE-EFFECTS**

- Cardiac arrest · dystonia · leucopenia · torsade de pointes · urinary retention

**PREGNANCY**

- May depress neonatal respiration if used during delivery.

**BREAST FEEDING**

- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**RENAL IMPAIRMENT**

- Use with caution.

**PATIENT AND CARER ADVICE**

- Patients given sedatives and analgesics during minor outpatient procedures should be carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**

- **SEVOFLURANE (Non-proprietary)**
  - Sevoflurane 1 ml per 1 ml Sevoflurane volatile liquid
  - 250 ml (£123.00 Hospital only)

1.1 **Anaesthetic adjuvants**

**Pre-medication and peri-operative drugs**

**Drugs that affect gastric pH**

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastrointestinal reflux disease and in circumstances where gastric emptying may be delayed.

- An **H₂-receptor antagonist** can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate are preferred.
Antimuscarinic drugs
Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 912 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine.

They also prevent bradycardia and hypotension associated with drugs such as propofol and suxamethonium chloride.

Atropine sulfate below is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 344 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 1100 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

Phenothiazines do not effectively reduce secretions when used alone.

Sedative drugs
Fears and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of preoperative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedics can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Benzodiazepines
Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1132 is used to antagonise the effects of benzodiazepines.

Diazepam p. 267 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 420 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 412 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 414 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Other drugs for sedation
Deremodetomodine p. 1110 and clonidine hydrochloride p. 137 are alpha2-adrenergic agonists with sedative properties. Dexmedetomidine p. 1110 is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride p. 137 [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

Antagonists for central and respiratory depression
Respiratory depression is a major concern with opioid anaesthetics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1133. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil p. 1132 is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram hydrochloride p. 261 is a central and respiratory stimulant but is of limited value in anaesthesia.

Antimuscarinic drugs

Atropine sulfate

The properties listed below are those particular to the drug only. For properties common to the class, see Antimuscarinics Systemic, p. 668.

INDICATIONS AND DOSE
Premedication

**BY INTRAVENOUS INJECTION**
- Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
- Adult: 300–600 micrograms, to be administered immediately before induction of anaesthesia

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
- Adult: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

**BY INTRAVENOUS INJECTION**
- Child 12–17 years: 0.6–1.2 mg
- Adult: 0.6–1.2 mg

**Intra-operative bradycardia**

**BY INTRAVENOUS INJECTION**
- Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
- Adult: 300–600 micrograms, larger doses may be used in emergencies
Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)

**BY INTRAVENOUS INJECTION**
- **Child:** 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
- **Adult:** 2 mg every 5–10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

**Bradyardia due to acute massive overdosage of beta-blockers**
- **BY INTRAVENOUS INJECTION**
  - **Child:** 40 micrograms/kg (max. per dose 3 mg)
  - **Adult:** 3 mg

**Excessive bradycardia associated with beta-blocker use**
- **BY INTRAVENOUS INJECTION**
  - **Adult:** 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

**Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm**
- **BY MOUTH**
  - **Adult:** 0.6–1.2 mg daily, dose to be taken at night

**UNLICENSED USE**
- With use in children Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication. Not licensed for the control of muscarinic side-effects of edrophonium in reversal of competitive neuromuscular block.

**INDICATIONS AND DOSE**
- **Premedication at induction**
  - **BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
    - **Adult:** 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)
- **Intra-operative bradycardia**
  - **BY INTRAVENOUS INJECTION**
    - **Adult:** 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary
- **Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block**
  - **BY INTRAVENOUS INJECTION**
    - **Adult:** 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

**Bowel colic in palliative care | Excessive respiratory secretions in palliative care**
- **BY SUBCUTANEOUS INJECTION**
  - **Adult:** 0.6–1.2 mg/24 hours

**GLYCOPYRRONIUM BROMIDE (Non-proprietary)**

**Glycopyrronium bromide**

The properties listed below are those particular to the drug only. For properties common to the class, see Antimuscarinics Systemic, p. 668.

**INDICATIONS AND DOSE**
- **Premedication at induction**
  - **BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
    - **Adult:** 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)
- **Intra-operative bradycardia**
  - **BY INTRAVENOUS INJECTION**
    - **Adult:** 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary
- **Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block**
  - **BY INTRAVENOUS INJECTION**
    - **Adult:** 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered
- **Bowel colic in palliative care | Excessive respiratory secretions in palliative care**
  - **BY SUBCUTANEOUS INJECTION**
    - **Adult:** 0.6–1.2 mg/24 hours

**MEDICATION FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
1.2 Malignant hyperthermia

MUSCLE RELAXANTS

Dantrolene sodium

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**INDICATIONS AND DOSE**

- **Malignant hyperthermia**
  - **By rapid intravenous injection**
    - Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course
  - **Chronic severe spasticity of voluntary muscle**
    - **By mouth**
      - Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

**Important safety information**

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

- **CONTRA-INDICATIONS**
  - With oral use acute muscle spasm - avoid when spasticity is useful, for example, locomotion
  
- **CAUTIONS**
  - With intravenous use avoid extravasation (risk of tissue necrosis)
  - With oral use females (hepatotoxicity) - history of liver disorders (hepatotoxicity) - if doses greater than 400 mg daily (hepatotoxicity) - impaired cardiac function - impaired pulmonary function - patients over 30 years (hepatotoxicity) · therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

- **INTERACTIONS**
  - With oral use Caution if concomitant use of hepatotoxic drugs.

- **SIDE-EFFECTS**
  - **Common or very common**
    - With oral use abdominal pain - anorexia - asthenia - chills - diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction) - dizziness - drowsiness - fatigue - fever - headache - hepatotoxicity - nausea - pericarditis - pleural effusion - rash - respiratory depression - seizures - speech disturbances - visual disturbances - vomiting
  - **Uncommon**
    - With oral use confusion - constipation - crystalluria - depression - dysphagia - dyspnoea - erratic blood pressure - exacerbation of cardiac insufficiency - haematuria - increased sweating - increased urinary frequency - insomnia - nervousness - tachycardia - urinary incontinence - urinary retention
  - **Frequency not known**
    - With intravenous use dizziness - erythema - hepatotoxicity - injection-site reactions - pulmonary oedema - rash - swelling - thrombophlebitis - weakness

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported—discontinue if abnormal liver function tests or symptoms of liver disorder; re-introduce only if complete reversal of hepatotoxicity.

- **PREGNANCY**
  - With intravenous use Use only if potential benefit outweighs risk.
  - With oral use Avoid use in chronic spasticity—embryotoxic in animal studies.

- **BREAST FEEDING**
  - With intravenous use Present only if potential benefit outweighs risk.
  - With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.

- **HEPATIC IMPAIRMENT**
  - Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

- **MONITORING REQUIREMENTS**
  - With oral use Test liver function before and at intervals during therapy.

- **PATIENT AND CARER ADVICE**
  - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
  - With oral use Hepatotoxicity Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**

| **Dantrolium** (Norgine Pharmaceuticals Ltd) |
| Dantrium (25 mg capsules) | 100 capsule [POD] £16.87 DT price = £16.87 |
| Dantrolene sodium 100 mg | Dantrium 100mg capsules | 100 capsule [POD] £43.07 DT price = £43.07 |

**Powder for solution for injection**

- **Dantrium** (Norgine Pharmaceuticals Ltd)
  - Dantrolene sodium 20 mg Dantrium Intravenous 20mg powder for solution for injection vials | 12 vial [POD] £612.00 (Hospital only) | 36 vial [POD] £1,836.00 (Hospital only)

1.3 Neuromuscular blockade

**Neuromuscular blockade**

**Neuromuscular blocking drugs**

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

**Non-depolarising neuromuscular blocking drugs**

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with
acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide p. 1104, rocuronium bromide p. 1105, and vecuronium bromide p. 1105; and the benzylisoquinolinium group, comprising atracurium besilate p. 1103, cisatracurium p. 1104, and mivacurium p. 1104.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vancuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

Neutralising neuromuscular blocking drugs
Suxamethonium chloride below has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride (below) should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride below use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride below and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride below but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

Drugs for reversal of neuromuscular blockade
Anticholinesterases
Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyronium bromide p. 1100 or alternatively atropine sulfate p. 1099, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade
Sugammadex p. 1106 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

NEUROMUSCULAR BLOCKING DRUGS (DEPOLARISING)

Suxamethonium chloride
(Succinylcholine chloride)

**DRUG ACTION**
Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

**INDICATIONS AND DOSE**
Neuromuscular blockade (short duration) during surgery and intubation

**BY INTRAVENOUS INJECTION**
- **Adult:** 1–1.5 mg/kg

**Important safety information**
Should only be administered by, or under the direct supervision of, personnel experienced in its use.

**CONTRA-INDICATIONS**
Duchenne muscular dystrophy · family history of malignant hyperthermia · hyperkalaemia · low plasma-cholinesterase activity (including severe liver

**SUGammadex PAGES 1105–1106**
Sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

**HFSA Note**
Sugammadex is a unique intervention for rapid reversal of neuromuscular blockade in cases of emergency. It is not used for maintenance neuromuscular blockade.
Neuromuscular blockade

Non-depolarising neuromuscular blocking drugs

Important safety information
Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Cautions
Burns (resistance can develop, increased doses may be required) - cardiovascular disease (reduce rate of administration) - electrolyte disturbances (response unpredictable) - fluid disturbances (response unpredictable) - hyperthermia (activity prolonged, lower doses required) - myasthenia gravis (activity prolonged, lower doses required) - neuromuscular disorders (response unpredictable)

Interactions
Appendix 1 (muscle relaxants).

Allergy and cross-sensitivity
Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

Pregnancy
Mildly prolonged maternal neuromuscular blockade may occur.

Breastfeeding
Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

Hepatic impairment
Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection
- Suxamethonium chloride (Non-proprietary)
  - Suxamethonium chloride 50 mg per 1 ml Suxamethonium chloride 100mg/2ml solution for injection ampoules | 10 ampoule | £5.76–£7.00
  - Anectine (GlaxoSmithKline Ltd)
    - Suxamethonium chloride 50 mg per 1 ml Anectine 100mg/2ml solution for injection ampoules | 5 ampoule | £3.57

NEUROMUSCULAR BLOCKING DRUGS (NON-DEPOLARISING)

Atracurium besilate
(Atracurium besilate)

Indications and dose
Neuromuscular blockade (short to intermediate duration) for surgery and intubation
- Initially by intravenous injection
  - Adult: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

Neuromuscular blockade during intensive care
- Initially by intravenous injection
  - Adult: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

Side-effects
- Very rare Anaphylactoid reactions
- Frequency not known Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - seizures - skin flushing - tachycardia

Further information
Cardiovascular effects
Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Directions for administration
For intravenous infusion (Tracrium®; Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- ATRACURIUM BESILATE (Non-proprietary)
  - Atracurium besilate 10 mg per 1 ml Atracurium besilate 250mg/25ml solution for injection vials | 1 vial | £16.50
    - Atracurium besilate 25mg/2.5ml solution for injection ampoules | 5 ampoule | £8.50–£9.25
    - Atracurium besilate 50mg/5ml solution for injection ampoules | 5 ampoule | £15.00–£17.50
  - Atracurium besilate 250mg/25ml solution for injection ampoules | 2 ampoule | £25.29
Cisatracurium

INDICATIONS AND DOSE
Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

Neuromuscular blockade (intermediate duration) during intensive care

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- SIDE-EFFECTS Acute myopathy (after prolonged use in intensive care) - bradycardia
- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use For intravenous infusion (Nimbex®, Nimbex Forte®), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **CISATRACURIAM (Non-proprietary)**
  - Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Cisatracurium besilate 20mg/10ml solution for injection vials | 5 vial £37.75 (Hospital only) | 5 vial £37.75
  - Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Cisatracurium besilate 150mg/30ml solution for injection vials | 1 vial £45.00 (Hospital only) | 1 vial £18.66
- **Nimbex** (GlaxoSmithKline UK Ltd)
  - Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml Nimbex 20mg/10ml solution for injection ampoules | 5 ampoule £37.75
  - Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml Nimbex Forte 150mg/30ml solution for injection vials | 1 vial £31.09

Mivacurium

INDICATIONS AND DOSE
Neuromuscular blockade (short duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

- Adult: 70–250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **CAUTIONS** Burns (low plasma cholinesterase activity; dose titration required) - elderly
- **SIDE-EFFECTS**
  - Very rare Anaphylactoid reactions
  - Frequency not known Bronchospasm - hypotension - skin flushing - tachycardia
  - **HEPATIC IMPAIRMENT** Reduce dose in severe impairment.
  - **RENAL IMPAIRMENT** Clinical effect prolonged in renal failure—reduce dose according to response.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Mivacurium (GlaxoSmithKline UK Ltd)**
  - Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacurin 10mg/5ml solution for injection ampoules | 5 ampoule £11.95
  - Mivacurin 20mg/10ml solution for injection ampoules | 5 ampoule £22.57

Pancuronium bromide

INDICATIONS AND DOSE
Neuromuscular blockade (long duration) during surgery and intubation

BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required

Neuromuscular blockade (long duration) during intensive care

BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS** Acute myopathy (after prolonged use in intensive care) - hypertension - tachycardia

SIDE-EFFECTS, FURTHER INFORMATION

Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

- **HEPATIC IMPAIRMENT** Possibly slower onset, higher dose requirement, and prolonged recovery time.

- **RENAL IMPAIRMENT** Use with caution; prolonged duration of block.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **PANCRONIUM BROMIDE (Non-proprietary)**
  - Pancuronium bromide 2 mg per 1 ml Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule £50.00
Vecuronium bromide

INDICATIONS AND DOSE
Neuromuscular blockade (intermediate duration) during surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 600 micrograms/kg; (by intravenous injection) maintenance 150 micrograms/kg, alternatively (by intravenous infusion) maintenance 300–600 micrograms/kg/hour, adjusted according to response
- Elderly: Initially 600 micrograms/kg; (by intravenous injection) maintenance 75–100 micrograms/kg, alternatively (by intravenous infusion) maintenance up to 400 micrograms/kg/hour, adjusted according to response

Neuromuscular blockade (intermediate duration) during intensive care

INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 600 micrograms/kg, initial dose is optional; (by intravenous infusion) maintenance 300–600 micrograms/kg/hour for first hour, then (by intravenous infusion), adjusted according to response

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

SIDE-EFFECTS
- Very rare: Anaphylactoid reactions
- Frequency not known: Acute myopathy (after prolonged use in intensive care) • bronchospasm • hypotension • skin flushing • tachycardia

HEPATIC IMPAIRMENT
Use with caution in significant impairment.

RENAL IMPAIRMENT
Use with caution.

DIRECTIONS FOR ADMINISTRATION
Reconstitute each vial with 5 mL. Water for Injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections. For continuous intravenous infusion, dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
- Norcuron (Merck Sharp & Dohme Ltd)
  Vecuronium bromide 10 mg Norcuron 10mg powder and solvent for solution for injection vials | 10 vial [PSt] £33.73 (Hospital only)

Glycopyrronium bromide with neostigmine

The properties listed below are those particular to the combination only. For the properties of the components please consider, glycopyrronium bromide p. 1100, neostigmine p. 912.

INDICATIONS AND DOSE
Reversal of non-depolarising neuromuscular blockade

BY INTRAVENOUS INJECTION
- Adult: 1–2 mL, repeated if necessary, alternatively 0.02 mL/kg/minute (max. per dose 2 mL), repeated if necessary, dose to be given over 10–30 seconds

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- GLYCOPHYRRONIUM BROMIDE WITH NEOSTIGMINE (Non-proprietary)
  Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine metilsulfate 2.5 mg per 1 mL
  Glycopyrronium bromide 500 microgram/1mL solution for injection ampoules | 10 ampoule [PSt] £9.11

1.4 Neuromuscular blockade reversal

Drugs used for Neuromuscular blockade reversal not listed below; Neostigmine, p. 912
**CHELATORS AND ANTIDOTES**

**Sugammadex**

**INDICATIONS AND DOSE**

Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium

- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 2–4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details

Immediate reversal of neuromuscular blockade induced by rocuronium

- **BY INTRAVENOUS INJECTION**
  - Adult: 16 mg/kg (consult product literature)

**Important safety information**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS**
  - Cardiovascular disease (recovery may be delayed) - elderly (recovery may be delayed) - pre-existing coagulation disorders - recurrence of neuromuscular blockade - monitor respiratory function until fully recovered - use of anticoagulants (unrelated to surgery) - wait 24 hours before re-administering rocuronium - wait 24 hours before re-administering vecuronium

- **INTERACTIONS** → Appendix 1 (sugammadex).

- **SIDE-EFFECTS**
  - Bradycardia - bronchospasm - cardiac arrest - hypersensitivity reactions

- **PREGNANCY**
  - Use with caution — no information available.

- **RENAL IMPAIRMENT**
  - Avoid if eGFR less than 30 mL/minute/1.73 m².

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular blockade is required.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  **ELECTROLYTES:** May contain Sodium

  - **Bridion** (Merck Sharp & Dohme Ltd)
    Sugammadex (as Sugammadex sodium) 100 mg per 1 ml Bridion 500 mg/5ml solution for injection vials | 10 vial (POD) £1,491.00 (Hospital only) Bridion 200 mg/2ml solution for injection vials | 10 vial (POD) £596.40 (Hospital only)

**1.5 Peri-operative analgesia**

**Peri-operative analgesia**

**Non-opioid analgesics**

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Acemetacin p. 917, diclofenac sodium p. 921, diclofenac potassium p. 920, flurbiprofen p. 994, ibuprofen p. 927, ketoprofen p. 930, paracetamol p. 354, parecoxib p. 1108, and ketorolac trometamol p. 1107 are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium, can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteral muscle to minimise pain and tissue damage. Ketorolac trometamol is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

**Opioid analgesics**

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain. See also the management of opioid-induced respiratory depression.

**Intra-operative analgesia**

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 357, fentanyl p. 362, and remifentanil p. 1108 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs. are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**Bupivacaine with fentanyl**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1113, fentanyl p. 362.

**INDICATIONS AND DOSE**

**Postoperative pain (once epidural block established)**

**BY CONTINUOUS EPIDURAL INFUSION**

- **Adult:** 4–18.75 mg/hour of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8–30 micrograms/hour of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion.
**During labour (once epidural block established)**

**BY CONTINUOUS LUMBAR EPIDURAL INFUSION**

- Adult: 10–18.75 mg/hour of bupivacaine to be administered and 16–30 micrograms/hour of fentanyl to be administered

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, infusion solution for injection ampoules.

**Solution for infusion**

- Bufyl (AMCO)
  - Bupivacaine hydrochloride 1 mg per 1 ml, Fentanyl 2 microgram per 1 ml
  - Bupivacaine 1mg/ml and 2 microgram/ml 250ml infusion bags | 20 bag £87.00 (Hospital only) Schedule 2 (CD)
  - Bupivacaine 1mg/ml and 2 microgram/ml 500ml infusion bags | 10 bag £92.00 (Hospital only) Schedule 2 (CD)
  - Bupivacaine hydrochloride 1.25 mg per 1 ml, Fentanyl (as Fentanyl citrate) 2 microgram per 1 ml
  - Bupivacaine 1.25mg/ml and 2micrograms/ml 250ml infusion bags | 20 bag £181.00 (Hospital only) Schedule 2 (CD)
  - Bupivacaine 1.25mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag £92.00 (Hospital only) Schedule 2 (CD)

**NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**

**Ketorolac trometamol**

**INDICATIONS AND DOSE**

Short-term management of moderate to severe acute postoperative pain only

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**

- Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, to be given over at least 15 seconds, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
- Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, to be given over at least 15 seconds, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
- Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, to be given over at least 15 seconds, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

**CONTRA-INDICATIONS**

Active or history of gastrointestinal bleeding - active or history of gastrointestinal ulceration - coagulation disorders - complete or partial syndrome of nasal polyps - confirmed or suspected cerebrovascular bleeding - dehydration - following operations with high risk of haemorrhage or incomplete haemostasis - haemorrhagic diatheses - history of gastrointestinal perforation - hypovolaemia - severe heart failure

**CAUTIONS**

Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS**

- Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- Rare: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

**ALLERGY AND CROSS-SENSITIVITY**

Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

- With intramuscular use or intravenous use: The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection. Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **KETOROLAC TROMETAMOL (Non-proprietary)**
  - Ketorolac trometamol 30 mg per 1 ml
  - Ketorolac 30mg/1ml solution for injection ampoules | 6 ampoule £58.56
  - Toradol (Roche Products Ltd)
  - Ketorolac trometamol 30 mg per 1 ml
  - Toradol 30mg/1ml solution for injection ampoules | 5 ampoule £50.36

---

**Peri-operative analgesia** **1107**

---
**Parecoxib**

- **DRUG ACTION** Parecoxib is a selective inhibitor of cyclo-oxygenase-2.

### INDICATIONS AND DOSE

**Short-term management of acute postoperative pain** by deep intramuscular injection or by intravenous injection
- Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
- Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day

- **CONTRA-INDICATIONS** Active gastrointestinal bleeding - active gastrointestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease
- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - dehystention - elderly (risk of serious side-effects and fatalities) - following coronary artery bypass graft surgery - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
  - **Common or very common** Alveolar ostitis - flatulence - hypoaesthesia - hypokalaemia - hypotension - postoperative anaemia - sweating
  - **Uncommon** Anorexia - arthralgia - bradycardia - cardiovascular events - ecchymosis - hyperglycaemia - malaise - pulmonary embolism
  - **Rare** Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
  - **Frequency not known** Angioedema - blood disorders - blood pressure may be raised - bronchospasms - circulatory collapse - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - rash - renal failure (especially in patients with pre-existing renal impairment) - tachycardia - tinnitus - vertigo

### SIDE-EFFECTS, FURTHER INFORMATION

**Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID— which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contraindicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Halve dose in moderate impairment (max. 40 mg daily). Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (January 2003) that parecoxib is not recommended for use within NHS Scotland.

- **MEDICINAL FORMS**
  - **Powder for solution for injection**
    - **Dynastat** (Pfizer Ltd)
      - Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder for solution for injection vials | 10 vial | £9.60
    - **Dynastat** (Pfizer Ltd)
      - Parecoxib (as Parecoxib sodium) 40 mg Dynastat 40mg powder and solvent for solution for injection vials | 5 vial | £7.83

### OPIOIDS

**Remifentanil**

The properties listed below are those particular to the drug only. For properties common to the class, see Opioids, p. 357.

### INDICATIONS AND DOSE

**Analgesia and enhancement of anaesthesia at induction**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, then (by intravenous infusion) 30–60 micrograms/kg/hour, alternatively (by intravenous infusion) initially 30–60 micrograms/kg/hour, if patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, according to anaesthetic technique and adjusted according to response, followed by (by intravenous infusion) 3–120 micrograms/kg/hour, intravenous infusion may be given with or without initial intravenous injection dose; in light anaesthesia supplemental doses by intravenous injection every 2–5 minute
Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)

BY INTRAVENOUS INFUSION
- Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients

BY INTRAVENOUS INFUSION
- Adult: Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia

BY INTRAVENOUS INFUSION
- Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

Cardiac surgery
- Adult: (consult product literature)

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

- UNLICENSED USE Remifentanil doses in BNF may differ from those in product literature.
- CONTRA-INDICATIONS Analgesia in conscious patients
- SIDE-EFFECTS
  - Common or very common Hypertension
  - Uncommon Hypoxia
  - Rare Asystole
  - Frequency not known AV block - convulsions

SIDE-EFFECTS, FURTHER INFORMATION

Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

Respiratory depression In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression.

- PREGNANCY No information available.
- BREAST FEEDING Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.
- RENAL IMPAIRMENT No dose adjustment necessary in renal impairment.
- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use For intravenous infusion (Ultiva®), give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

PRESCRIBING AND DISPENSING INFORMATION
Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- REMIFENTANIL (Non-proprietary)
  - Remifentanil (as Remifentanyl hydrochloride) 1 mg Remifentanil 1mg powder for concentrate for solution for injection vials | 5 vial (PBD) £25.58–£25.60 (Hospital only) Schedule 2 (CD)
  - Remifentanil (as Remifentanyl hydrochloride) 2 mg Remifentanil 2mg powder for concentrate for solution for injection vials | 5 vial (PBD) £29.13–£31.15 (Hospital only) Schedule 2 (CD)
  - Remifentanil (as Remifentanyl hydrochloride) 5 mg Remifentanil 5mg powder for concentrate for solution for injection vials | 5 vial (PBD) £127.00–£127.90 (Hospital only) Schedule 2 (CD)
  - Ultiva (GlaxoSmithKline UK Ltd)
    - Remifentanil (as Remifentanyl hydrochloride) 1 mg Ultiva 1mg powder for solution for injection vials | 5 vial (PBD) no price available (Hospital only) Schedule 2 (CD)
    - Remifentanil (as Remifentanyl hydrochloride) 2 mg Ultiva 2mg powder for solution for injection vials | 5 vial (PBD) no price available (Hospital only) Schedule 2 (CD)
    - Remifentanil (as Remifentanyl hydrochloride) 5 mg Ultiva 5mg powder for solution for injection vials | 5 vial (PBD) no price available (Hospital only) Schedule 2 (CD)

Hyoscine hydrobromide with papaveretum

The properties listed below are those particular to the combination only. For the properties of the components please consider, hyoscine hydrobromide p. 344, papaveretum p. 371.

INDICATIONS AND DOSE
Premedication
BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: 0.5–1 mL

LESS SUITABLE FOR PRESCRIBING Hyoscine hydrobromide with papaveretum is less suitable for prescribing.

- MEDICINAL FORMS
  - Medicines not identified.

1.6 Peri-operative sedation

Conscious sedation for clinical procedures

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.
**ALPHA₂-ADRENOCEPTOR AGONISTS**

**Dexmedetomidine**

**INDICATIONS AND DOSE**
Maintenance of sedation during intensive care

**BY INTRAVENOUS INFUSION**
- Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

**Important safety information**
Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Acute cerebrovascular disorders - second- or third-degree AV block (unless pacemaker fitted) - uncontrolled hypotension
- **CAUTIONS** Abrupt withdrawal after prolonged use - bradycardia - ischaemic heart disease - malignant hyperthermia - severe cerebrovascular disease (especially at higher doses) - severe neurological disorders - spinal cord injury
- **SIDE-EFFECTS**
  - Common or very common: Agitation - blood pressure changes - bradycardia - changes in blood sugar - dry mouth - hyperthermia - myocardial infarction - myocardial ischaemia - nausea - tachycardia - vomiting
  - Uncommon: Abdominal distension - AV block - decreased cardiac output - dyspnoea - hallucination - hypoalbuminaemia - metabolic acidosis - thirst
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Dose reduction may be required. Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Monitor cardiac function. Monitor respiratory function in non-intubated patients.
- **DIRECTIONS FOR ADMINISTRATION** To be diluted before use.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- Dexdor (Orion Pharma (UK) Ltd)
  - Dexmedetomidine (as Dexmedetomidine hydrochloride) 100 microgram per 1 ml
  - Dexdor 1mg/10ml concentrate for solution for infusion vials | 4 vial (Ref) £313.20 (Hospital only)
  - Dexdor 400micrograms/4ml concentrate for solution for infusion vials | 4 vial (Ref) £125.28 (Hospital only)
  - Dexdor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule (Ref) £78.30 (Hospital only) | 25 ampoule (Ref) £391.50 (Hospital only)

**ANAESTHETICS (GENERAL, INTRAVENOUS, NMDA RECEPTOR ANTAGONISTS)**

**Ketamine**

**INDICATIONS AND DOSE**
Induction and maintenance of anaesthesia for short procedures

**BY INTRAMUSCULAR INJECTION**
- Adult: Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia

**BY INTRAVENOUS INJECTION**
- Adult: Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

**Diagnostic manoeuvres and procedures not involving intense pain**
- Adult: Initially 4 mg/kg

**Induction and maintenance of anaesthesia for long procedures**
- Adult: Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

**Important safety information**
Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 - eclampsia - head trauma - hypertension - pre-eclampsia - raised intracranial pressure - severe cardiac disease - stroke
- **CAUTIONS** Acute circulatory failure (shock) - cardiovascular disease - dehydration - elderly - fixed cardiac output - hallucinations - head injury - hypertension - hypovolaemia - increased cerebrospinal fluid pressure - intracranial mass lesions - nightmares - predisposition to seizures - psychotic disorders - raised intra-ocular pressure - respiratory tract infection - thyroid dysfunction
- **INTERACTIONS** Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS**
  - Common or very common: Diplopia - hallucinations - hypertension - nausea - nightmares - nystagmus - rash - tachycardia - transient psychotic effects - vomiting
  - Uncommon: Arrhythmias - bradycardia - hypotension - laryngospasm - respiratory depression
  - Rare: Aplacata - cystitis - cystitis - haemorrhagic cystitis - hypersalivation - insomnia
  - Frequency not known: Raised intra-ocular pressure
- **SIDE-EFFECTS, FURTHER INFORMATION** Transient psychotic effects: Incidence of hallucinations, nightmares, and other transient psychotic effects can be reduced by a benzodiazepine such as diazepam or midazolam.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Avoid for at least 12 hours after last dose.
- **HEPATIC IMPAIRMENT** Consider dose reduction.
- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute to a concentration of 1 mg/ml with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia. For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/ml with Glucose 5% or Sodium Chloride 0.9% or Water for Injections.
- **PATIENT AND CARER ADVICE** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available.
Local anaesthesia

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is covered in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1113 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Chloroprocaine hydrochloride p. 1114, a para-aminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.

Levobupivacaine p. 1115, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1116 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 1196) is about 90 minutes.

Prilocaine hydrochloride p. 1120 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1121 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1122, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Use of vasoconstrictors

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravascular administration of a preparation containing adrenaline/epinephrine, and it is not advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 1119 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin
Severe local anaesthetic-induced cardiovascular toxicity

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy. If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given. Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service. Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.

ANAESTHETICS (LOCAL)

Articaine hydrochloride with adrenaline
(Carticaine hydrochloride with epinephrine)

INDICATIONS AND DOSE

Infiltration anaesthesia in dentistry

- Adult: Consult expert dental sources

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS Application to damaged skin · application to the middle ear (may cause otoxicity) · complete heart block · injection into infected tissues · injection into inflamed tissues · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block)

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- CAUTIONS Arrhythmias · arteriosclerosis · cardiovascular disease · cerebrovascular disease · cor pulmonale · debilitated patients (consider dose reduction) · diabetes mellitus · elderly (consider dose reduction) · epilepsy · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · hypovolaemia · impaired cardiac conduction · impaired respiratory function · ischaemic heart disease · myasthenia gravis · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · shock · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- INTERACTIONS → Appendix 1 (sympathomimetics).

SIDE-EFFECTS Angina · angle-closure glaucoma · anorexia · anxiety · arrhythmias · blurred vision · cardiac arrest · cold extremities · confusion · convulsions · difficulty in micturition · dizziness · drowsiness · dry mouth · dyspnoea · feeling of inebriation · headache · hyperglycaemia · hypersalivation · hypertension (risk of cerebral haemorrhage) · hypokalaemia · insomnia · lightheadedness · metabolic acidosis · methaemoglobinemia · muscle twitching · mydriasis · myocardial depression (resulting in hypotension and bradycardia) · myocardial infarction · nausea · numbness of the tongue and perioral region · pallor · palpitation · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · restlessness · sweating · tachycardia · tinnitus · tissue necrosis at injection site and of extremities, bowel, liver and kidneys · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremor · urinary retention · vomiting · weakness

SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- PREGNANCY Use only if potential benefit outweighs risk—no information available.

- BREAST FEEDING Avoid breast-feeding for 48 hours after administration.
**Medications**

**Bupivacaine hydrochloride**

**Indications and dose**

**Surgical anaesthesia, lumbar epidural block**

- Adult: 75–150 mg, dose administered using 5 mg/mL (0.5%) solution

**Surgical anaesthesia, field block**

- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, thoracic epidural block**

- Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, caudal epidural block**

- Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, major nerve block**

- Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

**Acute pain, intra-articular block**

- Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

**Acute pain, thoracic epidural block**

- Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute pain, lumbar epidural block**

- Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg at least every 30 minutes, repeated when required, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution

**Acute pain, field block**

- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

**Marcaine Heavy**

**Intrathecal anaesthesia for surgery**

- Adult: 10–20 mg

**Important safety information**

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**Contra-indications**

Application to the middle ear (can cause ototoxicity). Avoid injection into infected tissues. Avoid injection into inflamed tissues. Complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block) - should not be applied to damaged skin.

**Contra-indications, further information**

**Injection site**

Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**Cautions**

- Cardiovascular disease - cerebral atheroma - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypertension - hypotension - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - myocardial depression may be more severe and more resistant to treatment - shock

**Interactions**

- Appendix 1 (bupivacaine).

**Side-effects**

- Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessless - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**Side-effects, further information**

**Toxic effects**

Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**Allergy and cross-sensitivity**

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-
sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

**Solution for injection**

- **BUPIVACAINE HYDROCHLORIDE (Non-proprietary)**
  - Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule P<sub>FP</sub> £17.50
  - Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 0.5% solution for injection 10ml Sure-Amp ampoules | 20 ampoule P<sub>FP</sub> £18.30
  - Bupivacaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule P<sub>FP</sub> no price available
  - **Marcain** (AstraZeneca UK Ltd)
    - Bupivacaine hydrochloride 2.5 mg per 1 ml Marcain 0.25% solution for injection 10ml Polyamp Steripack ampoules | 5 ampoule P<sub>FP</sub> £9.25
    - Bupivacaine hydrochloride 5 mg per 1 ml Marcain 0.5% solution for injection 10ml Polyamp Steripack ampoules | 5 ampoule P<sub>FP</sub> £9.25

**Infusion**

- **BUPIVACAINE HYDROCHLORIDE (Non-proprietary)**
  - Bupivacaine hydrochloride 1 mg per 1 ml Bupivacaine 100mg/100ml (0.1%) infusion bags | 20 bag P<sub>FP</sub> no price available
  - Bupivacaine 250mg/250ml (0.1%) infusion bags | 20 bag P<sub>FP</sub> no price available
  - **Marcain** Bupivacaine hydrochloride 1.25 mg per 1 ml Bupivacaine 312.5mg/250ml (0.125%) infusion bags | 20 bag P<sub>FP</sub> no price available

Bupivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, adrenaline/epinephrine p. 196, bupivacaine hydrochloride p. 1113.

**INDICATIONS AND DOSE**

- **Surgical anaesthesia**
  - BY LUMBAR EPIDURAL OR BY LOCAL INFILTRATION OR BY CAUDAL EPIDURAL
    - Adult: (consult product literature)
  - Acute pain management
    - BY LUMBAR EPIDURAL OR BY LOCAL INFILTRATION
    - Adult: (consult product literature)

- **CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

**MEDICINAL FORMS**

- **Solutions for injection**
  - **ADRENALINE WITH BUPIVACAINE (Non-proprietary)**
    - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine

**INDICATIONS AND DOSE**

**Chloroprocaine hydrochloride**

**Indications and dose**

**Intrathecal anaesthesia for surgical procedures lasting up to 40 minutes**

**By slow intrathecal injection**

- **Adult:** 40–50 mg, dose depends on desired length of block

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

**Important safety information**

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • complete heart block • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) • severe anaemia • should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

**Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

- Acute porphyrias p. 864 • cardiovascular disease • debilitated patients (consider dose reduction) • elderly (consider dose reduction) • epilepsy • hypoclovaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • shock

**INTERACTIONS** → Appendix 1 (chloroprocaine).

**SIDE-EFFECTS**

- **Uncommon** Hypertension

**Frequency not known** Arrhythmias • blurred vision • cardiac arrest • convulsions • dizziness • drowsiness • feeling of inebriation • headache • lightheadedness • muscle twitching • myocardial depression (resulting in hypotension and bradycardia) • nausea • numbness of the tongue and perioral region • paraesthesia (including sensations of hot and cold) • peripheral vasodilatation (resulting in hypotension and bradycardia) • restlessness • tinnitus • transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • tremors • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Toxic effects**

Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful
surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - **Ampres (AMCo)**
    Chloroprocaine hydrochloride 10 mg per 1 ml Ampres 50mg/5ml solution for injection ampoules | 10 ampoule PBO £87.50

---

**Levobupivacaine**

### INDICATIONS AND DOSE

**Acute postoperative pain**

- **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

- **Acute labour pain**
  - **INITIALLY BY LUMBAR EPIDURAL**
    - Adult: 15–25 mg every 15 minutes as required, dose administered using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 5–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution

- **Surgical anaesthesia, peripheral nerve block**
  - **BY REGIONAL ADMINISTRATION**
    - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

- **Surgical anaesthesia, peribulbar nerve block**
  - **BY REGIONAL ADMINISTRATION**
    - Adult: 7.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

- **Surgical anaesthesia for caesarean section**
  - **BY LUMBAR EPIDURAL**
    - Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

- **Surgical anaesthesia**
  - **BY LUMBAR EPIDURAL**
    - Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution
  - **BY INTRATHecal INJECTION**
    - Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution
  - **BY LOCAL INFILTRATION**
    - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

### Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

#### Important safety information

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

- **CONTRA-INDICATIONS, FURTHER INFORMATION**

- **Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

- **INTERACTIONS** → Appendix 1 (levobupivacaine).

- **SIDE-EFFECTS** Anaemia - arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - pyrexia - restlessness - sweating - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

**Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester— toxicity in animal studies. May cause fetal
1116 Local anaesthesia

**Lidocaine hydrochloride**
(Lignocaine hydrochloride)

**INDICATIONS AND DOSE**

Dental practice
- **BY BUCCAL ADMINISTRATION USING OINTMENT**
  - Adult: Rub gently into dry gum

Infiltration anaesthesia
- **BY LOCAL INfiltrATION**
  - Adult: Dose to be given according to patient’s weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

Intravenous regional anaesthesia and nerve block
- Adult: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritis ani, pruritis vulvae, herpes zoster, or herpes labialis)
- Lubricant in cystoscopy | Lubricant in proctoscopy | Lubricant in cystoscopy | Lubricant in proctoscopy

TO THE SKIN USING OINTMENT
- Adult: Apply 1–2 mL as required, avoid long-term use

Sore nipples from breast-feeding
- TO THE SKIN USING OINTMENT
- Adult: Apply using gauze and wash off immediately before next feed

LARYNGOJECT®

Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract
- **TO MUCOUS MEMBRANES**
  - Adult: 40–200 mg, to be given as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient); usual dose 160 mg

**CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS
All grades of atrioventricular block - severe myocardial depression - sino-atrial disorders

SPECIFIC CONTRA-INDICATIONS
- When used by regional administration Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues -
preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block). Severe myocardial depression should not be applied to damaged skin.

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- **Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**SIDE-EFFECTS**

- With intravenous use Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose).
- When used by regional administration Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose) - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock.
- With oral (topical) use Avoid anaesthesia of the pharynx before meals - risk of choking - can damage plastic cuffs of endotracheal tubes.

**INTERACTIONS** → Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, gel, ointment, spray. There may be variation in licensing of different medicines.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Topical application** A single application of a topical lidocaine preparation does not generally cause systemic side-effects.

**Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**Methaemoglobinemia** Methaemoglobinemia can be treated with an intravenous injection of methylnitroimine chloride; neonates and infants under 6 months are particularly susceptible to methaemoglobinemia.

**Allergy and Cross-Sensitivity** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**Pregnancy** Crosses the placenta but not known to be harmful in animal studies - use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paradigm. May be harmful.

**Breast Feeding** Present in milk but amount too small to be harmful.

**Hepatic Impairment** Caution - increased risk of side-effects.

**Renal Impairment** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

**Profession Specific Information**

**Dental practitioners’ formulary** Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%.

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2008) that Versatis® is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

**Solution for injection**

- **LIDOCAINE HYDROCHLORIDE (Non-proprietary)**
  - Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (£0.70)

**Versatis®**
Lidocaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, adrenaline hydrochloride p. 1116, lidocaine hydrochloride p. 1116.

INDICATIONS AND DOSE
Anaesthesia before minor skin procedures including venepuncture

TO THE SKIN
- Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- Child 3-11 months: Apply up to 2 g for maximum 4 hours before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 11-1 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 12-17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
- Adult: Apply 1–5 hour before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics

TO THE SKIN
- Adult: Apply for 15 minutes (in adult men) and 60 minutes (in adult women), to be applied under occlusive dressing

Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1116, phenylephrine hydrochloride p. 166.

INDICATIONS AND DOSE
Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose

BY INTRanasal ADMINISTRATION
- Adult: Up to 8 sprays

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Spray
- LIDOCAINE WITH PHENYLEPHRINE (Non-proprietary)
  Lidocaine hydrochloride 50 mg per 1 ml, Phenylephrine hydrochloride 5 mg per 1 ml Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml | £11.48

Lidocaine with prilocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1116, prilocaine hydrochloride p. 1120.

INDICATIONS AND DOSE
Anaesthesia before minor skin procedures including venepuncture
Local anaesthesia

**Anaesthesia before surgical treatment of lesions on genital mucosa**

**TO THE SKIN**
- Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

**Anaesthesia before cervical curettage**

**TO THE SKIN**
- Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

**Anaesthesia before mechanical cleansing or debridement of leg ulcer**

**TO THE SKIN**
- Adult: Apply up to 10 g for 30–60 minutes, to be applied under occlusive dressing

- **CONTRA-INDICATIONS** Use in child less than 37 weeks corrected gestational age
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: EMLA cream for local anaesthesia www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia

      - Lidocaine 70 mg, Tetracaine 70 mg Plaglis 70mg/g / 70mg/g cream | 15 gram [P] £22.95

**Mepivacaine hydrochloride**

- **INDICATIONS AND DOSE**
  - Infiltration anaesthesia and nerve block in dentistry
    - Child 3-17 years: Consult expert dental sources
    - Adult: Consult expert dental sources

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- **Injection site** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease - children (consider dose reduction) - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

- **SIDE-EFFECTS** Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use with caution in early pregnancy.

- **BREAST FEEDING** Use with caution.

- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

- **RENAI IMPAIRMENT** Use with caution; increased risk of side-effects.
**Mepivacaine with adrenaline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, adrenaline/epinephrine p. 196, mepivacaine hydrochloride p. 1119.

### Indications and dose

**Infiltration anaesthesia and nerve block in dentistry**

**BY LOCAL INFILTRATION**

- **Adult:** consult product literature

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Scandonest plain (Deproco UK Ltd)
  - Mepivacaine hydrochloride 30 mg per 1 ml
- Scandonest special 2% solution for injection 2.2 ml cartridges
- Prioltekal

### CONTRA-INDICATIONS

- Acquired methaemoglobinaemia
- ▶️ By intrathecal injection

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Scandonest plain (Deproco UK Ltd)
  - Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 30 mg per 1 ml
- Scandonest special 2% solution for injection 2.2 ml cartridges

### Indications and dose

**Infiltration anaesthesia and nerve block in dentistry**

**BY LOCAL INFILTRATION**

- **Adult:** consult product literature

**SIDE-EFFECTS, FURTHER INFORMATION**

**Toxic effects**

Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**Methaemoglobinaemia**

Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride.

**Allergy and cross-sensitivity**

Reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**Pregnancy**

Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).

**Breast feeding**

Present in milk but not known to be harmful.

**Hepatic impairment**

Lower doses may be required for intrathecal anaesthesia. Use with caution.

**Renal impairment**

Lower doses may be required for intrathecal anaesthesia. Use with caution.

**National funding/access decisions**

**Prioltekal**

Scottish Medicines Consortium (SMC) Decisions

With intrathecal use The Scottish Medicines Consortium has advised (December 2010) that prilocaine 2% hyperbaric...
solution for injection (Prilokalc®) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- Citanest (AstraZeneca UK Ltd)
  Prilocaine hydrochloride 10 mg per 1 ml Citanest 3% solution for injection 50ml vials | 1 vial £5.06
- Prilokalc (AMCo)
  Prilocaine hydrochloride 20 mg per 1 ml Prilokalc 100mg/5ml solution for injection ampoules | 1 ampoule £78.75

**INDICATIONS AND DOSE**
Dental anaesthesia
- Adult: Consult expert dental sources for specific advice

**SIDE-EFFECTS**

**INTERACTIONS**

**CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity). Avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CAUTIONS** Acute porphyrias p. 864 - cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

**SIDE-EFFECTS**
- Common or very common - Hypertension - pyrexia
- Uncommon - Hypothermia - syncope
- Frequency not known - Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**Important safety information**
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**Ropivacaine hydrochloride**

**INDICATIONS AND DOSE**

**Acute pain, peripheral nerve block**
- Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

**Acute pain, field block**
- Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution

**Acute pain, lumbar epidural block**
- Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

**Acute labour pain**
- Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

**Acute postoperative pain**
- Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

**Postoperative pain, thoracic epidural block**
- Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

**Surgical anaesthesia, field block**
- Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, major nerve block (brachial plexus block)**
- Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)**
- Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia for caesarean section**
- Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

**Doses at extremes of body-weight**
To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**Prilocaine with felypressin**

The properties listed below are those particular to the combination only. For the properties of the components please consult, prilocaine hydrochloride p. 1120.

**Indications and dose**
Dental anaesthesia
- Adult: Consult expert dental sources for specific advice

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Citanest with Octapressin (Dentsply Ltd)
  Felypressin 0.03 unit per 1 ml, Prilocaine hydrochloride 30 mg per 1 ml Citanest 3% with Octapressin Dental 0.054 units/1.8 ml solution for injection self-aspirating cartridges | 100 cartridge £75.00
- Citanest 3% with Octapressin Dental 0.066 units/2.2 ml solution for injection self-aspirating cartridges | 100 cartridge £75.00

**Important safety information**
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.
### Local anaesthesia

#### SIDE-EFFECTS, FURTHER INFORMATION

**Toxic effects**
Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**
  Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  Not known to be harmful. Do not use for paracervical block in obstetrics.

- **BREAST FEEDING**
  Not known to be harmful.

- **HEPATIC IMPAIRMENT**
  Use with caution in severe impairment.

- **RENAL IMPAIRMENT**
  Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Hospital admission
Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 104, iron, paracetamol p. 354, tricyclic antidepressants, and co-phenotrope p. 55 (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information
TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number:
Tel: 0844 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

General care
It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol p. 354, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration
Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure
Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 851 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin p. 104 poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart
Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias
often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

**Body temperature**

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated. Hypothermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome. Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

**Convulsions**

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 412 or diazepam p. 267 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 414 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam can be administered as a rectal solution.

**Methaemoglobinemia**

Drug- or chemical-induced methaemoglobinemia should be treated with methylene blue chloride p. 1135 if the methylene blue concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylene blue chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylene blue chloride can itself cause methaemoglobinemia.

**Removal and elimination**

**Prevention of absorption**

Given by mouth, activated charcoal p. 1130 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

**Active elimination techniques**

Repeated doses of activated charcoal by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Activated charcoal p. 1130 should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

**Removal from the gastro-intestinal tract**

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration. Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

**Specific Drugs**

**Alcohol**

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportivey, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

**Analgesics**

**Aspirin**

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses...
should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

**Opioids**

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1133 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 848, or magnesium sulfate p. 858, or both; arrhythmias may occur for up to 12 hours.

**Paracetamol**

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1134 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving
Emergency treatment of poisoning

Acetylecysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylecysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

Acute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 1130 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylecysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 μmol/litre (0.66 mmol/litre) at 4 hours and 3.13 μmol/litre (0.02 mmol/litre) at 24 hours. Acetylecysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylecysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

‘Staggered’ overdose, uncertain time of overdose, or therapeutic excess

A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylecysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine p. 387, efavirenz p. 558, nevirapine p. 560, phenobarbital p. 409, phenytoin p. 398, primidone p. 401, rifabutin p. 507, rifampicin p. 508, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylecysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylecysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

Acetylecysteine dose and administration

For paracetamol overdosage, acetylecysteine p. 1134 is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylecysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of Acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylecysteine is added to Glucose Intravenous Infusion 5% p. 852.

**First infusion** (based on an acetylecysteine dose of approx. 150mg/kg) — add requisite volume of Acetylecysteine Concentrate for Intravenous Infusion to 200mL Glucose Intravenous Infusion 5%; infuse over 1 hour.

Antimalarials
Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotics
Phenothiazines and related drugs
Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 326 or diazepam p. 267 (emulsion preferred).

Second-generation antipsychotic drugs
Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1130 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepines
Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated p. 1130 can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1132 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

Beta blockers
Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de points type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions. Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1099 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 618 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not effective, a second intravenous injection of glucagon should be given.

Antidepressants
Tricyclic and related antidepressants
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, and cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery. Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Selective serotonin re-uptake inhibitors (SSRIs)
Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRi poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see Convolusions p. 1124. Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Emergency treatment of poisoning

Third infusion (based on an acetylcysteine dose of approx. 100mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose Intravenous Infusion 5%; infuse over 16 hours.

Emergency treatment of poisoning

available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

**Calcium-channel blockers**
Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated p. 1130 should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 857 or calcium gluconate p. 857 is given by injection; atropine sulfate p. 1099 is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypoglycaemia and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

**Iron salts**
Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour. Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 839, which chelates iron. The serum iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

**Lithium**
Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

**Stimulants**
Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 267 orlorazepam p. 412; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, rapid sponging, anticonvulsants, and artificial respiration may be needed.

**Cocaine**
Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hyperventilation, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam p. 267 to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

**Ecstasy**
Ecstasy (methylenedioxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methylenedioxymethamphetamine poisoning is supportive, with diazepam p. 267 to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

**Theophylline**
Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 349 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 863 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be
controlled by intravenous administration of lorazepam p. 412 or diazepam p. 267 (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Other poisons
Consult either the National Poisons Information Service day and night or TOXBASE, see under the National Poisons Information Service.

Cyanides
Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1131 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1131 followed by sodium thiosulfate p. 1131 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 837 (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol
Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals
Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases
Carbon monoxide
Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 202. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, ammonia
All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS spray
CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents
Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime chloride p. 1131 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticides
Organophosphorus insecticides
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. They are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure. Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1099 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride p. 1131, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is

Marine stings

The severe pain of weeverfish (Trachinus draco) and

Portuguese man-o’-war stings can be relieved by immersing

the stung area immediately in uncomfortably hot, but not

scalding, water (not more than 45°C). People stung by

jellyfish and Portuguese man-o’-war around the UK coast

should be removed from the sea as soon as possible.

Adherent tentacles should be lifted off carefully (wearing
gloves or using tweezers) or washed off with seawater.

Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service or

TOXBASE.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

BNF 70

continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 196. Indications for European viper snake venom antiserum treatment p. 1136 include systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service.

Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible.

Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine p. 196; self-administered intramuscular adrenaline/epinephrine (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (Trachinus draco) and

Portuguese man-o’-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. 2 Chemical toxicity

2.1 Cyanide toxicity

CHELATORS AND ANTIDOTES

Dicobalt edetate

**INDICATIONS AND DOSE**

Severe poisoning with cyanides

**BY INTRAVENOUS INJECTION**

- Child: Consult the National Poisons Information Service
- Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

**CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness

**SIDE-EFFECTS** Anaphylactoid reactions - cardiac abnormalities - facial oedema - hypotension - laryngeal oedema - tachycardia - vomiting

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **DICOBALT EDETATE (Non-proprietary)**
  Dicobalt edetate 15 mg per 1 mL
  Dicobalt edetate 100 mg/20 mL solution for injection ampoules | 6 ampoule [GBP] £11.20

Sodium nitrite

**INDICATIONS AND DOSE**

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

**BY INTRAVENOUS INJECTION**

- Child: 4–10 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
- Adult: 300 mg, to be given over 5–20 minutes (as sodium nitrite injection 30 mg/mL)

**Dose equivalence and conversion**

4–10 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.

**SIDE-EFFECTS** Flushing (due to vasodilatation) - headache (due to vasodilatation)

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Sodium thiosulfate

**INDICATIONS AND DOSE**

Poisoning with cyanides (used in conjunction with sodium nitrite)

**BY INTRAVENOUS INJECTION**

- Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
- Adult: 12.5 g, to be given over 10 minutes (as sodium thiosulfate injection 500 mg/mL), dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

**Dose equivalence and conversion**

400 mg/kg equates to 0.8 mL/kg of a 50% solution.

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion, liquid

2.2 Organophosphorous toxicity

Drugs used for Organophosphorous toxicity not listed below: Atropine sulfate, p. 1099

CHELATORS AND ANTIDOTES

Pralidoxime chloride

**INDICATIONS AND DOSE**

Adjuant at atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

**BY INTRAVENOUS INFUSION**

- Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

continued →

Toxicity or from the National Blood Service (or Welsh

from designated centres for organophosphorus insecticide

Adult:

▶ Reversal of sedative effects of benzodiazepines in intensive
care (if drowsiness recurs after initial dose)
INITIALLY BY INTRAVENOUS INFUSION
Adult: 100–400 micrograms/hour, adjusted according
to response, alternatively (by intravenous injection)
300 micrograms, adjusted according to response

In children

DIRECTIONS FOR ADMINISTRATION
The loading dose may be
administered by intravenous injection (diluted to a
concentration of 50 mg/mL with water for injections) over
at least 5 minutes if pulmonary oedema is present or if it
is not practical to administer an intravenous infusion.

In children For intravenous infusion, reconstitute each vial
with 20 mL Water for Injections, then dilute to a
concentration of 10–20 mg/mL with Sodium Chloride
0.9%.

PRESCRIBING AND DISPENSING INFORMATION
Available from designated centres for organophosphorous insecticide
poisoning or from the National Blood Service (or Welsh
Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).

EXCEPTIONS TO LEGAL CATEGORY
Prescription only
Medicine restriction does not apply where administration
is for saving life in emergency.

The National Poisons Information Service (Tel: 0844
892 0111) will provide specialist advice on all aspects of
poisoning day and night.

3 Drug toxicity

3.1 Benzodiazepine toxicity

BENZODIAZEPINE ANTAGONISTS

Flumazenil

INDICATIONS AND DOSE
Reversal of sedative effects of benzodiazepines in
anaesthesia and clinical procedures
BY INTRAVENOUS INJECTION
- Adult: 200 micrograms, dose to be administered over
15 seconds, then 100 micrograms every 1 minute if
required; usual dose 300–600 micrograms; maximum
1 mg per course

Reversal of sedative effects of benzodiazepines in intensive
care
BY INTRAVENOUS INJECTION
- Adult: 300 micrograms, dose to be administered over
15 seconds, then 100 micrograms every 1 minute if
required; maximum 2 mg per course

Reversal of sedative effects of benzodiazepines in intensive
care
INITIALLY BY INTRAVENOUS INFUSION
- Adult: 100–400 micrograms/hour, adjusted according
to response, alternatively (by intravenous injection)
300 micrograms, adjusted according to response

Important safety information
Should only be administered by, or under the direct
supervision of, personnel experienced in their use.

CONTRA-INDICATIONS
Life-threatening condition (e.g.
rised intracranial pressure, status epilepticus) controlled
by benzodiazepines

CAUTIONS
Avoid rapid injection following major surgery
Avoid rapid injection in high-risk or anxious patients
benzodiazepine dependence (may precipitate withdrawal
symptoms) elderly ensure neuromuscular blockade
vented before giving head injury (rapid reversal of
benzodiazepine sedation may cause convulsions) history
of panic disorders (risk of recurrence) prolonged
benzodiazepine therapy for epilepsy (risk of convulsions)
short-acting (repeat doses may be necessary
benzodiazepine effects may persist for at least 24 hours)

SIDE-EFFECTS
- Common or very common Nausea • vomiting
- Uncommon Anxiety • fear • palpitation
- Frequency not known Agitation • chills • convulsions
(particularly in those with epilepsy) • dizziness • flushing
• sensory disturbance • sweating • tachycardia • transient
hypertension
- PREGNANCY Not known to be harmful
- BREAST FEEDING Avoid breast-feeding for 24 hours
- HEPATIC IMPAIRMENT Carefully titrate dose

DIRECTIONS FOR ADMINISTRATION
For continuous
intravenous infusion, dilute with Glucose 5% or Sodium
Chloride 0.9%.

MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug.

Solution for injection
- FLUMAZENIL (Non-proprietary)
Flumazenil 100 microgram per 1 ml
Flumazenil 500micrograms/5ml solution for injection ampoules
5 ampoule (PZN) E67.50–E72.46

3.2 Digoxin toxicity

CHELATORS AND ANTIDOTES

Digoxin-specific antibody

INDICATIONS AND DOSE
Treatment of known or strongly suspected life-threatening
digoxin toxicity associated with ventricular arrhythmias or
bradyarrhythmias unresponsive to atropine and when
measures beyond the withdrawal of digoxin and
correction of any electrolyte abnormalities are considered
necessary
BY INTRAVENOUS INFUSION
- Child: Serious cases of digoxin toxicity should be
discussed with the National Poisons Information
Service (consult product literature)
- Adult: Serious cases of digoxin toxicity should be
discussed with the National Poisons Information
Service (consult product literature)
### 3.3 Heparin toxicity

**CHELATORS AND ANTIDOTES**

#### Protamine sulfate

**INDICATIONS AND DOSE**

- **Overdosage with intravenous injection of unfractionated heparin**
  - **BY INTRAVENOUS INJECTION**
    - Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg
  - **Overdosage with intravenous infusion of unfractionated heparin**
    - Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute
  - **Overdosage with subcutaneous injection of unfractionated heparin**
    - Initially by intravenous injection
      - Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course
    - **Overdosage with subcutaneous injection of low molecular weight heparin**
      - **BY INTRAVENOUS INJECTION OR BY CONTINUOUS INTRAVENOUS INFUSION**
        - Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg

**CAUTIONS** Excessive doses can have an anticoagulant effect

**SIDE-EFFECTS** Anaphylaxis · angioedema · back pain · bradycardia · dyspnoea · flushing · hypersensitivity reactions · hypertension · hypotension · lassitude · nausea · pulmonary oedema · rebound bleeding · vomiting

**ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile, or who have had a vasectomy and who may have antibodies to protamine).

**MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.

**PRESCRIBING AND DISPENSING INFORMATION**

The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Protamine sulfate** (non-proprietary)
  - Protamine sulfate 10 mg per 1 ml Protamine sulfate 300mg/10ml solution for injection ampoules | 5 ampoule | no price available Protamine sulfate 50mg/5ml solution for injection ampoules | 10 ampoule | £49.55

### 3.4 Opioid toxicity

**OPIOID RECEPTOR ANTAGONISTS**

#### Naloxone hydrochloride

**INDICATIONS AND DOSE**

- **Overdosage with opioids**
  - **BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
    - Neonate: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates.
    - Child 1 month–11 years: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates.
    - Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response, then review diagnosis; further doses may be required if respiratory function deteriorates, 4 mg dose may be required in seriously poisoned patients
    - Adult: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response, then review diagnosis; further doses may be required if respiratory function deteriorates, 4 mg dose may be required in seriously poisoned patients
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Neonate: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.
    - Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.
    - Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.
**1134 Drug toxicity**

**Overdose with opioids in a non-medical setting**

**BY INTRAMUSCULAR INJECTION**
- Adult: 400 micrograms every 2–3 minutes, to be injected into deltoid region or anterolateral thigh. Each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up.

**Reversal of postoperative respiratory depression initially by intravenous injection**
- Neonate: 1 microgram/kg, repeated every 2–3 minutes if required.
- Child 1 month–1 year: 1 microgram/kg, repeated every 2–3 minutes if required.
- Child 12–17 years: Initially 100–200 micrograms, alternatively 1.5–3 micrograms/kg; if response inadequate, give subsequent dose (by intravenous injection) of 100 micrograms every 2 minutes; alternatively, subsequent doses of 100 micrograms can be given by intramuscular injection every 1–2 hours.
- Adult: Initially 100–200 micrograms, alternatively 1.5–3 micrograms/kg; if response inadequate, give subsequent dose (by intravenous injection) of 100 micrograms every 2 minutes; alternatively, subsequent doses of 100 micrograms can be given by intramuscular injection every 1–2 hours.

**Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour**
- Neonate: 1 microgram/kg, repeated every 2–3 minutes if required.
- Child 1–17 years: 1 microgram/kg, repeated every 3–5 minutes if required.

**Pharmacokinetics**
Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

**Important:** Only give by subcutaneous or intramuscular routes if intravenous route is not feasible; intravenous administration has more rapid onset of action.

**Unlicensed use**
Naloxone doses in BNF may differ from those in product literature.

**Important safety information**

**Safe practice**
Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

**Caution**
Cardiovascular disease or those receiving cardioactive drugs (serious adverse cardiovascular effects reported) - maternal physical dependence on opioids (may precipitate withdrawal in newborn) - pain - physical dependence on opioids (precipitates withdrawal)

**Caution, further information**

**Titration of dose**
In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.

**Side-effects**
- **Common or very common** Cardiac arrest (in children) - dizziness - dyspnoea (in children) - headache - hypertension - hyperventilation (in children) - hypotension - nausea - pulmonary oedema (in children) - tachycardia - ventricular fibrillation (in children) - vomiting

**Uncommon** Agitation (in children) - arrhythmia (in adults) - bradycardia (in adults) - diarrhoea - dry mouth - excitement (in children) - hyperventilation (in adults) - paraesthesia (in children) - sweating - tremor

**Rare** Seizures (in adults)

**Very rare** Anaphylaxis (in adults) - cardiac arrest (in adults) - erythema multiforme - hypersensitivity reactions (in adults) - pulmonary oedema (in adults) - seizures (in children) - ventricular fibrillation (in adults)

**Frequency not known**
Agitation (in adults)

**Pregnancy**
Use only if potential benefit outweighs risk.

**Breast feeding**
Not orally bioavailable.

**Directions for administration**
- With intravenous use in children For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%
- With intravenous use in adults For intravenous infusion (Minijet® Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Naloxone Hydrochloride (Non-proprietary)**
  - Naloxone hydrochloride 20 microgram per 1 ml Naloxone 40 micrograms/2 ml solution for injection ampoules | 10 ampoules | £55.00
  - Naloxone hydrochloride 400 microgram per 1 ml Naloxone 400 micrograms/1 ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection | £20.40
  - Naloxone 2 mg/5 ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection | £20.40
  - Naloxone 400 micrograms/1 ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection | £17.70
  - Naloxone 800 micrograms/2 ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection | £53.70
- **Prenoxad** (Martindale Pharmaceuticals Ltd)
  - Naloxone hydrochloride 1 mg per 1 ml Prenoxad 2 mg/2 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £18.00

3.5 Paracetamol toxicity

**Chelators and Antidotes**

**Acetylcysteine**

**Indications and dose**

**Paracetamol overdose**

**By intravenous infusion**
- Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%
- Child (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose
Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%.

- Adult (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%.

- Child 3 months: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

**Methaemoglobinaemia 1135**

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: granules, tablet, eye drops, effervescent tablet, oral solution, capsule, liquid

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **ACETYLCYSTEINE (Non-proprietary)**
  - Acetylcysteine 200 mg per 1 ml Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule [POC] £19.58
  - Parvolex (Phoenix Labs Ltd)
    - Acetylcysteine 200 mg per 1 ml Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule [POC] £22.50

**INDICATIONS AND DOSE**

**Drug or chemical-induced methaemoglobinaemia**

**BY SLOW INTRAVENOUS INJECTION**

- Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

**Aniline- or dapsone-induced methaemoglobinaemia**

**BY SLOW INTRAVENOUS INJECTION**

- Child 3 months-17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

**SIDE-EFFECTS**

- Hypersensitivity-like reactions - rash, slight increase in INR, may slightly increase prothrombin time

**INTERACTIONS**

- → Appendix 1 (methylthioninium).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, irrigation site pain; not compatible with Sodium Chloride 0.9%.

**Solution for injection**

- **METHYLTHIONIUM CHLORIDE (Non-proprietary)**
  - Methylthioninium chloride 5 mg per 1 ml Methylthioninium chloride Proveblue 50mg/10ml solution for injection ampoules | 5 ampoule [POC] £196.89

**CHELATORS AND ANTIDOTES**

**Methylen blue (Methylene blue)**

**INDICATIONS AND DOSE**

**Drug or chemical-induced methaemoglobinaemia**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

**CAUTIONS**

- Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time

**SIDE-EFFECTS**

- Hypersensitivity-like reactions - rash, slight increase in INR, may slightly increase prothrombin time

**INTERACTIONS**

- → Appendix 1 (methylthioninium).

**SIDE-EFFECTS**

- Abdominal pain · agitation · anxiety · arrhythmia · blue-green discoloration of faeces · blue-green discoloration of skin · blue-green discoloration of urine · chest pain · confusion · dizziness · dyspnoea · fever · haemolytic anaemia · headache · hyperbilirubinaemia (in infants) · hypertension · hypotension · methaemoglobinaemia · mydriasis · nausea · sweating · tachypnoea · tremor · vomiting

**PREGNANCY**

- No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

**BREAST FEEDING**

- Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

**RENAL IMPAIRMENT**

- Use with caution in severe impairment; dose reduction may be required.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intravenous infusion (Parvolex®), give continuously in Glucose 5% or Sodium chloride 0.9%. Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.

**MEDICATIONS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, irrigation site pain; not compatible with Sodium Chloride 0.9%.

**Solution for injection**

- **METHYLTHIONIUM CHLORIDE (Non-proprietary)**
  - Methylthioninium chloride 5 mg per 1 ml Methylthioninium chloride Proveblue 50mg/10ml solution for injection ampoules | 5 ampoule [POC] £196.89

**Methaemoglobinemia 1135**

**CAUTIONS**

- Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) · atopy · may slightly increase INR · may slightly increase prothrombin time

**SIDE-EFFECTS**

- Hypersensitivity-like reactions - rash, slight increase in INR, may slightly increase prothrombin time

**INTERACTIONS**

- → Appendix 1 (methylthioninium).

**SIDE-EFFECTS**

- Abdominal pain · agitation · anxiety · arrhythmia · blue-green discoloration of faeces · blue-green discoloration of skin · blue-green discoloration of urine · chest pain · confusion · dizziness · dyspnoea · fever · haemolytic anaemia · headache · hyperbilirubinaemia (in infants) · hypertension · hypotension · methaemoglobinaemia · mydriasis · nausea · sweating · tachypnoea · tremor · vomiting

**PREGNANCY**

- No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

**BREAST FEEDING**

- Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

**RENAL IMPAIRMENT**

- Use with caution in severe impairment; dose reduction may be required.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intravenous infusion, dose to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%.

- Child 3 months: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

- Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
5 Snake bites

ANTISERA

European viper snake venom antiserum

INDICATIONS AND DOSE

Systemic envenoming from snake bites

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

▶ Adult: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

Severe systemic envenoming from snake bites in patients presenting with clinical features

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

▶ Adult: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

DIRECTIONS FOR ADMINISTRATION

By intravenous injection give over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

PRESCRIBING AND DISPENSING INFORMATION To order, email immform@dh.gsi.gov.uk.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.
Appendix 1

Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs), as for other adverse drug reactions.

Drug interactions may be pharmacodynamic or pharmacokinetic.

Pharmacodynamic interactions
These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions
These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of in-vitro information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions
Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function. Serious interactions The symbol ● has been placed against interactions that are potentially serious and where concomitant administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.
List of drug interactions
The following is an alphabetical list of drugs and their interactions, to avoid excessive cross-referencing, each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

**Abacavir**
- Analgesics: abacavir possibly reduces plasma concentration of METHAMFETAMINE
- Antibacterials: plasma concentration of abacavir possibly reduced by RIFAMPICIN
- Antiepileptics: plasma concentration of abacavir possibly reduced by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and DEXTROMETHORPHAN
- Antivirals: abacavir possibly reduces effects of RIBAVIRIN; plasma concentration of abacavir reduced by TIPRANAVIR
- Orlistat: absorption of abacavir possibly reduced by ORLISTAT

**Abiraterone**
- Analgesics: abiraterone increases plasma concentration of DEXTROMETHORPHAN
- Antibacterials: plasma concentration of abiraterone possibly reduced by RIFABUTIN—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by Rifampicin—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by ST JOHN'S WORT—manufacturer of abiraterone advises avoid concomitant use
- Antiepileptics: plasma concentration of abiraterone possibly reduced by PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of abiraterone advises avoid concomitant use

**Acarbose** see Antidiabetics

**ACE Inhibitors** (continued)
- Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by MAOIs
- Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of INSULIN, METFORMIN and SULfonylureAS
- Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with ANTIpsYCHOTICS
- Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with ANXIOLYtics AND HYPnotics
- Avanafil: hypotensive effect of enalapril possibly enhanced by AVANAFIL
- Azathioprine: increased risk of anaemia or leucopenia when captopril given with AZATHIOPRINE especially in renal impairment; increased risk of anaemia when enalapril given with AZATHIOPRINE especially in renal impairment
- Bee Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with BEE VENOM EXTRACTS
- Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with BETA-BLOCKers
- Calcium-Channel Blockers: enhanced hypotensive effect when ACE inhibitors given with CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: captopril possibly increases plasma concentration of DIGOXIN
- Cilostazol: increased risk of hyperkalaemia when ACE inhibitors given with CLOPIDOGREL
- Clonidine: enhanced hypotensive effect when ACE inhibitors given with CLONIDINE; antihypertensive effect of captopril possibly delayed by previous treatment with CLONIDINE
- Corticosteroids: hypotensive effect of ACE inhibitors antagonised by CORTICOSTERoids
- Cytotoxics: increased risk of angioedema when ACE inhibitors given with, EVEROLIMUS
- Diazoxide: enhanced hypotensive effect when ACE inhibitors given with DIAZoxide
- Diuretics: enhanced hypotensive effect when ACE inhibitors given with DIUREtics; increased risk of severe hyperkalaemia when ACE inhibitors given with POTASSium-SPARing DIuretics AND ALDOSTERONE ANTAGOnists
- Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with CO-BENEDOLpa, CO-CARELOpa or LEVODOPpa
- Lithium: ACE inhibitors reduce excretion of LITHIUM (increased plasma concentration)
- Methylprednisolone: enhanced hypotensive effect when ACE inhibitors given with METHYLPREDNISOLONE
- Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with MOXISylyTE
- Moxonidine: enhanced hypotensive effect when ACE inhibitors given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with BACLOFEN or TZANIDINE
- Nitrites: enhanced hypotensive effect when ACE inhibitors given with NITRATES
- Oestrogens: hypotensive effect of ACE inhibitors antagonised by OESTROGENs
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with POTASSIUM SALTS
- Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with APROstenol
- Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with SODIUM AUROTHIOMALATE
- Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with HYDRAZINE, MinoxidIL or SODIUM NITROPRUSSIIDE
- Wasp Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with WASP VENOM EXTRACTS

**Acetebutolol** see Beta-blockers

**Aceleclofenac** see NSAIDs

**Aciometacin** see NSAIDs

**Acenocoumarol** see Coumarins

**Acetazolamide** see Diuretics

**AcidoCin**
- NOTE Interactions do not apply to topical aciclovir preparations
- Aminophylline: aciclovir possibly increases plasma concentration of AMINOPHYLLINE
Appendix 1 Interactions

Adalimumab

- Increased risk of nephrotoxicity when adalimumab given with CYCLOSPORIN
- Mycophenolate: plasma concentration of adalimumab increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
- Tacrolimus: possible increased risk of nephrotoxicity when adalimumab given with TACROLIMUS
- Theophylline: adalimumab possibly increases plasma concentration of THEOPHYLLINE

Aciclovir (continued)

- Increased risk of nephrotoxicity when adalimumab given with CYCLOSPORIN
- Mycophenolate: plasma concentration of aciclovir increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
- Theophylline: aciclovir possibly increases plasma concentration of THEOPHYLLINE

Aclidinium see Retinoids

Acrivastine see Antihistamines

Adenine

NOTE Possibility of interaction with drugs having tendency to impair myocardial conduction
- Aminophylline: anti-arrhythmic effect of adenosine antagonised by AMINOPHYLLINE—manufacturer of adenine advises avoid aminophylline for 24 hours before adenine
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PHENOLCAINE or BOPIVACAINE
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ANTI-ARRHYTHMICS
- Anti-arrhythmics that prolong the QT interval given with other ANTI-ARRHYTHMICS that prolong the QT interval
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with other BETA-BLOCKERS
- Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by CAFFEINE CITRATE—manufacturer of adenine advises avoid caffeine citrate for at least 12 hours before adenine
- Dipyradomol: effect of adenine enhanced and extended by DIPYRIMIDOL (important risk of toxicity)—reduce dose of adenine, see p. 87
- Nicotine: effects of adenine possibly enhanced by NICOTINE
- Theophylline: anti-arrhythmic effect of adenine antagonised by THEOPHYLLINE—manufacturer of adenine advises avoid theophylline for 24 hours before adenine

Adrenergic Neurone Blockers

- Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with ALCOHOL
- Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with GENERAL ANAESTHETICS
- Analgesics: enhanced hypotensive effect when adrenergic neurone blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIS; hypotensive effect of adrenergic neurone blockers antagonised by TRICYCLICS
- Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by HALOPERIDOL; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of
### Appendix 1 Interactions

#### Afatinib (continued)
- Ciclosporin: plasma concentration of afatinib possibly increased by Ciclosporin — manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours.
- Tacrolimus: plasma concentration of afatinib possibly increased by tacrolimus — manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours.

#### Agalsidase Alfa and Beta
- Antiarhythmic: effects of agalsidase alfa and beta possibly inhibited by AMIODARONE and ALCYLAMINES (manufacturers of agalsidase alfa and beta advise avoid concomitant use).
- Antibacterials: effects of agalsidase alfa and beta possibly inhibited by Gentamicin (manufacturers of agalsidase alfa and beta advise avoid concomitant use).
- Antimalarials: effects of agalsidase alfa and beta possibly inhibited by Chloroquine and Hydroxychloroquine (manufacturers of agalsidase alfa and beta advise avoid concomitant use).

#### Alcohol
- Antidepressants: possible increased hypotensive effect when alcohol given with AVANAFIL.
- Beta-blockers: enhanced hypotensive effect when alcohol given with Beta-blockers.
- Calcium-channel blockers: enhanced hypotensive effect when alcohol given with Calcium-channel blockers.
- Diazoxide: increased sedative effect when alcohol given with Diazoxide.
- Disulfiram: disulfiram-like reaction when alcohol given with Disulfiram.
- Dopaminergic: alcohol reduces tolerance to Bromocriptine.
- Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of Lomitapide.
- Nitrovasodilators: enhanced hypotensive effect when alcohol given with Nitrovasodilators.
- Nitrates: enhanced hypotensive effect when alcohol given with Nitrates.
- Paraldehyde: increased sedative effect when alcohol given with Paraldehyde.
- Retinoids: enhanced hypotensive effect when alcohol given with Retinoids.
- Sympathomimetics: increased sedative effects of alcohol possibly enhanced by Methylphenidate.
- Vasodilators: enhanced hypotensive effect when alcohol given with Vasodilators.

#### Alcohol (continued)
- Antiepileptics: alcohol possibly increases CNS side-effects of Carbamazepine.
- Chronic heavy consumption of alcohol possibly reduces plasma concentration of fosphenytoin and Phenytoin.
- Increased sedative effect when alcohol given with Phenobarbital or Primidone.
- Increased risk of blurred vision when alcohol given with Retigabine.
- Antifungals: possibility of disulfiram-like reaction when alcohol given with ketoconazole.
- Effects of alcohol possibly enhanced by griseofulvin.
- Antihistamines: increased sedative effect when alcohol given with Antihistamines.
- Antimuscarnics: increased sedative effect when alcohol given with Hyoscine.
- Antipsychotics: increased sedative effect when alcohol given with Antipsychotics.
- Anxiolytics and Hypnotics: increased sedative effect when alcohol given with Anxiolytics and Hypnotics.
- Avanafil: possible enhanced hypotensive effect when alcohol given with Avanafil.
- Beta-blockers: enhanced hypotensive effect when alcohol given with Beta-blockers.
- Calcium-channel blockers: enhanced hypotensive effect when alcohol given with Calcium-channel blockers.
- Diazoxide: increased sedative effect when alcohol given with Diazoxide.
- Dopaminergic: alcohol reduces tolerance to Bromocriptine.
- Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of Lomitapide.
- Nitrates: enhanced hypotensive effect when alcohol given with Nitrates.
- Paraldehyde: increased sedative effect when alcohol given with Paraldehyde.
- Retinoids: presence of alcohol causes etretinate to be formed from Acitretin (increased risk of teratogenicity in women of child-bearing potential).
- Sympathomimetics: alcohol possibly enhances effects of Methylphenidate.
- Vasodilators: enhanced hypotensive effect when alcohol given with Vasodilators.
Aliskiren
- Beta-blockers: enhanced hypotensive effect when aliskiren given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when aliskiren given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when aliskiren given with CLONIDINE
- Corticosteroids: manufacturer of aliskiren advises avoid concomitant use with CORTICOSTEROIDS
- Cytotoxics: manufacturer of aliskiren advises avoid concomitant use with GLUCOTIDE, DACARBASINE and VINBLASTINE
- Diazoxide: enhanced hypotensive effect when aliskiren given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when aliskiren given with DIURETICS
- Moxonidine: enhanced hypotensive effect when aliskiren given with METHYLDOPA
- Nitrates: enhanced hypotensive effect when aliskiren given with NITRATES
- Vasodilator Antihypertensives: enhanced hypotensive effect when aliskiren given with HYDRALAZINE, MINOXIDIL OF SODIUM NITROPRUSSIDE

Alentuzumab
- Anti-psychotics: avoid concomitant use of cytoxotytics with CLOzapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Alendronic Acid see Bisphosphonates

Alfacalcidol see Vitamins

Alfentanil see Opioid Analgesics

Alfuzosin see Alpha-blockers

Alimemazine see Antihistamines

Aliskiren
- ACE inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ACE INHIBITORS—avoid concomitant use
- Analgesics: hypotensive effect of aliskiren possibly antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS—avoid concomitant use; plasma concentration of aliskiren possibly reduced by INDORAMIN
- Antibacterials: plasma concentration of aliskiren reduced by RIFAMPICIN
- Anticoagulants: increased risk of hyperkalaemia when aliskiren given with HEPARINS
- Antifungals: plasma concentration of aliskiren increased by KETOCONAZOLE; plasma concentration of aliskiren increased by IRACONAZOLE—avoid concomitant use
- Calcium-channel Blockers: Plasma concentration of aliskiren increased by VERAPAMIL
- Cilostazol: plasma concentration of aliskiren increased by CYCLOSPORIN—avoid concomitant use
- Diuretics: aliskiren reduces plasma concentration of FUROSEMIDE; increased risk of hyperkalaemia when aliskiren given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Grapefruit Juice: plasma concentration of aliskiren reduced by GRAPEFRUIT JUICE—avoid concomitant use
- Potassium Salts: increased risk of hyperkalaemia when aliskiren given with POTASSIUM SALTS

Altrinetin see Retinoids

Alkylydring Drugs see Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estraantrum, Ifosfamide, Lomustine, Melphalan, and Thiopeta

Allopurinol
- ACE inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when allopurinol given with ACE INHIBITORS especially in renal impairment
- Aminophylline: allopurinol possibly increases plasma concentration of AMINOPHYLLINE

Allopurinol (continued)
- Antibacterials: increased risk of rash when allopurinol given with AMOXICILLIN, AMPICILLIN OR CO-AMOXICLAV
- Anticoagulants: allopurinol possibly enhances anticoagulant effect of COUMARINS
- Antineoplastic: allopurinol increases plasma concentration of DIDANOSINE (risk of toxicity)—avoid concomitant use
- Azathioprine: allopurinol enhances effects and increases toxicity of AZATHIOPRINE (reduce dose of azathioprine to one quarter of usual dose)
- Ciclosporin: allopurinol possibly increases plasma concentration of CYCLOSPORIN (risk of nephrotoxicity)
- Cytotoxics: avoidance of allopurinol advised by manufacturer of CAPECITABINE; allopurinol enhances effects and increases toxicity of MERCAPTOPURINE (reduce dose of mercaptopurine to one quarter of usual dose)
- Diuretics: increased risk of hypersensitivity when allopurinol given with THIAZIDES AND RELATED DIURETICS especially in renal impairment
- Theophylline: allopurinol possibly increases plasma concentration of THEOPHYLLINE

Almotriptan see 5HT1-receptor Agonists (under HT)

Alogliptin see Antidiabetics

Alpha-adrenoceptor Stimulants see Apraclonidine, Brimonidine, Clonidine, and Methyldopa

Alpha-blockers
- ACE inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when alpha-blockers given with ALCOHOL; increased sedative effect when indoramin given with ALCOHOL
- Aliskiren: enhanced hypotensive effect when alpha-blockers given with ALDESLEUKIN
- Analgesics: enhanced hypotensive effect when alpha-blockers given with GENERAL ANALGESICS
- Anticoagulants: increased risk of first-dose hypotension with post-synaptic alpha-blockers
- Antihistamines: enhanced hypotensive effect when alpha-blockers given with Alpha-blockers
- Antivirals: enhanced hypotensive effect when alpha-blockers given with ALDESLEUKIN
- Antivirals: enhanced hypotensive effect when alpha-blockers given with ANTIVIRALS
- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with CALCIUM-CHANNEL BLOCKERS
- Cardiovascular Drugs: enhanced hypotensive effect when alpha-blockers given with CARDIOVASCULAR DRUGS
- Cardiac Glycosides: prazosin increases plasma concentration of DIGOXIN
- Clonidine: enhanced hypotensive effect when alpha-blockers given with CLONIDINE
### Interactions

<tr>
<td></td>
<td>- Oestrogens: hypotensive effect of alpha-blockers antagonised by Oestrogens</td>
</tr>
<tr>
<td></td>
<td>- Prostaglandins: enhanced hypotensive effect when alpha-blockers given with Prostaglandins</td>
</tr>
<tr>
<td></td>
<td>- Silodosin: enhanced hypotensive effect when alpha-blockers given with Silodosin (avoid alpha-blockers for 4 hours after silodosin) when patient is stable on the alpha blocker initiate silodosin at the lowest possible dose</td>
</tr>
<tr>
<td></td>
<td>- Sympathomimetics: avoid concomitant use of tolazoline with Sympathomimetics (e.g. phenetidine) or Dopamine</td>
</tr>
<tr>
<td></td>
<td>- Tadalafl: enhanced hypotensive effect when alpha-blockers given with Tadalafl when patient is stable on the alpha blocker initiate tadalafl at the lowest possible dose; enhanced hypotensive effect when doxazosin given with Tadalafl - manufacturer of tadalafl advises avoid concomitant use</td>
</tr>
<tr>
<td></td>
<td>- Ulcer-healing Drugs: effects of tolazoline antagonised by Ulcer-healing Drugs and Potassium Salts</td>
</tr>
<tr>
<td></td>
<td>- Vardenafil: enhanced hypotensive effect when alpha-blockers given with Vardenafil when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose — separate doses by 6 hours (except with tamsulosin)</td>
</tr>
<tr>
<td></td>
<td>- Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with Hydrazine, Minoxidil or Sodium Nitroprusside</td>
</tr>

</table>

**Alpha-blockers (post-synaptic)** see Alpha-blockers

**Alprazolam** see Anxiolytics and Hypnotics

**Alprostadil** see Prostaglandins

**Aluminium Hydroxide** see Antacids

**Amanitadine**

- Antimalarials: plasma concentration of amantadine possibly increased by Quinine
- Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with Antipsychotics
- Bupropion: increased risk of side-effects when amantadine given with Buproprion
- Memantine: increased risk of CNS toxicity when amantadine given with Memantine (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by Memantine
- Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with Methyldopa; antiparkinsonian effect of dopaminergics antagonised by Methyldopa
- Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with Tetrabenazine

**Ambrisantan**

- Antibacterials: plasma concentration of ambrisantan possibly increased by Rifampicin

**Ambrissept (continued)**

- Ciclosporin: plasma concentration of ambrisantan increased by Ciclosporin
- Tiazoxide: increased hypotensive effect when alpha-blockers given with Tiazoxide
- Adenosine: increased hypotensive effect when alpha-blockers given with Adenosine; plasma concentration of aminophylline possibly reduced by Adenosine; increased risk of convulsions when patient is stable on the alpha blocker when adenosine is given with aminophylline |

**Antibacterials**

- *Agalasidae Alpha* and Beta: gentamicin possibly inhibits effects of Agalasidae Alpha and Beta (manufacturers of agalasidae alpha and beta advise avoid concomitant use)
- Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by Indomethacin
- Antibacterials: neomycin reduces absorption of PHENOXYMETHYPENCILLIN; increased risk of nephrotoxicity when aminoglycosides given with COLISTIMETHATE SODIUM or POLYMIXINS; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with CAPREOMYCIN or VANCOMYCIN; possible increased risk of nephrotoxicity when aminoglycosides given with CEPHALOSPORINS
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with Contraceptives or Phenindione
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of Acarbose, also severity of gastro-intestinal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with Ambrofixcin
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with Bisphosphonates
- Cardiac Glycosides: gentamicin possibly increases plasma concentration of Digoxin; neomycin reduces absorption of Digoxin
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with Ciclosporin
- Cytotoxics: neomycin possibly reduces absorption of Methotrexate; neomycin reduces bioavailability of Sorafenib; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with Platinum Compounds
- Diuretics: increased risk of otoxicity when aminoglycosides given with Loop Diuretics
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with Mannitol
- Muscle Relaxants: aminoglycosides enhance effects of Non-depolarising Muscle Relaxants and Succinylcholine or Pyridostigmine
- Parasympathomimetics: aminoglycosides antagonise effects of Neostigmine and Pyridostigmine
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with Tacrolimus
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE — see under Typhoid Vaccine in BNF
- Vitamins: neomycin possibly reduces absorption of Vitamin A

**Aminophylline**

- Allopurinol: plasma concentration of aminophylline possibly increased by Allopurinol
- Anaesthetics, General: increased risk of convulsions when aminophylline given with Ketamine
- Anti-arrhythmics: aminophylline antagonises anti-arrhythmic effect of Adenosine — manufacturer of adenosine advises avoid aminophylline for 24 hours before adenosine; plasma concentration of aminophylline increased by Propafenone
- Antibacterials: plasma concentration of aminophylline possibly increased by Clarithromycin and Isoniazid; plasma concentration of aminophylline increased by Erythromycin (also aminophylline may reduce absorption of oral erythromycin); plasma concentration of aminophylline increased by Ciprofl oxacin and Norfloxac in; metabolism of aminophylline accelerated by Rifampicin (reduced plasma concentration); possible increased risk of convulsions when aminophylline given with Quinolones
- Antidepressants: plasma concentration of aminophylline increased by Fluvoxamine (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma-aminophylline concentration); plasma concentration of aminophylline possibly reduced by St John’s Wort
Aminophylline (continued)
- Antiepileptics: metabolism of aminophylline accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (reduced effect); plasma concentration of both drugs reduced when aminophylline given with FOSPHENYT OIN and PHENYTOIN.
- Antifungals: plasma concentration of aminophylline possibly increased by FLUCONAZOLE and KETOCONAZOLE.
- Antivirals: plasma concentration of aminophylline possibly increased by ACICLOVIR and VALACLOVIR; metabolism of amiodarone is accelerated by RITONAVIR (reduced plasma concentration).
- Anxiolytics and Hypnotics: aminophylline possibly reduces effects of BENZODIAZEPINES.
- Caffeine citrate: avoidance of aminophylline advised by manufacturer of CAFFEINE CITRATE.
- Calcium-channel Blockers: plasma concentration of aminophylline possibly increased by CALCUM-CHANNEL BLOCKERS (enhanced effect); plasma concentration of aminophylline increased by DILTIAZEM; plasma concentration of aminophylline increased by VERAPAMIL (enhanced effect).
- Corticosteroids: increased risk of hypokalaemia when aminophylline given with CORTICOSTEROIDS.
- Cytoxics: plasma concentration of aminophylline possibly increased by METHOTREXATE.
- Deferasirox: plasma concentration of aminophylline increased by DEFERASIRAX (consider reducing dose of aminophylline).
- Disulfiram: metabolism of aminophylline inhibited by DISULFIRAM (increased risk of toxicity).
- Diuretics: increased risk of hypokalaemia when aminophylline given with ACETAZOLAMIDE, LOOP DIURETICS or THIAZIDES and RELATED DIURETICS.
- Dopaminergic agonists: increased CNS stimulation when aminophylline given with DOXAPRAM.
- interferons: metabolism of aminophylline inhibited by INTERFERON ALFA and INTERFERON ALFA 2B (consider reducing dose of aminophylline).
- Leukotriene Receptor Antagonists: plasma concentration of aminophylline possibly increased by ZAFIRLUKAST, also plasma concentration of zafirlukast reduced.
- Lithium: aminophylline increases excretion of LITHIUM (reduced plasma concentration).
- Oestrogens: plasma concentration of aminophylline increased by OESTROGENS (consider reducing dose of aminophylline).
- Pentoxifylline: plasma concentration of aminophylline increased by PENTOXIFYLLINE.
- Roflumilast: avoidance of aminophylline advised by manufacturer of ROFLUMILAST.
- Sulfinpyrazone: plasma concentration of aminophylline reduced by SULFINPYRAZONE.
- Symptomametics: manufacturer of aminophylline advises avoid concomitant use with EPEDRINE in children.
- Symptomametics, Beta-2: increased risk of hypokalaemia when aminophylline given with high doses of BETA-2 SYMPTOMAMETICS.
- Ulcer-healing Drugs: metabolism of aminophylline inhibited by CIMETIDINE (increased plasma concentration); absorption of aminophylline possibly reduced by SUCRALFATE (give at least 2 hours apart).
- Vaccines: plasma concentration of aminophylline possibly increased by INFLUENZA VACCINE.

Aminosaliclylates see individual drugs

Aminophylline

NOTE Aminophylline has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.
- Agalactasidase Alfa and Beta: aminophylline possibly inhibits effects of AGALACTASIDASE ALFA AND BETA (manufacturers of agalactasidase alfa and beta advise avoid concomitant use).
- Anaesthetics: Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCaine or ROPIVACAINE.
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when aminophylline given with DISOPYRAMIDE or DROPERIDONE—avoid concomitant use.

Amiodarone

- Anti-arrhythmics (continued)
  - aminophylline increases plasma concentration of FLECAINIDE (halve dose of flecainide).
- Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with piperacillin—ERITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with LEVOFLOXACIN or MOXIFLOXACIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with SULFA-METHOXYAZOLE and TRIMETHOPRIM (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; increased risk of ventricular arrhythmias when amiodarone given with DELAMAND; avoidance of amiodarone advised by manufacturer of FIDAXOMICIN; possible increased risk of ventricular arrhythmias when amiodarone given with TELITROMYCIN.
- Anticoagulants: amiodarone inhibits metabolism of COUMARINS and PHENINDIONE (enhanced anticoagulant effect); amiodarone increases plasma concentration of DABIGATRAN (see under Dabigatran Eteixilate, p. 117).
- Anti-arrhythmics: increased risk of ventricular arrhythmias when amiodarone given with TRICYCLICS—avoid concomitant use.
- Antiepileptics: amiodarone inhibits metabolism of FOSPHENYT OIN and PHENYTOIN (increased plasma concentration).
- Anti-arrhythmics: increased risk of ventricular arrhythmias when amiodarone given with MIZOLASTINE—avoid concomitant use.
- Antimalarials: avoidance of amiodarone advised by manufacturer of ARTEMETHER with LUMESANTRINE (risk of ventricular arrhythmias); avoidance of amiodarone advised by manufacturer of ARTENIMOL with PIPERAQUINE (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with CHLOROQUINE, HYDROXYCHLOROQUINE, MELOQUIN or QUININE—avoid concomitant use.
- Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with TOLERODINE.
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ANTIPSYCHOTICS that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with BENPERIDOL—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with AMIULSPRIDE, DROPERIDOL, HALOPERIDOL, PHENOTHIAZINES, IMIDAZOID or ZUCLOPENTHIOLS—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with SULFUR.
- Anti-arrhythmics: increased risk of ventricular arrhythmias when amiodarone given with ATAZANAVIR; possible increased risk of bradycardia when amiodarone given with DACLATASVIR and SIMEPREVIR (with sofosbuvir)—see under Amiodarone, p. 88; plasma concentration of amiodarone possibly increased by FOSAPRENAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by INDINAVIR—avoid concomitant use; plasma concentration of amiodarone increased by RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with SAAQINUAVIR—avoid concomitant use; possible increased risk of bradycardia when amiodarone given with SOFOSBUVIR—see under Amiodarone, p. 88; avoidance of amiodarone advised by manufacturer of TELAPREVIR (risk of ventricular arrhythmias).
- Antituberculosis: increased risk of ventricular arrhythmias when amiodarone given with ATOMOXETINE.
- Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with BETABLOCKERS; increased myocardial depression when anti-
Amiodarone

- Beta-blockers (continued)
  - arrhythmics given with: ▶ BETA-BLOCKERS; increased risk of ventricular arrhythmias when amiodarone given with
  - SOTALOL—avoid concomitant use
  - Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ▶ DILTIAZEM or ▶ VERAPAMIL
  - Cardiac Glycosides: amiodarone increases plasma concentration of ▶ DIGOXIN (halve dose of digoxin)
  - Ciclosporin: amiodarone possibly increases plasma concentration of ▶ CICLOSPORIN
  - Ciclosporin: plasma concentration of amiodarone possibly increased by a ▶ COBI STATIST—manufacturer of ciclosporin advises avoid concomitant use
  - Colchicine: amiodarone possibly increases risk of ▶ COLCHICINE
  - Cytotoxics: amiodarone possibly increases the plasma concentration of ▶ AFatinib—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with ▶ Bosutinib; amiodarone possibly increases the plasma concentration of ▶ Ibrutinib—reduce dose of ibrutinib (see under ibrutinib, p. 809); avoidance of amiodarone advised by manufacturer of ▶ IDEALIS—possible increased risk of ventricular arrhythmias when amiodarone given with ▶ VANDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ▶ ARSEnic TRIOXide
  - Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with ▶ ACEATAZOLAMIDE, ▶ LOOPER DIURETICS or ▶ THIAZIDES AND RELATED DIURETICS; amiodarone increases plasma concentration of ▶ EPLERENONE (reduce dose of eplerenone)
  - Fingerlind: possible increased risk of bradycardia when amiodarone given with ▶ FINGERLIND
  - Grapefruit Juice: plasma concentration of amiodarone increased by ▶ GRAPEFRUIT JUICE
  - Ibradina: increased risk of ventricular arrhythmias when amiodarone given with ▶ I布拉DINA
  - Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with ▶ SIMVASTATIN (see under simvastatin, p. 181); separating administration from amiodarone by 12 hours advised by manufacturer of ▶ LOMITAPIDE
  - Lithium: manufacturer of amiodarone advises avoid concomitant use with ▶ LITHIUM (risk of ventricular arrhythmias)
  - Orlistat: plasma concentration of amiodarone possibly decreased by ▶ ORLSTAT
  - Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with ▶ PENTAMIDINE ISETIONATE—avoid concomitant use
  - Thyroid Hormones: amiodarone can affect serum concentrations of ▶ THYROID HORMONES—monitor thyroid function closely
  - Ulcer-healing Drugs: plasma concentration of amiodarone increased by ▶ CIMETIDINE

Amisulpride see Antipsychotics

Amiriptyline see Antidepressants, Tricyclic

Amiodipine see Calcium-channel Blockers

Amoxicillin see Penicillins

Amphotericin (continued)

- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with ▶ CICLOSPORIN
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with ▶ CORTICOSTEROIDS—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with ▶ ARSEnic TRIOXide
- Diuretics: increased risk of hypokalaemia when amphotericin given with ▶ LOOP DIURETICS or ▶ THIAZIDES AND RELATED DIURETICS
- Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with ▶ PENTAMIDINE ISETIONATE
- Sodium Stibogluconate: possible increased risk of arrhythmias when amphotericin given after ▶ SODIUM STIBOGLUCONATE—manufacturer of sodium stibogluconate advises giving 14 days apart
- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with ▶ TACROLIMUS

Anabolics see Anabolic Steroids

Anabolic Steroids

- Anti-cogulants: anabolic steroids enhance anticoagulant effect of ▶ OUDARINS and ▶ PHENINDIONE
- Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of ▶ ANTI-DIABETICS

Anaesthetics, General

NOTE See also Surgery and Long-term Medication, under General Anaesthesia in BNF

- ACE inhibitors: enhanced hypotensive effect when general anaesthetics given with ▶ ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with ▶ ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with ▶ ALPHA-BLOCKERS
- Naphthyline: increased risk of convulsions when ketamine given with ▶ AMINOPHYLINE
- Analgesics: metabolism of etomidate inhibited by ▶ Fentanyl (consider reducing dose of etomidate); effects of thiopental possibly enhanced by ▶ ASPRIN; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by ▶ OPIDN ALGASECS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with ▶ ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: increased risk of hepatotoxicity when isoflurane given with ▶ SULFAZID—effects of thiopental enhanced by ▶ SULFONAMIDES; hypersensitivity-like reactions can occur when general anaesthetics given with intravenous VANCOMYCIN
- Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with ▶ TRICYCLICs
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with ▶ ANTI-PSYCHOTICs; effects of thiopental enhanced by ▶ DROPERIDOL
- Anxiety and Hypnotics: increased sedative effect when general anaesthetics given with ▶ ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with ▶ BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with ▶ CALCIUM-CHANNEL BLOCKERS; general anaesthetics enhance hypotensive effect of ▶ VERAPAMIL (also AV delay)
- Clonidine: enhanced hypotensive effect when general anaesthetics given with ▶ CLONIDINE
- Cytotoxics: nitros oxide increases antifolate effect of ▶ METHOTREKATE—avoid concomitant use
- Diazoxide: enhanced hypotensive effect when general anaesthetics given with ▶ DIAZOXIDE
- Diuretics: enhanced hypotensive effect when general anaesthetics given with ▶ DIURETICS
- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with ▶ CO-BENELDopa, ▶ CO-CARELDOPO or ▶ LEVODOPA
Anaesthetics, General (continued)

- Dopram: increased risk of arrhythmias when volatile liquid general anaesthetics given with
- DOXAPRAM (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
- Memantine: increased risk of CNS toxicity when ketamine given with MEMANTINE (manufacturer of memantine advises avoid concomitant use)
- Methyldopa: enhanced hypotensive effect when general anaesthetics given with METHYLDOPA
- Metoclopramide: effects of thiopental enhanced by METOCLOPRAMIDE
- Moxonidine: enhanced hypotensive effect when general anaesthetics given with MOXONIDINE
- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with
- SUXAMETHONIUM; volatile liquid general anaesthetics enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; ketamine enhances effects of ATRACURIUM
- Nitrates: enhanced hypotensive effect when general anaesthetics given with NITRATES
- Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with OXYTOCIN
- Phosphodiesterase Type-3 inhibitors: avoid concomitant use with SYMPATHOMIMETICS (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with ADRENERGIC NEURONE BLOCKERS
- Theophylline: increased risk of convulsions when ketamine given with THEOPHYLLINE
- Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with HYDRALAZINE, MINOXIDIL or SODIUM NITRITOPRUSSIDE

Anaesthetics, General (Intravenous) see Anaesthetics, General

Anaesthetics, General (volatile liquids) see Anaesthetics, General

Anaesthetics, Local see Bupivacaine, Chloroprocaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine

Anagrelide

- Clolstol: manufacturer of anagrelide advises avoid concomitant use with CLOSTAZOL
- Prostaglandin Type-E1 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with ENOXIMONE and MILRINONE

Anakinra

- Cytotokins: avoid concomitant use of anakinra with LUMINUMAB, CERTOLIZUMAB PEGOL, GOLIMUMAB or INFILIXIMAB
- Etanercept: avoid concomitant use of anakinra with ETANERCEPT
- Vaccines: risk of generalised infections when anakinra given with live VACCINES—avoid concomitant use

Analgescics see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists (continued)

- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALPHA-BLOCKERS
- Anagrelide: General; enhanced hypotensive effect when angiotensin-II receptor antagonists given with GENERAL ANAESTHETICS
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDS, also hypotensive effect antagonised
- Antibacterials: plasma concentration of losartan and its active metabolite reduced by RIFAMPICIN; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with TRIMETHOPRIM
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with HEPARINS
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ANTIPSYCHOTICS
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CALCIUM-CHANNEL BLOCKERS
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with CICLOSPORIN
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by CORticosteroids
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with DIURETICS; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Lithium: angiotensin-II receptor antagonists reduce excretion of LITHIUM (increased plasma concentration)
- Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with NITRATES
- Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by OESTROGENS
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with KALCIUM SALTS
- Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with PROSTAGLANDINS
- Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with TACROLIMUS
- Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with HYDRALAZINE, MINOXIDIL or SODIUM NITRITOPRUSSID

Antacids

NOTE Antacids should preferably not be taken at the same time as other drugs since they may impair absorption
- ACE inhibitors: antacids possibly reduce absorption of ACE INHIBITORS; antacids reduce absorption of CAPTOPRIL, ENALAPRIL and FOSINOPRIL

BNF 70 Appendix 1 Interactions 1145
Antacids (continued)

Analgesics: antacids possibly reduce absorption of
ACETAMIN; alkaline urine due to some antacids increases excretion of ASPIRIN.

Antihelmintics: sodium bicarbonate increases the excretion of DIETHYLCARBAMAZINE.

Antibacterials: antacids reduce absorption of AZITHROMYCIN, CEFACLOR, CIPROFLOXACIN, ISONIAZID, LEVOFLOXACIN, MOXIFLOXACIN, NORFLOXACIN, OFLOXACIN, RIFAMPICIN and TETRACYCLINES; avoid concomitant use of antacids with METHENAMINE; oral magnesium salts (as magnesium trisilicate) reduce absorption of NITROFURANTOIN.

Antiepileptics: antacids reduce absorption of PHENYTOIN, GABAPENTIN and PHENYTOIN.

Antifungals: antacids reduce absorption of ITRACAZOLE and KETOCONAZOLE.

Antihistamines: antacids reduce absorption of FEXOFENADINE.

Antimalarials: antacids reduce absorption of CHLOROQUINE and HYDROXYCHLOROQUINE; oral magnesium salts (as magnesium trisilicate) reduce absorption of PROGUANIL.

Antipsychotics: antacids reduce absorption of PHENOTHIAZINES and SULFURIDE.

Antivirals: antacids reduce absorption of AZATAZANAVIR (give at least 2 hours before or 1 hour after antacids); aluminium hydroxide reduces absorption of DOLUTEGRAVIR—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium salts reduce absorption of DOLUTEGRAVIR—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium hydroxide reduces absorption of ELVITEGRAVIR (give at least 4 hours apart); oral magnesium salts reduce absorption of RALTEGRAVIR (give at least 4 hours apart); aluminium hydroxide reduces plasma concentration of RALTEGRAVIR—manufacturer of raltegravir advises avoid concomitant use; oral magnesium salts reduce plasma concentration of RALTEGRAVIR—manufacturer of raltegravir advises avoid concomitant use; manufacturer of rilpivirine advises give at least 2 hours before or 4 hours after RILPIVIRINE; antacids reduce absorption of TIPRANAVIR (give at least 2 hours apart)

Bile Acids: antacids possibly reduce absorption of BILE ACIDS.

Bisphosphonates: antacids reduce absorption of BISPHOSPHONATES.

Cardiac Glycosides: antacids possibly reduce absorption of DIGOXIN.

Corticosteroids: antacids reduce absorption of DEFLAZACORT.

Cytotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of ESTRAMUSTINE—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of BOSUTINIB; antacids possibly reduce plasma concentration of ERLOTINIB—give antacids at least 4 hours before or 2 hours after erlotinib.

Deferasirox: antacids containing aluminium possibly reduce absorption of DEFERASIROX (manufacturer of deferasirox advises avoid concomitant use)

Diflunisal: antacids possibly reduce absorption of DIFLUNISAL.

Drotrecogin: antacids possibly reduce absorption of DROTRECOGIN.

Eltrombopag: antacids reduce absorption of ELTROMBOPAG (give at least 4 hours apart)

Folates: antacids possibly reduce absorption of FOLIC ACID (manufacturer of folinic acid advises give at least 2 hours apart)

Iron Salts: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral IRON SALTS

Lipid-regulating Drugs: antacids reduce absorption of ROSUVASTATIN.

Lithium: sodium bicarbonate increases excretion of LITHIUM (reduced plasma concentration)

Myophosphonate: antacids reduce absorption of MYOPHOSPHONATE.

Penicillamine: antacids reduce absorption of PENICILLAMINE.

Polyethylene Sulfonate Resin: risk of intestinal obstruction when aluminium hydroxide given with POLYSTYRENE.

Antacids

Polystyrene Sulfonate Resins (continued)

SULFONATE RESINS; risk of metabolic alkalosis when oral magnesium salts given with POLYSTYRENE SULFONATE RESINS

Riociguat: antacids reduce absorption of RIOCIQUAT (give at least 2 hours before or 1 hour after riociguat).

Symptomlimiters: aluminium hydroxide possibly increases absorption of PSEUDOEPHEDRINE.

Thyroid Hormones: antacids possibly reduce absorption of LETHYLOXYRHODIZINE.

Ulcerc Healing Drugs: antacids possibly reduce absorption of LANSOPRAZOLE.

Antazoline see Antihistamines

Antithrombotics see Individual drugs

Antithrombin see Immunoglobulins

Anti-arrhythmics see Adenosine, Amiodarone, Disopyramide, Dronedarone, Flecaïnine, Lidocaïne, and Propafenone

Antibacterials see Individual drugs

Antibiotics (cytotoxic) see Bleomycin, Doxorubicin, Epirubicin, Idrabucin, Mitomycin, Mitoxantrone, and Pixaantrone

Anticoagulants see Apixaban, Argatroban, Bivalirudin, Coumarins, Dabigatran, Danaparoid, Fondaparinux, Heparins, Phenindione, and Rivaroxaban.

Antidepressants see Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John’s Wort; Venlafaxine.

Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine.

Antidepressants, SSRIs

Note see also Dapoxetine

Alcohol: sedative effects possibly increased when SSRIs given with ALCOHOL.

Aminophylline: fluvoxamine increases plasma concentration of AMINOPHYLLINE (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma-aaminophylline concentration)

Anaesthetics, Local: fluvoxamine inhibits metabolism of ROPIVACAINE—avoid prolonged administration of ropivacaine.

Analgesics: increased risk of bleeding when SSRIs given with NSAIDS or ASPIRIN; possible increased serotonergic effects when SSRIs given with FENTANYL; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of METHADONE; increased risk of CNS toxicity when SSRIs given with TRAMADOL.

Anti-arrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with AMIODARONE (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with DISOPYRAMIDE (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with DRONEDARONE (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of FLECAINIDE; fluoxetine and paroxetine possibly inhibit metabolism of PROPafenONE.

Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with intravenous AMIODARONE (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with TELITHROMYCIN (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with TELITHROMYCIN.

Anticoagulants: SSRIs possibly enhance anticoagulant effect of COUMARINS; possible increased risk of bleeding when SSRIs given with DABIGATRAN.

Antidepressants: avoidance of fluvoxamine advised by manufacturer of REBOXETINE; possible increased serotoninergic effects when SSRIs given with DUOXETINE; fluvoxamine inhibits metabolism of DUOXETINE—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not
Antidepressants, SSRI

- Antidepressants (continued)

be started until 2 weeks after stopping • MAOI, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by • MAOI (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with • MOLOBEMIDE, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start • MOLOBEMIDE for at least 1 week after stopping fluoxetine do not start • MOLOBEMIDE for 5 weeks; increased serotonergic effects when SSRIs given with • ST JOHN’S WORT—avoid concomitant use; fluvoxamine inhibits metabolism of • AGOMELATINE (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with • SSRIs increase plasma concentration of some • TRICYCLICS; manufacturer of citalopram and escitalopram advises avoid concomitant use with • TRICYCLICS (risk of ventricular arrhythmias)

- Antiepileptics: SSRIs antagonise anticonvulsant effect of • ANTIPELIEPTICS (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of • CARBAMAZEPINE; fluoxetine and fluvoxamine increase plasma concentration of • FOSPHENTYNO; plasma concentration of sertraline possibly reduced by • PHENYTOIN and • PHENOTYNO, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of paroxetine reduced by • FOSPHENTYNO, • PHENOBARBITAL, • PHENYTOIN and • PRIMIDONE; fluoxetine and fluvoxamine increase plasma concentration of • PHENOTYNO

- Antifungals: plasma concentration of paroxetine possibly increased by • TERBINAFINE

- Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with • MIZOLASTINE (risk of ventricular arrhythmias); antihistaminic effect of SSRIs possibly antagonised by • CYPROHEPTADINE

- Antimalarials: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and • ARTEMIL WITH PIPERAZINE; possible increased risk of ventricular arrhythmias; citalopram or escitalopram given with • ARTEMIL WITH LUMEFANTRINE—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with • ARTEMIL WITH PIPERAZINE—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with • CHLOROQUINE; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with • QUININE—avoid concomitant use

- Antipsychotics: citalopram increases plasma concentration of • DARIFENACIN and • PROCYCLIDINE

- Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of • DROPERIDOL (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with • HALOPERIDOL (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of • CLOzapine, • HALOPERIDOL and • RISPERIDONE; fluvoxamine possibly increases plasma concentration of • ASENAPINE and • HALOPERIDOL; paroxetine inhibits metabolism of • PERPHENAZINE (reduce dose of phenerazine); fluoxetine and paroxetine possibly increase plasma concentration of • ARPIpipRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by • ASENAPINE; fluvoxamine, paroxetine and sertraline increase plasma concentration of • CLOzapine; citalopram possibly increases plasma concentration of • CLOzapine (increased risk of toxicity); fluoxetine increases plasma concentration of • OLANZAPINE; manufacturer of citalopram and escitalopram advises avoid concomitant use with • PHENOTYNO (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with • PIMOZIDE (risk of ventricular arrhythmias); SSRIs possibly increase plasma concentration of • PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of • RISPERIDONE (increased risk of toxicity)

- Anti-HIV: plasma concentration of paroxetine and sertraline possibly reduced by • DURANAVIR; plasma concentration of SSRIs possibly increased by • RITONAVIR; plasma concentration of paroxetine possibly reduced by • RITONAVIR

- Anticholinergics: fluoxetine increases plasma concentration of • ALPRAZOLAM; fluoxetine increases plasma concentration of • PHENOBARBITAL, also plasma concentration of fosphenytoin increases plasma concentration of some • BENZODIAZEPINES; fluoxetine increases plasma concentration of • MELATONIN—avoid concomitant use; sedative effects possibly increased when sertraline given with • ZOLPIDEM

- Atomoxetine: possible increased risk of convulsions when antidepressants given with • ATOMOXETINE; fluoxetine and paroxetine possibly inhibit metabolism of • ATOMOXETINE

- Beta-blockers: citalopram and escitalopram increase plasma concentration of • METOPROLOL; paroxetine possibly increases the plasma concentration of • METOPROLOL—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of • PROPRANOLOL; • PROPRANOLOL increases risk of ventricular arrhythmias when citalopram given with • SOTALOL—avoid concomitant use; manufacturer of escitalopram advises avoid concomitant use with • SOTALOL (risk of ventricular arrhythmias)

- Buproprion: plasma concentration of citalopram possibly increased by • BUPROPION

- Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of • NIFEDIPINE (increased plasma concentration)

- Clopidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of • CLOPIDOGREL

- Dopaminergic: possible increased risk of serotonergic effects when SSRIs given with • DAPoxetine (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)

- Dopaminergic: increased risk of CNS toxicity when SSRIs given with • RASAGLINE; fluoxetine should not be started until 2 weeks after stopping • RASAGLINE; fluoxetine should not be started until 2 weeks after stopping • RASAGLINE, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; avoidance of citalopram and escitalopram when citalopram and escitalopram given with • CHLOROQUINE; increased risk of ventricular arrhythmias when citalopram or escitalopram given with • QUININE—avoid concomitant use

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)

- Dopaminergic: increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with • SELEGILINE (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine or sertraline given with • SELEGILINE (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline)

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)

- Dopaminergic: increased risk of toxicity when SSRIs given with • CLOZAPINE, • PERPHENAZINE; • SELEGILINE possibly increased by • CLOZAPINE (increased risk of toxicity)
Antidepressants, SSRI (continued)

- Lipid-regulating Drugs: separating administration from fluoxetine and fluvoxamine by 12 hours advised by manufacturer of LOMITAPIDE
- Lithium: increased risk of CNS effects when SSRIs given with lithium (lithium toxicity reported)
- Methylthioninium: risk of CNS toxicity when SSRIs given with methylthioninium (avoid concomitant use for up to 4 hours after administration)
- Metoclopramide: CNS toxicity reported when SSRIs given with METOCLOPRAMIDE
- Muscle Relaxants: fluvoxamine increases plasma concentration of TIZANIDINE (increased risk of toxicity)—avoid concomitant use
- Parasymptomimetics: paroxetine increases plasma concentration of GALANTAMINE
- Pentamidine isetionate: manufacturer of cilostopram and escitalopram avoids concomitant use with PENTAMIDINE ISETIONATE (risk of ventricular arrhythmias)
- Pirfenidone: fluvoxamine increases plasma concentration of PIRFENIDONE—manufacturer of pirfenidone advises avoid concomitant use
- Pomalidomide: fluvoxamine increases plasma concentration of POMALIDOMIDE
- Ranolazine: paroxetine increases plasma concentration of RANOLAZINE
- Roflumilast: fluvoxamine inhibits the metabolism of ROFLUMILAST
- Sympathomimetics: metabolism of SSRIs possibly inhibited by METHYLPHENIDATE
- Theophylline: fluvoxamine increases plasma concentration of THEOPHYLLINE (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma— Theophylline concentration)
- Ticagrelor: possible increased risk of bleeding when cilostopram, paroxetine or sertraline given with TICAGRELOR
- Ulcer-healing Drugs: plasma concentration of cilostopram, escitalopram and sertraline increased by Cimetidine; fluvoxamine possibly increases plasma concentration of Lansoprazole; plasma concentration of escitalopram increased by Omeprazole

Antidepressants, SSRI (related) see Duloxetine and Venlafaxine

Antidepressants, Tricyclic

- Adrenergic Neurone Blockers: tricyclics antagonise hypothetensive effect of ADRENERGIC NEURONE BLOCKERS
- Alcohol: increased sedative effect when tricyclics given with ALCOHOL
- Alpha-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of APRACLONIDINE and BRIMONIDINE
- Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with GENERAL ANAESTHETICS
- Analgesics: increased risk of CNS toxicity when tricyclics given with TRAMADOL—side effects possibly increased when tricyclics given with NEFOPAM; sedative effects possibly increased when tricyclics given with OPIOID ANALGESICS
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with DISOPYRAMIDE or FLECAINIDE; avoidance of tricyclics advised by manufacturer of DRONEDARONE (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with PRPAFENONE
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with MOXIFLOXACIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics that prolong the QT interval given with DELAMANID; possible increased risk of ventricular arrhythmias when tricyclics given with TELITHROMYCIN
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of COUMARINS
- Antidepressants: avoidance of tricyclics advised by manufacturer of CITOLAPRAM and ESCITALOPRAM (risk of ventricular arrhythmias); possible increased serotonergic

Antidepressants, Tricyclic

- Antidepressants (continued)
  - effects when amitriptyline or clomipramine given with DULOXETINE; increased risk of hypertension and CNS excitation when tricyclics given with MAOIS, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (5 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start MOLOBEMIDE for at least 4 weeks; plasma concentration of some tricyclics increased by SSRIs; plasma concentration of amitriptyline reduced by ST JOHN’S WORT
  - Antiepileptics: tricyclics antagonise anticonvulsant effect of ANTIEPILEPTICS (convulsive threshold lowered); metabolism of tricyclics accelerated by CARBAMAZEPINE (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by FOSPHENYTOIN and PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
  - Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by FLUCONAZOLE; plasma concentration of tricyclics possibly increased by TERTIBAFINE
  - Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with ANTHISTAMINES
  - Antimalarias: avoidance of antidepressants advised by manufacturer of ARTEMETHER with LUMEFANTRINE and ARTEMINIL with PIPERAQUIN
  - Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with ANTIMUSCARINICS
  - Antipsychotics: avoidance of tricyclics advised by manufacturer of DROPERIDOL, FLUPHENAZINE, HALOPERIDOL, SULPIRIDE and ZUCLOPENTHIXOL (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with CLOZAPINE; increased risk of antimuscarinic side-effects when tricyclics given with PHENOTHIAZINES; possible increased risk of ventricular arrhythmias when tricyclics given with RISPERIDONE
  - Antivirals: plasma concentration of tricyclics possibly increased by RITONAVIR; increased risk of ventricular arrhythmias when tricyclics given with SQUINAVIR—avoid concomitant use
  - Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with ANXIOLYTICS AND HYPNOTICS
  - Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with ATOMOXETINE; possible increased risk of convulsions when antidepressants given with ATOMOXETINE
  - Beta-blockers: plasma concentration of imipramine increased by LABELALOL and PROPRANOLOL; increased risk of ventricular arrhythmias when tricyclics given with SOTALOL
  - Bupropion: plasma concentration of tricyclics possibly increased by BUPROPION (possible increased risk of convulsions)
  - Calcium-channel Blockers: plasma concentration of imipramine increased by DILTIAZEM and VERAPAMIL; plasma concentration of tricyclics possibly increased by DILTIAZEM and VERAPAMIL
  - Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with CANNABIS EXTRACT
  - Clonidine: tricyclics antagonise hypertensive effect of CLONIDINE, also increased risk of hypertension on clonidine withdrawal
  - Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with ARSENIC TRIOXIDE
  - Dapoxetine: possible increased risk of serotonin effects when tricyclics given with DAPoxetine (manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
  - Disulfiram: metabolism of tricyclics inhibited by DISULFIRAM (increased plasma concentration); concomitant amitriptyline reported to increase DISULFIRAM reaction with alcohol
  - Diuretics: increased risk of postural hypotension when tricyclics given with diuretics
  - Dopaminergics: caution with tricyclics advised by manufacturer of ENTACAPONE; increased risk of CNS toxicity
Antidepressants, Tricyclic (related) (continued)

» Antimuscarnics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with

ANTIUSCARNICS

» Antivirals: plasma concentration of trazodone increased by

Ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with

SAQUINAVIR—avoid concomitant use; plasma concentration of trazodone possibly increased by TELAPREVIR

» Anticholinergics and hypnotics: increased sedative effect when tricyclic-related antidepressants given with ANTIUSCARNICS AND HYPNOTICS

» Atomoxetine: possible increased risk of convulsions when antidepressants given with

ATOMOXETINE

» Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with

DIAZoxide

» Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of

NITRATES (failure to dissolve under tongue owing to dry mouth)

» Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with

HYDRAZINE or SODIUM NITROPRUSIDE

Antidiabetics

NOTE Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when linsidetate is not administered, to minimise possible interference with absorption

NOTE Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by ACE INHIBITORS

» Alcohol: hypoglycaemic effect of antidiabetics enhanced by

ALCOHOL; increased risk of lactic acidosis when metformin given with

ALCOHOL

» Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by ANABOLIC STEROIDS

» Analgesics; effects of sulfonylureas possibly enhanced by

NEOcyn; lixisenatide possibly reduces the absorption of

PARACETAMOL when given 1 to 4 hours before paracetamol

Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by DISOPYRAMIDE

» Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by

NEOcyn; also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by

CLARITHROMYCIN; effects of glibenclamide possibly enhanced by

NORFLOXACIN; plasma concentration of canagliflozin and nateglinide reduced by

RIFAMPICIN; effects of linagliptin possibly reduced by

RIFAMPICIN; hypoglycaemic effect of repaglinide possibly antagonised by

RIFAMPICIN; effects of sulfonylureas enhanced by

CHLORAPMENIC; metabolism of tolbutamide accelerated by

RIFAMPICIN (reduced effect); metabolism of sulfonylureas possibly accelerated by

RIFAMPICIN (reduced effect); effects of sulfonylureas rarely enhanced by

SULFONAMIDES and TRIMETHOPRIM; hypoglycaemic effect of sulfonylureas possibly enhanced by

TETRACYCLINES; hypoglycaemic effect of repaglinide possibly enhanced by

TRIMETHOPRIM—manufacturer advises avoid concomitant use

» Anticoagulants: exenatide possibly enhances anticoagulant effect of

WARFARIN; hypoglycaemic effect of sulfonylureas possibly enhanced by

COUMARINS, also possible changes to anticoagulant effect

» Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by

MAOIS; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by

MAOIS

» Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with

PIGGLITAZONE

Antiepileptics: tolbutamide transiently increases plasma concentration of

FOSPHENITOIN and PHENYTOIN (possibility of toxicity); plasma concentration of glibenclamide possibly reduced by

TOPIRAMATE; plasma concentration of metformin possibly increased by

TOPIRAMATE

» Antifungals: plasma concentration of pioglitazone, saxagliptin and tolbutamide increased by

KETOCONAZOLE; plasma concentration of
Antidiabetics (continued)
- Antiarrhythmics: reduction in plasma concentration of acarbose; may be avoided concomitantly or a separate dose given
- Antiarrhythmics: reduced plasma concentration of acarbose; may be avoided concomitantly or a separate dose given
- Antiarrhythmics: increased risk of severe arrhythmias in patients treated with antiarrhythmics; do not use concomitantly

Antidiabetics (continued)
- Orlistat: avoidance of concomitant use with ORLISTAT
- Pancreatin: increased risk of severe diarrhea; do not use concomitantly
- Progestogens: hypoglycaemic effect of antidiabetes antagonised by PROGESTOGENS
- Sulfinpyrazone: effects of sulfinpyrazone antagonised by SULFINPYRAZONE
- Teriflunomide: plasma concentration of teriflunomide increased by TERIFLUNOMIDE
- Testosterone: hypoglycaemic effect of antidiabetes antagonised by TESTOSTERONE
- Ulcer-healing Drugs: excretion of metformin reduced by Cimetidine (increased plasma concentration); hypoglycaemic effect of sulfinpyrazone antagonised by Cimetidine

Antiepileptics
- Carbamazepine, Eslicarbazepine, Ethosuximide, Fosphenytoin, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenoxybutil, Phenyltoin, Pregabalin, Primidone, Reticaine, Rufinamide, Sodium valproate, Stiripentol, Tiagabine, Topiramate, Valproic acid, Vigabatin, and Zonisamide

Antifungals
- Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Fluconosine; Fluorosine; Griseofulvin; Micafungin; Terbinafine

Antifungals, Imidazole
- Alcohol: possibility of disulfiram-like reaction when ketoconazole given with ALCOHOL
- Aliskiren: increased plasma concentration of ALISKIREN
- Alpha-blockers: ketoconazole possibly increases plasma concentration of ALFLOZOSIN; ketoconazole increases plasma concentration of TAMSULOSIN
- Aminophylline: ketoconazole possibly increases plasma concentration of AMINOPHYLLINE
- Analgesics: ketoconazole inhibits metabolism of BUPRENORPHINE (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when ketoconazole given with METHADONE—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of OXYCODONE; manufacturer of ketoconazole advises avoid concomitant use with PARACETAMOL
- Antacids: absorption of ketoconazole reduced by ANTACIDS
- Antihelmintics: increased plasma concentration of PRAZIQUANTEL
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with DISOPYRAMIDE—avoid concomitant use; ketoconazole increases plasma concentration of DRONEDARONE—avoid concomitant use
- Antibacterial: manufacturer of ketoconazole advises avoid concomitant use with CLARITHROMYCIN in severe renal impairment; metabolism of ketoconazole accelerated by RIFAMPICIN (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; ketoconazole increases plasma concentration of BEDAQUILINE—avoid concomitant use if ketoconazole given for more than 14 days; avoidance of ketoconazole advised by manufacturer of FIDASOMICIN; plasma concentration of ketoconazole possibly reduced by ISONIAZID; ketoconazole increases the plasma concentration of TELITHROMYCIN—avoid in severe renal and hepatic impairment
- Anticoagulants: ketoconazole increases plasma concentration of APIKABAN—manufacturer of apixaban advises avoid concomitant use; miconazole enhances anticoagulant effect of COUMARINS (miconazole oral gel and possibly vaginal and topical formulations absorbed); ketoconazole enhances anticoagulant effect of COUMARINS; ketoconazole increases plasma concentration of DARIGABATAN and RIVAROXABAN—avoid concomitant use
- Antidepressants: avoidance of imidazoles advised by manufacturer of REBOXETINE; ketoconazole increases plasma concentration of MIRTAZAPINE
- Antiinfectives: miconazole enhances hypoglycaemic effect of GLICLIZIDE and GLIPIZIDE—avoid concomitant use;
Avanafil: increased plasma concentration of 
• PLOGLITAZONE, SAXAGLIPTIN and TOLBUTAMIDE; miconazole increases plasma concentration of 
• SULFONLURAEs

Antiepileptics: miconazole possibly increases plasma concentration of CARBABAZEPINE; plasma concentration of ketonazole possibly reduced by CARBABAZEPINE, also plasma concentration of carbamazepine possibly increased; plasma concentration of ketonazole reduced by:
• FOSPHENYTOIN and PHENYTOIN; miconazole enhances anticonvulsant effect of FOSPHENYTOIN and PHENYTOIN (plasma concentration of fosphenytoin and phenytoin increased); ketonazole increases plasma concentration of PERAMPANO

Antifungals: idazoxane possibly antagonise effects of AMPHOTERICIN

Antihistamines: idazoxane possibly inhibit metabolism of:
• MIZOLASTINE (avoid concomitant use)

Antimalarials: avoidance of idazoxane advised by manufacturer of:
• ARTEMETHER WITH LUMEFANTRINE; avoidance of idazoxane advised by manufacturer of:
• ARTEMINMOL WITH PIPERAQUIN (possible risk of ventricular arrhythmias); ketonazole increases plasma concentration of MELDOQUINE

Antimuscarnics: absorption of ketonazole reduced by ANTIMUSCARINICS; ketonazole increases plasma concentration of DARIFENACIN—avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketonazole given with FESOTERODINE—consult fesoterodine product literature; ketonazole increases plasma concentration of OXYBUTYNIN; ketonazole increases plasma concentration of SOLIFENACIN—see under Solifenacin, p. 670; avoidance of ketonazole advised by manufacturer of:
• TOLTERODINE

Antipsychotics: ketonazole inhibits metabolism of:
• ARIPIPRAZOLE (reduce dose of aripiprazole); ketonazole increases plasma concentration of Lurasidone—avoid concomitant use; increased risk of ventricular arrhythmias when idazoxane given with PIMOZIDE—avoid concomitant use; idazoxane possibly increase plasma concentration of QUIETAPINE—manufacturer of quetiapine advises avoid concomitant use

Antivirals: ketonazole increases plasma concentration of:
• BOCEPREVIR; ketonazole increases the plasma concentration of:
• DACLATASVIR (see under Daclatasvir, p. 544); plasma concentration of both drugs increased when ketonazole given with DARUNAVIR; plasma concentration of ketonazole reduced by:
• EFAVIRENZ; plasma concentration of ketonazole increased by RALTEGRAVIR (also possibly fosamprenavir possibly increased); ketonazole increases plasma concentration of:
• INDINAVIR and MARAVIROC (consider reducing dose of indinavir and maraviroc); plasma concentration of ketonazole reduced by:
• NEVIRAPINE—avoid concomitant use; plasma concentration of ketonazole increased by:
• RITONAVIR (reduce dose of ketonazole); idazoxane possibly increase plasma concentration of SAQUINAVIR; ketonazole increases plasma concentration of:
• SAQUINAVIR—manufacturer of ketonazole advises avoid concomitant use; avoidance of ketonazole advised by manufacturer of:
• SIMPREVIR; plasma concentration of both drugs possibly increased when ketonazole given with TELAPREVIR (increased risk of ventricular arrhythmias)—reduce dose of ketonazole

Antioxidants and Hypotensives: ketonazole increases plasma concentration of:
• ALPRAZOLAM—manufacturer of ketonazole advises avoid concomitant use; ketonazole increases plasma concentration of:
• MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam); ketonazole increases plasma concentration of ZOLPIDEM

Apresitant: ketonazole increases plasma concentration of:
• APREPIVIT

Avanafil: ketonazole increases plasma concentration of:
• AVANAFIL—avoid concomitant use

Antifungals, Imidazole (continued)

• Beta-blockers: ketonazole possibly increases plasma concentration of NADOLOL

Bosentan: ketonazole increases plasma concentration of:
• BOSENTAN

Calcium-channel Blockers: ketonazole inhibits metabolism of:
• FELODIPINE (increased plasma concentration)—manufacturer of ketonazole advises avoid concomitant use; avoidance of ketonazole advised by manufacturer of:
• LERANIDIPINE; ketonazole possibly inhibits metabolism of:
• DIHYDROPRIDINIDES (increased plasma concentration)

Cannabis Extract: ketonazole increases plasma concentration of CANNABIS EXTRACT

Ciclosporin: ketonazole inhibits metabolism of:
• CICLOSPORIN (increased plasma concentration); miconazole possibly inhibits metabolism of:
• CICLOSPORIN (increased plasma concentration)

Cilostazol: ketonazole increases plasma concentration of:
• CILOSTAZOL (see under Cilostazol, p. 206)

Cinacalcet: ketonazole inhibits metabolism of CINACALCET (increased plasma concentration)

Clopidogrel: ketonazole possibly reduces antiplatelet effect of:
• CLOPIDOGREL

Cobicistat: plasma concentration of ketonazole possibly increased by:
• COBICISTAT—manufacturer of cobicistat advises reduce dose of ketonazole

Colchicine: ketonazole possibly increases risk of:
• COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Corticosteroids: ketonazole possibly inhibits metabolism of:
• CORTICOSTEROIDS; ketonazole increases the plasma concentration of inhaled and oral (and possibly also intranasal and rectal) Budesonide; ketonazole increases plasma concentration of active metabolite of:
• CICLESONIDE; ketonazole possibly increases plasma concentration of inhaled Fluticasone; ketonazole inhibits the metabolism of Methylprednisolone; ketonazole increases plasma concentration of inhaled Mometasone

Cytotoxic: ketonazole inhibits the metabolism of:
• IFOSFAMIDE; possible increased risk of neutropenia when ketonazole given with:
• BRENXTUMIBM VEDOTIN; ketonazole possibly increases the plasma concentration of:
• AFATINIB—manufacturer of afatinib advises separating administration of ketonazole by 6 to 12 hours; ketonazole increases plasma concentration of:
• AXITINIB (reduce dose of axitinib—consult axitinib product literature); ketonazole increases the plasma concentration of:
• BOSTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ketonazole increases plasma concentration of:
• BORTezOMIB; CARBOZANTINIB, DABRAFENIB, IDOPOSIDE, IDELALISIB, IMATINIB and PONATINIB; ketonazole increases plasma concentration of:
• CRIZOTINIB; LAPATINIB, NILOTINIB and REGORAFENIB—avoid concomitant use; ketonazole possibly increases plasma concentration of:
• DASATINIB; ketonazole inhibits metabolism of:
• ERLOTINIB and SUNITINIB (increased plasma concentration); ketonazole increases plasma concentration of:
• EVEROLIMUS—manufacturer of ketonazole advises avoid concomitant use; ketonazole increases plasma concentration of:
• IBRUTINIB; reduce dose of ibrutinib (see under ibrutinib, p. 809); ketonazole increases plasma concentration of:
• PAZOPANIB (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ketonazole given with:
• RUXOLITINIB—consult ruxolitinib product literature); ketonazole reduces plasma concentration of:
• IRINOTECAN (but concentration of irinotecan increased)—avoid concomitant use; ketonazole increases plasma concentration of:
• VINFLUNINE—manufacturer of vinflunine advises avoid concomitant use
Antifungals, Imidazole (continued)
- Dapoxetine: ketoconazole increases plasma concentration of dapoxetine—manufacturer of dapoxetine advises avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of diuretics—avoid concomitant use
- Domperidone: manufacturer of ketoconazole advises avoid concomitant use with domperidone (risk of ventricular arrhythmias)
- Ergot Alkaloids: manufacturer of ketoconazole advises avoid concomitant use with ergot alkaloids; increased risk of ergotism when imidazoles given with ergotamine—avoid concomitant use
- Fingolimod: ketoconazole increases plasma concentration of fingolimod
- Fosaprepitant: ketoconazole increases plasma concentration of fosaprepitant
- Hormone Antagonists: manufacturer of ketoconazole advises avoid concomitant use with pasireotide
- SHT-receptor Agonists: ketoconazole increases plasma concentration of almotriptan (increased risk of toxicity); ketocazole increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Itraloxifene: ketoconazole increases plasma concentration of itraloxifene—avoid concomitant use
- Ivacafort: ketoconazole increases plasma concentration of ivacafort (see under ivacafort, p. 257)
- Lanthanum: absorption of ketoconazole possibly reduced by lanthanum (give at least 2 hours apart)
- Lenalidomide: ketoconazole possibly increases plasma concentration of lenalidomide (increased risk of toxicity)
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin; possible increased risk of myopathy when ketoconazole given with atorvastatin—manufacturer of ketoconazole advises avoid concomitant use; increased risk of myopathy when ketoconazole given with simvastatin (avoid concomitant use); possible increased risk of myopathy when miconazole given with simvastatin; ketoconazole increases plasma concentration of lipophilic statins—avoid concomitant use
- Macitentan: ketoconazole increases plasma concentration of macitentan
- Mirabegron: when given with ketoconazole avoid or reduce dose of mirabegron in hepatic or renal impairment—see mirabegron, p. 671
- Nintedanib: ketoconazole increases plasma concentration of nintedanib
- Nintedanib
- Oxycodeone: absorption of ketoconazole possibly reduced by oxycodeone (increased risk of uveitis; manufacturer of oxycodeone advises avoid concomitant use with oxycodeone; itraconazole possibly increases plasma concentration of oxycodeone increases plasma concentration of paricalcitol)
- Anticancer Drugs: concentration of fluorouracil is increased by ketoconazole; rifampicin possibly increases risk of toxicity when ketoconazole given with rifampicin; fluconazole increases plasma concentration of itraconazole—avoid concomitant use
- Aminophylline: fluconazole possibly increases plasma concentration of aminophylline
- Analgesics: fluconazole increases plasma concentration of celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of diclofenac, ibuprofen and oxycodone; fluconazole increases plasma concentration of parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of alfentanil and methadone; fluconazole increases plasma concentration of fentanyl; triazoles possibly increase plasma concentration of methadone (increased risk of ventricular arrhythmias); itraconazole increases plasma concentration of oxycodone
- Antacids: absorption of itraconazole reduced by antacids
- Antiarrhythmics: manufacturer of itraconazole advises avoid concomitant use with disopyramide; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of dronedarone
- Antibacterials: plasma concentration of itraconazole increased by clarithromycin; manufacturer of fluconazole advises avoid concomitant use with erythromycin; triazoles possibly increase plasma concentration of rifabutin (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of rifabutin (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of rifabutin, also rifabutin reduces plasma concentration of voriconazole (increased dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by rifabutin and rifampicin; manufacturer of itraconazole advises avoid concomitant use; plasma concentration of posaconazole reduced by rifampicin; plasma concentration of voriconazole reduced by rifampicin—avoid concomitant use; metabolism of fluconazole accelerated by rifampicin (reduced plasma concentration); fluconazole possibly increases plasma concentration of bedaquiline—avoid concomitant use if fluconazole given for more than 14 days
- Anticoagulants: avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of apixaban; fluconazole, itraconazole and voriconazole enhance
Antifungals, Triazole
- Anticoagulants (continued)
  anticoagulant effect of COUMARINS; avoidance of itraconazole advised by manufacturer of dabigatran and rivaroxaban; avoidance of posaconazole and voriconazole advised by manufacturer of rivaroxaban
- Antidepressants: avoidance of triazoles advised by manufacturer of reboxetine; fluconazole possibly increases plasma concentration of amitriptyline and nortriptyline; plasma concentration of voriconazole reduced by ST JOHN’S WORT—avoid concomitant use
- Antibacterials: posaconazole possibly enhances hypoglycaemic effect of glipizide; fluconazole possibly enhances hypoglycaemic effect of Nateglinide; itraconazole possibly enhances hypoglycaemic effect of repaglinide; fluconazole increases plasma concentration of sulfonylureas; voriconazole possibly increases plasma concentration of sulfonylureas
- Antiepileptics: fluconazole possibly increases plasma concentration of clobazam; plasma concentration of voriconazole possibly reduced by carbamazepine; phenobarbital and primidone—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by carbamazepine; voriconazole increases plasma concentration of fosphenytoin and phenytoin, also fosphenytoin and phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for fosphenytoin and phenytoin toxicity); plasma concentration of posaconazole reduced by fosphenytoin and phenytoin; plasma concentration of itraconazole reduced by fosphenytoin and phenytoin; primidone; plasma concentration of itraconazole and posaconazole possibly reduced by phenobarbital; plasma concentration of itraconazole and posaconazole possibly reduced by primidone
- Antifungals: triazoles possibly antagonise effects of AMPHOTERICIN; monitoring for increased voriconazole side effects advised by manufacturer of fluconazole if voriconazole given after fluconazole; plasma concentration of itraconazole increased by micafungin (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by terbinafine
- Antihistamines: itraconazole inhibits metabolism of mizolastine—avoid concomitant use
- Antimalarials: avoidance of triazoles advised by manufacturer of arteether with lumefantrine; avoidance of triazoles advised by manufacturer of arteether with piperaquine (possible risk of ventricular arrhythmias)
- Antimuscarinics: avoidance of itraconazole advised by manufacturer of darifenacine and tolterodine; manufacturer of fesoterodine advises dose reduction when itraconazole given with fesoterodine—consult fesoterodine product literature; itraconazole possibly increases plasma concentration of solifenacin—see under Solifenacin, p. 670
- Antipsychotics: itraconazole possibly increases plasma concentration of haloperidol; voriconazole possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of lurasidone—avoid concomitant use; voriconazole possibly increases the plasma concentration of lurasidone (see under Lurasidone, p. 315); increased risk of ventricular arrhythmias when triazoles given with pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of risperidone
- Antivirals: plasma concentration of voriconazole increased or decreased by atazanavir and plasma concentration of atazanavir also reduced; posaconazole increases plasma concentration of atazanavir; itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of daclatasvir—reduce dose of daclatasvir (see under daclatasvir, p. 544); plasma concentration of voriconazole reduced by efavirenz, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of itraconazole and posaconazole reduced by efavirenz; plasma concentration of both drugs may increase when itraconazole given with fosamprenavir; plasma concentration of posaconazole possibly reduced by fosamprenavir; itraconazole increases plasma concentration of indinavir (consider reducing dose of indinavir); fluconazole increases plasma concentration of nevirapine, ritonavir and tipranavir; plasma concentration of itraconazole possibly reduced by nevirapine—consider increasing dose of itraconazole; plasma concentration of voriconazole reduced by ritonavir—avoid concomitant use; combination of itraconazole with ritonavir may increase plasma concentration of either drug (or both); triazoles possibly increase plasma concentration of saquinavir; fluconazole, itraconazole, posaconazole and voriconazole possibly increase plasma concentration of simprevir—manufacturer of simprevir advises avoid concomitant use; plasma concentration of voriconazole possibly affected by telaprevir (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by telaprevir (increased risk of ventricular arrhythmias); plasma concentration of itraconazole possibly increased by telaprevir; voriconazole increases plasma concentration of zidovudine (increased risk of toxicity)
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; fluconazole and voriconazole increase plasma concentration of diazepam (risk of prolonged sedation); fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of midazolam (risk of prolonged sedation); itraconazole increases plasma concentration of buspirone (reduce dose of buspirone)
- Avanafil: itraconazole and voriconazole possibly increase plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use; fluconazole possibly increases plasma concentration of avanafil—see under Avanafil, p. 698
- Bosentan: fluconazole possibly increases plasma concentration of bosentan—avoid concomitant use; itraconazole possibly increases plasma concentration of bosentan
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with calcium-channel blockers; itraconazole inhibits metabolism of felodipine (increased plasma concentration); avoidance of itraconazole advised by manufacturer of lercanidipine; itraconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Cardiac Glycosides: itraconazole increases plasma concentration of digoxin
- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of ciclosporin (increased plasma concentration)
- Clofazimine: itraconazole possibly increases plasma concentration of clofazimine (and clofazimine is a CYP3A inhibitor), itraconazole possibly increases plasma concentration of lurasidone (see under Lurasidone, p. 315); increased risk of ventricular arrhythmias when triazoles given with pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of risperidone
- Corticosteroids: itraconazole possibly inhibits metabolism of corticosteroids and methylprednisolone; itraconazole increases the plasma concentration of inhaled and oral (and...
Antifungals, Triazole
- Corticosteroids (continued) possibly also intranasal and rectal
- Budesonide; itraconazole increases plasma concentration of inhaled flusolone
- Cytotoxic: itraconazole inhibits metabolism of busulfan (increased risk of toxicity); fluconazole and itraconazole possibly increase side-effects of cyclophosphamide; itraconazole possibly increases the plasma concentration of astemizole; manufacturer of astemizole advises parating administration of itraconazole by 6 to 12 hours; itraconazole possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); fluconazole, itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of bosutinib; itraconazole possibly increases plasma concentration of cabozantinib; itraconazole and voriconazole possibly increase plasma concentration of crizotinib; manufacturer of crizotinib advises avoid concomitant use; avoidance of itraconazole advised by manufacturer of dasatinib and temsirolimus (plasma concentration of dasatinib and temsirolimus possibly increased); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of gefitinib; fluconazole, itraconazole and voriconazole possibly increase the plasma concentration of ifritinib—reduce dose of ifritinib (see under ifritinib, p. 809); avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of lapatinib; avoidance of itraconazole and voriconazole advised by manufacturer of nilotinib; itraconazole and voriconazole possibly increase plasma concentration of pazopanib; itraconazole and voriconazole possibly increase plasma concentration of ponatinib—consider reducing initial dose of ponatinib (see under ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when fluconazole, itraconazole, posaconazole and voriconazole given with ruxolitinib—consult ruxolitinib product literature; itraconazole and voriconazole possibly increase the plasma concentration of cabazitaxel—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; itraconazole and voriconazole possibly increase plasma concentration of docetaxel—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of toxicity when itraconazole given with rimodotanec—avoid concomitant use; itraconazole possibly increases plasma concentration of vinblastine, vindesine, vinflunline and vinorelbin toxicity; posaconazole possibly inhibits metabolism of vinblastine and vincristine (increased risk of neurotoxicity); itraconazole increases risk of vincristine toxicity.
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fluconazole given with dapoxetine (see under dapoxetine, p. 705); avoidance of itraconazole advised by manufacturer of dapoxetine (increased risk of toxicity).
- Diuretics: fluconazole increases plasma concentration of eplerenone (reduce dose of eplerenone); itraconazole increases plasma concentration of eplerenone—avoid concomitant use; plasma concentration of fluconazole increased by hydrochlorothiazide.
- Domperidone: possible increased risk of ventricular arrhythmias when itraconazole or voriconazole given with domperidone—avoid concomitant use.
- Ergot Alkaloids: increased risk of ergotism when voriconazole given with ergometrine—avoid concomitant use; manufacturer of itraconazole advises avoid concomitant use with ergometrine (increased risk of ergotism); increased risk of ergotism when triazoles given with ergotamine—avoid concomitant use.
- SHT-receptor Agonists: itraconazole increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.

Antifungals, Triazole (continued)
- Ibravaine: fluconazole increases plasma concentration of ibravaine—reduce initial dose of ibravaine; itraconazole possibly increases plasma concentration of ibravaine—avoid concomitant use.
- Icavator: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of icavator (see under Icavator, p. 257); fluconazole increases plasma concentration of icavator—avoid concomitant use.
- Lenalidomide: itraconazole possibly increases plasma concentration of lenalidomide (increased risk of toxicity).
- Leukotriene Receptor Antagonists: fluconazole increases plasma concentration of zafirlukast.
- Lipid-regulating Drugs: increased risk of myopathy when itraconazole, posaconazole or voriconazole given with atorvastatin; possible increased risk of myopathy when fluconazole given with atorvastatin or simvastatin; fluconazole increases plasma concentration of fluvastatin—possible increased risk of myopathy; itraconazole increases plasma concentration of rosuvastatin (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with simvastatin (avoid concomitant use); increased risk of myopathy when voriconazole given with simvastatin; avoidance of triazoles advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased).
- Mirabegron: when given with itraconazole avoid or reduce dose of mirabegron in hepatic or renal impairment—see Mirabegron, p. 671.
- Oestrogens: plasma concentration of voriconazole increased by oestrogens.
- Progestogens: plasma concentration of voriconazole possibly increased by progestogens.
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Retinoids: fluconazole and voriconazole possibly increase risk of retinoid toxicity.
- Rizoglan: avoidance of itraconazole and voriconazole advised by manufacturer of rizoglan.
- Sildenafil: itraconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
- Sirolimus: fluconazole and posaconazole possibly increase plasma concentration of sirolimus; itraconazole and voriconazole increase plasma concentration of sirolimus—avoid concomitant use.
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of tacrolimus (consider reducing dose of tacrolimus).
- Tadalafil: itraconazole possibly increases plasma concentration of tadalafil.
- Theophylline: fluconazole possibly increases plasma concentration of theophylline.
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by cimetidine and esomeprazole—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of posaconazole possibly reduced by famotidine, lansoprazole, nizatidine, omeprazole, pantoprazole, rabeprazole and ranitidine—manufacturer of posaconazole suspension advises avoid concomitant use; voriconazole possibly increases plasma concentration of esomeprazole; voriconazole increases plasma concentration of omeprazole (consider reducing dose of omeprazole); absorption of itraconazole reduced by histamine H2-antagonists and proton pump inhibitors.
- Ulipristal: avoidance of itraconazole advised by manufacturer of ulipristal.
- Vardenafil: itraconazole possibly increases plasma concentration of vardenafil—avoid concomitant use.

Antihistamines
- Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation).
Antihistamines (continued)

- Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)
- Analgesics: sedative effects possibly increased when sedating antihistamines given with opioids, analgesics
- Antacids: absorption of fexofenadine reduced by antacids
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with amiodarone, disopyramide, or flecainide; manufacturer of mizolastine advises avoid concomitant use with propafenone (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of lomatadine advises plasma concentration possibly increased by erythromycin; metabolism of mizolastine inhibited by itraconazole—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with moxifloxacin—avoid concomitant use; effects of fexofenadine possibly reduced by rifampicin; metabolism of mizolastine possibly inhibited by macrolides (avoid concomitant use)
- Antidepressants: avoidance of mizolastine advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; manufacturer of promethazine advises avoid for 2 weeks after stopping MAOIs; manufacturer of hydroxyzine advises avoid concomitant use with MAOIs; cyproheptadine possibly antagonises antidepresant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with tricyclic-related antidepresants
- Antidiabetics: thomboctye count decreased when ketotifen given with metformin (manufacturer of ketotifen advises avoid concomitant use)
- Antifungals: metabolism of mizolastine inhibited by itraconazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by imidazoles (avoid concomitant use)
- Antimalarials: avoidance of mizolastine advised by manufacturer of artemisomil with piperaquine (possible risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with antimuscarinics
- Antipsychotics: plasma concentration of chlorpromazine possibly increased by lorazepam; plasma concentration of chlorpromazine possibly increased when antimuscarinics given with MAOIs or tricyclics; increased risk of ventricular arrhythmias when mizolastine given with antimuscarinics possibly reduced effects of antimuscarinics and antihistamines; increased risk of ventricular arrhythmias when mizolastine given with imipramine when antimuscarinics given with manufactured by loratadine advises plasma concentration possibly increased by erythromycin; plasma concentration of active metabolite of fexofenadine reduced by rifampicin
- Anti-arrhythmics: increased risk of ventricular arrhythmias when toterodine given with amiodarone, disopyramide, or flecainide; increased risk of antimuscarinic side-effects when antihistamines given with nefopam
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with amiodarone, disopyramide, or flecainide; increased risk of antimuscarinic side-effects when antihistamines given with nefopam
- Antihistamines: increased sedative effect when antihistamines given with alcohol (possibly increased effect with non-sedating antihistamines)
- Antihistamines, Sedating see Antihistamines
- Antimalarials see Artemether with lumefantrine, artemisomil with piperaquine, chloroquine, hydroxychloroquine, melfloquine, primaquine, proguanil, pyrimethamine, and quinine
- Antimetabolites see Cepacitabine, cladribine, cytarabine, decitabine, fludarabine, fluorouracil, gemcitabine,
- Antimetabolites (continued) Mercaptopurine, methotrexate, pemetrexed, raltitrexed, tegafur, and tioguanine
- Antimuscarinics see Antihistamines
- Antivirals see Ulcer-healing Drugs

Antimuscarinics

- Antidepressants: increased risk of ventricular arrhythmias when mizolastine given with amiodarone, disopyramide, or flecainide—avoid concomitant use; increased risk of antimuscarinic side-effects when antihistamines given with nefopam
- Antihistamines: increased sedative effect when antihistamines given with alcohol (possibly increased effect with non-sedating antihistamines)
- Analgesics: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)
- Antihistamines, Sedating see Antihistamines
- Antimalarials see Artemether with lumefantrine, artemisomil with piperaquine, chloroquine, hydroxychloroquine, melfloquine, primaquine, proguanil, pyrimethamine, and quinine
- Antimetabolites see Cepacitabine, cladribine, cytarabine, decitabine, fludarabine, fluorouracil, gemcitabine,
Antimuscarnics (continued)

- Dopaminergics: antimuscarnics possibly reduce absorption of
  **CO-BENELDOPA, CO-CARELDOPA and LEVODOPA**

- Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxybutynin given with **PASIRECTIDE**

- Memantine: effects of antimuscarnics possibly enhanced by **MEMANTINE**

- Metoclopramide: antimuscarnics antagonise effects of **METOCLOPRAMIDE** on gastro-intestinal activity

- Nitrates: antimuscarnics possibly reduce effects of sublingual tablets of **NITRATES** (failure to dissolve under tongue owing to dry mouth)

- Parasympathomimetics: antimuscarnics antagonise effects of **PARASYMPATOMIMETICS**

**Antipsychotics**

- Note: Increased risk of toxicity with myelosuppressive drugs

  **Note**: Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

- ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with **ACE INHIBITORS**

- Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with **ADRENERGIC NEURONE BLOCKERS**; higher doses of chlorpromazine antagonise hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**; haloperidol antagonises hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**

- Adsorbents: absorption of phenothiazines possibly reduced by **KAOLIN**

- Alcohol: increased sedative effect when antipsychotics given with **ALCOHOL**

- Alpha-blockers: enhanced hypotensive effect when antipsychotics given with **ALPHA-BLOCKERS**

- Anaesthetics, General: droperidol enhances effects of **THIOPENTAL**; enhanced hypotensive effect when antipsychotics given with **GENERAL ANAESTHETICS**

- Analgesics: possible severe drowsiness when haloperidol given with **ACEMETACIN** or **INDOMETACIN**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **METHADONE**; increased risk of ventricular arrhythmias when amisulpride given with **METHADONE**—avoid concomitant use; increased risk of convulsions when antipsychotics given with **TRAMADOL**; enhanced hypotensive and sedative effects when antipsychotics given with **OPIOID ANALGESICS**

- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**

- Antacids: absorption of phenothiazines and sulpiride reduced by **ANTACIDS**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **ANTI-ARRHYTHMICS** that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with **AMIODARONE**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **AMIODARONE**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **AMIODARONE** or **DISOPYRAMIDE**; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide or zuclopenthixol given with **DISOPYRAMIDE**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with **DISOPYRAMIDE**; increased risk of ventricular arrhythmias when phenothiazines given with **DISOPYRAMIDE**; increased risk of ventricular arrhythmias when clozapine given with **DISOPYRAMIDE**; increased risk of ventricular arrhythmias when zuclopenthixol given with **DISOPYRAMIDE**

- Antibacterials: plasma concentration of lurasidone possibly increased by **CLARITHROMYCIN** and **TELITHROMYCIN**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with **CLARITHROMYCIN** or **MOXIFLOXACIN** or **TELITHROMYCIN**—avoid concomitant use; plasma concentration of quetiapine possibly increased by **CLARITHROMYCIN**—manufacturer of quetiapine advises avoid interactions

**Antipsychotics**

- Antibacterials (continued) concomitant use; plasma concentration of lurasidone possibly increased by **ERYTHROMYCIN** (see under Lurasidone, p. 515); increased risk of ventricular arrhythmias when amisulpride given with **ERYTHROMYCIN**—avoid concomitant use; plasma concentration of clozapine possibly increased by **ERYTHROMYCIN** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with **ERYTHROMYCIN**—avoid concomitant use; plasma concentration of quetiapine increased by **ERYTHROMYCIN**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **parenteral** **ERYTHROMYCIN**; increased risk of ventricular arrhythmias when zuclopenthixol given with **parenteral** **ERYTHROMYCIN**—avoid concomitant use; plasma concentration of clozapine increased by **CIPROFLOXACIN**; plasma concentration of olanzapine possibly increased by **CIPROFLOXACIN**; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with **CIPROFLOXACIN**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **CIPROFLOXACIN**—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by **RIFAMPICIN**; plasma concentration of olanzapine possibly increased by **RIFAMPICIN**; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with **RIFAMPICIN**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **RIFAMPICIN**—avoid concomitant use; plasma concentration of clozapine possibly reduced by **RIFAMPICIN**; metabolism of haloperidol accelerated by **RIFAMPICIN** (reduced plasma concentration); avoid concomitant use of clozapine with **CHLORMPHENICOL** or **SULFONAMIDES** (increased risk of agranulocytosis); increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with **DELANAMID**

- Antidepressants: plasma concentration of clozapine possibly increased by **CITALOPRAM** (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of **CITALOPRAM** (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of **CITALOPRAM** (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by **FLUOXETINE** and **PAROXETINE**—reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of lurasidone reduced by **RIFAMPICIN**—avoid concomitant use; plasma concentration of clozapine possibly reduced by **RIFAMPICIN**; metabolism of haloperidol accelerated by **RIFAMPICIN**—avoid concomitant use; increased risk of ventricular arrhythmias when chlorpromazine given with **TELIHROMYCIN**; plasma concentration of quetiapine possibly increased by **TELIHROMYCIN**

- Antidepressants: plasma concentration of clozapine possibly increased by **CITALOPRAM** (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of **CITALOPRAM** (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of **CITALOPRAM** (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by **FLUOXETINE** and **PAROXETINE**—reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by **FLUOXETINE**; manufacturer of droperidol advises avoid concomitant use with **FLUOXETINE** and **FLUOXAMINE**; **SERTRALINE** and **TRICYCLES** (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by **FLUOXAMINE**; plasma concentration of clozapine and olanzapine increased by **FLUOXAMINE**; **FLUOXAMINE**; asenapine possibly increases plasma concentration of **PAROXETINE**; plasma concentration of clozapine increased by **PAROXETINE** and **SERTRALINE**; plasma concentration of risperidone possibly increased by **PAROXETINE** (increased risk of toxicity); metabolism of perphenazine inhibited by **PAROXETINE** (reduce dose of perphenazine); plasma concentration of haloperidol increased by **VENLAFAXINE**; clozapine possibly increases CNS effects of **MADIS**; plasma concentration of pimozide possibly increased by **SSRIS**; increased risk of ventricular arrhythmias—avoid concomitant use; plasma concentration of lurasidone possibly reduced by **ST JOHN’S WORT**—avoid concomitant use; plasma concentration of aripiprazole possibly reduced by **ST JOHN’S WORT** (avoid concomitant use or consider increasing the dose of aripiprazole—consult
Antipsychotics

- Antidepressants (continued)
  - Aripiprazole product literature; manufacturer of fluphenazine, haloperidol, sulpiride and zuclopenthixol advises avoid concomitant use with TRICYCLES (risk of ventricular arrhythmias); increased risk of antimuscarinic side-effects when phenothiazines given with TRICYCLES; possible increased risk of ventricular arrhythmias when risperidone given with TRICYCLES; possible increased antimuscarinic side-effects when clozapine given with TRICYCLES.
  - Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulfonylureas.
  - Antiepileptics: antipsychotics antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of clozapine accelerated by CARBAMAZEPINE (reduced plasma concentration); also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by CARBAMAZEPINE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paliperidone reduced by CARBAMAZEPINE; plasma concentration of haloperidol possibly increased by CARBAMAZEPINE and PHENOTHIAZINES; metabolism of haloperidol accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration).
  - Antipsychotics: metabolism of clozapine and quetiapine accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration; possible increased risk of ventricular arrhythmias when pimozide given with PHENOBARBITAL—avoid concomitant use; plasma concentration of lurasidone possibly increased by PHENOBARBITAL and PRIMIDONE; plasma concentration of clozapine possibly reduced by PHENOBARBITAL and PRIMIDONE; metabolism of clozapine and quetiapine accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration; effects of haloperidol possibly reduced by PHENOBARBITAL and PRIMIDONE); plasma concentration of lurasidone possibly increased by PHENOBARBITAL and PRIMIDONE; plasma concentration of clozapine possibly reduced by PHENOBARBITAL and PRIMIDONE; metabolism of clozapine and quetiapine accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration; increased risk of antimuscarinic side-effects including neutropenia when olanzapine given with SODIUM VALPROATE and VALPROIC ACID; plasma concentration of clozapine possibly increased or decreased by SODIUM VALPROATE and VALPROIC ACID).

- Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with ANTIMUSCARINICS; plasma concentration of phenothiazines reduced by ANTIMUSCARINICS; possible increased risk of ventricular arrhythmias when pimozide given with ANTIMUSCARINICS; possible increased risk of ventricular arrhythmias when pimozide given with ARTEMETHER WITH LUMEFANTRINE; avoidance of clozapine advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; avoidance of droperidol, haloperidol, phenothiazines and pimozide advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when droperidol given with CHLOROQUINE, HYDROXYCHLOROQUINE or QUININE; increased risk of ventricular arrhythmias when haloperidol given with MEFLOQUINE or DRUGS WITH SUBSTANTIAL POTENTIAL FOR CAUSING AGRANULOCYTOSIS.

- Antimalarials: increased risk of antimuscarinic side-effects when mepropazine given with ANTIMUSCARINICS; concentration of chlorpromazine possibly increases or decreases plasma concentration); manufacturer of quetiapine advises avoid concomitant use; plasma concentration of quetiapine increased or decreased by RITONAVIR; plasma concentration of quetiapine increased by FOSAMPRENAVIR, LOPINAVIR, SAQUINAVIR, and TELAPREVIR—avoid concomitant use; plasma concentration of pimozide increased by RITONAVIR, FOSAMPRENAVIR, LOPINAVIR, and SAQUINAVIR and TELAPREVIR (reduced dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by ATAZANAVIR, DARUNAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR; increased sedative effect when nefazodone or mirtazapine given with PHENOTHIAZINES (risk of toxicity); increased risk of toxicity; possible increased risk of ventricular arrhythmias when pimozide given with PHENOTHIAZINES.

- Antivirals: plasma concentration of aripiprazole possibly increased by ATAZANAVIR, DARUNAVIR, FOSAMPRENAVIR, INIDNAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR (increased risk of toxicity); increased risk of toxicity; possible increased risk of ventricular arrhythmias when pimozide given with PHENOTHIAZINES; possible increased risk of ventricular arrhythmias when pimozide given with PHENOTHIAZINES; possible increased risk of ventricular arrhythmias when pimozide given with PHENOTHIAZINES; possible increased risk of ventricular arrhythmias when pimozide given with PHENOTHIAZINES.
Antipsychotics (continued)
- Ergot Alkaloids: lurasidone possibly increases plasma concentration of ergot alkaloids (increased risk of toxicity)
- Fosaprepitant: avoidance of pimozide advised by manufacturer of fosaprepitant
- Grapefruit Juice: manufacturer of lurasidone and pimozide avoids concomitant use with grapefruit juice; plasma concentration of quetiapine possibly increased by grapefruit juice—manufacturer of quetiapine advises avoid concomitant use
- Histamine: antipsychotics theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with tamoxifen (risk of ventricular arrhythmias)
- Ivabradine: increased risk of ventricular arrhythmias when pimozide given with ivabradine
- Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol given with lithium; possible risk of toxicity when olanzapine given with lithium; extrapyramidal side-effects of quetiapine possibly increased by lithium; increased risk of extrapyramidal side-effects when sulphuride given with lithium
- Memantine: effects of antipsychotics possibly reduced by memantine
- Methylphenidate: enhanced hypotensive effect when antipsychotics given with methylphenidate (also increased risk of extrapyramidal effects)
- Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with metoclopramide
- Moxonidine: enhanced hypotensive effect when antipsychotics given with moxonidine
- Muscle Relaxants: promazone possibly enhances effects of suxamethonium
- Nitrates: enhanced hypotensive effect when phenothiazines given with nitrates
- Penicillamine: avoid concomitant use of clozapine with penicillamine (increased risk of agranulocytosis)
- Pentamidine: increased risk of ventricular arrhythmias when amisulpiride or droperidol given with pentamidine isethionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with pentamidine isethionate
- Sodium Benzoate: haloperidol possibly reduces effects of sodium benzoate
- Sodium Oxbate: antipsychotics possibly enhance effects of sodium oxybate
- Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate
- Sympathomimetics: antipsychotics antagonise hypertensive effect of sympathomimetics; antipsychotic effects of chlorpromazine possibly antagonised by dexamethasone; chlorpromazine possibly reduces effects of lisdekapetamine; side-effects of risperidone possibly increased by methylphenidate
- Tacroplimus: manufacturer of droperidol advises avoid concomitant use with tacroplimus (risk of ventricular arrhythmias)
- Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with tetrabenzine
- Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by cimetidine; plasma concentration of clozapine possibly reduced by omeprazole; absorption of sulphuride reduced by sucralfate
- Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with hydralazine, minoxidil or sodium nitroprusside

Antivirals
- See individual drugs

Anxiolytics and Hypnotics
- ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with ACE inhibitors

- BNF 70

Dopaminergics:
- Diazoxide:
- Desferrioxamine:
- Clonidine:
- Atomoxetine:
- Aprepitant:
- Anxiolytics and Hypnotics
- Antipsychotics
- Cytotoxics:
- Clonidine:
- Cobicitab: plasma concentration of lurasidone possibly increased by cobicitab—avoid concomitant use; plasma concentration of pimozide possibly increased by cobicitab—manufacturer of cobicitab advises avoid concomitant use
- Cytotoxics: avoid concomitant use of clozapine with:
  - Cytotoxics (increased risk of agranulocytosis; possible increased risk of ventricular arrhythmias when haloperidol given with bosutinib; caution with pimozide advised by manufacturer of crizotinib; avoidance of pimozide and quetiapine advised by manufacturer of idealisib; avoidance of pimozide advised by manufacturer of lapatinib; possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulphide or zuclopenthixol given with vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with:
  - Arsenic trioxide; increased risk of ventricular arrhythmias when haloperidol given with arsenic trioxide
- Deferasirox: avoidance of clozapine advised by manufacturer of deferasirox
- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with desferrioxamine; avoidance of prochlorperazine advised by manufacturer of desferrioxamine
- Diazoxide: enhanced hypotensive effect when phenothiazines given with diazoxide
- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by diuretics; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by diuretics (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with diuretics
- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with amantadine; antipsychotics antagonise effects of apomorphine, benzelodopa, cabergoldopa, levodopa and pergolide; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of bromocriptine and cabergoline; manufacturer of amisulpride advises avoid concomitant use of benzelodopa, cabergoldopa and levodopa (antagonism of effect); avoidance of antipsychotics advised by manufacturer of pramipexole, ropinirole and rotigotine (antagonism of effect)
Anxiolytics and Hypnotics (continued)

- Adrenergic Neurone Blockers: enhanced hypertensive effect when anxiolytics and hypnotics given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: increased sedative effect when anxiolytics and hypnotics given with ALCOHOL
- Alpha-blockers: enhanced hypertensive and sedative effects when anxiolytics and hypnotics given with ALPHABLOCKERS
- Aminophylline: effects of benzodiazepines possibly reduced by AMINOPHYLLINE
- Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with GENERAL ANAESTHETICS
- Analgesics: when anxiolytics and hypnotics given with ANTIPSYCHOTICS; alprazolam possibly increases plasma concentration of HALOPERIDOL; buspirone increases plasma concentration of HALOPERIDOL; serious adverse events reported with concomitant use of benzodiazepines and CLOZAPINE (causality not established); plasma concentration of midazolam increased by LURASIDONE; increased risk of hypotension, bradycardia and respiratory depression when parenteral benzodiazepines given with intramuscular OLANZAPINE
- Antidepressants: plasma concentration of midazolam possibly increased by ATAZANAVIR—avoid concomitant use of oral midazolam; plasma concentration of oral midazolam increased by BOCEPREVIR—manufacturer of boceprevir advises avoid concomitant use; increased risk of prolonged sedation when midazolam given with EFAVIRENZ—avoid concomitant use; plasma concentration of midazolam possibly increased by FOSAMPRENAVIR, INDINAVIR, RITONAVIR and TELAPREVIR (risk of prolonged sedation—avoid concomitant use of oral midazolam); increased risk of prolonged sedation when alprazolam given with INDINAVIR—avoid concomitant use; plasma concentration of anxiolytics and hypnotics possibly increased by RITONAVIR; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by RITONAVIR (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of buspirone increased by RITONAVIR (increased risk of toxicity); plasma concentration of midazolam increased by SAQUINAVIR (risk of prolonged sedation—avoid concomitant use of oral midazolam); plasma concentration of oral midazolam increased by SIMEPREVIR
- Aprepitant: plasma concentration of midazolam increased by APREPIANT (risk of prolonged sedation)
- Beta-blockers: enhanced hypertensive effect when anxiolytics and hypnotics given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypertensive effect when anxiolytics and hypnotics given with CALCIUM-CHANNEL BLOCKERS; midazolam increases absorption of LERCANIDIPINE; metabolism of midazolam inhibited by DILTIAZEM and VERAPAMIL (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by DILTIAZEM and VERAPAMIL (reduce dose of buspirone)
- Cardiac Glycosides: alprazolam increases plasma concentration of DOXOZIN (increased risk of toxicity)
- Clonidine: enhanced hypertensive effect when anxiolytics and hypnotics given with CLONIDINE
- Cobimetap: avoidance of oral midazolam advised by manufacturer of COBICISTAT
- Cytotoxics: plasma concentration of midazolam increased by CRIZOTINIB and Nilotinib; avoidance of oral midazolam advised by manufacturer of IDELVISIB
- Deferasirox: plasma concentration of midazolam possibly reduced by DEFERASIROX
- Diazoxide: enhanced hypertensive effect when anxiolytics and hypnotics given with DIAZOXIDE
- Disulfiram: metabolism of benzodiazepines inhibited by DISULFIRAM (increased sedative effects); increased risk of temazepam toxicity when given with DISULFIRAM
- Diuretics: enhanced hypertensive effect when anxiolytics and hypnotics given with DIURETICS; administration of chloral with parenteral TROGEMIDE may displace thyroid hormone from binding sites
- Dopaminergics: benzodiazepines possibly antagonise effects of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- Fosaprepitant: plasma concentration of midazolam increased by FOSAPREPIANT (risk of prolonged sedation)
### Interactions

#### Anxiolytics and Hypnotics (continued)
- Grapefruit juice: plasma concentration of oral midazolam possibly increased by GRAPEFRUIT JUICE; plasma concentration of buspirone increased by GRAPEFRUIT JUICE
- Ivaecor: plasma concentration of midazolam increased by IVAECOR
- Lipid-regulating Drugs: plasma concentration of midazolam possibly increased by ATORVASTATIN; separating administration from alprazolam by 12 hours advised by MANUFACTURER OF LOMITAPID
- Lithium: increased risk of neurotoxicity when clonazepam given with LITHIUM
- Lofezidine: increased sedative effect when anxiolytics and hypnotics given with LOFEXIDINE
- Methylodopa: enhanced hypotensive effect when anxiolytics and hypnotics given with METHYLDOPA
- Methylthioninium: possible risk of CNS toxicity when buspirone given with METHYLTHIONIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with MOXONIDINE; sedative effects possibly increased when benzodiazepines given with MOXONIDINE
- Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with BACLOFEN OR TIZANIDINE
- Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with NITRATES
- Oestrone: plasma concentration of melatonin increased by OESTROGENS; plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by OESTROGENS; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by OESTROGENS
- Progesterone: plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by PROGESTOGENS; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by PROGESTOGENS
- Sodium Oxytate: benzodiazepines enhance effects of SODIUM OXYTE (avoid concomitant use)
- Theophylline: effects of benzodiazepines possibly reduced by THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of melatonin increased by CIMETIDINE; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by CIMETIDINE (increased plasma concentration); metabolism of diazepam possibly inhibited by ESOMEPRAZOLE and OMEPRAZOLE (increased plasma concentration)
- Vasodilator: Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with HYDRAZONE, MINOXIDIL OR SODIUM NITROPRUSSIDE

#### Apixaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins)
- Antibacterials: manufacturer of apixaban advises avoid concomitant use with CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of apixaban possibly reduced by RIFAMPICIN—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- Anticoagulants: increased risk of haemorrhage when apixaban given with other ANTICOAGULANTS (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with DABIGATRAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of apixaban possibly reduced by ST JOHN’S WORT—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- Antifungals: plasma concentration of apixaban possibly reduced by CARBAMAZEPINE—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; plasma concentration of apixaban possibly reduced by FOSPHENOTHIOINE, PHENOBARBITAL, PHENOTYRA and PRIMIDONE
- Antihypertensives: plasma concentration of apixaban possibly reduced by KETOCONAZOLE—manufacturer of apixaban advises avoid concomitant use; manufacturer of apixaban advises avoid concomitant use with ITRAZONAZOLE, POSACONAZOLE AND VORICONAZOLE
- Antivirals: manufacturer of apixaban advises avoid concomitant use with ATAZANAVIR, BOCEPREVIR, DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR, TELAPREO AND TIPSANAVIR
- Cobicistat: manufacturer of apixaban advises avoid concomitant use with COBICISTAT
- Sulfapyrazine: increased risk of bleeding when apixaban given with SULFIPYRAZONE

#### Apomorphine

- Antipsychotics: effects of apomorphine antagonised by ANTIPSYCHOTICS
- Dopaminergics: effects of apomorphine possibly enhanced by ENTACAPONE
- 5HT1-receptor Antagonists: possible increased hypotensive effect when apomorphine given with ONDANSETRON—avoid concomitant use
- Memantine: effects of dopaminergics possibly enhanced by METHYLDOPA
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA

#### Apraclonidine

- Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIS, TRICYCLIC-RELATED ANTIDEPRESSANTS AND TRICYCLICS
- Symptomatologists: manufacturer of apraclonidine advises avoid concomitant use with SYMPATHOMIMETICS

#### Aprepitant

- Antibacterials: plasma concentration of aprepitant possibly increased by CLARITHROMYCIN AND TELITHROMYCIN; plasma concentration of aprepitant reduced by RIFAMPICIN
- Anticoagulants: aprepitant possibly reduces anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with ST JOHN’S WORT
- Antiadipetics: aprepitant reduces plasma concentration of TOLBUTAMIDE
- Antiepileptics: plasma concentration of aprepitant possibly reduced by CARBAMAZEPINE, FOSPHENOTHIOINE, PHENOBARBITAL, PHENOTYRA AND PRIMIDONE
- Antifungals: plasma concentration of aprepitant increased by KETOCONAZOLE
- Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with PIMOZIDE
- Antivirals: plasma concentration of aprepitant possibly increased by RITONAVIR
- Anxiolytics and Hypnotics: aprepitant increases plasma concentration of MIDAZOLAM (risk of prolonged sedation)
- Avanafil: aprepitant possibly increases plasma concentration of AVANAFIL—see under Avanafil, p. 698
- Calcium-channel Blockers: plasma concentration of both drugs may increase when aprepitant given with DILTIAZEM
- Corticosteroids: aprepitant inhibits metabolism of DEXAMETHASONE AND METHYLPREDNISOLONE (reduce dose of dexamethasone and methylprednisolone)
- Cytotoxics: aprepitant possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; aprepitant possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibritunib (see under Ibrutinib, p. 809)
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when aprepitant given with DAPoxetine (see under Dapoxetine, p. 703)
Aprepitant (continued)

- Oestrogens: aprepiptant possibly causes contraceptive failure of hormonal contraceptives containing **OESTROGENS** (alternative contraception recommended)
- Progestogens: aprepiptant possibly causes contraceptive failure of hormonal contraceptives containing **PROGESTOGENS** (alternative contraception recommended)

**Argatroban**

- Analgesics: increased risk of haemorrhage when anticoagulants given with **ICLODOMAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **KETOROLAC** (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with **APIXABAN**, **DABIGATRAN** and **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

**Aripiprazole** see Antipsychotics

**Arsenic Trioxide**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with **AMIODARONE** or **DISOPYRAMIDE**
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with **CEFTAZIDIME**, **ERYTHROMYCIN**, **LEVOFLOXACIN** or **MOXIFLOXACIN**
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with **AMITRIPTYLINE** or **CLOMIPRAMINE**
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with **AMPHTERICIN**
- Antimalarials: avoidance of arsenic trioxide advised by manufacturer of artenimol with piperaquine
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with **CITALOPRAM**
- Antiarrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with **HALOPERIDOL**; avoid concomitant use with **CLOzapine** (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with **SOTALOL**
- Cytotoxics: possible increased risk of ventricular arrhythmias when arsenic trioxide given with **VANDΕΤΑΝΙΒ**—avoid concomitant use
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by **ACETAZOLAMIDE**, **LOOP DIURETICS** or **THIAZIDES AND RELATED DIURETICS**
- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with **LITHIUM**

**Artemether with Lumeferantrine**

- Anti-arrhythmics: manufacturer of artemether with lumefantrine advises avoid concomitant use with **AMIODARONE**, **DISOPYRAMIDE** and **FLECAINIDE** (risk of ventricular arrhythmias)
- Antibacterials: manufacturer of artemether with lumefantrine advises avoid concomitant use with **MACROLIDES** and **QUINOLONES**
- Antidepressants: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with **CITALOPRAM** or **ESCLATOPRAM**—avoid concomitant use; manufacturer of artemether with lumefantrine advises avoid concomitant use with **ANTIDEPRESSANTS**
- Antifungals: manufacturer of artemether with lumefantrine advises avoid concomitant use with **IMIDAZOLINES** and **TRIAZOLES**
- Antimalarials: manufacturer of artemether with lumefantrine advises avoid concomitant use with **ANTIMALARIALS**; increased risk of ventricular arrhythmias when artemether with lumefantrine given with **QUININE**
- Antipsychotics: manufacturer of artemether with lumefantrine advises avoid concomitant use with **ANTIPSYCHOTICS**
- Antivirals: manufacturer of artemether with lumefantrine advises caution with **ATAZANAVIR**, **FOSAMPRENAVIR**, **INDINAVIR**, **LOPINAVIR**, **RITONAVIR**, **SAQUINAVIR** and **TIPRANAVIR**; avoidance of artemether with lumefantrine advised by manufacturer of **BOCERPAN**; plasma concentration of lumefantrine increased when artemether with lumefantrine given with **DARUNAVIR**; plasma concentration of artemether with lumefantrine reduced by **EFAVIREN** and **ETRANIRINE**
- Beta-blockers: manufacturer of artemether with lumefantrine advises avoid concomitant use with **METOPROLOL** and **SOTALOL**
- Cytotoxics: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with **VANDΕΤΑΝΙΒ**—avoid concomitant use
- Grapefruit Juice: plasma concentration of artemether with lumefantrine possibly increased by **GRAPEFRUIT JUICE**
- Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
- Ulcer-healing Drugs: manufacturer of artemether with lumefantrine advises avoid concomitant use with **CIMETIDINE**

**Artemisinin with Piperaquine**

*NOTE* Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped
- Analgesics: manufacturer of artemisinin with piperaquine advises concomitant use with **METHADONE** (possible risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of artemisinin with piperaquine advises concomitant use with **AMIODARONE** and **DISOPYRAMIDE** (possible risk of ventricular arrhythmias)
- Anticoagulants: manufacturer of artemisinin with piperaquine advises concomitant use with **CLOMIDINE** and **MOXIFLOXACIN** (possible risk of ventricular arrhythmias)
- Antipsychotics: manufacturer of artemisinin with piperaquine advises concomitant use with **CITALOPRAM** or **ESCLATOPRAM**—avoid concomitant use; manufacturer of artemisinin with piperaquine advises avoid concomitant use with **ANTIDEPRESSANTS**
- Anti-epileptics: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENITOIN**, **PHENOBARBITAL**, **PHENITOIN** and **PRIMIDONE**
- Antifungals: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **IMIDAZOLINES** and **TRIAZOLINES** (possible risk of ventricular arrhythmias)
- Antiadrenalinics: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **MIZOLASTINE** (possible risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of **ARTENIMOL WITH PIPERAQUINE**
- Antipsychotics: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **METOCLOPRAMIDE**
- Beta-blockers: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **SAQUINAVIR** (possible risk of ventricular arrhythmias)
- Cytotoxics: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **ARSENIC TRIOXIDE** (possible risk of ventricular arrhythmias); manufacturer of artemisinin with piperaquine advises avoid concomitant use with **VINBLELINE**
- Grapefruit Juice: manufacturer of artemisinin with piperaquine advises avoid concomitant use with **GRAPEFRUIT JUICE**
Artemisin with Piperaquine (continued)
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Pentamidine isethionate: manufacturer of artemisin with piperaquine advises avoid concomitant use with
- Pentamidine isethionate (possible risk of ventricular arrhythmias)
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
Ascorbic acid see Vitamins
Asenapine see Antipsychotics
Aspirin
- Adsorbents: absorption of aspirin possibly reduced by KAOLIN
- Anaesthetics, General: aspirin possibly enhances effects of THIOPENTAL
- Analgesics: concomitant use of aspirin with ◆ NSAIDS (increased side-effects); antiplatelet effect of aspirin possibly reduced by IBUPROFEN
- Antacids: excretion of aspirin increased by alkaline urine due to some ANTACIDS
- Anticoagulants: increased risk of bleeding when aspirin given with◆ COUMARINS or◆ PHENINDION (due to antiplatelet effect); aspirin enhances anticoagulant effect of◆ HEPARINS
- Antidepressants: increased risk of bleeding when aspirin given with◆ SSRIS or◆ VENLAFAXINE
- Antiepileptics: aspirin enhances effects of FOSPHENYTIN, PHENYTOIN, SODIUM VALPROATE and VALPROIC ACID
- Clopidogrel: increased risk of bleeding when aspirin given with CLOPIDOGREL
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with CORTICOSTEROIDS, also corticosteroids reduce plasma concentration of salicylate
- Cytotoxics: aspirin reduces excretion of◆ METHOTREXATE (increased risk of toxicity); aspirin possibly reduces renal excretion of PEMETREXED—consult product literature
- Diuretics: increased risk of toxicity when high-dose aspirin given with◆ ACETAZOLAMIDE; aspirin antagonises diuretic effect of SPIRONOLACTONE; possible increased risk of toxicity when high-dose aspirin given with LOOP Diuretics (also possible reduced effect of loop diuretics)
- Iloprost: increased risk of bleeding when aspirin given with ILOPROST
- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of ZAFIRULKAST
- Metoclopramide: rate of absorption of aspirin increased by METOCLOPRAMIDE (enhanced effect)
- Sulfipyrazone: aspirin antagonises effects of SULFOPYRAZONE
Atazanavir
- Antacids: absorption of atazanavir reduced by ANTACIDS (give at least 2 hours before or 1 hour after aspirin)
- Antidepressants: atazanavir possibly increases plasma concentration of◆ AMIODARONE and◆ LIDOCAINE
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with CLARITHROMYCIN; atazanavir increases plasma concentration of◆ Rifabutin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by◆ Rifampicin—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of◆ Telithromycin
- Antifungals: plasma concentration of atazanavir increased by◆ POSaconazole; atazanavir decreases or increases the plasma concentration of◆ Voriconazole and plasma concentration of atazanavir also reduced
- Antimalarials: caution with atazanavir advised by manufacturer of Artemether with Lumefantrine; atazanavir possibly increases plasma concentration of◆ Quinine (increased risk of toxicity)
- Antimycobacterials: avoidance of atazanavir advised by manufacturer of Daripenam; manufacturer of fosoterodine advises dose reduction when atazanavir given with◆ Fosoterodine—consult fosoterodine product literature
- Antiparkinsonians: increase in plasma concentration of atazanavir also reduced
- Antituberculars: atazanavir possibly increases plasma concentration of◆ Ipyrrole (reduce dose of pyrrole; consult product literature); atazanavir possibly increases plasma concentration of◆ Ethambutol—manufacturer of ethambutol advises avoid concomitant use; atazanavir possibly increases plasma concentration of◆ Ethibon—manufacturer of ethibon advises avoid concomitant use
- Antivirals: plasma concentration of atazanavir reduced by◆ Bosentan; atazanavir increases plasma concentration of◆ Viroptic—manufacturer of viroptic advises avoid concomitant use
- Antiulcer: plasma concentration of atazanavir reduced by◆ Omeprazole (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of◆ Efavirenz (reduce dose of efavirenz); avoid concomitant use of atazanavir with◆ INIDAVIR; atazanavir increases plasma concentration of◆ Maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by◆ Nevirapine—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with◆ Saquinavir—avoid concomitant use; atazanavir possibly reduces plasma concentration of◆ Telaprevir, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by◆ Tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of◆ TIPRANAVIR (also plasma concentration of atazanavir reduced)
- Antiulcer: plasma concentration of◆ Midazolam—avoid concomitant use of oral midazolam
- Avanafil: atazanavir possibly increases plasma concentration of◆ Avanafil—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: atazanavir increases plasma concentration of◆ Diltiazem (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of◆ Verapamil
- Ciclosporin: atazanavir possibly increases plasma concentration of◆ Ciclosporin
- Colchicine: atazanavir possibly increases risk of◆ Colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of◆ Axitinib (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of◆ Bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of◆ Crizotinib and◆ Everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases the plasma concentration of◆ Ibrutinib—reduce dose of ibrutinib (see under ibrutinib, p. 809); atazanavir possibly increases plasma concentration of◆ Pazopanib (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of◆ Cabazitaxel; atazanavir possibly inhibits metabolism of◆ Pinotocan (increased risk of toxicity)
- Dopamine: avoidance of atazanavir advised by manufacturer of◆ Dopoxetine (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of◆ Ergot Alkaloids—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with◆ Atorvastatin or Pravastatin; atazanavir increases plasma concentration of◆ Rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with◆ Simvastatin (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of◆ Ethinylestradiol
- Orlistat: absorption of atazanavir possibly reduced by◆ Orlistat
- Progestogens: atazanavir increases plasma concentration of◆ Nordestosterone
Atovaquone

- RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- SILDENAFIL
- SIROLIUMS
- TACROLIUMS: atovaquone possibly increases plasma concentration of
- TICAGRELOR—manufacturer of ticagrelor advises avoid concomitant use
- Ulcer-healing Drugs: manufacturer of atovaquone advises adjust doses of both drugs when atazanavir given with Cimetidine and Nizatidine—consult atazanavir product literature; plasma concentration of atazanavir reduced by FAMOTIDINE and Ranitidine (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by PROTON PUMP INHIBITORS—avoid or adjust dose of both drugs (consult product literature)

Atenolol see Beta-blockers

Atomoxetine

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with METHADONE; possible increased risk of convulsions when atomoxetine given with TRAMADOL
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with AMIODARONE or DISOPYRAMIDE
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with FLUOXETINE and PAROXETINE; possible increased risk of convulsions when atomoxetine given with ANTIDEPRESSANTS; atomoxetine should not be started until 2 weeks after stopping MADOL, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with TRICYCLICS
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with MELOQUINE
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with ANTIPSYCHOTICS that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with SOTALOL
- Buproprion: possible increased risk of convulsions when atomoxetine given with BUPROPION
- Diuretics: risk of ventricular arrhythmias when atomoxetine increased by Hypokalaemia caused by DIURETICS
- Sympathomimetics, Beta₂: Increased risk of cardiovascular side-effects when atomoxetine given with parenteral SALBUTAMOL

Atozavastatin see Statins

Atracurium see Muscle Relaxants

Atropine see Antimuscarinic Agents

Avanafil

- ACE Inhibitors: avanafil possibly enhances hypotensive effect of ENALAPRIL
- Alpha-blockers: enhanced hypotensive effect when avanafil given with ALPHA-BLOCKERS—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Antibacterials: plasma concentration of avanafil possibly increased by CLARITHROMYCIN and TELITHROMYCIN—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by ERYTHROMYCIN—see under Avanafil, p. 698; plasma concentration of avanafil possibly reduced by RIFAMPICIN—manufacturer of avanafil advises avoid concomitant use
- Antiepileptics: plasma concentration of avanafil possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE—manufacturer of avanafil advises avoid concomitant use
- Antifungals: plasma concentration of avanafil increased by KETOCONAZOLE—avoid concomitant use; plasma concentration of avanafil possibly reduced by FOSAMPRENAVIR—see under Avanafil, p. 698; plasma concentration of avanafil significantly increased by ITRAZONAZOLE; avanafil possibly reduces plasma concentration of avanafil reduced by IFENEPHREN—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by FLUCONAZOLE—see under Avanafil, p. 698; plasma concentration of avanafil possibly increased by IRONAVIR—avoid concomitant use
- Antivirals: plasma concentration of avanafil possibly increased by ATAZANAVIR, INDINAVIR and SAQUINAVIR—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly reduced by TELITROMYCIN—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by HEMIFEPHREN—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly reduced by BOSENTAN—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of avanafil possibly increased by DILTIAZEM and VERAPAMIL—see under Avanafil, p. 698
- Fosaprepitant: plasma concentration of avanafil possibly increased by FOSAPREPITANT
- Grapefruit juice: plasma concentration of avanafil possibly increased by GRAPEFRUIT JUICE—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Nicardipine: avanafil significantly enhances hypotensive effect of NICORANDIL (avoid concomitant use)
- Nitrates: avanafil significantly enhances hypotensive effect of NITRATES (avoid concomitant use)
- Bosentan: plasma concentration of avanafil significantly increased by bosentan; manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of avanafil possibly increased by DILTIAZEM and VERAPAMIL—see under Avanafil, p. 698
- Fosaprepitant: plasma concentration of avanafil possibly increased by FOSAPREPITANT
- Grapefruit juice: plasma concentration of avanafil possibly increased by GRAPEFRUIT JUICE—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Nicardipine: avanafil significantly enhances hypotensive effect of NICORANDIL (avoid concomitant use)
- Nitrates: avanafil significantly enhances hypotensive effect of NITRATES (avoid concomitant use)
- Bosentan: plasma concentration of avanafil significantly increased by bosentan; manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of avanafil possibly increased by DILTIAZEM and VERAPAMIL—see under Avanafil, p. 698
- Fosaprepitant: plasma concentration of avanafil possibly increased by FOSAPREPITANT
- Grapefruit juice: plasma concentration of avanafil possibly increased by GRAPEFRUIT JUICE—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Nicardipine: avanafil significantly enhances hypotensive effect of NICORANDIL (avoid concomitant use)
- Nitrates: avanafil significantly enhances hypotensive effect of NITRATES (avoid concomitant use)
- Bosentan: plasma concentration of avanafil significantly increased by bosentan; manufacturer of avanafil advises avoid concomitant use

Avanafil see Antimuscarinic Agents

Avanafil see Antimuscarinic Agents
Axitinib
Antifungals (continued)
increased by ITRACONAZOLE (reduce dose of axitinib—consult axitinib product literature)
» Antipsychotics: avoid concomitant use of cytoxotics with
CLOzapine (increased risk of agranulocytosis)
» Antivirals: plasma concentration of axitinib possibly reduced by
ATAZANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR (reduce dose of axitinib—consult axitinib product literature)
» Corticosteroids: plasma concentration of axitinib possibly decreased by DEXMETHASONE (increase dose of axitinib—consult axitinib product literature)
» Grapefruit juice: plasma concentration of axitinib possibly increased by GRAPEFRUIT JUICE

Azathioprine
ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with Captopril, especially in renal impairment; increased risk of anaemia when azathioprine given with Enalapril, especially in renal impairment
» Allopurinol: enhanced effects and increased toxicity of azathioprine when given with Allopurinol (reduce dose of azathioprine to one quarter of usual dose)
» Antibacterials: increased risk of haematological toxicity when azathioprine given with Sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with Primithrom (also with co-trimoxazole)
» Anticoagulants: azathioprine possibly reduces anticoagulant effect of Coumarins
» Antivirals: myelosuppressive effects of azathioprine possibly enhanced by Ribavirin
» Febuxostat: avoidance of azathioprine advised by manufacturer of FEBUXOSTAT

Azelastin see Antihistamines
Azilsartan see Angiotensin-II Receptor Antagonists
Azthromycin see Macrolides
Aztreonam
Anticoagulants: aztreonam possibly enhances anticoagulant effect of Coumarins
» Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Baclofen see Muscle Relaxants
Bambuterol see Sympathomimetics, Beta3
Basiliximab
Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
» Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

BCG Vaccine see Vaccines
Beclometasone see Corticosteroids
Bedaquiline
Antibacterials: plasma concentration of bedaquiline possibly increased by CIPROFLOXACIN, CLARITHROMYCIN and ERYTHROMYCIN—avoid concomitant use if ciprofloxacin, clarithromycin and erythromycin given for more than 14 days; manufacturer of bedaquiline advises avoid concomitant use with MOXIFLOXACIN; plasma concentration of bedaquiline possibly reduced by Rifabutin—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline reduced by Rifampicin—manufacturer of bedaquiline advises avoid concomitant use; possible increased risk of ventricular arrhythmias when bedaquiline given with Clofazimine
» Antidepressants: plasma concentration of bedaquiline possibly reduced by St John’s Wort—manufacturer of bedaquiline advises avoid concomitant use
» Antiepileptics: plasma concentration of bedaquiline possibly reduced by Carbamazepine, Fosphenytoin and Phenytoin—manufacturer of bedaquiline advises avoid concomitant use
» Antifungals: plasma concentration of bedaquiline increased by Ketoconazole—avoid concomitant use if ketoconazole given for more than 14 days; plasma concentration of bedaquiline possibly increased by Fluconazole—avoid concomitant use if fluconazole given for more than 14 days

Bedaquiline (continued)
» Antivirals: plasma concentration of bedaquiline possibly reduced by Efavirenz and Etravirine—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline possibly increased by Ritonavir—avoid concomitant use if ritonavir given for more than 14 days
» Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Bee Venom Extracts
ACE Inhibitors: possible severe anaphylactoid reaction when bee venom extracts given with ACE INHIBITORS

Belimumab
Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
» Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Bendamustine
Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)

Bendroflumethiazide see Diuretics
Benperidol see Antipsychotics
Benzodiazepines see Anxiolytics and Hypnotics
Benzthiazide see Diuretics
Benzylpenicillin see Penicillins

Beta-blockers
NOTE Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind
» ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ACE INHIBITORS
» Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers with ADRENERGIC NEURONE BLOCKERS
» Alcohol: enhanced hypotensive effect when beta-blockers given with ALCOHOL
» Aldesleukin: enhanced hypotensive effect when beta-blockers given with ALDESLEUKIN
» Alpha-blockers: enhanced hypotensive effect when beta-blockers given with ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
» Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with GENERAL ANAESTHETICS
» Anaesthetics, Local: propranolol increases risk of BUPIVACAINE toxicity
» Analgesics: hypotensive effect of beta-blockers antagonised by NSAIDS; plasma concentration of esmolol possibly increased by MORPHINE
» Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
» Anti-arrhythmics: increased myocardial depression when beta-blockers given with ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when sotalol given with AMIODARONE, DISOPYRAMIDE or DROPERIDOL—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with AMIODARONE; plasma concentration of metoprolol and propranolol possibly increased by DROPERIDOL; increased risk of myocardial depression and bradycardia when beta-blockers given with AMIODARONE; plasma concentration of metoprolol and propranolol possibly increased by FLECAINIDE; propranolol increases risk of LIDOCAINE toxicity; nadolol possibly increases risk of LIDOCAINE toxicity; plasma concentration of metoprolol and propranolol increased by PROPafenone
» Antibacterials: increased risk of ventricular arrhythmias when sotalol given with MOXIFLOXACIN—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by Rifampicin (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by Rifampicin; plasma concentration of oral timolol possibly reduced by Rifampicin; increased risk of ventricular arrhythmias when sotalol given with DELAMANID
» Antidepressants: plasma concentration of metoprolol increased by CITALOPRAM and ESCITALOPRAM; Increased risk of
Beta-blockers

- Antidepressants (continued)
  - ventricular arrhythmias when sotalol given with
  - CITALOPRAM—avoid concomitant use; avoidance of sotalol advised by manufacturer of CITALOPRAM (risk of ventricular arrhythmias); plasma concentration of propranolol increased by FLUVOXAMINE; plasma concentration of metoprolol possibly increased by PAROXETINE—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); plasma concentration of propranolol increased by ATOMOXETINE; possible increased risk of ventricular arrhythmias when sotalol given with MAOIS; increased risk of ventricular arrhythmias when sotalol given with TRICYCLICS;
  - Antiarrhythmics: beta-blockers may mask warning signs of bradycardia (such as tremor) when betablockers given with CICLOSPORIN increased risk of ventricular arrhythmias when beta-blockers given with beta-blockers enhance hypoglycaemic effect of ANTIARRHYTHMICS; beta-blockers increase when propranolol given with concomitant use; plasma concentration of both drugs may increased risk of ventricular arrhythmias; plasma concentration of sotalol increased by hypokalaemia caused by ARSENIC TRIOXIDE; enhanced hypotensive effect when beta-blockers given with severe hypotension and heart failure when beta-blockers given with increased peripheral vasoconstriction when beta-blockers given with MIRABEGRON increased risk of ventricular arrhythmias when beta-blockers given with MEFLOQUINE increased risk of ventricular arrhythmias when sotalol given with TOLTERODINE;
  - Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with DROPERIDOL or ZUCLOPENTHIXOL—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with HALOPERIDOL—avoid concomitant use; plasma concentration of both drugs may increased when propranolol given with CHLORPROMAZINE; increased risk of bradycardia when beta-blockers given with AMISULPRIDE, PHENTHIazines, FIMOZIDE or ATMOTEXetine; possible increased risk of ventricular arrhythmias when sotalol given with RISPERIDONE;
  - Antivirals: beta-blockers may mask warning signs of bradycardia (such as tremor) when beta-blockers given with CITALOPRAM increased risk of ventricular arrhythmias when beta-blockers given with beta-blockers enhance hypoglycaemic effect of ANTIDEPRESSANTS; beta-blockers increase when propranolol given with concomitant use; plasma concentration of both drugs may increased risk of ventricular arrhythmias; plasma concentration of sotalol increased by hypokalaemia caused by ARSENIC TRIOXIDE; enhanced hypotensive effect when beta-blockers given with severe hypotension and heart failure when beta-blockers given with increased peripheral vasoconstriction when beta-blockers given with MIRABEGRON increased risk of ventricular arrhythmias when beta-blockers given with MEFLOQUINE increased risk of ventricular arrhythmias when sotalol given with TOLTERODINE;
  - Antihistamines: increased risk of ventricular arrhythmias when sotalol given with MIZOLATINE—avoid concomitant use; antiarrhythmics: avoidance of metoprolol and sotalol advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; avoidance of sotalol advised by manufacturer of ARTEMETHIN WITH PIPERAQUINE (possible risk of ventricular arrhythmias); increased risk of bradycardia when beta-blockers given with MEFLQUINE;
  - Antimigraine: increased risk of ventricular arrhythmias when sotalol given with a Tolterodine
  - Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with DROPERIDOL or ZUCLOPENTHIXOL—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with HALOPERIDOL—avoid concomitant use; plasma concentration of both drugs may increased when propranolol given with CHLORPROMAZINE; increased risk of bradycardia when beta-blockers given with AMISULPRIDE, PHENTHIazines, FIMOZIDE or ATMOTEXetine; possible increased risk of ventricular arrhythmias when sotalol given with RISPERIDONE;
  - Antivirals: beta-blockers may mask warning signs of bradycardia (such as tremor) when beta-blockers given with CITALOPRAM increased risk of ventricular arrhythmias when beta-blockers given with beta-blockers enhance hypoglycaemic effect of ANTIDEPRESSANTS; beta-blockers increase when propranolol given with concomitant use; plasma concentration of both drugs may increased risk of ventricular arrhythmias; plasma concentration of sotalol increased by hypokalaemia caused by ARSENIC TRIOXIDE; enhanced hypotensive effect when beta-blockers given with severe hypotension and heart failure when beta-blockers given with increased peripheral vasoconstriction when beta-blockers given with MIRABEGRON increased risk of ventricular arrhythmias when beta-blockers given with MEFLOQUINE increased risk of ventricular arrhythmias when sotalol given with TOLTERODINE;
  - Antihistamines: increased risk of ventricular arrhythmias when sotalol given with MIZOLATINE—avoid concomitant use; antiarrhythmics: avoidance of metoprolol and sotalol advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; avoidance of sotalol advised by manufacturer of ARTEMITHIN WITH PIPERAQUINE (possible risk of ventricular arrhythmias); increased risk of bradycardia when beta-blockers given with MEFLQUINE;
  - Antimigraine: increased risk of ventricular arrhythmias when sotalol given with a Tolterodine
Bexarotene (continued)
• Lipid-regulating Drugs: plasma concentration of bexarotene increased by • GEMFIBROZIL — avoid concomitant use
Bezafibrate see Fibrates
Bicalutamide
• Anticoagulants: bicalutamide possibly enhances anticoagulant effect of COUMARINS
• Lipid-regulating Drugs: separating administration from bicalutamide by 12 hours advised by manufacturer of LOMITAPID
Bezafibrate see Antidiabetics
Bilastine see Antihistamines
Bile Acid Sequestrants see Colesevelam, Colestipol, and Colestyramine
Bile Acids
• Antacids: absorption of bile acids possibly reduced by ANTACIDS
• Ciclosporin: ursodeoxycholic acid increases absorption of CICLOSPORIN
• Lipid-regulating Drugs: absorption of bile acids possibly reduced by COLESTIROL and COLESTYRAMINE
Bisoprolol see Beta-blockers
Bisphosphonates
• Antacids: absorption of bisphosphonates reduced by ANTACIDS
• Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with AMINOGLYCOSIDES
• Calcium Salts: absorption of bisphosphonates reduced by CALCIUM SALTS
• Cytotoxics: sodium clodronate increases plasma concentration of ESTRAMUSTINE
• Iron Salts: absorption of bisphosphonates reduced by oral IRON SALTS
Bivalirudin
• Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • KETOROLAC (avoid concomitant use, including low-dose heparins)
• Anticoagulants: increased risk of haemorrhage when other anticoagulants given with • APIXABAN, • DABIGATRAN and • RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
Bleomycin
• Antipsychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)
• Cardiac Glycosides: bleomycin possibly reduces absorption of DIGOXIN tablets
• Cytotoxics: increased risk of pulmonary toxicity when bleomycin given with • BRENTHUIMAB VEDOTIN—avoid concomitant use; increased pulmonary toxicity when bleomycin given with • CISPLATIN
Boceprevir
• Alpha-blockers: boceprevir possibly increases plasma concentration of DOXAZOSIN and TAMISULOSIN—manufacturer of boceprevir advises avoid concomitant use
• Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with BUPRENORPHINE; boceprevir possibly affects plasma concentration of METHADONE
• Antibacterials: manufacturer of boceprevir advises avoid concomitant use with • RIFAMPICIN (plasma concentration of boceprevir possibly reduced)
• Anticoagulants: avoidance of boceprevir advised by manufacturer of APIXABAN
• Antiepilptics: manufacturer of boceprevir advises avoid concomitant use with • CARBAMAZEPINE, • FOSPHENYTOIN, • PHENOBARBITAL, • PHENOTYON and • PRIMIDONE (plasma concentration of boceprevir possibly reduced)
• Antifungals: plasma concentration of boceprevir increased by KETOCONAZOLE
• Antimalarials: manufacturer of boceprevir advises avoid concomitant use with • ARTEMETHER with LUMEFAOTINE
Boceprevir (continued)
• Antipsychotics: boceprevir possibly increases plasma concentration of • LURASIDONE—avoid concomitant use; manufacturer of boceprevir advises avoid concomitant use with • PIMOZIDE; boceprevir possibly increases plasma concentration of • QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
• Antivirals: boceprevir reduces plasma concentration of • ATAZANAVIR; boceprevir possibly increases the plasma concentration of • DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 544); avoid concomitant use of boceprevir with • DARUNAVIR; effects of both drugs possibly reduced when boceprevir given with ETRAVIRINE; avoidance of boceprevir advised by manufacturer of • ROSAMPRENAVIR, • NEVIRAPINE and • TIPRANAVIR; manufacturers advise avoid concomitant use of boceprevir with • LOPINAVIR; boceprevir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with • RITONAVIR
• Antioxidants and Hypnotics: boceprevir increases plasma concentration of orai • MIDAZOLAM—manufacturer of boceprevir advises avoid concomitant use
• Cardiac Glycosides: boceprevir possibly increases side-effects of DIGOXIN
• Ciclosporin: boceprevir increases plasma concentration of CICLOSPORIN
• Cilostazol: boceprevir possibly increases plasma concentration of • CILOSTAZOL (see under Cilostazol, p. 206)
• Cobicistat: avoidance of boceprevir advised by manufacturer of COBICISTAT
• Cytotoxics: boceprevir possibly increases the plasma concentration of • BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with • DASATINIB, • ERLOTINIB, • Gefitinib, • IMATINIB, • LAPATINIB, • Nilotinib, • Pazopanib, • Sorafenib and • SUNITINIB; manufacturer of ruxolitinib advises dose reduction when boceprevir given with a RUXOLITINIB—consult ruxolitinib product literature
• Domperidone: possible increased risk of ventricular arrhythmias when boceprevir given with • DOMPERIDONE—avoid concomitant use
• Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with • ERGOT ALKALOIDS
• Lipid-regulating Drugs: boceprevir increases plasma concentration of • ATORVASTATIN (reduce dose of atorvastatin); boceprevir increases plasma concentration of • PRAVASTATIN; manufacturers advise avoid concomitant use of boceprevir with • SIMVASTATIN
• Protonpump inhibitors: boceprevir increases plasma concentration of DROSPIRENONE (increased risk of toxicity)
• Sirolimus: boceprevir increases plasma concentration of • SIROLIMUS (increased risk of toxicity—reduce sirolimus dose)
• Tacrolimus: boceprevir increases plasma concentration of • TACROLIMUS (reduce dose of tacrolimus)
Bortezomib
• Antibacterials: plasma concentration of bortezomib reduced by • RIFAMPICIN—manufacturer of bortezomib advises avoid concomitant use
• Antidepressants: plasma concentration of bortezomib possibly reduced by • ST JOHN'S WORT—manufacturer of bortezomib advises avoid concomitant use
• Antiepilptics: plasma concentration of bortezomib possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN, • PHENOBARBITAL, • PHENOTYON and • PRIMIDONE—manufacturer of bortezomib advises avoid concomitant use
• Antifungals: plasma concentration of bortezomib reduced by • KETOCONAZOLE
• Antipsychotics: avoid concomitant use of cytotoxics with • CROZAPINE (increased risk of agranulocytosis)
Bosantan
• Antibacterials: plasma concentration of bosantan reduced by • RIFAMPICIN—avoid concomitant use
• Anticoagulants: manufacturer of bosantan recommends monitoring anticoagulant effect of COUMARINS
Appendix 1 Interactions

Bosentinib (continued)
- Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with ▶ HALOPERIDOL; avoid concomitant use of cytoxics with ▶ CLOzapine (increased risk of agranulocytosis)
- Antifungals: plasma concentration of bosutinib possibly increased by ▶ ATAZANAVIR, ▶ BOCEPREVIR, ▶ DARunavir, ▶ FOsamPrenavir, ▶ INIDinavir, ▶ RITOnavir, ▶ SAQuINavir and ▶ Telaprevir—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by ▶ EFAtreN and ▶ STRAvinir—manufacturer of bosutinib advises avoid concomitant use
- Aprepitant: plasma concentration of bosutinib possibly increased by ▶ APRePitanT—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with ▶ Sotalol
- Bosentin: plasma concentration of bosutinib possibly reduced by ▶ Bosentin—manufacturer of bosutinib advise concomitant use
- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by ▶ DilTiazem and ▶ Verapamil—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Cytoxics: plasma concentration of bosutinib possibly increased by ▶ MatINib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Domperidone: manufacturer of bosutinib advises avoid concomitant use with ▶ Domperidone (risk of ventricular arrhythmias)
- Fosaprepitant: plasma concentration of bosutinib possibly increased by ▶ FOSaprepitanT—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Grapefruit juice: plasma concentration of bosutinib possibly increased by ▶ Grapefruit Juice—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Modafinil: plasma concentration of bosutinib possibly reduced by ▶ Modafinil—manufacturer of bosutinib advises avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of bosutinib reduced by ▶ Lansoprazole

Brentuximab vedotin
- Antibacterials: effects of brentuximab vedotin possibly reduced by ▶ Rifampicin
- Antifungals: possible increased risk of neutropenia when brentuximab vedotin given with ▶ KetoCONAZOLE
- Antipsychotics: avoid concomitant use of cytoxics with ▶ CLOzapine (increased risk of agranulocytosis)
- Cytoxics: increased risk of pulmonary toxicity when brentuximab vedotin given with ▶ Bleomycin—avoid concomitant use
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ▶ Vaccines—avoid concomitant use

Brimonidine
- Antidepressants: manufacturer of brimonidine advises avoid concomitant use with ▶ MAOIs, TRICYClic-RELATED ANtiDEPressants and TRiCylcics

Brinzolamide see Diuretics

Bromocriptine
- Alcohol: tolerance of bromocriptine reduced by ▶ Alcohol
- Antiparkinsonian: possible increased risk of ventricular arrhythmias when bromocriptine given with ▶ MOXYflUCOXIN; plasma concentration of bromocriptine possibly reduced by ▶ RifabUTIN—manufacturer of bromocriptine advises avoid concomitant use
- Antidepressants: manufacturer of bromocriptine advises avoid concomitant use
- Antiepileptics: plasma concentration of bromocriptine possibly reduced by ▶ CarbAMAZEPINE, ▶ PhoenYtoin, ▶ PheNobarbital, ▶ Phenytoin and ▶ PrimOdone—manufacturer of bromocriptine advises avoid concomitant use
- Antifungals: plasma concentration of bromocriptine increased by ▶ KetoCONAZOLE—manufacturer of bromocriptine advises avoid or consider reducing dose of bromocriptine; plasma concentration of bromocriptine possibly increased by ▶ Macrolides (increased risk of toxicity)
- Antipsychotics: possible increased risk of ventricular arrhythmias when bromocriptine given with ▶ ChlorOquine and ▶ HydroxyChloroquine
- Beta-blockers: possible increased risk of ventricular arrhythmias when bromocriptine given with ▶ Haloperidol; avoid concomitant use of cytoxics with ▶ Clozapine (increased risk of agranulocytosis)
- Antifungals: plasma concentration of bromocriptine possibly increased by ▶ KetoCONAZOLE—manufacturer of bromocriptine advises avoid or consider reducing dose of bromocriptine; plasma concentration of bromocriptine possibly increased by ▶ Fluconazole, ▶ Itraconazole, ▶ Posaconazole and ▶ Voriconazole—manufacturer of bromocriptine advises avoid or consider reducing dose of bromocriptine
- Antimalarials: possible increased risk of ventricular arrhythmias when bromocriptine given with ▶ HydroxyChloroquine and ▶ ChlorOquine and ▶ ChlorOquine

Bosentinib (continued)
- Antidiabetics: increased risk of hepatotoxicity when bosutinib given with ▶ GlibenClamide—avoid concomitant use
- Antifungals: plasma concentration of bosentan increased by ▶ KetoConazole; plasma concentration of bosentan possibly increased by ▶ FlucOnazole—avoid concomitant use; plasma concentration of bosentan possibly increased by ▶ ItraConazole
- Antivirals: avoidance of bosentan advised by manufacturer of ▶ EnteGravir and ▶ TiraPreviN; bosentan possibly reduces plasma concentration of ▶ Indinavir; plasma concentration of bosentan increased by ▶ Lopinavir and ▶ RitoNavir (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of ▶ Telaprevir, also plasma concentration of bosentan possibly increased
- Avanafil: bosentan possibly reduces plasma concentration of ▶ AvanaFil—manufacturer of avanafil advises avoid concomitant use
- Ciclosporin: plasma concentration of bosentan increased by ▶ Ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Cobicistat: avoidance of bosentan advised by manufacturer of ▶ Cobicistat
- Cytotoxics: bosentan possibly reduces plasma concentration of ▶ BosuTinib—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: bosentan reduces plasma concentration of ▶ SimvasTatin
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing ▶ Oestrogen (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing ▶ Progestogens (alternative contraception recommended)
- Rifampicin: bosentan reduces plasma concentration of ▶ RifOGiCat
- Sildenafil: bosentan reduces plasma concentration of ▶ SildenaFil, also plasma concentration of bosentan increased
- Tadalafil: bosentan reduces plasma concentration of ▶ TadaFalin

Bosentinib
- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with ▶ Methadone
- Antacids: manufacturer of bosutinib advises separating administration with ▶ Antacids by about 12 hours
- Anti-arthritis: possible increased risk of ventricular arrhythmias when bosutinib given with ▶ AmiodaronE and ▶ Disopyramide; plasma concentration of bosutinib possibly increased by ▶ Dronedarone—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antituberculotics: plasma concentration of bosutinib possibly increased by ▶ CiproflOXacin; ▶ ClariThromycin, ▶ EryTHromycin and ▶ Telithromycin—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with ▶ MOXiflucOXin; plasma concentration of bosutinib possibly reduced by ▶ Rifabutin—manufacturer of bosutinib advises avoid concomitant use; plasma concentration of bosutinib reduced by ▶ Rifampicin—manufacturer of bosutinib advises avoid concomitant use
- Antidepressants: plasma concentration of bosutinib possibly reduced by ▶ St John’s Wort—manufacturer of bosutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of bosutinib possibly reduced by ▶ CarbamazEpine, ▶ Fosphenytoin, ▶ PhenoBarbital, ▶ Phenytoin and ▶ PrimOdone—manufacturer of bosutinib advises avoid concomitant use
- Anti-fungals: plasma concentration of bosutinib increased by ▶ KetoConazole—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib, plasma concentration of bosutinib possibly increased by ▶ Fluconazole, ▶ Itraconazole, ▶ Posaconazole and ▶ Voriconazole—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antimalarials: possible increased risk of ventricular arrhythmias when bosutinib given with ▶ ChloroQuine and ▶ HydroxyChloroQuine
Interactions (Appendix 1 Interactions)

Bromocriptine (continued)
- Sympathomimetics: risk of toxicity when bromocriptine given with MOCLOBEMIDE; manufacturer of bromocriptine advises avoid concomitant use with MOCLOBEMIDE; bromocriptine possibly increases plasma concentration of TRICYCLICS (possible increased risk of convulsions)

Antiepileptics: plasma concentration of bromocriptine reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN; metabolism of bromocriptine inhibited by SODIUM VALPROATE and VALPROIC ACID
- Antivirals: metabolism of bromocriptine accelerated by EFAVIRENZ (reduced plasma concentration); plasma concentration of bromocriptine reduced by RITONAVIR
- Atomoxetine: possible increased risk of convulsions when bromocriptine given with ATOMOXETINE
- Dopaminergics: increased risk of side-effects when bromocriptine given with AMANTADINE, CO-BENEDELPA, CO-CARELDOPA or LEVODOPA
- Hormone Antagonists: bromocriptine possibly inhibits metabolism of TAMOXIFEN to active metabolite (avoid concomitant use)
- Methylthioninium: possible risk of CNS toxicity when bromocriptine given with METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Buspirone see>Anxiolytics and Hypnotics

Busulfan
- Analgesics: metabolism of intravenous busulfan possibly inhibited by PARACETAMOL (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol)
- Antibacterials: plasma concentration of busulfan increased by METRONIDAZOLE (increased risk of toxicity)
- Antiepileptics: plasma concentration of busulfan possibly reduced by FOSPHENYTOIN and PHENYTOIN
- Antifungals: metabolism of busulfan inhibited by ITRACONAZOLE (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
- Cytotoxic: increased risk of hepatotoxicity when busulfan given with TIOGUANINE

Butyrophenones see Antipsychotics

Cabazitaxel
- Antibacterials: plasma concentration of cabazitaxel possibly increased by CLARITHROMYCIN and TELITHROMYCIN—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with rifabutin; plasma concentration of cabazitaxel reduced by Rifampicin—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with ST JOHN’S WORT
- Antiepileptics: plasma concentration of cabazitaxel possibly increased by ITRACONAZOLE and voriconazole—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cabergoline
- Antibacterials: plasma concentration of cabergoline increased by ERYTHROMYCIN (increased risk of toxicity); plasma concentration of cabergoline possibly increased by MACROLIDES (increased risk of toxicity)
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergoline antagonised by ANTIPSYCHOTICS
- Memantine: effects of dopaminergics possibly enhanced by MEMPANTINE
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by METOCLOPRAMIDE

Cabozantinib
- Antibacterials: plasma concentration of cabozantinib possibly increased by CLARITHROMYCIN and ERYTHROMYCIN; plasma concentration of cabozantinib reduced by rifampicin—avoid concomitant use
- Antidepressants: plasma concentration of cabozantinib potentially reduced by ST JOHN’S WORT—manufacturer of cabozantinib advises avoid concomitant use
- Antiepileptics: plasma concentration of cabozantinib possibly increased by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—avoid concomitant use
- Antifungals: plasma concentration of cabozantinib increased by ITRACONAZOLE; plasma concentration of cabozantinib possibly increased by ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Calcium salts: plasma concentration of calcium citrate increased by GRAPFUIT JUICE

Caffeine citrate
- Aminophylline: manufacturer of caffeine citrate advises avoid concomitant use with AMINOPHYLLINE
- Anti-arrhythmics: caffeine citrate antagonises anti-arrhythmic effect of ADENOSINE—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
- Antiepileptics: plasma concentration of caffeine citrate reduced by FOSPHENYTOIN and PHENYTOIN; caffeine citrate possibly antagonises effects of PHENOBARBITAL and PRIMIDONE
- Theophylline: manufacturer of caffeine citrate advises avoid concomitant use with THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of caffeine citrate increased by CIMETIDINE

Calcitriol see Vitamins

Calcium Salts

NOTE see also Antacids
- Antibacterials: calcium salts reduce absorption of CIPROFLOXACIN and TETRACYCLINE
- Antivirals: calcium salts reduce absorption of DOLUTEGRAVIR—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after RILPIVIRINE
- Bisphosphonates: calcium salts reduce absorption of BISPHOSPHONATES
- Cardiac Glycosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with CARDIAC GLYCOSIDES
- Corticosteroids: absorption of calcium salts reduced by CORTICOSTEROIDS
Calcium channel blockers: note Dihydropyridine calcium channel blockers include amlodipine, felodipine, isradipine, lacidipine, lercanidine, nicardipine, nifedipine, and nimodipine

- ACE inhibitors: enhanced hypertensive effect when calcium channel blockers given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypertensive effect when calcium channel blockers given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypertensive effect when calcium channel blockers given with ALCOHOL; verapamil possibly increases plasma concentration of ALCOHOL
- Aldesleukin: enhanced hypertensive effect when calcium channel blockers given with ALDESLEUKIN
- Alfentanil: verapamil increases plasma concentration of ALFENTANIL
- Alpha-blockers: verapamil increases plasma concentration of TAMSULOSIN; enhanced hypertensive effect when calcium channel blockers given with ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Amphotericin: calcium channel blockers possibly increase plasma concentration of AMINOPHYLLINE (enhanced effect); diltiazem increases plasma concentration of AMINOPHYLLINE; verapamil increases plasma concentration of AMINOPHYLLINE (enhanced effect)
- Analgesics: increased hypertensive effect of calcium-channel blockers antagonised by NSAIDS; diltiazem inhibits metabolism of ALFENTANIL (risk of prolonged or delayed respiratory depression)
- Angiotensin-II Receptor Antagonists: enhanced hypertensive effect when calcium-channel blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Anti-arrhythmics: increased risk of bradyarrhythmia, AV block and myocardial depression when diltiazem or verapamil given with AMIODARONE; increased risk of myocardial depression and asystole when verapamil given with DISOPYRAMIDE or FLECAINIDE; increased risk of bradyarrhythmia and myocardial depression when diltiazem and verapamil given with DRONEDARONE; nifedipine increases plasma concentration of DRONEDARONE
- Antidiabetics: metabolism of calcium-channel blockers possibly inhibited by CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (increased risk of side-effects); manufacturer of lercanidine advises avoid concomitant use with ERYTHROMYCIN; metabolism of diltiazem, nicardipine, nifedipine, and verapamil accelerated by RIFAMPICIN (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by RIFAMPICIN (possible significantly reduced plasma concentration); plasma concentration of felodipine possibly reduced by RIFAMPICIN; avoidance of verapamil advised by manufacturer of FIDAXOMICIN
- Anticoagulants: verapamil possibly increases plasma concentration of DABIGATRAN (see under Dabigatran Etxelate, p. 117)
- Antidepressants: metabolism of nifedipine possibly inhibited by FLUOXETINE (increased plasma concentration); diltiazem and verapamil increase plasma concentration of IMIPRAMINE; Calcium-channel blockers
- Antidepressants: enhanced hypertensive effect when calcium-channel blockers given with MAOIS; plasma concentration of nifedipine reduced by ST JOHN'S WORT; plasma concentration of amlodipine and felodipine possibly reduced by ST JOHN'S WORT; plasma concentration of verapamil significantly reduced by ST JOHN'S WORT; diltiazem and verapamil possibly increase plasma concentration of tricyclics
- Antihypertotics: glucose tolerance occasionally impaired when nifedipine given with INSULIN
- Antiepileptics: effects of dihydropyridines, nicardipine and nifedipine possibly inhibited by CARBAMAZEPINE; effects of felodipine and isradipine reduced by CARBAMAZEPINE; effects of diltiazem and verapamil possibly increase plasma concentration of CARBAMAZEPINE, FOSPHENOTIN and PHENOTHIN (plasma concentration of nimodipine possibly reduced); effects of felodipine and verapamil reduced by FOSPHENOTIN; manufacturer of isradipine advises avoid concomitant use with FOSPHENOTIN, PHENOBARBITAL, PHENOTHIN and PRIMIDONE; diltiazem increases plasma concentration of PHENOBARBITAL and PRIMIDONE (plasma concentration of nimodipine reduced); effects of felodipine and verapamil reduced by PHENOTHIN
- Antifungals: metabolism of dihydropyridines possibly inhibited by ITRACONAZOLE and KETOCONAZOLE (increased plasma concentration); metabolism of fosphenytoin is inhibited by KETOCONAZOLE (increased plasma concentration)—manufacturer of ketoconazole advises avoid concomitant use; manufacturer of lercanidine advises avoid concomitant use with ITRACONAZOLE and KETOCONAZOLE; negative inotropic effect possibly increased when calcium-channel blockers given with ITRACONAZOLE; metabolism of felodipine inhibited by ITRACONAZOLE (increased plasma concentration); plasma concentration of nifedipine increased by NICAFUNGIN
- Antimarialarials: possible increased risk of bradyarrhythmia when calcium-channel blockers given with MEFLOQUINE
- Antimicrobials: avoidance of verapamil advised by manufacturer of DARIFENACIN; verapamil increases plasma concentration of SOLIFENACIN
- Antipsychotics: enhanced hypertensive effect when calcium-channel blockers given with ANTIPSYCHOTICS; diltiazem increases the plasma concentration of LURASIDONE (see under Luzasidone, p. 315); verapamil possibly increases the plasma concentration of LURASIDONE (see under Luzasidone, p. 315)
- Antivirals: plasma concentration of verapamil possibly increased by ATAZANAVIR; plasma concentration of diltiazem increased by ATAZANAVIR (reduce dose of diltiazem); plasma concentration of diltiazem reduced by LAMINIREN; manufacturer of lercanidine advises avoid concomitant use with RITONAVIR; plasma concentration of calcium-channel blockers possibly increased by RITONAVIR; caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer of TELAPREVID; plasma concentration of amlodipine increased by TELAPREVID (consider reducing dose of amlodipine)
- Anxiolytics and Hypnotics: enhanced hypertensive effect when calcium-channel blockers given with ANXIOLYTICS AND HYPNOTICS; diltiazem and verapamil inhibit metabolism of MIDAZOLAM (increased plasma concentration with increased sedation); absorption of lercanidine increased by MIDAZOLAM; diltiazem and verapamil increase plasma concentration of BUSPIRONE (reduce dose of buspirone)
- Aprepitant: plasma concentration of both drugs may increase when diltiazem given with APREPIVAT
- Avanafil: diltiazem and verapamil possibly increase plasma concentration of AVANAFIL—see under Avanafil, p. 698
- Beta-blockers: enhanced hypertensive effect when calcium-channel blockers given with Beta-blockers; increased risk of
Interactions

Calcium-channel Blockers
- Beta-blockers (continued)
  AV block and bradycardia when diltiazem given with beta-blockers; asystole, severe hypotension and heart failure when verapamil given with beta-blockers (see under Verapamil, p. 156); possible severe hypotension and heart failure when nifedipine given with beta-blockers
- Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with rifampicin
- Candesartan: diltiazem, lercanidipine and nifedipine increase plasma concentration of diltiazem; verapamil increases plasma concentration of diltiazem, also increased risk of AV block and bradycardia; nifedipine possibly increases plasma concentration of diltiazem
- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combination of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyperplasia)
- Clocastazol: diltiazem increases plasma concentration of clocastazol (consider reducing dose of clocastazol)
- Clonidine: enhanced hypotensive effect when calcium-channel blockers are antagonised by corticosteroids; diltiazem increases plasma concentration of methylprednisolone
- Cytotoxics: verapamil possibly increases plasma concentration of doxorubicin; verapamil possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of bradycardia when diltiazem or verapamil given with everolimus (consider reducing the dose of everolimus—consult everolimus product literature); diltiazem and verapamil possibly increase the plasma concentration of ibritinib—reduce dose of ibritinib (see under ibritinib, p. 809); nifedipine possibly inhibits metabolism of vincristine
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with dapoxetine (see under Dapoxetine, p. 705)
- Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with diazoxide
- Diuretics: enhanced hypotensive effect when calcium-channel blockers given with diuretics; diltiazem and verapamil increase plasma concentration of eplerenone (reduce dose of eplerenone)
- Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with co-beneldopa, co-careldopa or levodopa
- Fingolimod: possible increased risk of bradycardia when diltiazem or verapamil given with fingolimod
- Fosaprepitant: plasma concentration of both drugs may increase when diltiazem given with fosaprepitant
- Grapefruit juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimoipidine and verapamil increased by grapefruit juice; plasma concentration of amlopidine possibly increased by grapefruit juice
- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of dutasteride; possible increased risk of bradycardia when diltiazem or verapamil given with pasireotide
- Ibrivanadine: diltiazem and verapamil increase plasma concentration of ibrivanadine—avoid concomitant use
- Lenalidomide: verapamil possibly increases plasma concentration of lenalidomide (increased risk of toxicity)
- Lipid-regulating Drugs: diltiazem increases plasma concentration of atorvastatin—possible increased risk of myopathy; plasma concentration of verapamil increased by atorvastatin, also possible increased risk of myopathy (consider reducing dose of atorvastatin); possible increased risk of myopathy when amiodipine and diltiazem given with atorvastatin
- Simvastatin: see under Simvastatin, p. 181; increased risk of myopathy when verapamil given with simvastatin (see under Simvastatin, p. 181); separating administration from amiodipine and lacidipine by 12 hours advised by manufacturer of lomitapide; avoidance of diltiazem and verapamil advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- Lithium: neurotoxicity may occur when diltiazem or verapamil given with lithium without increased plasma concentration of lithium
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and magnesium in pre-eclampsia
- Methylodopa: enhanced hypotensive effect when calcium-channel blockers given with methylodopa
- Moxisylyte: enhanced hypotensive effect when calcium-channel blockers given with moxisylyte
- Moxifloxacin: enhanced hypotensive effect when calcium-channel blockers given with moxifloxacin
- Muscle Relaxants: verapamil enhances effects of non-depolarising muscle relaxants and suxamethonium; enhanced hypotensive effect when calcium-channel blockers given with tacrolimus or tizanidine; manufacturer of verapamil advises avoid concomitant use of intravenous dantrolene; possible increased risk of ventricular arrhythmias when diltiazem given with intravenous dantrolene—manufacturer of dantrolene advises avoid concomitant use; calcium-channel blockers possibly enhance effects of non-depolarising muscle relaxants
- Nitrates: enhanced hypotensive effect when calcium-channel blockers given with nitrates
- Oestrogens: hypotensive effect of calcium-channel blockers antagonised by oestrogens
- Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with alprostadil
- Ranolazine: diltiazem and verapamil increase plasma concentration of ranolazine (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypotensive effect when amiodipine given with sildenafil
- Sirolimus: diltiazem increases plasma concentration of sirolimus; plasma concentration of both drugs increased when verapamil given with sirolimus; nicardipine possibly increases plasma concentration of sirolimus
- Sulfipyrazone: plasma concentration of verapamil reduced by sulfipyrazone
- Tacrolimus: diltiazem, nicardipine and nifedipine increase plasma concentration of tacrolimus
- Theophylline: calcium-channel blockers possibly increase plasma concentration of theophylline (enhanced effect); diltiazem increases plasma concentration of theophylline; verapamil increases plasma concentration of theophylline (enhanced effect)
- Ticagrelor: diltiazem increases plasma concentration of ticagrelor
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by cimetidine (increased plasma concentration); plasma concentration of isradipine increased by cimetidine. (halve dose of isradipine)
- Ulipristal: avoidance of verapamil advised by manufacturer of ulipristal
- Vanadefil: enhanced hypotensive effect when nifedipine given with vanadefil
- Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with hydralazine, minoxidil of sodium nitroprusside
Carbamazepine (continued)
- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of DRONEDARONE—avoids concomitant use
- Antibacterials: plasma concentration of carbamazepine increased by CLARITHROMYCIN (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by ERYTHROMYCIN; plasma concentration of carbamazepine reduced by RIFABUTIN; carbamazepine accelerates metabolism of DOXYCYCLINE (reduced effect); carbamazepine possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of DELAMANDI; plasma concentration of carbamazepine increased by ISONIAZID (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of TELITHROMYCIN (avoid during and for 2 weeks after carbamazepine)
- Anticoagulants: carbamazepine possibly reduces plasma concentration of APIXABAN—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; carbamazepine accelerates metabolism of COUMARINS (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of RIVAROXaban, manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: carbamazepine possibly reduces plasma concentration of ROBENOXINE; plasma concentration of carbamazepine increased by FLUOXETINE and FLUVOXAMINE; carbamazepine reduces plasma concentration of MIANERIN, MIRTAZAPINE and Trazodone; anticonvulsant effect of antiepileptics possibly antagonised by MAIDS and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); manufacturer of carbamazepine advises avoid for 2 weeks after stopping MAIDS, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by ST JOHN’S WORT; carbamazepine accelerates metabolism of TRICYCLICS (reduced plasma concentration and reduced effect)
- Antiepileptics: carbamazepine possibly reduces plasma concentration of ESILCARAZEPINE but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of ETHOSUXIMIDE and RITABINE; plasma concentration of both drugs often reduced when carbamazepine given with FOSPHENYTOIN or PHENYTOIN, also plasma concentration of fosphenytoin or phenytoin may be increased; carbamazepine often reduces plasma concentration of LAMOTRIGINE, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with LEVETIRACEM; plasma concentration of carbamazepine sometimes reduced by OCARBAZEPINE (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of PERAMPANEL (see under Perampanel, p. 398); carbamazepine possibly increases plasma concentration of PHENOBARBITAL and PRIMIDONE; plasma concentration of both drugs possibly reduced when carbamazepine given with RUFINAMIDE; carbamazepine reduces plasma concentration of SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of active metabolite of carbamazepine increased; plasma concentration of carbamazepine increased by STRIPENTROL; carbamazepine reduces plasma concentration of TIAGABINE and ZONISAMIDE; carbamazepine often reduces plasma concentration of TOPIRAMATE
- Antifungals: plasma concentration of carbamazepine possibly increased by KETOCONAZOLE, also plasma concentration of ketoconazole possibly reduced; plasma concentration of carbamazepine possibly increased by FLUCONAZOLE and
Interactions

Cytotoxics
- Carbamazepine
  - Antifungals (continued)
    - MICONAZOLE; carbamazepine possibly reduces plasma concentration of ITRACONAZOLE and POSaconazole; carbamazepine possibly reduces plasma concentration of DOXORUBICIN, DRUGS REDUCED WHEN CARBAMAZEPINE GIVEN WITH ARTENIOL WITH PIPERAZINE, antiepileptic effect of antiepileptics antagonised by MEfloquine
  - Antipyschotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered); carbamazepine accelerates metabolism of DAUNORUBICIN, OLANZAPINE, QUETIAPINE and RISPERIDONE (reduced plasma concentration); carbamazepine reduces plasma concentration of ARIPIRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole — consult aripiprazole product literature); carbamazepine accelerates metabolism of CLOZAPINE (reduced plasma concentration), also as concomitant use of drugs reduced when carbamazepine given with EFAVIRENZ; carbamazepine possibly reduces plasma concentration of LURASIDONE — avoid concomitant use; carbamazepine reduces plasma concentration of PALPERIDONE
  - Antivirals: avoidance of carbamazepine advised by manufacturer of BOCEPREVIR and RILPIVIRINE (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of DAKLADASVIR and ETARINIMOL WITH PIPERAQUINE, manufacturer of daclatasvir advises avoid concomitant use; carbamazepine often reduces plasma concentration of SOFOSBUVIR, TIPRANAVIR and NEVIRAPINE; plasma concentration of both drugs reduced when carbamazepine given with EFAVIRENZ; carbamazepine possibly reduces plasma concentration of INDIANAVIR, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of NEVIRAPINE; plasma concentration of carbamazepine possibly increased by RITONAVIR
  - Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of CLONAZEPAM; carbamazepine reduces plasma concentration of MIDAZOLAM
  - Aprepitant: carbamazepine possibly reduces plasma concentration of APREPI TANT
  - Avanafil: carbamazepine possibly reduces plasma concentration of AVANAFIL — manufacturer of avanafil advises avoid concomitant use
  - Bupropion: carbamazepine reduces plasma concentration of BUPROPION
  - Calcium-channel Blockers: carbamazepine reduces effects of FELODIPINE and HRADIPINE; carbamazepine probably reduces effects of DIONYDROPHRIDINES, NICARDIPINE and NIFEDIPINE; avoidance of carbamazepine advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by DILTIAZEM and VERAPAMIL
  - Cannabis Extract: carbamazepine possibly reduces plasma concentration of CANNABIS EXTRACT — manufacturer of cannabis extract advises avoid concomitant use
  - Ciclosporin: carbamazepine accelerates metabolism of CICLOSPORIN (reduced plasma concentration)
  - Clopidogrel: carbamazepine possibly reduces antplatelet effect of CLOPIDOGREL
  - Cobicistat: carbamazepine possibly reduces plasma concentration of Cobicistat — manufacturer of cobicistat advises avoid concomitant use
  - Corticosteroids: carbamazepine accelerates metabolism of CORTICOSTEROIDS (reduced effect)
  - Cytoxics: carbamazepine possibly decreases plasma concentration of AXITINIB (increase of axitinib — consult axitinib product literature); carbamazepine possibly reduces plasma concentration of BORTezOmiB, BOSUTINIB, CRizOTINIB, IBUrITINIB, IDEALISIB and PONATINIB — manufacturer of carbamazepine

Corticosteroids
- Carbamazepine
  - Cytoxotics (continued)
    - bortezomib, bosutinib, crizotinib, ibritinib, idelisib and ponatinib advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of CARBOZANTINIB — avoid concomitant use; avoidance of carbamazepine advised by manufacturer of CABAZITAXEL, DABRAFENIB, GETINIBIN and VEmurafenib; avoidance of carbamazepine advised by manufacturer of DASatinib, VANDetanIB and VISMODEGIB (plasma concentration of dasatinib, vandetanib and vismodegib possibly reduced); carbamazepine reduces plasma concentration of IMATINIB and LAPATINIB — avoid concomitant use; carbamazepine possibly reduces plasma concentration of Eribulin; carbamazepine reduces plasma concentration of IRINotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with PROCARBAZINE
  - Diuretics: increased risk of hyponatraemia when carbamazepine given with DIURETICS; plasma concentration of carbamazepine increased by ETALOLAMIDE; carbamazepine reduces plasma concentration of Fingolimod
  - Fosaprepitant: carbamazepine possibly reduces plasma concentration of FOSAPREPI tant
  - Hormone Antagonists: carbamazepine possibly reduces plasma concentration of ABLERATONE — manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by DANAZOL (increased risk of toxicity); carbamazepine possibly accelerates metabolism of TOREMIFENE (reduced plasma concentration)
  - HTR2-receptor Antagonists: carbamazepine accelerates metabolism of ONDANSETRON (reduced effect)
  - Ivacator: carbamazepine possibly reduces plasma concentration of IVCATOR — manufacturer of ivacator advises avoid concomitant use
  - Lipid-regulating Drugs: carbamazepine reduces plasma concentration of SIMVASTATIN — consider increasing dose of simvastatin
  - Lithium: neurotoxicity may occur when carbamazepine given with LITHIUM without increased plasma concentration of lithium
  - Mirtazapine: avoidance of carbamazepine advised by manufacturer of MACITENANT
  - Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of NON-DEPOLARISING MUSCLE RELAXANTS (accelerated recovery from neuromuscular blockade)
  - Oestrogens: carbamazepine accelerates metabolism of OESTROGENS; reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings — see Contraceptive Interactions in BNF
  - Orlistat: possible increased risk of convulsions when carbamazepine given with ORLISTAT
  - Progestogens: carbamazepine accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormone contraception — see Contraceptive Interactions in BNF)
  - Retinoids: plasma concentration of carbamazepine possibly reduced by ISOTRETININ
  - Roflumilast: carbamazepine possibly inhibits effects of ROFLUMILAST — manufacturer of roflumilast advises avoid concomitant use
  - Theophylline: carbamazepine accelerates metabolism of THEOPHYLLINE (reduced effect)
  - Thyroid Hormones: carbamazepine accelerates metabolism of THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism)
  - Tibolone: carbamazepine accelerates metabolism of TIBOLONE (reduced plasma concentration)
  - Ticagrelor: carbamazepine possibly reduces plasma concentration of TICAGRELOR
Cardiac Glycosides (continued)
▶ Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with CORTICOSTEROIDS
▶ Cytotoxics: absorption of digoxin tablets possibly reduced by BLEMOMICIN, CARMUSTINE, CYCLOPHOSPHAMIDE, CYTARABINE, DOXORUBICIN, MELPHALAN, METHOTREXATE, PROCARBAZINE and WINCristine; possible increased risk of bradycardia when digoxin given with CRZOTINIB; manufacturer of digoxin advises give IBUTRINT at least 6 hours before or after ibritinib; plasma concentration of digoxin increased by VANDETANIB—possibly increased risk of bradycardia
▶ Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with ACETAZOLAMIDE, LOOP DIURETICS or THIACID Diuretics; plasma concentration of digoxin possibly increased by POTASSIUM CARBONATE; plasma concentration of digoxin increased by SPIRONOLACTONE
▶ Ivermectin: plasma concentration of digoxin increased by IVACANTORF
▶ Lenalidomide: plasma concentration of digoxin possibly increased by LENALIDOMIDE
▶ Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by COLESTIPOL and COLESTYRAMINE; plasma concentration of digoxin possibly increased by ATORVASTATIN
▶ Mirabegron: plasma concentration of digoxin increased by MIRABEGRON—reduce initial dose of digoxin
▶ Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with SUXAMETHONIUM; possible increased risk of bradycardia when cardiac glycosides given with TIZANIDINE
▶ Penicillamine: plasma concentration of digoxin possibly increased by PENICILLAMINE
▶ Ranolazine: plasma concentration of digoxin increased by RANOLAZINE
▶ Sympathomimetics, Beta:-; plasma concentration of digoxin possibly reduced by SALBUTAMOL
▶ Ticagrelor: plasma concentration of digoxin increased by TICAgRELOR
▶ Tolbutamide: plasma concentration of digoxin increased by TOlvapTaN (increased risk of toxicity)
▶ Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by PROTON PUMP INHIBITORS; absorption of cardiac glycosides possibly reduced by SUCARLAfTE
▶ Ulipristal: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after ULIPRISTAL
Carmustine
▶ Antipsychotics: avoid concomitant use of carmustine with CLOzapine (increased risk of agranulocytosis)
▶ Cardiac Glycosides: carmustine possibly reduces absorption of DIOXIN tablets
▶ Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by CIMERTIDINE
Carbapenems see Ertaopenem, Imipenem with Cilastatin, and Meropenem
Carbonic Anhydride Inhibitors see Diuretics
Carboplatin see Platinum Compounds
Carboprost see Prostaglandins
Cardiac Glycosides
▶ ACE inhibitors: plasma concentration of digoxin possibly increased by CAPTOPRIL
▶ Alpha-blockers: plasma concentration of digoxin increased by PRAZOSIN
▶ Aminoglycosides: absorption of digoxin possibly reduced by SULFASALAZINE
▶ Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDS, also possible exacerbation of heart failure and reduction of renal function
▶ Antacids: absorption of digoxin possibly reduced by ANTACIDS
▶ Anti-arrhythmics: plasma concentration of digoxin increased by AMIODARONE, DRONEDARONE and PROPAFENONE (halve dose of digoxin)
▶ Antibacterials: plasma concentration of digoxin possibly increased by CEFOTAXIM, CEPHALOSPORIN, TEETTHROXIM and TRIMETHOPRIM; absorption of digoxin reduced by NEOMYCIN; plasma concentration of digoxin possibly increased by RIFAMPICIN; plasma concentration of digoxin increased by MACROLIDES (increased risk of toxicity)
▶ Antidepressants: plasma concentration of digoxin reduced by ST JOHN'S WORT—avoid concomitant use
▶ Anti-diabetics: plasma concentration of digoxin possibly reduced by ACARBOS, plasma concentration of digoxin increased by CANAGLIFLOZIN and SITAGLITIEN
▶ Antiepileptics: plasma concentration of digoxin possibly reduced by FOSPHENYTOIN and PHENTYNOl
▶ Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with AMPHOTERIEIN; plasma concentration of digoxin increased by ITRAConAZOLE
▶ Antimalarials: plasma concentration of digoxin possibly increased by CHLOROQUINE and HYDROXYCHLOROQUINE; possible increased risk of bradycardia when digoxin given with MELOQUEINE; plasma concentration of digoxin increased by QUININE
▶ Antimuscarinics: plasma concentration of digoxin possibly increased by DARIFENACIN
▶ Antivirals: side-effects of digoxin possibly increased by BOCePREVIR; plasma concentration of digoxin increased by DAclTASVIR, ETARVirINE, SIMEPREVIR and TELAPREVeR; plasma concentration of digoxin possibly increased by RITONAVIR
▶ Anxiolytics and Hypnotics: plasma concentration of digoxin increased by ALPRAZOLAM (increased risk of toxicity)
▶ Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with BETABLOCKERS
▶ Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of CALCIUM SALTS
▶ Calcium-channel Blockers: plasma concentration of digoxin increased by DILTiazEM, LERCaPIDINE and NICaPIDINE; plasma concentration of digoxin possibly increased by NIFEDiPINE; plasma concentration of digoxin increased by VERAPAMI, also increased risk of AV block and bradycardia
▶ Ciclosporin: plasma concentration of digoxin increased by CICLOSPORINE (increased risk of toxicity)
▶ Cobicistat: plasma concentration of digoxin possibly increased by CObICISTAT—reduce initial dose of digoxin
▶ Colchicine: possible increased risk of myopathy when digoxin given with COLECHINE

Appendix 1 Interactions
Catumaxomab (continued)  
- Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use

Cefadroxil see Cephalosporins

Cefalexin see Cephalosporins

Cefixime see Cephalosporins

Cefotaxime see Cephalosporins

Cefuroxime see Cephalosporins

Cefaclor see Cephalosporins

Ceftaroline see Cephalosporins

Chloramphenicol see Chloramphenicol

Chloral see Chloral

Ciclosporin see Ciclosporin

Ceftadoline see Cephalosporins

Ceftriaxone see Cephalosporins

Cefuroxime see Cephalosporins

Celiprolol see Beta-blockers

Cephalosporins
  - Antacids: absorption of cefaclor reduced by antacids
  - Antibacterials: possible increased risk of nephrotoxicity when cefuroxime given with aminoglycosides
  - Anticoagulants: cefuroxime possibly increases plasma concentration of warfarin
  - Teriflunomide: plasma concentration of cefuroxime increased by teriflunomide
  - Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Certilzumab pegol
  - Abacavir: avoid concomitant use of certilzumab pegol with abacavir
  - Anakinra: avoid concomitant use of certilzumab pegol with anakinra
  - Antipsychotics: avoid concomitant use of cytoxan with cer tilzumab pegol
  - Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use

Cetuximab
  - Antibacterials: metabolism of cetuximab accelerated by rifampicin (reduced plasma concentration)
  - Anticoagulants: monoclonal antibodies possibly enhance anticoagulant effect of coumarins
  - Teriflunomide: plasma concentration of cefuroxime increased by teriflunomide
  - Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Chloroquine (continued)  
- Agalsidase alfa and beta: chloroquine possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Antacids: absorption of chloroquine reduced by antacids
- Anthelmintics: chloroquine reduces plasma concentration of praziquantel—consider increasing praziquantel dose when given for systemic infections
- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine given with amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when chloroquine given with moxiﬂoxacin—avoid concomitant use
- Antidepressants: possible increased risk of ventricular arrhythmias when chloroquine given with citalopram and escitalopram
- Antimalarials: avoidance of antimalarials advised by manufacturer of arte mether with lumefantrine; increased risk of convulsions when chloroquine given with mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine given with bosutinib
- Histamine: avoidance of antiarrhythmials advised by manufacturer of histamine
- Lanthanum: absorption of chloroquine possibly reduced by lanthanum (give at least 2 hours apart)
- Laronidase: chloroquine possibly inhibits effects of Laronidase (manufacturer of laronidase advises avoid concomitant use)
- Parasymptomathetics: chloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine
- Ulcer-healing Drugs: metabolism of chloroquine inhibited by cimetidine (increased plasma concentration)
- Vaccines: antimalarials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Chlorothiazide see Diuretics

Chlorphenamine see Antihistamines

Chlorpromazine see Antipsychotics

Chlorotope see Diuretics

Chloroquine see Antimalarials

Ciclosporin see Ciclosporin

Ciclosporin
  - Anticoagulants: metabolism of ciclosporin possibly inhibited by rifampicin (reduced plasma concentration)
  - Anticoagulants: monoclonal antibodies possibly enhance anticoagulant effect of coumarins
  - Antidepressants: monoclonal antibodies possibly enhance effects of sulfonylureas
  - Antiepileptics: ciclosporin increases plasma concentration of fosphenytoin and phenytoin (increased risk of toxicity); metabolism of ciclosporin possibly accelerated by phenobarbital and primidone (reduced plasma concentration)
  - Antipsychotics: avoid concomitant use of ciclosporin with clozapine (increased risk of agranulocytosis)
  - Ciclosporin: ciclosporin possibly reduces plasma concentration of ciclosporin
  - Clopidogrel: ciclosporin possibly reduces antiplatelet effect of clopidogrel
  - Hydroxocobalamin: ciclosporin reduces response to hydroxocobalamin
  - Tacrolimus: ciclosporin possibly increases plasma concentration of tacrolimus
  - Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Chlorozapine see Antidepressants

Chlorpromazine see Antipsychotics

Ciclosporin see Ciclosporin
Ciclosporin

- Antibacterials (continued)
  - CHLORMPHENICOL and TELITROMYCIN; increased risk of myopathy when ciclosporin given with DAFTOMYCIN (preferably avoid concomitant use); avoidance of ciclosporin advised by manufacturer of FIDAXOMICIN; metabolism of ciclosporin possibly inhibited by MACROLIDES (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with TRIMETHOPRIM, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
- Anticoagulants: ciclosporin possibly increases plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use
- Antidepressants: plasma concentration of ciclosporin reduced by ST JOHN'S WORT—avoid concomitant use
- Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of REPAGLINIDE
- Antiepileptics: metabolism of ciclosporin accelerated by CARBAMAZEPINE, OXFENITOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by OXCARBAZEPINE
- Antifungals: metabolism of ciclosporin inhibited by FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE, POSaconazole and VORICONAZOLE (increased plasma concentration); metabolism of ciclosporin possibly inhibited by MICONAZOLE (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with FENITOIN; ciclosporin possibly increases plasma concentration of CASPOFUNGIN (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by GRISEOFULVIN and TERBINAFINE; plasma concentration of ciclosporin possibly increased by MICAFUNGIN
- Antimalarials: plasma concentration of ciclosporin increased by CHLOROQUINE and HYDROXYCHLOROQUINE (increased risk of toxicity)
- Antimucosarins: avoidance of ciclosporin advised by manufacturer of TARIFENACIN
- Antivirals: increased risk of nephrotoxicity when ciclosporin given with ACICLOVIR or VALACICLOVIR; plasma concentration of ciclosporin possibly increased by AZANAVIR and RITONAVIR; plasma concentration of ciclosporin increased by FOSAMPRENISIDE; plasma concentration of ciclosporin possibly reduced by EFAVIRENZ; plasma concentration of both drugs increased when ciclosporin given with SAAQUINAVIR; plasma concentration of both drugs increased when ciclosporin given with TELAPREVIR (reduce dose of ciclosporin)
- Beta-blockers: plasma concentration of ciclosporin increased by CARVEDIOL
- Bile Acids: absorption of ciclosporin increased by URSODEOXYCHOLIC ACID
- Bosenat: ciclosporin increases plasma concentration of BOSENTAN (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with LERCANIDIPINE may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by DILTIAZEM, NICARDIPINE and VERAPAMIL; ciclosporin possibly increases plasma concentration of NIFEDIPINE (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of DIGOXIN (increased risk of toxicity)
- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with COLCHICINE—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Colestilan: manufacturer of colestilan advises give ciclosporin at least 1 hour before or 3 hours after COLESTILAN
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose METHYLPREREDINOSOLONE (risk of convulsions); ciclosporin increases plasma concentration of PREREDINOSOLONE

Ciclosporin (continued)

- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with MELPHALAN; increased risk of neurotoxicity when ciclosporin given with DOXORUBICIN; ciclosporin increases plasma concentration of EPURUBICIN and IDARUBICIN; ciclosporin reduces excretion of MITOXANTRONE (increased plasma concentration); risk of toxicity when ciclosporin given with METHOTREXATE; ciclosporin possibly increases the plasma concentration of APATINIB—manufacturer of apatinib advises separating administration of ciclosporin by 6 to 12 hours; caution with ciclosporin advised by manufacturer of CRIZOTINIB; ciclosporin increases plasma concentration of EVEROLUSIN (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of ciclosporin possibly increased by IMatinib; in vitro studies suggest a possible interaction between ciclosporin and Docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of Etoposide (increased risk of toxicity)
- Dexrazoxane: increased risk of immunosupression with ciclosporin advised by manufacturer of Dexrazoxane
- Diuretics: plasma concentration of ciclosporin possibly increased by ACETAZOLAMIDE; increased risk of hyperkalaemia when ciclosporin given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with THIAZIDES AND RELATED DIURETICS
- Grapefruit juice: plasma concentration of ciclosporin increased by GRAPEFRUIT JUICE (increased risk of toxicity)
- Hormone Antagonists: metabolism of ciclosporin inhibited by PHENOBARBITAL, PHENOBARBITAL and PHENOBARBITAL; ciclosporin advised by manufacturer of Mifepristone; plasma concentration of ciclosporin possibly increased by DANAZOL (increased plasma concentration); plasma concentration of ciclosporin reduced by LANREOTIDE and OCTREOTIDE; plasma concentration of ciclosporin possibly reduced by PASREOTIDE
- Lenalidomide: ciclosporin possibly increases plasma concentration of LENALIDOMIDE (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by COLESEVELAM; increased risk of renal impairment when ciclosporin given with BEZAFIBRATE or FENOBIBRATE; increased risk of myopathy when ciclosporin given with ATORVASTATIN (see under Atorvastatin, p. 179); increased risk of myopathy when ciclosporin given with FLUVASTATIN or PRAVASTATIN; increased risk of myopathy when ciclosporin given with ROSUVASTATIN or SIMVASTATIN (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with EZETIMIBE; separating administration from ciclosporin by 12 hours advised by manufacturer of LOMITAPIDE
- Manipol: possible increased risk of nephrotoxicity when ciclosporin given with MANIPOL
- Metoclopramide: plasma concentration of ciclosporin increased by METOCLOPROMIDE
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of MIFAMURTIDE
- Modafinil: plasma concentration of ciclosporin reduced by MODAFINIL
- Oestrogens: plasma concentration of ciclosporin possibly increased by OESTROGENS
- Orlstat: absorption of ciclosporin possibly reduced by ORLISTAT
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with POTASSIUM SALTS
- Progestogens: plasma concentration of ciclosporin possibly increased by PROGESTOGENS
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with RANOLAZINE
- Sevelamer: plasma concentration of ciclosporin possibly reduced by SEVELAMER
- Sirolimus: ciclosporin increases plasma concentration of SIROLIMUS
- Sulfipyrazole: plasma concentration of ciclosporin reduced by SYLFINPYRAZONE
- Tacrolimus: plasma concentration of ciclosporin increased by SYLFINPYRAZONE
- Tuglakolyne: plasma concentration of ciclosporin increased by SYLFINPYRAZONE
- Trilostane: plasma concentration of ciclosporin increased by SYLFINPYRAZONE
Ciclesonin (continued)

- Ticagrelor: ciclesonin increases plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: plasma concentration of ciclesonin possibly increased by CLONIDINE; plasma concentration of ciclesonin possibly affected by OMPERAZOLE
- Vitamins: plasma concentration of ciclesonin possibly affected by VITAMIN E

Clidrocin

- Antidepressants: avoidance of cildrocin advised by manufacturer of ANAGRELIDE

Clindamycin

- Antibiotics: plasma concentration of clindamycin possibly increased by CLARITHROMYCIN (see under Cilostazol, p. 206); plasma concentration of clindamycin increased by ERYTHROMYCIN (see under Cilostazol, p. 206)
- Anti-infectivals: plasma concentration of clindamycin increased by KETOCONAZOLE (see under Cilostazol, p. 206)
- Antifungals: plasma concentration of clindamycin increased by ITRACONAZOLE (see under Cilostazol, p. 206)

Clonidine

- Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of clonidine antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIS; hypotensive effect of clonidine possibly antagonised by MIRTAZAPINE; hypotensive effect of clonidine antagonised by TRICYCLES, also increased risk of hypertension on clonidine withdrawal
- Anti-psychotics: enhanced hypotensive effect when clonidine given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with BETA-BLOCKERS (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with CALCIUM-CHANNEL BLOCKERS
- Corticosteroids: hypotensive effect of clonidine antagonised by CORTICOSTEROIDS
- Cytoxics: possible increased risk of bradycardia when clonidine given with CRIZOTINIB
- Diazoxide: enhanced hypotensive effect when clonidine given with DIAZoxide
- Diuretics: enhanced hypotensive effect when clonidine given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when clonidine given with CO-BENELDOPA, CO-CARBDOPA or LEVODopa
- Histamine: avoidance of clonidine advised by manufacturer of HISTAMINE
- Methylprednisolone: enhanced hypotensive effect when clonidine given with METHYLDOPIA
- Moxisylyte: enhanced hypotensive effect when clonidine given with MOXISLYTE
- Monoxidine: enhanced hypotensive effect when clonidine given with MONOXIDINE
- Muscle Relaxants: enhanced hypotensive effect when clonidine given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when clonidine given with NITRATES
- Oestrogens: hypotensive effect of clonidine antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when clonidine given with ALPROSTADIL
- Symphathomimetics: possible risk of hypertension when clonidine given with ADRENALINE (EPINEPHRINE) or NORADRENALINE (NOREPINEPHRINE); serious adverse events reported with concomitant use of clonidine and METHYLPHENIDATE (causality not established)
- Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Clomipramine

- Antidepressants: increased risk of bleeding when clopidogrel given with NSAIDS or ASPIRIN
- Antibiotics: antplatelet effect of clopidogrel possibly reduced by CHLORAMPHENICOL, CIPROFLOXACIN and ERYTHROMYCIN
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with WARFARIN; antplatelet action of clopidogrel enhances anticoagulant effect of COUMARINS and PHENINDIONE; increased risk of bleeding when clopidogrel given with HEPARINS
- Antidepressants: antplatelet effect of clopidogrel possibly reduced by FLUXOTIN, FLUVOXAMINE and MOLOBEMIDE
- Antiepileptics: antplatelet effect of clopidogrel possibly reduced by CARBAMAZEPINE and OXCARBAMAZEPINE
- Antifungals: antplatelet effect of clopidogrel possibly reduced by FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE and VORICONAZOLE

Clomipramine (continued)

- ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE INHIBITORS; previous treatment with clonidine possibly delays antihypertensive effect of CAPTOPRIL
- Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when clonidine given with ALCOHOL
- Aldehydes: enhanced hypotensive effect when clonidine given with ALDEHYDES
- Alpha-blockers: enhanced hypotensive effect when clonidine given with ALPHA-BLOCKERS
Co-beneldopa (continued)  
▶ Vasodilator Antihypertensives: enhanced hypotensive effect when co-beneldopa given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSSIDE  

Co-beneldopa (continued)  
▶ Vasodilator Antihypertensives: enhanced hypotensive effect when co-beneldopa given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSSIDE  

Clobidogrel (continued)  
▶ Antivirals: antiplatelet effect of clobidogrel possibly reduced by • ETARVIRINE  

Clopipamide: increased risk of bleeding when clobidogrel given with • DIPYRIDAMOLE  

Cloprostenol: increased risk of bleeding when cloprostenol given with • ILOPROST  

Lipid-regulating Drugs: clobidogrel increases plasma concentration of • ROSUVASTATIN—adjust dose of rosuvastatin (even with product literature)  

Prasugrel: possible increased risk of bleeding when clopidogrel given with • PRASUGREL  

Ulcet-healing Drugs: antiplatelet effect of clobidogrel possibly reduced by • CIMETIDINE, LANOSPORAZOLE, PANTOPRAZOLE and RABEPRAZOLE; antiplatelet effect of clopidogrel reduced by • ESOMEPRAZOLE and • OMEPRAZOLE  

Clobazam see Antipsychotics  

Co-amoxiclav see Penicillins  

Co-beneldopa  
▶ ACE inhibitors: enhanced hypotensive effect when co-beneldopa given with • ACE INHIBITORS  
▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when co-beneldopa given with • ADRENERGIC NEURONE BLOCKERS  
▶ Alpha-blockers: enhanced hypotensive effect when co-beneldopa given with • ALPHA-BLOCKERS  
▶ Anaesthetics, General: increased risk of arrhythmias when co-beneldopa given with • VOLATILE LIQUID GENERAL ANAESTHETICS  
▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-beneldopa given with • ANGIOTENSIN-II RECEPTOR ANTAGONISTS  
▶ Antidepressants: effects of co-beneldopa possibly reduced by • ISONIAZID  
▶ Antidepressants: risk of hypertensive crisis when co-beneldopa given with • MAOIS, avoid co-beneldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when co-beneldopa given with • MOCLOBEMIDE  
▶ Antiepileptics: effects of co-beneldopa possibly reduced by • FOSPHENYTOIN and • PHENYTOIN  
▶ Antimuscarinics: absorption of co-beneldopa possibly reduced by • ANTIMUSCARINICS  
▶ Antipsychotics: effects of co-beneldopa antagonised by • ANTIPSYCHOTICS; avoidance of co-beneldopa advised by manufacturer of • AMISULPRIDE (antagonism of effect)  
▶ Anxiolytics and Hypnotics: effects of co-beneldopa possibly antagonised by • BENZODIAZEPINES  
▶ Beta-blockers: enhanced hypotensive effect when co-beneldopa given with • BETA-BLOCKERS  
▶ Bupropion: increased risk of side-effects when co-beneldopa given with • BUPROPION  
▶ Calcium-channel Blockers: enhanced hypotensive effect when co-beneldopa given with • CALCIUM-CHANNEL BLOCKERS  
▶ Clonidine: enhanced hypotensive effect when co-beneldopa given with • CLONIDINE  
▶ Diazoxide: enhanced hypotensive effect when co-beneldopa given with • DIAZOXIDE  
▶ Diuretics: enhanced hypotensive effect when co-beneldopa given with • DIURETICS  
▶ Dopaminergics: enhanced effects and increased toxicity of co-beneldopa when given with • SELEGILINE (reduce dose of co-beneldopa)  
▶ Iron Salts: absorption of co-beneldopa possibly reduced by • oral IRON SALTS  
▶ Memantine: effects of dopaminergics possibly enhanced by • MEMANTINE  
▶ Methyldopa: enhanced hypotensive effect when co-beneldopa given with • METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by • METHYLDOPA  
▶ Monoxidine: enhanced hypotensive effect when co-beneldopa given with • MONOXIDINE  
▶ Muscle Relaxants: possible agitation, confusion and hallucinations when co-beneldopa given with • BACLOFEN  
▶ Nitrates: enhanced hypotensive effect when co-beneldopa given with • NITRATES  

Co-beneldopa (continued)  
▶ Vasodilator Antihypertensives: enhanced hypotensive effect when co-beneldopa given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSSIDE  

Cobicistat  
▶ Alpha-blockers: cobicistat possibly increases plasma concentration of • ALFUSIZON—manufacturer of cobicistat advises avoid concomitant use  
▶ Anti-arrhythmics: cobicistat possibly increases plasma concentration of • AMIODARONE—manufacturer of cobicistat advises avoid concomitant use  
▶ Antibacterials: plasma concentration of cobicistat reduced by • RIFABUTIN (adjust dose—consult product literature); plasma concentration of cobicistat possibly reduced by • RIFAMPCIN—manufacturer of cobicistat advises avoid concomitant use  
▶ Anticoagulants: avoidance of cobicistat advised by manufacturer of • APIXABAN; cobicistat possibly enhances anticoagulant effect of • RIVAROXABAN—avoid concomitant use  
▶ Antidepressants: plasma concentration of cobicistat possibly reduced by • ST JOHN’S WORT—manufacturer of cobicistat advises avoid concomitant use  
▶ Antiepileptics: plasma concentration of cobicistat possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN, • PHENOGRABARTIAL, • PHENTHOIN and • PRIMIDONE—manufacturer of cobicistat advises avoid concomitant use  
▶ Antifungals: cobicistat possibly increases plasma concentration of • ITRACONAZOLE and • KETOCONAZOLE—manufacturer of cobicistat advises reduce dose of itraconazole and ketoconazole  
▶ Antipsychotics: cobicistat possibly increases plasma concentration of • Lurasidone—avoid concomitant use; cobicistat possibly increases plasma concentration of • PIMOZIDE—manufacturer of cobicistat advises avoid concomitant use  
▶ Antivirals: manufacturer of cobicistat advises avoid concomitant use with • BOCEPREVIR; cobicistat possibly increases the plasma concentration of • Daclatasvir—reduce dose of daclatasvir (see under Daclatasvir, p. 544); cobicistat possibly increases plasma concentration of • MARAVIROC (reduce dose of maraviroc); avoidance of cobicistat advised by manufacturer of • NEVIRAPINE; cobicistat possibly increases plasma concentration of • SIMPEPREVIR—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs reduced when cobicistat given with • Tipranavir (avoid concomitant use)  
▶ Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with • ORAL • MIDAZOLAM  
▶ Bosentan: manufacturer of cobicistat advises avoid concomitant use with • BOSENTAN  
▶ Cardiac Glycosides: cobicistat possibly increases plasma concentration of • Digoxin—reduce initial dose of digoxin  
▶ Cytoxotics: cobicistat possibly increases the plasma concentration of • Ibrutinib—reduce dose of ibrutinib (see under Ibrutinib, p. 809)  
▶ Concomitant use of sildenafil for pulmonary arterial
Cobicistat

- Sildenafil (continued)
  - hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
- Sympathomimetics, Beta: manufacturer of cobicistat advises avoid concomitant use with salmeterol
- Tadalafil: cobicistat possibly increases plasma concentration of tadalafil (consult cobicistat product literature)
- Vardenafil: cobicistat possibly increases plasma concentration of vardenafil (consult cobicistat product literature)

Co-careldopa

- ACE Inhibitors: enhanced hypotensive effect when co-careldopa given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when co-careldopa given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when co-careldopa given with ALPHA-BLOCKERS
- Anaesthetics, General: increased risk of arrhythmias when co-careldopa given with volatile liquid general anaesthetics
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-careldopa given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: effects of co-careldopa possibly reduced by ISONIAZID
- Antidepressants: risk of hypertensive crisis when co-careldopa given with MAOIS, increased risk of side-effects when co-careldopa given with moclobumide
- Antiepileptics: effects of co-careldopa possibly reduced by fosphenytoin and phenytoin
- Antimuscarnics: absorption of co-careldopa possibly reduced by antimuscarinics
- Antipsychotics: effects of co-careldopa antagonised by antipsychotics; avoidance of co-careldopa advised by manufacturer of amisulpride (antagonism of effect)
- Anxiolytics and Hypnotics: effects of co-careldopa possibly antagonised by benzodiazepines
- Beta-blockers: enhanced hypotensive effect when co-careldopa given with beta-blockers
- Bupropion: increased risk of side-effects when co-careldopa given with bupropion
- Calcium-channel Blockers: enhanced hypotensive effect when co-careldopa given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when co-careldopa given with clonidine
- Diazoxide: enhanced hypotensive effect when co-careldopa given with diazoxide
- Diuretics: enhanced hypotensive effect when co-careldopa given with diuretics
- Dopaminergics: enhanced effects and increased toxicity of co-careldopa when given with selegiline (reduce dose of co-careldopa)
- Iron Salts: absorption of co-careldopa possibly reduced by oral iron salts
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methyldopa: enhanced hypotensive effect when co-careldopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Moxonidine: enhanced hypotensive effect when co-careldopa given with moxonidine
- Muscle Relaxants: possible agitation, confusion and hallucinations when co-careldopa given with baclofen
- Nitrates: enhanced hypotensive effect when co-careldopa given with nitrates
- Vasodilator: Antihypertensives: enhanced hypotensive effect when co-careldopa given with hydralazine, minoxidil or sodium nitroprusside

Codeine see Opioid Analgesics

Co-fluampicil see Penicillins

Colchicine

- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with amiodarone

Colchicine (continued)

- Antibacterials: possible increased risk of colchicine toxicity when given with azithromycin, clarithromycin, erythromycin and telithromycin—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with itraconazole and ketoconazole—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with atazanavir, indinavir, ritonavir and telaprevir—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with diltiazem and verapamil—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with digoxin
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ciclosporin—suspend or reduce dose of ciclosporin (avoid concomitant use in hepatic or renal impairment)
- Grapefruit Juice: possible increased risk of colchicine toxicity when given with grapefruit juice
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with fibrates or statins

Colecalficeral see Vitamins

Colesevelam

NOTE Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption

- Antidiabetics: colesevelam reduces absorption of glimepiride and glipizide; colesevelam reduces absorption of glipizide—manufacturer of glimepiride advises give at least 4 hours before colesevelam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 hours before canagliflozin
- Antiepileptics: colesevelam possibly reduces absorption of fosphenytoin and phenytoin
- Ciclosporin: colesevelam reduces absorption of ciclosporin
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
- Oestrogens: colesevelam reduces absorption of ethinylestradiol
- Thyroid Hormones: colesevelam reduces absorption of levothyroxine

Colestipol

NOTE Other drugs should be taken at least 1 hour before or 3 hours after colestipol to reduce possible interference with absorption

- Ciclosporin: manufacturer of colestipol advises give ciclosporin at least 1 hour before or 3 hours after colestipol
- Mycophenolate: manufacturer of colestipol advises give mycophenolate at least 1 hour before or 3 hours after colestipol
- Tacrolimus: manufacturer of colestipol advises give tacrolimus at least 1 hour before or 3 hours after colestipol
- Mycophenolate: manufacturer of colestipol advises give mycophenolate at least 1 hour before or 3 hours after colestipol

Colestipol (continued)

- Antibacterials: colestipol possibly reduces absorption of tetracycline
- Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 hours before canagliflozin
- Bile Acids: colestipol possibly reduces absorption of bile acids
- Cardiac Glycosides: colestipol possibly reduces absorption of cardiac glycosides
- Diuretics: colestipol reduces absorption of thiazides and related diuretics (give at least 2 hours apart)
Corticosteroids

Antibacterials: corticosteroids possibly reduce absorption of LOMITAPIDE (give at least 4 hours apart)

Thyroid Hormones: corticosteroids reduce absorption of THYROID HORMONES

NOTE Other drugs should be taken at least 1 hour before or 4–6 hours after corticosteroids to reduce possible interference with absorption

Analgesics: corticosteroids increase the excretion of MELOXICAM; corticosteroids reduce absorption of PARACETAMOL

Anti-infectives: corticosteroids may enhance or reduce anticoagulant effect of COUMARINS and PHENIDINE

Antidiabetics: corticosteroids may enhance or reduce hypoglycaemic effect of ANTI DIABETICS

Antiepileptics: corticosteroids possibly reduce absorption of SODIUM VALPROATE and VALPROIC ACID

Bile Acids: corticosteroids possibly reduce absorption of BILE ACIDS

Cardiac Glycosides: corticosteroids possibly reduce absorption of CARDIAC GYCOSES

Diuretics: corticosteroids reduce absorption of THIAZIDES and RELATED DIURETICS (give at least 2 hours apart)

Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of LOMITAPIDE (give at least 4 hours apart)

Myophenolate: corticosteroids reduce absorption of MYCOPHENOLATE

Ranolazine: corticosteroids reduce absorption of RANOLAZINE (manufacturer of ranolazine advises avoid concomitant administration)

Terfenadine: corticosteroids significantly decreases effect of TERFLUNOMIDE (enhanced elimination)—avoid unless drug elimination desired

Cardiac Glycosides: corticosteroids reduce absorption of CARDIAC GYCOSES

Thyroid Hormones: corticosteroids reduce absorption of THYROID HORMONES

Contraceptives, oral

NOTE Interactions do not generally apply to corticosteroids used for topical application (including inhalation) unless specified

ACE inhibitors: corticosteroids antagonise hypotensive effect of ACE INHIBITORS

Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS

Aldesleukin: avoidance of corticosteroids advised by manufacturer of ADELSEUKIN

Alpha-blockers: corticosteroids antagonise hypotensive effect of ALPHA-BLOCKERS

Aminophylline: increased risk of hypokalaemia when corticosteroids given with AMINOPHYLLINE

Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NSAIDS; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with ASPIRIN, also corticosteroids reduce plasma concentration of salicylate

Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypertensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS

Antacids: absorption of deflazacort reduced by ANTACIDS

Anthelmintics: dexamethasone increases plasma concentration of active metabolite of ALBENDAZOLE; continuous use of dexamethasone possibly reduces plasma concentration of PRAZIQUANTEL

Antibacterials: plasma concentration of methylprednisolone possibly increased by CLARITHROMYCIN; metabolism of METHYLPREDNISOLONE possibly increased by cabozantinib

Anticoagulants: plasma concentration of CABOZANTINIB possibly increased by INHIBITORS

Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of ANTI COAGULANTS

Antidepressants: corticosteroids may enhance or reduce antidepressant effect of ANTI DEPRESSANTS

Antihistamines: plasma concentration of ANTIHISTAMINES possibly increased by INHIBITORS

Antiepileptics: metabolism of dexamethasone possibly increased by INHIBITORS

Antiparkinsonians: corticosteroids antagonise hypotensive effect of ANTIPARKINSONIANS

Antituberculous: increased risk of active metabolite of ISONIAZID when given with corticosteroids

Antivirals: plasma concentration of antiviral possibly increased by INHIBITORS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS

Antiplatelet Agents: metabolism of corticosteroids possibly inhibited by INHIBITORS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS

Anticoagulants: increased risk of hypokalaemia when corticosteroids given with INHIBITORS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS

Antiarrhythmics: metabolism of corticosteroids possibly inhibited by INHIBITORS

Anticoagulants: increased risk of hypokalaemia when corticosteroids given with INHIBITORS

Lipid-regulating Drugs: corticosteroids antagonise hypotensive effect of LIPID-REGULATING DRUGS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS

Anticoagulants: increased risk of hypokalaemia when corticosteroids given with INHIBITORS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS

Anticoagulants: increased risk of hypokalaemia when corticosteroids given with INHIBITORS

Anticoagulants: metabolism of corticosteroids possibly inhibited by INHIBITORS
Appendix 1 Interactions

Corticosteroids (continued)

- Diuretics: corticosteroids antagonise diuretic effect of DIURETICS; increased risk of hypokalaemia when corticosteroids given with Aacetazolamide, Loop Diuretics or related diuretics
- Fosaprepitant: metabolism of dexamethasone and methylprednisolone inhibited by Fosaprepitant (reduce dose of dexamethasone and methylprednisolone)
- Grapefruit juice: plasma concentration of oral budesonide increased by Grapefruit Juice—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
- Histamine: avoidance of corticosteroids advised by manufacturer of HISTAMINE
- Metyldopa: corticosteroids antagonise hypotensive effect of METHYLDOPA
- Mifamurtide: avoidance of corticosteroids advised by manufacturer of MIFAMURTIDE
- Mileprolone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after MIFEPRISTONE
- Moxonidine: corticosteroids antagonise hypotensive effect of MOXONIDINE
- Muscle Relaxants: corticosteroids possibly antagonise effects of pancuronium and vecuronium
- Nitrates: corticosteroids antagonise hypotensive effect of NITRATES
- Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing OESTROGENS
- Sodium Benzoate: corticosteroids possibly reduce effects of SODIUM BENZOATE
- Sodium Phenytoin: corticosteroids possibly reduce effects of SODIUM PHENYTOIN
- Somatropin: corticosteroids may inhibit growth-promoting effect of SOMATROPIN
- Sympathomimetics: metabolism of dexamethasone accelerated by SYMPATHOMIMETICS
- Theophylline: increased risk of hypokalaemia when corticosteroids given with high doses of THEOPHYLLINE
- Vaccines: high doses of corticosteroids impair immune response to VACCINES—avoid concomitant use with live vaccines
- Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of HYDRAZALINE, MINOXIDIL and SODIUM NITROPRUSSIDES

Co-trimoxazole see Trimethoprim and Sulfamethoxazole Co-trimoxazole

Note: Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect antiarrhythmic control

- Alcohol: antiarrhythmic control with co-trimoxazole may be affected by major changes in consumption of ALCOHOL
- Alopurinol: antiarrhythmic effect of co-trimoxazole possibly enhanced by ALOPURINOL
- Anabolic Steroids: antiarrhythmic effect of co-trimoxazole possibly enhanced by ANABOLIC STEROIDS
- Analgesics: antiarrhythmic effect of co-trimoxazole possibly enhanced by NSAIDS; increased risk of haemorrhage when antiarrhythmics given with INTRAVENOUS DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when antiarrhythmics given with KETOROLAC (as avoid concomitant use, including low-dose heparins); increased risk of bleeding when co-trimoxazole given with TRAMADOL; increased risk of bleeding when co-trimoxazole given with ASPIRIN (due to antplatelet effect); antiarrhythmic effect of co-trimoxazole possibly enhanced by prolonged regular use of PARACETAMOL
- Anthelmintics: antiarrhythmic effect of co-trimoxazole possibly enhanced by IVERMECTIN; antiarrhythmic effect of co-trimoxazole possibly enhanced by LEVAMISOLE

Cumarins (continued)

- Anti-arrhythmics: metabolism of coumarins inhibited by AMIODARONE
- Anti-arrhythmics: metabolism of coumarins inhibited by DISOPYRAMIDE; anticoagulant effect of coumarins possibly enhanced by DIPRENALONE and PROPafenone
- Anticoagulants: experience in anticoagulant clinics suggests that INR may be altered; plasma concentration of warfarin possibly enhanced by RIFAMYCINS (reduced anticoagulant effect)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APREPITANT, DABIGATRAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: anticoagulant effect of warfarin possibly enhanced by SSRI; anticoagulant effect of coumarins possibly enhanced by ST JOHN’S WORT (avoid concomitant use); anticoagulant effect of warfarin enhanced by MIRTAZAPINE; anticoagulant effect of co-trimoxazole may be enhanced or reduced by TRICYCLICS
- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (reduced anticoagulant effect); plasma concentration of warfarin reduced by ERLIBARbezEPINE; metabolism of coumarins accelerated by ORIFIA and RIFAPENTON (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by SODIUM VALPROATE and VALPROIC ACID
- Antifungals: anticoagulant effect of co-trimoxazole enhanced by FLUCONAZOLE, ITRACONAZOLE, VORICONAZOLE and MICONAZOLE (miconazole oral gel and possibly vaginal and topical formulations absorbed); anticoagulant effect of coumarins reduced by GRISEOFULVIN
- Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by PROGUANIIL; plasma concentration of both drugs increased when warfarin given with QUININE
- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by ATAZANAVIR, NEVIRAPINE and RITONAVIR and plasma concentration of coumarins possibly affected by AMIODARONE; anticoagulant effect of warfarin enhanced or reduced by TELAPREVIR
- Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by CHLORAL
- Aprepitant: anticoagulant effect of warfarin possibly reduced by Aprepitant
- Azathioprine: anticoagulant effect of coumarins possibly enhanced by AZATHIOPRINE
- Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of BOSENTAN
### Coumarins (continued)
- Clodigorel: anticoagulant effect of coumarins enhanced due to antiplatelet action of Clodigorel; avoidance of warfarin advised by manufacturer of Clodigorel.
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by corticosteroids (high-dose corticosteroids enhance anticoagulant effect).
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by Cranberry Juice—avoid concomitant use.
- Cytoxotics: anticoagulant effect of coumarins possibly enhanced by Entacapone.
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of Dipyridamole.
- Disulfiram: anticoagulant effect of coumarins enhanced by Disulfiram.
- Dopaminergics: anticoagulant effect of warfarin enhanced by Entacapone.
- Enteral Foods: anticoagulant effect of coumarins antagonised by vitamin K (present in some Enteral Foods).
- Fosaprepitant: anticoagulant effect of warfarin possibly reduced by Fosaprepitant.
- Glucosamine: anticoagulant effect of warfarin enhanced by Glucosamine.
- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by Bicalutamide and Toremifene, metabolism of coumarins inhibited by Danazol (enhanced anticoagulant effect); plasma concentration of coumarins possibly reduced by Enzalutamide; anticoagulant effect of coumarins enhanced by FLUTAMIDE and TAMOXIFEN.
- Iloprost: anticoagulant effect of coumarins possibly enhanced by Iloprost.
- Lactulose: anticoagulant effect of coumarins possibly enhanced by Lactulose.
- Leflunomide: anticoagulant effect of warfarin enhanced by Leflunomide.
- Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by Zafirlukast.
- Levozinc: anticoagulant effect of coumarins enhanced by Levozinc.
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by Colestyramine; anticoagulant effect of warfarin may be transiently reduced by ATORVASTATIN; anticoagulant effect of coumarins enhanced by FIBRATES and FLUVASTATIN; anticoagulant effect of coumarins possibly enhanced by Ezetimibe and Rosuvastatin; anticoagulant effect of coumarins can be enhanced by Simvastatin; anticoagulant effect of warfarin possibly enhanced by Lomitapide.
- Memantine: anticoagulant effect of warfarin possibly enhanced by Memantine.
- Oestroges: anticoagulant effect of coumarins may be enhanced or reduced by Oestroges.
- Orlisat: monitoring anticoagulant effect of coumarins recommended by manufacturer of Orlisat.
- Prasugrel: possible increased risk of bleeding when coumarins given with Prasugrel.
- Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by Progestogens.
- Raloxifene: anticoagulant effect of coumarins antagonised by Raloxifene.
- Retinoids: anticoagulant effect of coumarins possibly reduced by Acitretin; anticoagulant effect of coumarins enhanced by Sulfynpyrazone.
- Sulfinpyrazone: anticoagulant effect of coumarins enhanced by Sulfinpyrazone.
- Testosterone: anticoagulant effect of coumarins enhanced by Testosterone.
- Thyroid Hormones: anticoagulant effect of coumarins enhanced by Thyroid Hormones.
- Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by Ubidecarenone.
- Ulcer-healing Drugs: metabolism of coumarins inhibited by Cimetidine (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly reduced by Esomeprazole and Omeprazole; anticoagulant effect of coumarins may be enhanced by Pantoprazole; absorption of coumarins possibly reduced by Sucralfate (reduced anticoagulant effect).
- Vaccines: anticoagulant effect of warfarin possibly enhanced by Influenza Vaccine.
- Vitamins: anticoagulant effect of coumarins possibly enhanced by Vitamin E; anticoagulant effect of coumarins antagonised by Vitamin K.

### Cranberry Juice
- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of Coumarins—avoid concomitant use.

### Crizotinib
- Analgesics: manufacturer of crizotinib advises caution with Alfentanil and Fentanyl.
- Anti-bacterials: plasma concentration of crizotinib possibly increased by clarithromycin and telithromycin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by Rifabutin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by Rifampicin—manufacturer of crizotinib advises avoid concomitant use.
- Antidepressants: plasma concentration of crizotinib possibly reduced by ST John’s Wort—manufacturer of crizotinib advises avoid concomitant use.
- Antiepileptics: plasma concentration of crizotinib possibly reduced by Carbamazepine, fosphenytoin, phenobarbital, phenytoin and Primidone—manufacturer of crizotinib advises avoid concomitant use.
- Antifungals: plasma concentration of crizotinib increased by Ketoconazole—avoid concomitant use; plasma concentration of crizotinib possibly increased by Itraconazole and Voriconazole—manufacturer of crizotinib advises avoid concomitant use.
- Antimalarials: possible increased risk of bradycardia when crizotinib given with Mefloquine.
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with Pimozide.
- Antivirals: plasma concentration of crizotinib possibly increased by Atazanavir, Indinavir, Ritonavir and Saquinavir—manufacturer of crizotinib advises avoid concomitant use.
- Antiulcerative: plasma concentration of crizotinib possibly reduced by Carbaazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone—manufacturer of crizotinib advises avoid concomitant use.
- Antibacterials: plasma concentration of crizotinib possibly increased by clarithromycin and telithromycin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by Rifabutin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by Rifampicin—manufacturer of crizotinib advises avoid concomitant use.
- Anti-bacterials: plasma concentration of crizotinib possibly increased by clarithromycin and telithromycin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by Rifabutin—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by Rifampicin—manufacturer of crizotinib advises avoid concomitant use.
- Antiepileptics: plasma concentration of crizotinib possibly reduced by Carbamazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone—manufacturer of crizotinib advises avoid concomitant use.
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with Pimozide.
- Antivirals: plasma concentration of crizotinib possibly increased by Atazanavir, Indinavir, Ritonavir and Saquinavir—manufacturer of crizotinib advises avoid concomitant use.
- Antiulcerative: plasma concentration of crizotinib possibly reduced by Carbaazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone—manufacturer of crizotinib advises avoid concomitant use.
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with Pimozide.
- Antivirals: plasma concentration of crizotinib possibly increased by Atazanavir, Indinavir, Ritonavir and Saquinavir—manufacturer of crizotinib advises avoid concomitant use.
- Antiulcerative: plasma concentration of crizotinib possibly reduced by Carbaazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone—manufacturer of crizotinib advises avoid concomitant use.
Cytarabine: see Cyproheptadine

Cyclizine: see Antihistamines

Cyclophosphamide
- Antifungals: side-effects of cyclophosphamide possibly increased by flucloxacillin and itraconazole.
- Anticoagulants: avoid concomitant use of cyclophosphamide with anticoagulants or using heparin to maintain catheter patency; increased risk of haemorrhage when anticoagulants given with 
  - warfarin
- Cardiac Glycosides: increased risk of agranulocytosis.
- Antibacterials: increased risk of CNS toxicity when cycloserine given with
  - chloramphenicol
- Vaccines: antibacterials inactivate oral typhoid vaccine.

Cyclophosphamide enhance effects of

Cycloserine
- Alcohol: increased risk of convulsions when cycloserine given with
  - alcohol
- Antibacterials: increased risk of CNS toxicity when cycloserine given with
  - isoniazid
- Vaccines: antibacterials inactivate oral typhoid vaccine.

Cyproheptadine: see Antihistamines

Cytarabine
- Antifungals: cytarabine possibly reduces plasma concentration of fuflcyclosine.
- Anticoagulants: avoid concomitant use of cytoxics with
  - warfarin
- Cardiac Glycosides: cytarabine possibly reduces absorption of digoxin tablets.
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with
  - pentostatin

Muscle Relaxants: cyclophosphamide enhances effects of

Cyclophosphamide enhance effects of

Cycloserine
- Alcohol: increased risk of convulsions when cycloserine given with
  - alcohol
- Antibacterials: increased risk of CNS toxicity when cycloserine given with
  - isoniazid
- Vaccines: antibacterials inactivate oral typhoid vaccine.

Cyproheptadine: see Antihistamines

Cytarabine
- Antifungals: cytarabine possibly reduces plasma concentration of flucytosine.
- Antipsychotics: avoid concomitant use of cytoxics with
  - clozapine
- Cardiac Glycosides: cytarabine possibly reduces absorption of digoxin tablets.
- Cytotoxics: intracellular concentration of cytarabine increased by fluorouracil.

Cytotoxic: see individual drugs

Dabigatran
- Analgesics: possible increased risk of bleeding when dabigatran given with
  - NSAIDs
- Antibacterials: increased risk of haemorrhage when anticoagulants given with intravenous
  - diclofenac
- Antibacterials: plasma concentration of dabigatran reduced by
  - Amodarone
- Drug interactions: dabigatran reduced by
  - Dronedarone
- Antibacterials: possible increased risk of bleeding when dabigatran given with clindamycin.
- Anticoagulants: plasma concentration of dabigatran reduced by
  - Rifampicin
- Antibacterials: possible increased risk of bleeding when dabigatran given with
  - Ampicillin
- Anticoagulants: increased risk of haemorrhage when dabigatran given with other
  - Anticoagulants: avoid concomitant use except when switching with another anticoagulant or using heparin to maintain catheter patency.
- Antidepressants: possible increased risk of bleeding when dabigatran given with
  - SSRIs
- Anticoagulants: manufacturer of dabigatran advises avoid concomitant use.

Dabrafenib
- Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with
  - rifampicin
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
  - ketoconazole
- Anticoagulants: dabrafenib reduces plasma concentration of
  - warfarin
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with
Daclatasvir
- Antiepileptics (continued)
  - PRIMIDONE — manufacturer of daclatasvir advises avoid concomitant use
- Antigenas: plasma concentration of daclatasvir increased by
  - KETOCONAZOLE — reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of daclatasvir possibly increased by
  - ERGOTRALFONAZOLE, POSaconazole and VORICONAZOLE — reduce dose of daclatasvir (see under Daclatasvir, p. 544)
- Antivirals: plasma concentration of daclatasvir increased by
  - ATAZANAVIR and TELAPREVIR — reduce dose of daclatasvir (see under Daclatasvir, p. 544); plasma concentration of daclatasvir possibly increased by
  - BOCEprevir — reduce dose of daclatasvir (see under Daclatasvir, p. 544); manufacturer of daclatasvir advises avoid concomitant use with DUNAVIR and LOPINAVIR (plasma concentration of daclatasvir possibly increased); plasma concentration of daclatasvir reduced by
  - EFAVIRENZ — increase dose of daclatasvir (see under Daclatasvir, p. 544); manufacturer of daclatasvir advises avoid concomitant use with
  - Cobicitstat: plasma concentration of daclatasvir possibly increased by
  - COBICISTAT — reduce dose of daclatasvir (see under Daclatasvir, p. 544)
- Corticosteroids: plasma concentration of daclatasvir possibly reduced by
  - DEXAMETHASONE — manufacturer of daclatasvir advises avoid concomitant use
- Lipid-regulating Drugs: daclatasvir increases plasma concentration of
  - Rosuvastatin

Dactinomycin
- Antipsychotics: avoid concomitant use of cytoxics with
  - Clozapine (increased risk of agranulocytosis)
- Vitamins: dactinomycin possibly reduces effects of
  - Calcitriol, Alfacalcidol, Ergocalciferol, Paricalcitol and Vitamin D

Dairy Products
- Antibacterials: dairy products reduce absorption of
  - Ciprofloxacin and Norfloxacin; dairy products reduce absorption of Tetracyclines (except doxycycline and minocycline)
- Corticosteroids: dairy products possibly reduce plasma concentration of
  - Mercaptopurine — manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
- Anticoagulants: dairy products possibly reduce absorption of
  - Dapoxetine (give at least 4 hours apart)

Dalfetarin see Heparins

Danaparoid
- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with
  - Ketorolac (avoid concomitant use, including low-dose heparin)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with
  - Apixaban, Dabigatran and Rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Danazol
- Anticoagulants: danazol inhibits metabolism of
  - Coumarins (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of
  - Carbamazepine (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of
  - Ciclosporin (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with
  - Simvastatin — avoid concomitant use
  - Tacrolimus: danazol possibly increases plasma concentration of
  - Tacrolimus

Dantrolene see Muscle Relaxants

Dapagliflozin see Antidiabetics

Dapoxetine
- Alcohol: increased sedative effect when dapoxetine given with
  - Alcohol
- Analgesics: possible increased risk of serotonic effects when dapoxetine given with
  - Tramadol (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Clarithromycin and erythromycin (see under Dapoxetine, p. 703); manufacturer of dapoxetine advises avoid concomitant use with
  - Telithromycin (increased risk of toxicity)
- Antidepressants: possible increased risk of serotonergic effects when dapoxetine given with
  - SSRI, St John’s Wort,
  - DULoxetine, TRICYCLICS and venlafaxine (manufacturer of dapoxetine advises SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine); increased risk of serotonergic effects when dapoxetine given with
  - MAOIs (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Antifungals: plasma concentration of dapoxetine increased by
  - KETOCONAZOLE — manufacturer of dapoxetine advises avoid concomitant use; manufacturer of dapoxetine advises dose reduction when dapoxetine given with
  - Fluconazole (see under Dapoxetine, p. 705); manufacturer of dapoxetine advises avoid concomitant use with
  - Itraconazole (increased risk of toxicity)
- Antivirals: manufacturer of dapoxetine advises avoid concomitant use with
  - Atazanavir, Ritonavir and Saquinavir (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with
  - Fosamprenavir (see under Dapoxetine, p. 705)
- Aprepitant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with aprepitant (see under Dapoxetine, p. 705)
- Calcium-channel Blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with
  - Diltiazem and verapamil (see under Dapoxetine, p. 705)
- SHT: receptor ago: possible increased risk of serotonergic effects when dapoxetine given with
  - SHT, agonists (manufacturer of dapoxetine advises SHT, agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SHT, agonists)
- Lithium: possible increased risk of serotonergic effects when dapoxetine given with
  - Lithium (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with
  - Sildenafil
  - Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with tadalafil
  - Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with
  - Vardenafil

Dapsone
- Antibacterials: plasma concentration of dapsone reduced by
  - Rifampicin; plasma concentration of both drugs may increase when dapsone given with trimethoprim
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with
  - Saquinavir — avoid concomitant use
- Vaccines: antibacterials inactivate oral typhoid vaccine — see under Typhoid Vaccine in BNF

Daptomycin
- Ciclosporin: increased risk of myopathy when daptomycin given with
  - Ciclosporin (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with
  - Fibric acid or Statins (preferably avoid concomitant use)
Daptomycin (continued)
- Antibacterials: inactivate ORAL TYPHOID VACCINE — see under Typhoid Vaccine in BNF
Darifenacin see Antimuscarinics

Darunavir
- Antibacterials: darunavir possibly increases plasma concentration of LIDOCAINE — avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of • Rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by • Rifampicin — avoid concomitant use
- Anticoagulants: avoidance of darunavir advised by manufacturer of Apixaban and Rivaroxaban
- Antidepressants: darunavir possibly reduces plasma concentration of PAROXETINE and SERTRALINE; plasma concentration of darunavir reduced by • ST JOHN’S WORT — avoid concomitant use
- Antiepileptics: plasma concentration of darunavir possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of both drugs increased when darunavir given with KETOCONAZOLE
- Antimalarials: plasma concentration of lumefantrine increased when darunavir given with ARTEMETHER with LUMEFANTRINE; darunavir possibly increases plasma concentration of • Quinine (increased risk of toxicity)
- Antipsychotics: darunavir possibly increases plasma concentration of • Aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of darunavir advises take DIDANOSINE 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by • Efavirenz (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with INDINAVIR; plasma concentration of darunavir reduced by • Lopinavir, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of • Maraviroc (consider reducing dose of maraviroc); increased risk of rash when darunavir given with Raltegravir; plasma concentration of darunavir reduced by • Saquinavir; plasma concentration of both drugs increased when darunavir given with • Simperevir — manufacturer of simperervir advises avoid concomitant use
- Antipsychotics: darunavir possibly increases plasma concentration of • Bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of • Everolimus—manufacturer of everolimus advises avoid concomitant use; darunavir possibly increases the plasma concentration of • Ibrutinib—reduce dose of ibrutinib (see under ibrutinib, p. 809)
- Ergot Alkaloids: increased risk of ergotism when darunavir given with • Ergot Alkaloids—manufacturer of darunavir advises avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when darunavir given with ATORVASTATIN; darunavir possibly increases plasma concentration of PRAVASTATIN; darunavir increases plasma concentration of • Rosuvastatin—adjust dose of rosuvastatin (consult product literature); avoidance of darunavir advised by manufacturer of • Lomitapide (plasma concentration of lomitapide possibly increased)
- Oritistat: absorption of darunavir possibly reduced by • Ursolidat
- Ranolazine: darunavir possibly increases plasma concentration of • Ranolazine—manufacturer of ranolazine advises avoid concomitant use

Dasatinib
- Antibacterials: manufacturer of dasatinib advises avoid concomitant use with CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (plasma concentration of dasatinib possibly increased); metabolism of dasatinib accelerated by • Rifampicin (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: manufacturer of dasatinib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (plasma concentration of dasatinib possibly increased)
- Antifungals: plasma concentration of dasatinib possibly increased by KETOCONAZOLE; manufacturer of dasatinib advises avoid concomitant use with IRAFONAZOLE (plasma concentration of dasatinib possibly increased)
- Antipsychotics: avoid concomitant use of cytotoxics with • Clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of dasatinib advised by manufacturer of • Boceprevir; manufacturer of dasatinib advises avoid concomitant use with • Ritonavir (plasma concentration of dasatinib possibly increased)
- Grapefruit Juice: manufacturer of dasatinib advises avoid concomitant use with • Grapefruit Juice (plasma concentration of dasatinib possibly increased)
- Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of SIMVASTATIN
- Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by FAMOTIDINE

Decitabine
- Antipsychotics: avoid concomitant use of cytotoxics with • Clozapine (increased risk of agranulocytosis)

Deferasirox
- Aminophyline: deferasirox increases plasma concentration of • Aminophyline (consider reducing dose of aminophyline)
- Antacids: absorption of deferasirox possibly reduced by • Antacids containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
- Antibacterials: plasma concentration of deferasirox reduced by • Rifampicin
- Antidiabetics: deferasirox increases plasma concentration of • Repaglinide
- Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with • Clozapine
- Anxietytics and Hypnotics: deferasirox possibly reduces plasma concentration of • Midazolam
- Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with • Tizanidine
- Theophylline: deferasirox increases plasma concentration of • Theophylline (consider reducing dose of theophylline)

Diferiprone
- Antacids: absorption of deferiprone possibly reduced by • Antacids containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

Deflazacort see Corticosteroids

Delamanid
- Analgesics: increased risk of ventricular arrhythmias when delamanid given with • Methadone
- Anti-arrhythmics: increased risk of ventricular arrhythmias when delamanid given with • Amiodarone or • Disopyramide
- Antibacterials: possible increased risk of ventricular arrhythmias when delamanid given with • Clarithromycin and • erythromycin; Increased risk of ventricular arrhythmias when delamanid given with • moxifloxacin; plasma concentration of delamanid reduced by • Rifampicin; delamanid increases plasma concentration of ethambutol
- Antidepressants: possible increased risk of ventricular arrhythmias when delamanid given with • Tricyclics that prolong the QT interval
- Antiepileptics: manufacturer of delamanid advises avoid concomitant use with • Carbamazepine
- Antipsychotics: increased risk of ventricular arrhythmias when delamanid given with • Droperidol, Haloperidol or • Pipemid; increased risk of ventricular arrhythmias when delamanid given with • phenothiazines that prolong the QT interval
Delamanid

- Antivirals: plasma concentration of delamanid increased by LOPINAVIR and RITONAVIR; increased risk of ventricular arrhythmias when delamanid given with NIFEDIPINE.
- Beta-blockers: increased risk of ventricular arrhythmias when delamanid given with METOPROLOL.
- Cytotoxics: increased risk of ventricular arrhythmias when delamanid given with ARSENIC TRIOXIDE or VINFLUNINE; possible increased risk of ventricular arrhythmias when delamanid given with VINBLASTINE, VINCRISTINE, VINDESINE and VINORELBINE.
- Domperidone: possible increased risk of ventricular arrhythmias when delamanid given with DOMPERIDONE.
- Pentamidine isetionate: increased risk of ventricular arrhythmias when delamanid given with PENTAMIDINE.

Isetionate

- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE; see under Typhoid Vaccine in BNF.

Demeclocycline see Tetracyclines

Desferrioxamine

- Antipsychotics: avoidance of desferrioxamine advised by manufacturer of LEVOMEPROMAZINE; manufacturer of desferrioxamine advises concomitant use with PROCHLORPERAZINE.

Desflurane see Anaesthetics, General

Desloratadine see Antihistamines

Desmosprin

- Analgesics: effects of desmosprin enhanced by INDOMETACIN.
- Loperamide: plasma concentration of oral desmosprin increased by LOPERAMIDE.

Desogestrel see Progestogens

Dexamethasone see Corticosteroids

Dexamfetamine see Symptomatics

Dexibuprofen see NSAIDs

Dextropropoxyphene see Opioid Analgesics

Diazepam see Anxiolytics and Hypnotics

Diazoxide

- ACE Inhibitors: enhanced hypotensive effect when diazoxide given with ACE INHIBITORS.
- Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with ADRENERGIC NEURONE BLOCKERS.
- Alcohol: enhanced hypotensive effect when diazoxide given with ALCOHOL.
- Aldesleukin: enhanced hypotensive effect when diazoxide given with ALDESLEUKIN.
- Alpha-blockers: enhanced hypotensive effect when diazoxide given with ALPHA-BLOCKERS.
- Anaesthetics, General: enhanced hypotensive effect when diazoxide given with GENERAL ANAESTHETICS.
- Analgesics: hypotensive effect of diazoxide antagonised by NSAIDS.
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
- Antidepressants: enhanced hypotensive effect when diazoxide given with MAOI or TRICYCLIC-RELATED ANTIDEPRESSANTS.
- Antidiabetics: diazoxide antagonises hypoglycaemic effect of ANTIDIABETICS.
- Antiepileptics: diazoxide reduces plasma concentration of FOSFENYPHTHALIN and PHENTHOIN, also effect of diazoxide may be reduced.
- Antipsychotics: enhanced hypotensive effect when diazoxide given with PHENOTHIAZINES.

Diacyclavine see Antimuscarnics

Didanosine

- NOTE Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.
- Allopurinol: plasma concentration of didanosine increased by ALLOPURINOL (risk of toxicity)—avoid concomitant use.
- Analgesics: plasma concentration of didanosine possibly reduced by METHADONE.
- Antimicrobials: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after NORFLOXACIN.
- Antivirals: didanosine tablets reduce absorption of ATAZANAVIR (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after DARUNAVIR; plasma concentration of didanosine increased by GANCICLOVIR and VALGANCICLOVIR; didanosine tablets reduce absorption of INDINAVIR (give at least 1 hour apart); increased risk of side-effects when didanosine given with RIBAVIRIN—avoid concomitant use; manufacturer of ritonavir advises give didanosine 2 hours before or 4 hours after RILPIVIRINE; manufacturer of rilpivirine advises didanosine and RITONAVIR should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with STAVUDINE; plasma concentration of didanosine increased by TENOFIVIR (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by TIPRANAVIR—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 1 hour apart.
- Cytotoxics: increased risk of toxicity when didanosine given with HYDROXYCARBAMIDE—avoid concomitant use.
- Orlistat: absorption of didanosine possibly reduced by ORLISTAT.

Dienogest see Progestogens

Diethylcarbamazine

- Antacids: excretion of diethylcarbamazine increased by SODIUM BICARBONATE.

Digoxin see Cardiac Glycosides

Dihydrocodeine see Opioid Analgesics

Dihydrotachysterol see Vitamins

Diltiazem see Calcium-channel Blockers

Dimethyl sulfoxide

- Analgesics: avoid concomitant use of dimethyl sulfoxide with SUINDAC.

Dinoprost see Prostaglandins
Disopyramide (continued)

- Antivirals: plasma concentration of disopyramide possibly increased by ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with saquinavir—avoid concomitant use; avoidance of disopyramide advised by manufacturer of telaprevir (risk of ventricular arrhythmias).
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with atomoxetine.
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; increased risk of ventricular arrhythmias when disopyramide given with sotalol—avoid concomitant use.
- Calcium-channel blockers: increased risk of myocardial depression and asystole when disopyramide given with verapamil.
- Cytotoxics: possible increased risk of ventricular arrhythmias when disopyramide given with bosutinib; possible increased risk of ventricular arrhythmias when disopyramide given with vanetupib—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with arsenic trioxide.
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with acetazolamide; loop diuretics or thiazides and related diuretics.
- Fingolimod: possible increased risk of bradyarrhythmia when disopyramide given with fingolimod.
- Ixabradine: increased risk of ventricular arrhythmias when disopyramide given with ivabradine.
- Nitrates: disopyramide reduces effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth).
- Pentamidine isetionate: possible increased risk of ventricular arrhythmias when disopyramide given with pentamidine isetionate.
- Ranolazine: avoidance of disopyramide advised by manufacturer of ranolazine.
- Sildenafil: manufacturer of disopyramide advises avoid concomitant use with sildenafil (risk of ventricular arrhythmias).
- Tadalafil: manufacturer of disopyramide advises avoid concomitant use with tadalafil (risk of ventricular arrhythmias).
- Vardenafil: manufacturer of disopyramide advises avoid concomitant use with vardenafil (risk of ventricular arrhythmias).

Disulfiram

- Alcohol: disulfiram reaction when disulfiram given with alcohol.
- Aminophylline: disulfiram inhibits metabolism of aminophylline (increased risk of toxicity).
- Antibacterials: psychotic reaction reported when disulfiram given with metronidazole; CNS effects of disulfiram possibly increased by isoniazid.
- Anticoagulants: disulfiram enhances anticoagulant effect of coumarins.
- Antidepressants: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration).
- Antiepileptics: disulfiram inhibits metabolism of fosphenytoin and phenytoin (increased risk of toxicity).
- Anxietytics and Hypnotics: disulfiram increases risk of temazepam toxicity; disulfiram inhibits metabolism of benzodiazepines (increased sedative effects).
- Paraldehyde: risk of toxicity when disulfiram given with paraldehyde.
- Theophylline: disulfiram inhibits metabolism of theophylline (increased risk of toxicity).

Diuretics

- Note: Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.
- Note: Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.
Diuretics (continued)
- ACE inhibitors: enhanced hypotensive effect when diuretics given with ACE INHIBITORS; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ACE INHIBITORS.
- Adrenergic α-Blockers: enhanced hypotensive effect when diuretics given with ADRENERGIC NEURONE BLOCKERS.
- Alcohol: enhanced hypotensive effect when diuretics given with ALCOHOL.
- Allspironil: increased risk of hypokalaemia when thiazides and related diuretics given with ALLOPURINOL especially in renal impairment.
- Alpha-blockers: enhanced hypotensive effect when diuretics given with ALPHA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
- Aminophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with AMINOALKALOIDS.
- Anaesthetics: enhanced hypotensive effect when diuretics given with GENERAL ANAESTHETICS.
- Analgesics: diuretics increase risk of nephrotoxicity of NSAIDS, also antagonism of diuretic effect; diuretic effect of potassium canrenoate possibly antagonised by NSAIDS; possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with NSAIDS; furosemide possibly increases the excretion of ACEMETACIN; effects of diuretics antagonised by INDOMETACIN and KETOCONAZOLE; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with INDOMETACIN; occasional reports of reduced renal function when triamterene given with INDOMETACIN—avoid concomitant use; increased risk of toxicity when acetazolamide given with high-dose ASPRIN; diuretic effect of spironolactone antagonised by ASPRIN; possible increased risk of toxicity when loop diuretics given with high-dose ASPRIN (also possible reduced effect of loop diuretics).
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
- Anti-arrhythmics: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with DISOPRIMIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with FLECAINIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics action of LIDOCAINE.
- Antibacterials: plasma concentration of eplerenone increased by CLARITHROMYCIN and TELITHROMYCIN—avoid concomitant use; plasma concentration of eplerenone increased by ERYTHROMYCIN (reduce dose of eplerenone); plasma concentration of eplerenone reduced by RIFAMPICIN—avoid concomitant use; avoidance of diuretics advised by manufacturer of LYMCEFCLINE; increased risk of oto toxicity when loop diuretics given with AMINOLUCOSIDES, POLYMIXINS OR VANCOMYCIN; acetazolamide antagonises effects of diuretics given with COLCHICINES; plasma concentration of eplerenone increased by TRIMETHOPRIM; increased risk of hyperkalaemia when spironolactone given with TRIMETHOPRIM; increased risk of hyperkalaemia when eplerenone given with TRIMETHOPRIM.
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with REBOXETINE; enhanced hypotensive effect when diuretics given with CLONIDINE.
- Antiemetics: increased risk of hyperkalaemia when diuretics given with antiemetics.
- Antidiabetics: enhanced hypotensive effect when diuretics given with ANTI DIABETICS.
- Antiarrhythmics: diuretics increase risk of ventricular arrhythmias with AMISULPRIDE; enhanced hypotensive effect when diuretics given with PHENOTHIAZINES; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with PIMOZIDE (avoid concomitant use).
- Antitussives: plasma concentration of eplerenone increased by RITONAVIR—avoid concomitant use; plasma concentration of eplerenone increased by SAQUINAVIR (reduce dose of eplerenone).
- Anti-inflammatory: diuretics increase risk of nephrotoxicity with ANTIINFLAMMATORY DRUGS.
- Antihypertensives: plasma concentration of eplerenone possibly increased by CLONIDINE and ZANAMIVIR; furosemide with parenteral CHLORAL may displace thyroid hormone from binding sites.
- Antihistamines: plasma concentration of eplerenone increased by CYCLOSPORIN—avoid concomitant use; plasma concentration of eplerenone increased by CYCLOSPORIN.
- Antiinfectives: plasma concentration of eplerenone increased by SULPHASALAZINE, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
- Antiparkinson: plasma concentration of eplerenone increased by CARBAMAZEPINE; acetalazolamide increases plasma concentration of CARBAMAZEPINE; effects of furosemide antagonised by FOSPHENYTOIN and PHENYTOIN; acetalazolamide possibly increases plasma concentration of FOSPHENYTOIN and PHENYTOIN; increased risk of osteomalacia when thiazides and related diuretics given with CARBAMAZEPINE; hyperkalaemia when thiazides and related diuretics antagonise action of DIURETICS; increased risk of postural hypotension when diuretics given with TRICYCLIC ANTI DEPRESSANTS; plasma concentration of eplerenone increased by DISOPYRAMIDE.
- Antineoplastic: plasma concentration of eplerenone possibly increased by DAPAGLIFLOZIN; diuretics increase cardiac toxicity with ANTI NEOPLASTIC DRUGS.
- Antipyretics: plasma concentration of eplerenone increased by IBU PROFEN and IBU PROFEN.
- Anti-Parkinson: plasma concentration of eplerenone increased by IBU PROFEN and IBU PROFEN.
- Anti-convulsants: plasma concentration of eplerenone possibly increased by PHENYTOIN; plasma concentration of eplerenone increased by CANAGLIFLOZIN; reduced effect of loop diuretics given with CANAGLIFLOZIN; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by DAPAGLIFLOZIN.
- Antiparkinson: plasma concentration of eplerenone increased by CARBAMAZEPINE; plasma concentration of eplerenone increased by CARBAMAZEPINE; effects of furosemide antagonised by FOSPHENYTOIN and PHENYTOIN; acetalazolamide possibly increases plasma concentration of TOPIRAMATE; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of ZONISAMIDE.
- Antitussives: plasma concentration of eplerenone increased by RITONAVIR—avoid concomitant use; plasma concentration of eplerenone increased by SAQUINAVIR (reduce dose of eplerenone).
- Antihistamines: diuretics increase risk of nephrotoxicity with ANTIINFLAMMATORY DRUGS.
- Administration of parenteral furosemide with CHLORAL may displace thyroid hormone from binding sites.
- Antihistamines: plasma concentration of eplerenone increased by CYCLOSPORIN—avoid concomitant use; plasma concentration of eplerenone increased by CYCLOSPORIN.
- Anti-infectives: plasma concentration of eplerenone increased by SULPHASALAZINE, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
- Antihypertensives: plasma concentration of eplerenone possibly increased by CLONIDINE and ZANAMIVIR; furosemide with parenteral CHLORAL may displace thyroid hormone from binding sites.
- Antihistamines: plasma concentration of eplerenone increased by CYCLOSPORIN—avoid concomitant use; plasma concentration of eplerenone increased by CYCLOSPORIN.
- Anti-Parkinson: plasma concentration of eplerenone possibly increased by DAPAGLIFLOZIN; diuretics increase cardiac toxicity with ANTI NEOPLASTIC DRUGS.
- Antipyretics: plasma concentration of eplerenone increased by IBU PROFEN and IBU PROFEN.
- Anti-convulsants: plasma concentration of eplerenone possibly increased by PHENYTOIN; plasma concentration of eplerenone increased by CANAGLIFLOZIN; reduced effect of loop diuretics given with CANAGLIFLOZIN; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by DAPAGLIFLOZIN.
- Antiparkinson: plasma concentration of eplerenone increased by CARBAMAZEPINE; plasma concentration of eplerenone increased by CARBAMAZEPINE; effects of furosemide antagonised by FOSPHENYTOIN and PHENYTOIN; acetalazolamide possibly increases plasma concentration of TOPIRAMATE; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of ZONISAMIDE.
- Antitussives: plasma concentration of eplerenone increased by RITONAVIR—avoid concomitant use; plasma concentration of eplerenone increased by SAQUINAVIR (reduce dose of eplerenone).
- Anti-Parkinson: plasma concentration of eplerenone possibly increased by DAPAGLIFLOZIN; diuretics increase cardiac toxicity with ANTI NEOPLASTIC DRUGS.
- Antipyretics: plasma concentration of eplerenone increased by IBU PROFEN and IBU PROFEN.
- Anti-convulsants: plasma concentration of eplerenone possibly increased by PHENYTOIN; plasma concentration of eplerenone increased by CANAGLIFLOZIN; reduced effect of loop diuretics given with CANAGLIFLOZIN; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by DAPAGLIFLOZIN.
- Antiparkinson: plasma concentration of eplerenone increased by CARBAMAZEPINE; plasma concentration of eplerenone increased by CARBAMAZEPINE; effects of furosemide antagonised by FOSPHENYTOIN and PHENYTOIN; acetalazolamide possibly increases plasma concentration of TOPIRAMATE; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of ZONISAMIDE.
- Antitussives: plasma concentration of eplerenone increased by RITONAVIR—avoid concomitant use; plasma concentration of eplerenone increased by SAQUINAVIR (reduce dose of eplerenone).
- Anti-Parkinson: plasma concentration of eplerenone possibly increased by DAPAGLIFLOZIN; diuretics increase cardiac toxicity with ANTI NEOPLASTIC DRUGS.
- Antipyretics: plasma concentration of eplerenone increased by IBU PROFEN and IBU PROFEN.
- Anti-convulsants: plasma concentration of eplerenone possibly increased by PHENYTOIN; plasma concentration of eplerenone increased by CANAGLIFLOZIN; reduced effect of loop diuretics given with CANAGLIFLOZIN; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by DAPAGLIFLOZIN.
- Antiparkinson: plasma concentration of eplerenone increased by CARBAMAZEPINE; plasma concentration of eplerenone increased by CARBAMAZEPINE; effects of furosemide antagonised by FOSPHENYTOIN and PHENYTOIN; acetalazolamide possibly increases plasma concentration of TOPIRAMATE; avoidance of carbonic anhydrase inhibitors in children advised by manufacturer of ZONISAMIDE.
Appendix 1 Interactions

Diuretics

Corticosteroids (continued)
acacetazolamide, loop diuretics or thiazides and related diuretics given with CORTICOSTEROIDS

<table>
<thead>
<tr>
<th>Drug Class</th>
<th>Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cytotocics: alkaline urine due to acetazolamide increases excretion of METHOTREXATE; hypocalcaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with</td>
<td></td>
</tr>
<tr>
<td>ARSENIC TROXIDE; avoidance of spironolactone advised by manufacturer of MITOTANE (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with PLATINUM COMPOUNDS</td>
<td></td>
</tr>
<tr>
<td>Diazoxide: enhanced hypotensive and hyperglycaemic effects when diuretics given with DIAZoxide</td>
<td></td>
</tr>
<tr>
<td>Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with ACETAZOLAMIDE; profound diuresis possible when metolazone given with FUROSEMIDE; increased risk of hypokalaemia when thiazides and related diuretics given with LOOP DIURETICS</td>
<td></td>
</tr>
<tr>
<td>Dopaminergics: enhanced hypotensive effect when diuretics given with CO-BENEDOPA, CO-CARELDOPA or LEVODOPA</td>
<td></td>
</tr>
<tr>
<td>Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with TOREMIFENE</td>
<td></td>
</tr>
<tr>
<td>Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by COLESTIPOL and COLESTYRAMINE (give at least 2 hours apart)</td>
<td></td>
</tr>
<tr>
<td>Lithium: loop diuretics and thiazides and related diuretics reduce excretion of LITHIUM (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of LITHIUM (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of LITHIUM</td>
<td></td>
</tr>
<tr>
<td>Methylpiperazine: enhanced hypotensive effect when diuretics given with MOXISLYTE</td>
<td></td>
</tr>
<tr>
<td>Moxonidine: enhanced hypotensive effect when diuretics given with MOXONIDINE</td>
<td></td>
</tr>
<tr>
<td>Muscle Relaxants: enhanced hypotensive effect when diuretics given with BACLOFEN or TIZANIDINE</td>
<td></td>
</tr>
<tr>
<td>Nitrates: enhanced hypotensive effect when diuretics given with NITRATES</td>
<td></td>
</tr>
<tr>
<td>Oestrogens: diuretic effect of diuretics antagonised by OESTROGENS</td>
<td></td>
</tr>
<tr>
<td>Potassium Salts: increased risk of hypercalcaemia when potassium-sparing diuretics and aldosterone antagonists given with POTASSIUM SALTS</td>
<td></td>
</tr>
<tr>
<td>Progestogens: risk of hypercalcaemia when potassium-sparing diuretics and aldosterone antagonists given with DROSPIRENONE (monitor serum potassium during first cycle)</td>
<td></td>
</tr>
<tr>
<td>Prostaglandins: enhanced hypotensive effect when diuretics given with ALPROSTALID</td>
<td></td>
</tr>
<tr>
<td>Sympathomimetics, Beta: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of BETA,SYMPATHOMIMETICS</td>
<td></td>
</tr>
<tr>
<td>Tacrolimus: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with TACROLIMUS</td>
<td></td>
</tr>
<tr>
<td>Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with THEOPHYLLINE</td>
<td></td>
</tr>
<tr>
<td>Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSIDE</td>
<td></td>
</tr>
<tr>
<td>Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with ALFACALCICOL, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHysterol, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D</td>
<td></td>
</tr>
</tbody>
</table>

Antacids: absorption of dolutedegravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS—manufacturer of dolutedegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts

Antibacterials: plasma concentration of dolutedegravir reduced by RIFAMPICIN (see under Dolutedegravir, p. 1186)

Antidepressants: manufacturer of dolutedegravir advises avoid concomitant use with ST JOHN'S WORT

Antiepileptics: manufacturer of dolutedegravir advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and PRIMIDONE

Antivirals: plasma concentration of dolutedegravir reduced by EFAVIRENZ, ETRAVIRINE and TIPRANAVIR (see under Dolutedegravir, p. 1186); plasma concentration of dolutedegravir reduced by FOSAMPRENAVIR; plasma concentration of dolutedegravir possibly reduced by NEVIRAPINE (see under Dolutedegravir, p. 1186)

Calcium Salts: absorption of dolutedegravir reduced by CALCIUM SALTS—manufacturer of dolutedegravir advises give at least 2 hours before or 6 hours after calcium salts

Iron Salts: absorption of dolutedegravir reduced by oral IRON SALTS—manufacturer of dolutedegravir advises give at least 2 hours before or 6 hours after oral iron salts

Docetaxel

Antibacterials: plasma concentration of docetaxel possibly increased by CLARITHROMYCIN and TELITHROMYCIN—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose

Antifungals: in vitro studies suggest a possible interaction between docetaxel and KETOCONAZOLE (consult docetaxel product literature); plasma concentration of docetaxel possibly increased by ITRACONAZOLE and VORICONAZOLE—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose

Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)

Antivirals: plasma concentration of docetaxel possibly increased by INDINAVIR, RITONAVIR and SAQUINAVIR—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose

Ciclosporin: in vitro studies suggest a possible interaction between docetaxel and CICLOSPORIN (consult docetaxel product literature)

Cytotoxics: possible increased risk of neutropenia when docetaxel given with LAPTANIB; plasma concentration of docetaxel increased by SORAFENIB

Dolutedegravir

Antacids: absorption of dolutedegravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS—manufacturer of dolutedegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts

Antibacterials: plasma concentration of dolutedegravir reduced by RIFAMPICIN (see under Dolutedegravir, p. 1186)

Antidepressants: manufacturer of dolutedegravir advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and PRIMIDONE

Antivirals: plasma concentration of dolutedegravir reduced by EFAVIRENZ, ETRAVIRINE and TIPRANAVIR (see under Dolutedegravir, p. 1186); plasma concentration of dolutedegravir reduced by FOSAMPRENAVIR; plasma concentration of dolutedegravir possibly reduced by NEVIRAPINE (see under Dolutedegravir, p. 1186)

Calcium Salts: absorption of dolutedegravir reduced by CALCIUM SALTS—manufacturer of dolutedegravir advises give at least 2 hours before or 6 hours after calcium salts

Iron Salts: absorption of dolutedegravir reduced by oral IRON SALTS—manufacturer of dolutedegravir advises give at least 2 hours before or 6 hours after oral iron salts

Dorperazone Analgesics: effects of dorperazone on gastro-intestinal activity antagonised by OPIOID ANALGESICS

Antibacterials: possible increased risk of ventricular arrhythmias when dorperazone given with CLARITHROMYCIN or TELITHROMYCIN—or VORICONAZOLE—avoid concomitant use; plasma concentration of dorperazone increased by ERITHROMYCIN (increased risk of ventricular arrhythmias—avoid concomitant use); possible increased risk of ventricular arrhythmias when dorperazone given with DELAMANID

Antifungals: avoidance of dorperazone advised by manufacturer of KETOCONAZOLE (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when dorperazone given with ITRACONAZOLE or VORICONAZOLE—avoid concomitant use

Antimalaria: avoidance of dorperazone advised by manufacturer of ARTEMISININ WITH PIPERQUIN (possible risk of ventricular arrhythmias)

Antimuscarinics: effects of dorperazone on gastro-intestinal activity antagonised by ANTIMUSCARINICS

Antivirals: possible increased risk of ventricular arrhythmias when dorperazone given with BOCEPREVIR, RITONAVIR, SAQUINAVIR or TELAPREVIR—avoid concomitant use

Cobicistat: possible increased risk of ventricular arrhythmias when dorperazone given with Cobicistat—avoid concomitant use

Cytotoxics: avoidance of dorperazone advised by manufacturer of ROSUVASTATIN (risk of ventricular arrhythmias)
Dopamine see Sympathomimetics
Dopaminergics see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolid, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Toclapon
Dopexamine see Sympathomimetics
Dorzolamide see Diuretics
Doxepin see Antidepressants, Tricyclic
Doxapram
- Aminophylline: increased CNS stimulation when doxapram given with AMINOPHYLLINE
  - Anaesthetics, General: increased risk of arrhythmias when doxapram given with VOLATILE LIQUID GENERAL ANAESTHETICS (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
  - Antibacterials: effects of doxapram enhanced by MAOIS
  - Antidepressants: increased risk of hypertension when doxapram given with SYMPATHOMIMETICS
  - Theophylline: increased CNS stimulation when doxapram given with THEOPHYLLINE
Doxazosin see Alpha-blockers
Doxepin see Antidepressants, Tricyclic
Doxorubicin see Cytotoxics
Doxorubicin see Antidepressants, Tricyclic
Doxapram (continued)
- Aminephrine: increased CNS stimulation when doxapram given with AMINOPHYLLINE
  - Anaesthetics, General: increased risk of arrhythmias when doxapram given with VOLATILE LIQUID GENERAL ANAESTHETICS (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
  - Antibacterials: effects of doxapram enhanced by MAOIS
  - Antidepressants: increased risk of hypertension when doxapram given with SYMPATHOMIMETICS
  - Theophylline: increased CNS stimulation when doxapram given with THEOPHYLLINE
Dronedarone see Cardiac Glycosides
Dronedarone (continued)
- Antiarrhythmics: plasma concentration of drozdarone possibly reduced by KETOCONAZOLE—avoid concomitant use; manufacturer of drozdarone advises avoid concomitant use with ITRA
  - Antiarrhythmics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ANTIPSYCHOTICS that prolong the QT interval; manufacturer of drozdarone advises avoid concomitant use with PHENOTHIAZINES (risk of ventricular arrhythmies)
  - Antivirals: manufacturer of drozdarone advises avoid concomitant use with RITONAVIR; increased risk of ventricular arrhythmias when drozdarone given with
  - CYP450 3A4 inhibitors: drozdarone possibly increases plasma concentration of METOTR accrued and PRPRANOLOL; increased risk of ventricular arrhythmias when drozdarone given with SOTALOL—avoid concomitant use
  - Calcium-channel Blockers: plasma concentration of drozdarone increased by NIFEDIPINE; increased risk of hypotension with drozdarone given with
  - Cardiac Glycosides: drozdarone increases plasma concentration of DIGOXIN (risk of ventricular arrhythmias)
  - CYP450 3A4 inhibitors: drozdarone possibly increases plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; drozdarone possibly increases the plasma concentration of IBURITINIB—reduce dose of ibritinib (see under ibritinib, p. 909)
  - Fingolimod: possible increased risk of hypotension with drozdarone given with FINGOLIMOD
  - Grapefruit Juice: plasma concentration of drozdarone increased by GRAPEFRUIT JUICE—avoid concomitant use
  - Lipid-regulating Drugs: drozdarone possibly increases plasma concentration of ATORVASTATIN; drozdarone increases plasma concentration of ROSUVA STATIN—adjust dose of rosuvastatin; increased risk of hypotension with drozdarone given with SIMVASTATIN; avoidance of drozdarone advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
  - Sirolimus: manufacturer of drozdarone advises caution with SIROLIMUS
  - Tacrolimus: manufacturer of drozdarone advises caution with TACROLIMUS
Droperidol see Antiemetics
Drospirenone see Progestogens
Duloxetine
- Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with FENTANYL; possible increased serotonergic effects when duloxetine given with PETHIDINE or TRAMADOL
  - Antiarrhythmics: metabolism of duloxetine inhibited by CIPROFLOXACIN;—avoid concomitant use
  - Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with DABIGATRAN
  - Antidepressants: metabolism of duloxetine inhibited by FLUVAXMIDINE—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, ST JOHN’S WORT, AMITRIPTYLINE, CLOMIPRAMINE, MOCLOBEMIDE or VENLAFAXINE; duloxetine should not be started until 2 weeks after stopping; MAOIS, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRIs-related antidepressants do not start MOCLOBEMIDE for at least 1 week
  - Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE and ARTEMIMOL WITH PIPERAQIUNE
Efavirenz (continued)

- **Antivirals:** plasma concentration of **SAQUINAVIR**; efavirenz reduces plasma concentration of **TELAPREVIR**—increase dose of telaprevir
- **Anxiolytics and Hypnotics:** increased risk of prolonged sedation when efavirenz given with **MIDAZOLAM**—avoid concomitant use
- **Atovaquone:** efavirenz reduces plasma concentration of **ATOVACUONE**—avoid concomitant use
- **Avanafil:** efavirenz possibly reduces plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
- **Bupropion:** efavirenz accelerates metabolism of **BUPROPION** (reduced plasma concentration)
- **Calcium-channel Blockers:** efavirenz reduces plasma concentration of **DILTIAZEM**
- **Ciclosporin:** efavirenz possibly reduces plasma concentration of **CICLOSPORIN**
- **Cytotoxics:** efavirenz possibly reduces plasma concentration of **BOSUTINIB**—manufacturer of bosutinib advises avoid concomitant use
- **Ergot Alkaloids:** increased risk of ergotism when efavirenz given with **ERGOT ALKALOIDS**—avoid concomitant use
- **Grapefruit Juice:** plasma concentration of efavirenz possibly increased by **GRAPEFRUIT JUICE**
- **Lipid-regulating Drugs:** efavirenz reduces plasma concentration of **ATORVASTATIN**, **PRAVASTATIN** and **SIMVASTATIN**
- **Orlistat:** absorption of efavirenz possibly reduced by **ORLISTAT**
- **Progestogens:** efavirenz possibly reduces contraceptive effect of **PROGESTOGENS**
- **Tacrolimus:** efavirenz possibly affects plasma concentration of **TACROLIMUS**

Elotrubbogain

- **Antacids:** absorption of elotrubbogain reduced by **ANTACIDS** (give at least 4 hours apart)
- **Antivirals:** plasma concentration of elotrubbogain possibly reduced by **LOPINAVIR**
- **Calcium Salts:** absorption of elotrubbogain possibly reduced by **CALCIUM SALTS** (give at least 4 hours apart)
- **Dairy Products:** absorption of elotrubbogain possibly reduced by **DAIRY PRODUCTS** (give at least 4 hours apart)
- **Iron Salts:** absorption of elotrubbogain possibly reduced by **IRON SALTS** (give at least 4 hours apart)
- **Lipid-regulating Drugs:** elotrubbogain increases plasma concentration of **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature)
- **Selenium:** absorption of elotrubbogain possibly reduced by **SELENIUM** (give at least 4 hours apart)
- **Zinc:** absorption of elotrubbogain possibly reduced by **ZINC** (give at least 4 hours apart)

Elivtegravir

- **Antacids:** absorption of elivtegravir reduced by **ALUMINIUM HYDROXIDE** and **ORAL MAGNESIUM SALTS** (give at least 4 hours apart)
- **Antibacterials:** plasma concentration of elivtegravir reduced by **rifabutin** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elivtegravir advises avoid concomitant use with ****
- **Antileptics:** manufacturer of elivtegravir advises avoid concomitant use with ****
- **Antidepressants:** manufacturer of elivtegravir advises avoid concomitant use with **ST JOHNS WORT**
- **Antivirals:** avoidance of efavirenz advised by manufacturer of ****
- **Bosentan:** manufacturer of elivtegravir advises avoid concomitant use with ****
- **Calcium Salts:** absorption of elivtegravir possibly reduced by **CALCIUM SALTS** (give at least 4 hours apart)
- **Ciclosporin:** efavirenz reduces plasma concentration of **CICLOSPORIN**
- **Cytotoxic:** efavirenz possibly reduces plasma concentration of **BOSUTINIB**—manufacturer of bosutinib advises avoid concomitant use
- **Dairy Products:** absorption of elivtegravir possibly reduced by **DAIRY PRODUCTS** (give at least 4 hours apart)
- **Iron Salts:** absorption of elivtegravir possibly reduced by **IRON SALTS** (give at least 4 hours apart)
- **Methylthioninium:** manufacturer of elivtegravir advises avoid concomitant use
- **Atovaquone:** efavirenz reduces plasma concentration of **ATOVACUONE**—avoid concomitant use
- **Avanafil:** efavirenz possibly reduces plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
- **Bupropion:** efavirenz accelerates metabolism of **BUPROPION** (reduced plasma concentration)
- **Calcium-channel Blockers:** efavirenz reduces plasma concentration of **DILTIAZEM**
- **Ciclosporin:** efavirenz possibly reduces plasma concentration of **CICLOSPORIN**
- **Cytotoxic:** efavirenz possibly reduces plasma concentration of **BOSUTINIB**—manufacturer of bosutinib advises avoid concomitant use
- **Ergot Alkaloids:** increased risk of ergotism when efavirenz given with **ERGOT ALKALOIDS**—avoid concomitant use
- **Grapefruit Juice:** plasma concentration of efavirenz possibly increased by **GRAPEFRUIT JUICE**
- **Lipid-regulating Drugs:** efavirenz reduces plasma concentration of **ATORVASTATIN**, **PRAVASTATIN** and **SIMVASTATIN**
- **Orlistat:** absorption of efavirenz possibly reduced by **ORLISTAT**
- **Progestogens:** efavirenz possibly reduces contraceptive effect of **PROGESTOGENS**
- **Tacrolimus:** efavirenz possibly affects plasma concentration of **TACROLIMUS**
- **Antacids:** absorption of elotrubbogain reduced by **ANTACIDS** (give at least 4 hours apart)
- **Antivirals:** plasma concentration of elotrubbogain possibly reduced by **LOPINAVIR**
- **Calcium Salts:** absorption of elotrubbogain possibly reduced by **CALCIUM SALTS** (give at least 4 hours apart)
- **Dairy Products:** absorption of elotrubbogain possibly reduced by **DAIRY PRODUCTS** (give at least 4 hours apart)
- **Iron Salts:** absorption of elotrubbogain possibly reduced by **IRON SALTS** (give at least 4 hours apart)
- **Lipid-regulating Drugs:** elotrubbogain increases plasma concentration of **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature)
- **Selenium:** absorption of elotrubbogain possibly reduced by **SELENIUM** (give at least 4 hours apart)
- **Zinc:** absorption of elotrubbogain possibly reduced by **ZINC** (give at least 4 hours apart)
Elvitegravir (continued)  
> Progestogens: elvitegravir increases plasma concentration of NORGESTIMATE

Emagliflozin see Antidiabetics

Emtricitabine  
Antiviral, manufacturer of emtricitabine advises avoid concomitant use with LAMIVUDINE  
> Orlistat: absorption of emtricitabine possibly reduced by ORLISTAT

Enalapril see ACE Inhibitors

Enfuvirtide  
Orlistat: absorption of enfuvirtide possibly reduced by ORLISTAT

Enoxaparin see Heparins

Enoximone see Phosphodiesterase Inhibitors

Entacapone  
> Anti-coagulants: entacapone enhances anti-coagulant effect of WARFARIN

> Anti-depressants: manufacturer of entacapone advises caution with MOCLOBEMIDE, TRICYCLICS and VENLAFAXINE; avoid concomitant use of entacapone with non-selective MAOIS

Dopaminergics: entacapone possibly enhances effects of APOMORPHINE; entacapone possibly reduces plasma concentration of RASAGILINE; manufacturer of entacapone advises max. dose of 10 mg SELEGILINE if used concomitantly

Iron Salts: absorption of entacapone reduced by oral IRON SALTS

Memesantine: effects of dopaminergics possibly enhanced by MEMANTINE

Methyldopa: entacapone possibly enhances effects of METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA

Sympathomimetics: entacapone possibly enhances effects of ADRENALINE (EPINEPHRINE), DOBUTAMINE, DOPAMINE and NORADRENALINE (NOREPINEPHRINE)

Enteral Foods  
> Anti-coagulants: the presence of vitamin K in some enteral feeds can antagonise the anti-coagulant effect of COUMARINS and PHENINDIONE

> Antiepileptics: enteral feeds possibly reduce absorption of FOSPHENYTOIN and PHENYTOIN

Enzalutamide  
> Anti-bacterials: manufacturer of enzalutamide advises avoid concomitant use with RIFAMPICIN

> Anticoagulants: enzalutamide possibly reduces plasma concentration of COUMARINS

Lipid-regulating Drugs: plasma concentration of enzalutamide increased by GEMFIBROZIL—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide

Ephedrine see Sympathomimetics

Epinephrine  
> NOTE Epinephrine interactions as for adrenaline, see under sympathomimetics

Epirubicin  
> Anti-psychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)

Cloclosporin: plasma concentration of epirubicin increased by CICLOSPORIN

Ulcer-healing Drugs: plasma concentration of epirubicin increased by CIMETIDINE

Eplerenone see Diuretics

Eprosartan see Angiotensin-II Receptor Antagonists

Epifibatide  
> Iloprost: increased risk of bleeding when epifibatide given with ILOPROST

Ergocalciferol see Vitamins

Ergometrine see Ergot Alkaloids

Ergot Alkaloids  
> Anti-bacterials: increased risk of ergotism when ergometrine given with MACROLIDES or ERYTHROMYCIN—avoid concomitant use; increased risk of ergotism when ergometrine given with TETRACYCLINES

Ergot Alkaloids (continued)  
> Anti-depressants: possible risk of hypertension when ergotamine given with REBOXETINE

> Anti-fungals: avoidance of ergot alkaloids advised by manufacturer of KETOCONAZOLE; avoidance of ergotamine advised by manufacturer of TRICLOROANIL (increased risk of ergotism); increased risk of ergotism when ergometrine given with VORICONAZOLE—avoid concomitant use; increased risk of ergotism when ergotamine given with IMIDAZOLES or TRIAZOLEs; avoid concomitant use

Anti-psychotics: plasma concentration of ergot alkaloids possibly increased by LURASIDONE (increased risk of toxicity)

Anti-virals: plasma concentration of ergot alkaloids possibly increased by ATAZANAVIR—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of BOCREPRAVIR and TELAPREVIR; increased risk of ergotism when ergot alkaloids given with DARUNAVIR—manufacturer of darunavir advises avoid concomitant use; increased risk of ergotism when ergot alkaloids given with EFAVIRENZ—avoid concomitant use; increased risk of ergotism when ergotamine given with FOSAMPRENAVIR, INDINAVIR, RITONAVIR or SAQUINAVIR—avoid concomitant use; increased risk of ergotism when ergometrine given with INDINAVIR or RITONAVIR—avoid concomitant use

Beta-blockers: increased peripheral vasocostriction when ergotamine given with BETA-BLOCKERS

Cobicistat: plasma concentration of ergot alkaloids possibly increased by COBICISTAT—manufacturer of cobicistat advises avoid concomitant use

Cytotoxics: caution with ergot alkaloids advised by manufacturer of CHIZOTINIB; avoidance of ergotamine advised by manufacturer of IDELALISIB

5HT-receptor Agonists: increased risk of vasospasm when ergotamine given with ALMOTRIPTAN, RIZATRIPTAN, SUMATRIPTAN or ZOLMITRIPTAN (avoid ergotamine for 6 hours after almotriptan, rizatRIPTan, sumatriptan or zolmitriptan, avoid almotriptan, rizatRIPTan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with ELETRIPTAN, FROVATRIPTAN or NARATRIPTAN (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naranatriptan, avoid eletriptan, frovatrIPAIN or naranatriptan for 24 hours after ergotaine)

Sympathomimetics: increased risk of ergotism when ergotamine given with SYMPATHOMIMETICS

Ticagrelor: plasma concentration of ergot alkaloids possibly increased by TICAGRELOR

Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with CIMETIDINE—avoid concomitant use

Ergotamine see Ergot Alkaloids

Eribulin  
> Anti-bacterials: plasma concentration of eribulin possibly reduced by RIFAMPICIN

> Anti-depressants: plasma concentration of eribulin possibly reduced by ST JOHN’S WORT's

Antiepileptics: plasma concentration of eribulin possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN

Anti-psychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)

Erlotinib  
> Analgesics: increased risk of bleeding when erlotinib given with NSAIDS

> Anti-cids: plasma concentration of erlotinib possibly reduced by ANTACIDS—give antacids at least 4 hours before or 2 hours after erlotinib

> Anti-bacterials: plasma concentration of erlotinib increased by CIPROFLOXACIN; metabolism of erlotinib accelerated by RIFAMPICIN (reduced plasma concentration)

> Anti-coagulants: increased risk of bleeding when erlotinib given with COUMARINS

> Anti-fungals: metabolism of erlotinib inhibited by KETOCONAZOLE (increased plasma concentration)

Anti-psychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)

Anti-virals: avoidance of erlotinib advised by manufacturer of BOCREPRAVIR
Erlotinib (continued)

- Cytotoxic: plasma concentration of erlotinib possibly increased by CAPECITABINE
- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with Cimetidine, Esomeprazole,
  Famotidine, Lansoprazole, Nizatidine, Pantoprazole and Rabeprazole; plasma concentration of erlotinib reduced by Ranitidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by Omeprazole—manufacturer of erlotinib advises avoid concomitant use

Ertapenem
- Antiepileptics: carbapenems reduce plasma concentration of Sodium Valproate and Valproic Acid—avoid concomitant use
- Vaccines: antibacterials inactivate Oral Typhoid Vaccine—see under Typhoid Vaccine in BNF

Erythromycin see Macrolides

Escitalopram see Antidepressants, SSRI

Escarbazepine
- Antiepileptics: escarbazepine reduces plasma concentration of Warfarin
- Antidepressants: anticongestant effect of antiepileptics possibly antagonised by MAOIs and Tricyclic-Related Antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and Tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of escarbazepine possibly reduced by Carbamazepine but risk of side-effects increased; plasma concentration of escarbazepine reduced by Phenytoin and Phenytoin, also plasma concentration of fosphenytoin and phenytoin increased; manufacturer of escarbazepine advises avoid concomitant use with Oxcarbazepine
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by Mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by Antipsychotics (convulsive threshold lowered)
- Lipid-regulating Drugs: escarbazepine reduces plasma concentration of Rosuvastatin; escarbazepine reduces plasma concentration of Simvastatin—consider increasing dose of simvastatin
- Oestrogens: escarbazepine accelerates metabolism of Oestrogens
- Progestogens: escarbazepine accelerates metabolism of Progestogens
- Antiepileptics: reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF
- Orlistat: possible increased risk of convulsions when antiepileptics given with Orlistat
- Progestogens: escarbazepine accelerates metabolism of Progestogens
- Antiepileptics: reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF

Esmolol see Beta-blockers

Esomeprazole see Proton Pump Inhibitors

 Estradiol see Oestrogens

 Estramustine
- Antacids: absorption of estramustine possibly reduced by Aluminium Hydroxide and Oral Magnesium Salts—manufacturer of estramustine advises avoid concomitant administration
- Antipsychotics: avoid concomitant use of cytotoxics with Clozapine (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by Sodium Clodronate
- Calcium Salts: absorption of estramustine reduced by Calcium Salts (manufacturer of estramustine advises avoid concomitant administration)

Estradiol see Oestrogens

Estrone see Oestrogens

Etanercept
- Abatacept: avoid concomitant use of etanercept with Abatacept

Etenostradiol see Oestrogens

Ethosuximide
- Antibacterials: metabolism of ethosuximide inhibited by Isoniazid (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and Tricyclic-Related Antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and Tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by Carbamazepine, Phenobarbital, and Primidone; plasma concentration of ethosuximide possibly reduced by Phenytoin and Phenytion, also plasma concentration of fosphenytoin and phenytoin increased; plasma concentration of ethosuximide possibly increased by Sodium Valproate and Valproic Acid
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by Mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by Antipsychotics (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with Orlistat

Etodolac see NSAIDs

Etomate see Anaesthetics, General

Etonogestrel see Progestogens

Etosapide
- Anticoagulants: etosapide possibly enhances anticoagulant effect of Coumarins
- Antiepileptics: plasma concentration of etosapide possibly reduced by Phenytoin, Phenobarbital, Phenytion and Primidone
- Antifungals: plasma concentration of etosapide increased by Ketoconazole
- Antipsychotics: avoid concomitant use of cytotoxics with Clozapine (increased risk of agranulocytosis)
- Atovaquone: plasma concentration of etosapide possibly increased by Atovaquone
- Ciclosporin: plasma concentration of etosapide possibly increased by Ciclosporin (increased risk of toxicity)

Etoricoxib see NSAIDs

Etravirine
- Antibacterials: etravirine reduces plasma concentration of Clarithromycin (but concentration of an active metabolite increased), also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with Rifabutin; manufacturer of etravirine advises avoid concomitant use with Rifamycin; etravirine possibly reduces plasma concentration of Bedaquiline—manufacturer of bedaquiline advises avoid concomitant use
- Antidepressants: manufacturer of etravirine advises avoid concomitant use with St John’s Wort
- Antiepileptics: manufacturer of etravirine advises avoid concomitant use with Carbamazepine, Fosphenytoin, Phenobarbital, Phenytion and Primidone
- Antimalarials: etravirine reduces plasma concentration of Artemether with Lumefantrine
- Antivirals: effects of both drugs possibly reduced when etravirine given with Bictegravir; avoidance of etravirine advised by manufacturer of Dolutegravir (plasma concentration of dolutegravir possibly reduced); etravirine reduces the plasma concentration of Dolutegravir (see under Dolutegravir, p. 557); plasma concentration of etravirine possibly reduced by Efavirenz and Nevirapine—
Etravirine
- Antivirals (continued)
  avoid concomitant use; etravirine increases plasma concentration of ciclosporin (consider reducing dose of ciclosporin); etravirine possibly reduces plasma concentration of tizanidine—avoid concomitant use; etravirine possibly reduces plasma concentration of maraviroc; avoidance of etravirine advised by manufacturer of simprevir; plasma concentration of etravirine reduced by
  tizanidine, also plasma concentration of tipranavir increased (avoid concomitant use)
  cardiac glycosides: etravirine increases plasma concentration of digoxin
  clopidogrel: etravirine possibly reduces antiplatelet effect of
  clopidogrel
  cytoxotics: etravirine possibly reduces plasma concentration of
  bosutinib—manufacturer of bosutinib advises avoid concomitant use
  lipid-regulating Drugs: etravirine possibly reduces plasma concentration of atorvastatin
  orlistat: absorption of etravirine possibly reduced by
  orlistat
  sildenafil: etravirine reduces plasma concentration of sildenafil

Everolimus
- ACE inhibitors: increased risk of angioedema when everolimus given with
  ACE INHIBITORS
- Antibacterials: plasma concentration of everolimus possibly increased by
  clarithromycin and telithromycin—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by
  erythromycin (consider the reducing the dose of everolimus—consult everolimus product literature); plasma concentration of everolimus reduced by
  rifampicin (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature)
- Antidepressants: plasma concentration of everolimus possibly reduced by st john’s wort—manufacturer of everolimus advises avoid concomitant use
- Antifungals: plasma concentration of everolimus increased by
  ketoconazole—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of everolimus possibly increased by
  itraconazole, posaconazole and voriconazole—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by
  atazanavir, darunavir, indinavir, ritonavir and saquinavir—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with
  verapamil (consider reducing the dose of everolimus—consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by
  cyclosporin (consider reducing the dose of everolimus—consult everolimus product literature)
- Cytoxotics: plasma concentration of everolimus increased by
  imatinib (consider reducing the dose of everolimus—consult everolimus product literature)
- Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with grapefruit juice

Exemestane
- Antibacterials: plasma concentration of exemestane possibly reduced by rifampicin

Exenatide see Antidiabetics

Ezetimibe
- Anticoagulants: ezetimibe possibly enhances anticoagulant effect of
  coumadins
- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with
  ciclosporin
- Lipid-regulating Drugs: ezetimibe increases plasma concentration of
  rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of cholelithiasis

Famotidine see Histamine H2-antagonists

Fampridine
- Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with
  cimetidine

Fexofenadine see Antihistamines

Fenofibrate see Fibrates

Fenoprofen see NSAIDs

Fentanyl see Opioid Analgesics

Ferrous Gluconate see Iron salts

Ferrous Sulphate see Iron salts

Fesoterodine see Antimuscarinics

Fexofenadine see Antihistamines

Fibrates
- Antibacterials: increased risk of myopathy when fibrates given with
  daptomycin (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of
  coumadins and
  phenindione
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with
  insulin or sulfonylureas;
  gemfibrozil possibly enhances hypoglycaemic effect of
  nateglinide; increased risk of severe hypoglycaemia when gemfibrozil given with
  repaglinide—avoid concomitant use
  ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with
  ciclosporin
  colchicine: possible increased risk of myopathy when fibrates given with
  colchicine
  cytoxotics: gemfibrozil increases plasma concentration of
darafenib; gemfibrozil increases plasma concentration of
  bexarotene—avoid concomitant use
- Hormone Antagonists: gemfibrozil increases plasma concentration of
  enzalutamide—manufacturer of enzalutamide advises avoid concomitant use or half dose of enzalutamide
- Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of montelukast
- Lipid-regulating Drugs: increased risk of myopathy when fibrates given with
  atorvastatin, fluvastatin or pravastatin (preferably avoid concomitant use); increased risk of myopathy when fibrates given with
  rosuvastatin (see under Rosuvastatin, p. 180); possible increased risk of myopathy when bezafibrate given with
  simvastatin (see under Simvastatin, p. 181); possible increased risk of myopathy when ciprofibrate given with
  simvastatin (see under Simvastatin, p. 181); increased risk of myopathy when gemfibrozil given with
  simvastatin (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; increased risk of myopathy when fibrates given with
  statins; reduce maximum dose of fenofibrate when given with
  statins—see under Fenofibrate, p. 175

Fidaxomicin
- Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with
  amiodarone and dronedarone
- Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with
  clarithromycin and erythromycin
- Antifungals: manufacturer of fidaxomicin advises avoid concomitant use with
  ketoconazole
- Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with
  verapamil
- Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with
  ciclosporin
- Vaccines: antibacterials inactivate
  oral typhoid vaccine—see under Typhoid Vaccine in BNF
Filgrastim
- Cytotoxics: neutropenia possibly exacerbated when filgrastim given with capecitabine, fluorouracil or tegafur

Fingolimod
- Anti-arrhythmics: possible increased risk of bradycardia when fingolimod given with amiodarone, disopyramide or dronedarone
- Antidepressants: plasma concentration of fingolimod possibly reduced by St John's Wort—manufacturer of fingolimod advises avoid concomitant use
- Antiepileptics: plasma concentration of fingolimod reduced by carbamazepine
- Antifungals: plasma concentration of fingolimod increased by ketconazole
- Beta-blockers: possible increased risk of bradycardia when fingolimod given with beta-blockers
- Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with diltiazem or verapamil

Flavonoids see Antimuscarinics

Flecainide
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; plasma concentration of flecainide increased by amiodarone (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by fluoxetine; increased risk of ventricular arrhythmias when flecainide given with fluoxetine
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with mizolastine—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of arteether with lumefantrine (risk of ventricular arrhythmias); plasma concentration of flecainide increased by quinine
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with folterodine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of arrhythmias when flecainide given with clozapine
- Antivirals: plasma concentration of flecainide possibly increased by fosamprenavir, indinavir, lopinavir and ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with saquinavir—avoid concomitant use; caution with flecainide advised by manufacturer of lularitrevir (risk of ventricular arrhythmias)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with beta-blockers; increased myocardial depression when anti-arrhythmics given with beta-blockers
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with verapamil
- Diuretics: increased cardiac toxicity with flecainide if hyponatraemia occurs with acetazolamide, loop diuretics or triazoles and related diuretics
- Ulcer-healing Drugs: metabolism of flecainide inhibited by cimetidine (increased plasma concentration)

Fluoxacillin see Penicillins
Fluconazole see Antifungals, Triazole

Flucytosine
- Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by amphotericin (toxicity possibly increased)
- Cytotoxics: plasma concentration of flucytosine possibly reduced by cytarabine

Fludarabine
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Cytotoxics: fludarabine increases intracellular concentration of cytarabine; increased pulmonary toxicity when

Fludarabine (continued)
- Cytotoxics (continued) fludarabine given with pentostatin (unacceptably high incidence of fatalities)
- Dipyridamole: effects of fludarabine possibly reduced by dipyridamole

Fluudrocortisone see Corticosteroids

Fluorides
- Calcium Salts: absorption of fluorides reduced by calcium salts

Fluouracil
- Antibacterials: metabolism of fluorouracil inhibited by metronidazole (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of coumarins
- Antiepileptics: fluorouracil possibly inhibits metabolism of fosphenytoin and phenytoin (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Fibrates: neutropenia possibly exacerbated when fluouracil given with filgrastim
- Folates: toxicity of fluorouracil increased by folinic acid—avoid concomitant use
- Lipoglitazin: neutropenia possibly exacerbated when fluorouracil given with lipoglitazin
- Pegfilgrastim: neutropenia possibly exacerbated when fluorouracil given with pegfilgrastim
- Temoporfin: increased skin photosensitivity when topical fluorouracil used with temoporfin
- Ulcer-healing Drugs: metabolism of fluorouracil inhibited by cimetidine (increased plasma concentration)

Fluoxetine see Antidepressants, SSRI
Flupenthixol see Antipsychotics
Fluphenazine see Antipsychotics
Flurazepam see Anxiolytics and Hypnotics
Flurbiprofen see NSAIDs

Flutamide
- Anticoagulants: flutamide enhances anticoagulant effect of coumarins

Fluticasone see Corticosteroids
Fluvastatin see Statins
Fluvoxamine see Antidepressants, SSRI

Folates
- Aminosaliclyates: absorption of folic acid possibly reduced by sulphasalazine
- Antacids: absorption of folic acid possibly reduced by antacids (manufacturer of folic acid advises give at least 2 hours apart)
- Antiepileptics: folates possibly reduce plasma concentration of fosphenytoin, phenobarbital, phenytoin and primidone
- Cytotoxics: folic acid increases toxicity of capecitabine, fluorouracil and tegafur—avoid concomitant use; avoidance of folates advised by manufacturer of raltitrexed

Folic Acid see Folates
Folinic Acid see Folates

Fondaparinux
- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with apixaban, dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Formoterol see Sympathomimetics, Beta2
Fosamprenavir
Note Fosamprenavir is a prodrug of amprenavir
- Analgesics: fosamprenavir reduces plasma concentration of methadone
- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of amiodarone, flecainide and propafenone (increased risk of ventricular arrhythmias—
Fosamprenavir
- Anti-arrhythmics (continued)
  avoid concomitant use; fosamprenavir possibly increases plasma concentration of • LIDOCAINE—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration of • RIFAPTIN (reduce dose of rifapentin); plasma concentration of fosamprenavir significantly reduced by • RIFAMPICIN—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of • TELITHROMYCIN
- Anti-coagulants: avoidance of fosamprenavir advised by manufacturer of APIXABAN and RIVAROXABAN; fosamprenavir may enhance or reduce anticoagulant effect of COUMARINS
- Antidepressants: plasma concentration of fosamprenavir reduced by • ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of fosamprenavir possibly reduced by • CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE
- Anti-fungals: fosamprenavir increases plasma concentration of • KETOCONAZOLE (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with • ITRACONAZOLE; fosamprenavir possibly reduces plasma concentration of • POSANOCAZOLE
- Antimalarials: caution with fosamprenavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; fosamprenavir possibly increases plasma concentration of • QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of DARIFENACIN and TOLTERODINE
- Antivirals: fosamprenavir possibly increases plasma concentration of • ARIPIZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); fosamprenavir increases plasma concentration of • PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of • QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturer of fosamprenavir advises avoid concomitant use with • BOCEPREVIR and • RALTEGRAVIR; fosamprenavir reduces plasma concentration of • DULUTEGRAVIR; plasma concentration of fosamprenavir increased by • ETARIVIRINE (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by • LOPINAVIR, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir reduced by • MARAVIROC—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by • NEVIRAPINE—avoid unboosted fosamprenavir; manufacturers advise avoid concomitant use of fosamprenavir with • TELAPREVIR; plasma concentration of fosamprenavir reduced by • TIPRANAVIR
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of • MIDAZOLAM (risk of prolonged sedation)—avoid concomitant use of oral midazolam)
- Avanafil: fosamprenavir possibly increases plasma concentration of • AVANAFIL—see under Avanafil, p. 698
- Ciclosporin: fosamprenavir increases plasma concentration of • CICLOSPORIN
- Cytotoxics: fosamprenavir possibly increases the plasma concentration of • BOSONIN—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosamprenavir possibly increases the plasma concentration of • IBRUTINIB—reduce dose of ibritunib (see under ibritunib, p. 809)
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fosamprenavir given with • DAPOXETINE (see under Dapoxetine, p. 703)
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with • ERGOTAMINE—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with • ATORVASTATIN; possible increased risk of myopathy when fosamprenavir given with • ROSUVASTATIN—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with • SIMVASTATIN—avoid concomitant

Fosamprenavir
- Lipid-regulating Drugs (continued)
  use; avoidance of fosamprenavir advised by manufacturer of • LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of fosamprenavir possibly reduced by • ORLISTAT
- Ranolazine: fosamprenavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: fosamprenavir possibly increases plasma concentration of • SILDENAFIL
- Tacrolimus: fosamprenavir increases plasma concentration of • TACROLIMUS
- Vardenafil: fosamprenavir possibly increases plasma concentration of • VARDENAFIL

Fosaprepitant
- Antibacterials: plasma concentration of fosaprepitant possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN; plasma concentration of fosaprepitant reduced by • RIFAMPICIN
- Anti-coagulants: fosaprepitant possibly reduces anticoagulant effect of • WARFARIN
- Antidepressants: manufacturer of fosaprepitant advises avoid concomitant use with • ST JOHN’S WORT
- Anti-diabetics: fosaprepitant reduces plasma concentration of • TOLBUTAMIDE
- Antiepileptics: plasma concentration of fosaprepitant possibly reduced by • CARBAMAZEPINE, PHENOBARBITAL, PHENYTOIN and • PRIMIDONE
- Anti-fungals: plasma concentration of fosaprepitant increased by • KETOCONAZOLE
- Antipsychotics: manufacturer of fosaprepitant advises avoid concomitant use with • PIMOZIDE
- Antivirals: plasma concentration of fosaprepitant possibly increased by • RITONAVIR
- Anxiolytics and Hypnotics: fosaprepitant increases plasma concentration of • MIDAZOLAM (risk of prolonged sedation)
- Avanafil: fosaprepitant possibly increases plasma concentration of • AVANAFIL
- Calcium-channel Blockers: plasma concentration of both drugs may increase when fosaprepitant given with • DILTIAZEM
- Corticosteroids: fosaprepitant inhibits metabolism of • DEXAMETHASONE and • METHYLPHENIDYLINE (reduce dose of dexamethasone and methylphenidylsline)
- Cytotoxics: fosaprepitant possibly increases the plasma concentration of • BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosaprepitant possibly increases plasma concentration of • IBRUTINIB
- Lipid-regulating Drugs: separating administration from fosaprepitant by 12 hours advised by manufacturer of • LOMITAPIDE
- Oestrogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing • OSTREGENS (alternative contraception recommended)
- Progestogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing • PROGESTEGENS (alternative contraception recommended)

Foscarnet
- Pentamidine isethionate: increased risk of hypocaemia when foscarnet given with • PARENTERAL • PENTAMIDINE ISETHONATE

Fosfomycin
- Metoclopramide: plasma concentration of fosfomycin reduced by • METOCLOPRAMIDE
- Vaccines: antibacterials inactivate • ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Fosinopril see ACE Inhibitors

Fosphenytoin
- Alcohol: plasma concentration of fosphenytoin possibly reduced by chronic heavy consumption of • ALCOHOL
- Aminophylline: plasma concentration of both drugs reduced when fosphenytoin given with • AMINOPHYLLINE
- Analgesics: excretion of fosphenytoin possibly reduced by • ACETAMIN (increased risk of toxicity); fosphenytoin possibly
Interactions

Fosphenytoin

- Analgesics (continued)
  - accelerates metabolism of FENTANYL (reduced effect); fosphenytoin accelerates metabolism of METHADONE (reduced effect and risk of withdrawal effects); fosphenytoin possibly increases risk of FENTHION toxicity; effects of fosphenytoin enhanced by ASPIRIN; fosphenytoin possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)

- Anthelmintics: fosphenytoin reduces plasma concentration of:
  - ALBENDAZOLE and PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections; plasma concentration of fosphenytoin possibly increased by LEVAMISOLE

- Anti-arrhythmics: metabolism of fosphenytoin inhibited by:
  - AMIODARONE (increased plasma concentration); fosphenytoin reduces plasma concentration of DISOPRIMADI; fosphenytoin possibly reduces plasma concentration of:
    - DRONEDARONE—avoid concomitant use

- Antibacterials: metabolism of fosphenytoin inhibited by:
  - CLARITHROMYCIN (increased plasma concentration); metabolism of fosphenytoin possibly inhibited by:
    - METRONIDAZOLE (increased plasma concentration); plasma concentration of fosphenytoin increased or decreased by:
      - CIPROFLOXACIN; fosphenytoin accelerates metabolism of:
        - DOXYCYCLINE (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of:
          - BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of fosphenytoin increased by:
            - CHLORAMPHENICOL (increased risk of toxicity); metabolism of fosphenytoin possibly inhibited by:
              - SONIDAZO (increased risk of toxicity); metabolism of fosphenytoin accelerated by:
                - RIFAMYCINS (reduced plasma concentration); plasma concentration of fosphenytoin possibly increased by:
                  - SULFONAMIDES; fosphenytoin reduces plasma concentration of:
                    - TELITHROMYCIN (avoid during and for 2 weeks after fosphenytoin); plasma concentration of fosphenytoin increased by:
                      - TRIMETHOPRIM (also increased antifolate effect)

- Anticoagulants: fosphenytoin possibly reduces plasma concentration of:
  - APYXABAN; fosphenytoin accelerates metabolism of:
    - COUMARINS (possibility of reduced anticoagulant effect, but enhancement also reported); fosphenytoin possibly reduces plasma concentration of:
      - DARIGRAZIN—manufacturer of darigrazin advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of:
        - RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis

- Antidepressants: plasma concentration of fosphenytoin increased by:
  - FLUDEXTORIN; fosphenytoin reduces plasma concentration of:
    - MIASERRIN, MIRTAZAPINE and PAROXETINE; plasma concentration of fosphenytoin possibly increased by:
      - SERTRALINE, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of:
        - antiepileptics possibly antagonised by:
          - MADOS and TRICYCLIC-RELATED ANTIPSYCHOTICS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by:
            - SSRIS and TRICYCLICS (convulsive threshold lowered); plasma concentration of fosphenytoin possibly reduced by:
              - ST JOHN'S WORT—avoid concomitant use; fosphenytoin possibly reduces plasma concentration of:
                - TRICYCLICS

- Antidiabetics: plasma concentration of fosphenytoin transiently increased by:
  - TOLBUTAMIDE (possibility of toxicity)

- Antiepileptics: plasma concentration of both drugs often reduced when fosphenytoin given with:
  - CARBAMAZEPINE, also plasma concentration of:
    - ESLICARBZEPINE, also plasma concentration of fosphenytoin may be increased;
      - fosphenytoin reduces plasma concentration of:
        - ESICARBZEPINE, also plasma concentration of fosphenytoin increased;
          - plasma concentration of fosphenytoin possibly increased by:
            - ETHOSUXIMIDE possibly reduced; fosphenytoin reduces plasma concentration of:
              - LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of fosphenytoin increased by:
                - OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; fosphenytoin reduces
Fosphenytoin (continued)

- Calcium-channel Blockers: fosphenytoin reduces effects of
  feleodipine and verapamil; avoidance of fosphenytoin advised by manufacturer of isradipine; avoidance of fosphenytoin advised by manufacturer of nimodipine (plasma concentration of nimodipine possibly reduced); plasma concentration of fosphenytoin increased by diltiazem but also effect of diltiazem reduced
- Cardiovascular Extract: fosphenytoin possibly reduces plasma concentration of abiretroplina—manufacturer of abiretroplina advises reduced concomitant use; fosphenytoin possibly accelerates metabolism of toremifene
- SHTS-receptor Antagonists: fosphenytoin accelerates metabolism of ondasertorin (reduced effect)
- Pancitria: fosphenytoin possibly reduces plasma concentration of vacatorin—manufacturer of vacatorin advises avoid concomitant use

Fosphenytoin (continued)

- Leflunomide: plasma concentration of fosphenytoin possibly increased by leflunomide
- Lipid-regulating Drugs: absorption of fosphenytoin possibly reduced by colesevelam; combination of fosphenytoin with fluvastatin may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when fosphenytoin given with lithium without increased plasma concentration of lithium
- Macitentan: avoidance of fosphenytoin advised by manufacturer of macitentan
- Modafinil: plasma concentration of fosphenytoin possibly increased by modafinil
- Muscle Relaxants: long-term use of fosphenytoin reduces effects of non-depolarising muscle relaxants (but acute use of fosphenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: fosphenytoin accelerates metabolism of
  oestrogens (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Progestogens: fosphenytoin accelerates metabolism of
  progestogens (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
- Roluplumast: fosphenytoin possibly inhibits effects of roluplumast (manufacturer of roluplumast advises avoid concomitant use)
- Sulfonpyrazone: plasma concentration of fosphenytoin increased by sulfinpyrazone
- Symptomimetics: plasma concentration of fosphenytoin increased by methylphenidate
- Tacrolimus: fosphenytoin reduces plasma concentration of tacrolimus, also plasma concentration of fosphenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when fosphenytoin given with theophylline
- Thyroid Hormones: fosphenytoin accelerates metabolism of
  thyroid hormones (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin possibly increased
- Tbilonol: fosphenytoin accelerates metabolism of tibolone
- Ticagrelor: fosphenytoin possibly reduces plasma concentration of ticagrelor
- Ulcer-healing Drugs: metabolism of fosphenytoin inhibited by
  cimetidine (increased plasma concentration); effects of fosphenytoin enhanced by esomeprazole; effects of fosphenytoin possibly enhanced by omeprazole; absorption of fosphenytoin reduced by sucralfate
- Ulipristal: avoidance of fosphenytoin advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of fosphenytoin enhanced by influenza vaccine
- Vitamins: fosphenytoin possibly increases requirements for alfalcaldidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D

Fosaprepitant see SH7—receptor Agonists (under HT)
Furosemide see Diuretics
Fusidic Acid

- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ritonavir—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given with saquinavir
- Lipid-regulating Drugs: risk of myopathy and rhabdomyolysis when fusidic acid given with statins—avoid concomitant use and for 7 days after last fusidic acid dose
- Sugammadex: fusidic acid possibly reduces response to sugammadex
**Fusidic Acid** (continued)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see under Typhoid Vaccine in BNF

**Gabapentin**
- Analgesics: bioavailability of gabapentin increased by **anticonvulsants**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antimalarias: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Galcantamine** see Parasympathomimetics

**Ganciclovir**
- **NOTE**: Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Antibacterials: increased risk of convulsions when ganciclovir given with **imipenem with cilastatin**
- Antivirals: ganciclovir possibly increases plasma concentration of **didanosine**; profound myelosuppression when ganciclovir given with **zidovudine** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
- MycopHENolate: plasma concentration of ganciclovir possibly increased by **mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with **tacrolimus**

**Gefitinib**
- Antibacterials: plasma concentration of gefitinib reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of **warfarin**
- Antidepressants: manufacturer of gefitinib advises avoid concomitant use with **st john’s wort**
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone
- Antifungals: plasma concentration of gefitinib increased by **itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antiretrovirals: avoidance of gefitinib advised by manufacturer of **boceprevir**
- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by **ranitidine**

**Gemcitabine**
- Anticoagulants: gemcitabine possibly enhances anticoagulant effect of **warfarin**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Gentamicin** see Aminoglycosides

**Gestodene** see Progestogens

**Glibenclamide** see Antidiabetics

**Gliclazide** see Antidiabetics

**Glimepiride** see Antidiabetics

**Glipizide** see Antidiabetics

**Glucosamine**
- Anticoagulants: glucosamine enhances anticoagulant effect of **warfarin** (avoid concomitant use)

**Glyceril Trinitrate** see Nitrates

**Glycopyronium** see Antimuscarinics

**Golimumab** (continued)
- Anakinra: avoid concomitant use of golimumab with **anakinra**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live **vaccines**—avoid concomitant use

**Granisetron** see 5HT3-receptor Antagonists (under HT)

**Grapefruit Juice**
- Alcohol: grapefruit juice reduces plasma concentration of **aliskiren**—avoid concomitant use
- Antiarrhythmics: grapefruit juice increases plasma concentration of active metabolite of **albendazole**; grapefruit juice increases plasma concentration of **pradaxa**—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of **sertraline**
- Antihistamines: grapefruit juice reduces plasma concentration of **bilstain**
- Antimalarials: grapefruit juice possibly increases plasma concentration of **artemether with lumefantrine**; avoidance of grapefruit juice advised by manufacturer of **artemimol with piperaquine**
- Antipsychotics: avoidance of grapefruit juice advised by manufacturer of **lurasidone and pimozone**; grapefruit juice possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: grapefruit juice possibly increases plasma concentration of **efavirenz**
- Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of **oral midazolam**; grapefruit juice increases plasma concentration of **bispirono**
- Avanafil: grapefruit juice possibly increases plasma concentration of **avanafil**—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of **amlodipine**; grapefruit juice increases plasma concentration of **felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamila**
- Ciclosporin: grapefruit juice increases plasma concentration of **ciclosporin** (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of **colchicine** toxicity
- Corticosteroids: grapefruit juice increases plasma concentration of **oral budesonide**—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
- Cytotoxics: grapefruit juice possibly increases plasma concentration of **axitinib, cabozantinib and ponatinib**; grapefruit juice possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; grapefruit juice possibly increases plasma concentration of **crizotinib** and **vinflunine**—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of **dasatinib** (plasma concentration of dasatinib possibly increased); avoidance of grapefruit juice advised by manufacturer of **everolimus, ibrutinib**
- Lapatinib, nilotinib and pazopanib
- Ivabradine: grapefruit juice increases plasma concentration of **ivabradine**
- Ivaftor: grapefruit juice possibly increases plasma concentration of **ivaftor**—manufacturer of ivafator advises avoid concomitant use
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of **atorvastatin**; grapefruit juice increases plasma concentration of **simvastatin**—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of **lomitapide**
- Pirfenidone: avoidance of grapefruit juice advised by manufacturer of **pirfenidone**
Grapefruit Juice (continued)
- Ranolazine: grapefruit juice possibly increases plasma concentration of RANOLAZINE — manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of SILDENAFIL
- Sirolimus: grapefruit juice increases plasma concentration of SIROLIUMS — avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of TACROLIMUS
- Tadalafil: grapefruit juice possibly increases plasma concentration of TADALAFIL
- Tolvaptan: grapefruit juice increases plasma concentration of TOLVAPTAN — avoid concomitant use
- Vardenafil: grapefruit juice possibly increases plasma concentration of VARDENAFIL — avoid concomitant use

Griseofulvin
- Alcohol: griseofulvin possibly enhances effects of ALCOHOL
- Anticoagulants: griseofulvin reduces anticoagulant effect of COUMARINS
  - Antiepileptics: absorption of griseofulvin reduced by PHENOBARBITAL and PHENYTOIN (reduced effect)
  - Cimetidine: griseofulvin possibly reduces plasma concentration of CICLOSPORIN
  - Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with OESTROGENS
  - Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with PROGESTOGENS

Guanethidine
- see Adrenergic Neurone Blockers

Haemophilus Vaccine
- see Vaccines

Haloperidol
- see Antipsychotics

Heparin
- see Heparins

Heparins
- ACE inhibitors: increased risk of hyperkalaemia when heparins given with ACE INHIBITORS
- Alikiren: increased risk of hyperkalaemia when heparins given with ALIKIREN
- Analgesics: possible increased risk of bleeding when heparins given with NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by ASPIRIN and ANGIOTENSIN-ll Receptor Antagonists: increased risk of hyperkalaemia when heparins given with ANGIOTENSIN-ll RECEPTOR ANTAGONISTS
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APIXABAN, DABIGATRAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Clopidogrel: increased risk of bleeding when heparins given with CLOPIDOGREL
- Dipyridamole: anticoagulant effect of heparins enhanced by DIPYRIDAMOLE
- Iloprost: anticoagulant effect of heparins possibly enhanced by ILOPROST
- Nitrites: anticoagulant effect of heparins reduced by infusion of GLYCERYL TRINITRATE

Hepatitis Vaccines
- see Vaccines

Histamine (continued)
- Antimalarials: manufacturer of histamine advises avoid concomitant use with ANTIMALARIALS
- Antipsychotics: effects of histamine theoretically antagonised by ANTIPSYCHOTICS — manufacturer of histamine advises avoid concomitant use
- Antihistamines: effects of histamine theoretically antagonised by ANTIHISTAMINES — manufacturer of histamine advises avoid concomitant use

Histamine H2-antagonists
- Alpha-blockers: cimetidine and ranitidine antagonise effects of TOLAZOLINE
- Aminophylline: cimetidine inhibits metabolism of AMINOPHYLLINE (increased plasma concentration)
- Analgesics: cimetidine inhibits metabolism of OPIOID ANALGESICS (increased plasma concentration)
- Anthelmintics: cimetidine possibly enhances effects of ALBENDAZOLE; cimetidine possibly inhibits metabolism of MEBENDAZOLE (increased plasma concentration); cimetidine increases plasma concentration of PRAZIQUANTEL
- Anti-arrhythmics: cimetidine increases plasma concentration of AMIODARONE and PROPafenone; cimetidine inhibits metabolism of FLECAINIDE (increased plasma concentration); cimetidine increases plasma concentration of LIDOCAINE (increased risk of toxicity)
- Antibacterials: cimetidine increases plasma concentration of ERYTHROMYCIN (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of METRONIDAZOLE (increased plasma concentration); metabolism of cimetidine accelerated by RIFAMPICIN (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of COUMARINS (enhanced anticoagulant effect)
- Antidepressants: cimetidine increases plasma concentration of CITALOPRAM, ESCITALOPRAM, MIRTAZAPINE and SERTRALINE; cimetidine inhibits metabolism of AMITRIPTYLINE, DOXEPIN, IMIPRAMINE and NORTRIPTYLINE (increased plasma concentration); cimetidine increases plasma concentration of MOXOLEMIDE (halve dose of moxolamide); cimetidine possibly increases plasma concentration of TOLAZOLINE; cimetidine inhibits metabolism of lithium (increased plasma concentration); cimetidine enhances hypoglycaemic effect of SULfonylureas
- Antiepileptics: cimetidine inhibits metabolism of CARBAMAZEPINE, FOSFOHENOTOIN, PHENYTOIN, SODIUM VALPROATE and VALPROIC ACID (increased plasma concentration)
- Antifungals: histamine H2—antagonists reduce absorption of ITRACONAZOLE and KETOCONAZOLE; cimetidine reduces plasma concentration of POSaconazole — manufacturer of posaconazole suspension advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of POSaconazole — manufacturer of posaconazole suspension advises avoid concomitant use; cimetidine increases plasma concentration of TELFENACINE
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of LORATADINE; cimetidine increases plasma concentration of HYDROXYZINE
- Antimalarials: avoidance of cimetidine advised by manufacturer of ARTEMETHER with LUMEFANTRINE; cimetidine inhibits metabolism of CHLOROQUINE, HYDROXYCHLOROQUINE and QUININE (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of ANTIPSYCHOTICS, CHLORPROMAZINE and CLOzapine
- Antivirals: manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with ATAZANAVIR (adjust doses of both drugs—consult atazanavir product literature); famotidine and ranitidine reduce the plasma concentration of ATAZANAVIR (adjust doses of both drugs—consult atazanavir product literature); famotidine increases plasma concentration of ATAZANAVIR

Appendix 1 Interactions 1199
Histamine H₂-antagonists
- Antivirals (continued)
concentration of Raltegravir; avoidance of histamine H₂-antagonists for 12 hours before or 4 hours after Rilpivirine advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of Saquinavir
  "Anxiolytics and Hypnotics: cimetidine inhibits metabolism of Benzodiazepines, Clomethiazole and Zaleplon (increased plasma concentration); cimetidine increases plasma concentration of MELATONIN"
- Beta-blockers: cimetidine increases plasma concentration of Labetalol, Metoprolol and Propranolol; cimetidine possibly increases plasma concentration of Oral Timolol
- Caffeine citrate: cimetidine increases plasma concentration of Caffeine
- Calcium-channel Blockers: cimetidine possibly inhibits metabolism of Calcium-channel blockers (increased plasma concentration); cimetidine increases plasma concentration of Sradipine (halve dose of isradipine)
- Ciclosporin: cimetidine possibly increases plasma concentration of Ciclosporin
- Clopidogrel: cimetidine possibly reduces antiplatelet effect of Clopidogrel
- Cytostatics: cimetidine possibly enhances myelosuppressive effects of Carmustine and Lomustine; cimetidine reduces plasma concentration of Doxorubicin; cimetidine increases plasma concentration of Epirubicin; cimetidine inhibits metabolism of Capecitabine, Fluorouracil and Tegafur (increased plasma concentration); famotidine possibly reduces plasma concentration of Dasatinib; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of Erlotinib; ranitidine reduces plasma concentration of Erlotinib—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of Gefitinib; histamine H₂-antagonists possibly reduce absorption of Lapatinib; histamine H₂-antagonists possibly reduce absorption of Pazopanib—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H₂-antagonists
- Dopaminergics: cimetidine reduces excretion of Pramipexole (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with Ergotamine—avoid concomitant use
- Famipridine: avoidance of cimetidine advised by manufacturer of Famipride
- Histamine: histamine H₂-antagonists theoretically antagonise effects of Histamine—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: absorption of cimetidine possibly delayed by Octreotide
- SHT₁-receptor Agonists: cimetidine inhibits metabolism of Zolmitriptan (reduce dose of zolmitriptan)
- Lipid-regulating Drugs: separating administration from cimetidine and ranitidine by 12 hours advised by manufacturer of Lomitapide
- Roflumilast: cimetidine inhibits the metabolism of Roflumilast
- Sildenafil: cimetidine increases plasma concentration of Sildenafil—consider reducing dose of sildenafil for erectile dysfunction
- Sympathomimetics: cimetidine possibly inhibits metabolism of Dobutamine
- Theophylline: cimetidine inhibits metabolism of Theophylline (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of Levothyroxine

Hormone Antagonists see Antimuscarinics

Hormone Antagonists see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flu tamide, Lane reotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

SHT₁-receptor Agonists
- Antibacterials: plasma concentration of eletriptan increased by Clarithromycin and Erythromycin (risk of toxicity)

Ibosafamide (continued)

- Antifungals: metabolism of ibosafamide inhibited by KETOCONAZOLE.
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Cytotoxics: increased risk of toxicity when ibosafamide given with cisplatin.

Iloprost

- Analgesics: increased risk of bleeding when iloprost given with NSAIDS or ASPIRIN.
- Anticoagulants: iloprost possibly enhances anticoagulant effect of coumarins and heparins; increased risk of bleeding when iloprost given with phenindione.
- Epithelial: increased risk of bleeding when iloprost given with etipifibatide.
- Tirofiban: increased risk of bleeding when iloprost given with tirofiban.

Imatinib

- Analgesics: manufacturer of imatinib advises caution with paracetamol.
- Antibacterials: plasma concentration of imatinib reduced by rifampicin—avoid concomitant use.
- Anticoagulants: manufacturer of imatinib advises replacement of warfarin with a heparin (possibility of enhanced warfarin effect).
- Antidepressants: plasma concentration of imatinib reduced by St John’s Wort—avoid concomitant use.
- Antiepileptics: plasma concentration of imatinib reduced by carbamazepine, fosphenytoin, oxcarbazepine and phenytoin—avoid concomitant use.
- Antifungals: plasma concentration of imatinib increased by bosutinib—manufacturer of bosutinib advises replacement of ifosfamide and normal immunoglobulin; anti-d immunoglobulin might impair immune response to vacciniam might impair immune response to anti-d immunoglobulin with normal immunoglobulin; anti-d immunoglobulin might impair immune response to vac.</p>
Indinavir

Antipsychotics (continued)

- *Quetiapine*: manufacturer of quetiapine advises avoid concomitant use
- *Aripiprazole*: avoid concomitant use of indinavir with
- *Azaprazole*: plasma concentration of both drugs increased when indinavir given with *Darunavir*; absorption of indinavir reduced by *Didanosine* tablets (give at least 1 hour apart); plasma concentration of indinavir reduced by *Efavirenz* and *Nevirapine*; plasma concentration of indinavir possibly reduced by *Etravirine*—avoid concomitant use; indinavir increases plasma concentration of *Maraviroc* (consider reducing dose of maraviroc); plasma concentration of indinavir increased by *Ritonavir*; indinavir increases plasma concentration of *Saquinavir*
- *Acetaminophen*: increased risk of prolonged sedation when indinavir given with *Alprazolam*—avoid concomitant use; indinavir possibly increases plasma concentration of *Midazolam* (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- *Ato伐quone*: plasma concentration of indinavir possibly reduced by *Ato伐quone*
- *Avanaflu*: indinavir possibly increases plasma concentration of *Avanafil*—manufacturer of avanafil advises avoid concomitant use
- *Bosentan*: plasma concentration of indinavir possibly reduced by *Bosentan*
- *Ciclosporin*: indinavir increases plasma concentration of *Ciclosporin*
- *Colchicine*: indinavir possibly increases risk of *Colchicine* toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- *Corticosteroids*: plasma concentration of indinavir possibly reduced by *Dexamethasone*
- *Cytosines*: indinavir possibly increases plasma concentration of *Axitinib* (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of *Bosutinib* and *Cabazitaxel*—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of *Crizotinib* and *Everolimus*—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases the plasma concentration of *Ibrutinib*—reduce dose of ibrutinib (see under ibrutinib, p. 809); indinavir possibly increases plasma concentration of *Pazopanib* (reduce dose of pazopanib); indinavir possibly increases plasma concentration of *Ponatinib*—consider reducing initial dose of ponatinib (see under ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when indinavir given with *Ruxolitinib*—consult ruxolitinib product literature; indinavir possibly increases plasma concentration of *Docetaxel*—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- *Ergot Alkaloids*: increased risk of ergotism when indinavir given with *Ergometrine* or *Ergotamine*—avoid concomitant use
- *SH1-Receptor Agonists*: indinavir increases plasma concentration of *Eleptrafin* (risk of toxicity)—avoid concomitant use
- *Lipid-Regulating Drugs*: possible increased risk of myopathy when indinavir given with *Atorvastatin*; possible increased risk of myopathy when indinavir given with *Rosuvastatin*—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with *Simvastatin* (avoid concomitant use); avoidance of indinavir advised by manufacturer of *Lomitapide* (plasma concentration of lomitapide possibly increased)
- *Orlistat*: absorption of indinavir possibly reduced by *Orlistat*
- *Ranolazine*: indinavir possibly increases plasma concentration of *Ranolazine*—manufacturer of ranolazine advises avoid concomitant use
- *Sildenafil*: indinavir increases plasma concentration of *Sildenafil*—reduce initial dose of sildenafil

Indinavir (continued)

- *Tadalafil*: indinavir possibly increases plasma concentration of *Tadalafil*
- *Vardenafil*: indinavir increases plasma concentration of *Vardenafil*—avoid concomitant use
- *Indomethacin*: see NSAIDs
- *Inodoramin*: see Alpha-blockers

Infliximab

- *Abatacept*: avoid concomitant use of infliximab with *Abatacept*
- *Anakinra*: avoid concomitant use of infliximab with *Anakinra*
- *Antipsychotics*: avoid concomitant use of infliximab with *Antipsychotics*

Interferons

- *Interferon Alfa*: see Interferons
- *Interferon Gamma*: see Interferons

Iron Salts

- *Antacids*: absorption of oral iron salts reduced by *oral Magnesium Salts* (as magnesium trisilicate)
- *Antibacterials*: oral iron salts reduce absorption of *Ciprofloxacin*, *Levofloxacin*, *Moxifloxacin* and *Ofloxacin*; oral iron salts reduce absorption of *Norfloxacin* (give at least 2 hours apart); oral iron salts reduce absorption of *Tetracyclines*, also absorption of oral iron salts reduced by *Tetracyclines*
- *Antivirals*: oral iron salts reduce absorption of *Dolutegravir*—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral iron salts
Iron Salts (continued)

- Bisphosphonates: oral iron salts reduce absorption of
  BISPHOSPHONATES
- Calcium Salts: absorption of oral iron salts reduced by CALCIUM SALTS
- Dopaminergic: oral iron salts possibly reduce absorption of
  CO-BENELDOPA, CO-CARELDOPA and LEVODOPA; oral iron salts reduce absorption of ENTACAPONE
- Eltrombopag: oral iron salts possibly reduce absorption of
  ELTROMOPAG (give at least 4 hours apart)
- Methyldopa: oral iron salts antagonise hypnotic effect of
  METHYLDOPA
- Mycophenolate: oral iron salts reduce absorption of
  MYCOPHENOLATE
- Penicillamine: oral iron salts reduce absorption of
  PENICILLAMINE
- Thyroid Hormones: oral iron salts reduce absorption of
  LEVOTHYROXINE (give at least 2 hours apart)
- Trientine: absorption of oral iron salts reduced by TRIENTINE
- Zinc: oral iron salts reduce absorption of ZINC, also absorption of
  oral iron salts reduced by zinc

Isocarboxazid see MAOIs
Isoflurane see Anaesthetics, General
Isomethyptene see Sympathomimetics
Isoniazid
- Aminophylline: isoniazid possibly increases plasma concentration of
  AMINOPHYLLINE
- Anaesthetics, General: increased risk of hepatotoxicity when
  isoniazid given with ISOFLURANE
- Analgesics: avoidance of isoniazid advised by manufacturer of
  PETHIDINE
- Antacids: absorption of isoniazid reduced by ANTACIDS
- Antibacterials: increased risk of hepatotoxicity when isoniazid given with
  RIFAMPICIN; increased risk of CNS toxicity when
  isoniazid given with CYCLOSERINE
- Antiepileptics: isoniazid increases plasma concentration of
  CARBAMAZEPINE (also possibly increased isoniazid
  hepatotoxicity); isoniazid inhibits metabolism of
  ETHOSUXIMIDE (increased plasma concentration and risk
  of toxicity); isoniazid possibly inhibits metabolism of
  PHENOBARBITAL and PHENTHYON (increased risk of toxicity)
- Antifungals: isoniazid possibly reduces plasma concentration of
  KETOCONAZOLE
- Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of
  DIAZEPAM
- Corticosteroids: plasma concentration of isoniazid possibly reduced by
  CORTICOSTEROIDS
- Disulfiram: isoniazid possibly increases CNS effects of
  DISULFiram
- Dopaminergic: isoniazid possibly reduces effects of
  CO-BENELDOPA, CO-CARELDOPA and LEVODOPA
- Lipid-regulating Drugs: separating administration from
  isoniazid by 12 hours advised by manufacturer of
  LOMITAPIDE
- Theophylline: isoniazid possibly increases plasma concentration of
  THEOPHYLLINE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Isosorbide Dinitrate see Nikrates
Isosorbide Mononitrate see Nikrates
Isotsrinoin see Betains
Isradipine see Calcium-channel Blockers
Itraconazole see Antifungals, Triazole
Ivabradine
- Anti-arrhythmics: increased risk of ventricular arrhythmias
  when ivabradine given with AMIODARONE or DISOPYRAMIDE
- Antibacterials: plasma concentration of ivabradine possibly increased by
  CLARITHROMYCIN and TELITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias
  when ivabradine given with ERYTHROMYCIN—avoid concomitant use
- Antiepileptics: plasma concentration of ivabradine reduced by
  ST JOHN’S WORT—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by
  FLUCONAZOLE—avoid concomitant use; plasma concentration of ivabradine increased by
  FLUCONAZOLE—reduce initial dose of ivabradine; plasma concentration of
  ivabradine possibly increased by ITRACONAZOLE—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when
  ivabradine given with MELOquine
- Antipsychotics: increased risk of ventricular arrhythmias when
  ivabradine given with PIMozide
- Antivirals: plasma concentration of ivabradine possibly increased by
  RITONAVIR—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when
  ivabradine given with SOTALOL
- Calcium-channel Blockers: plasma concentration of ivabradine
  increased by DILTIAZEM and VERAPAMIL—avoid concomitant use
- Grapefruit Juice: plasma concentration of ivabradine increased by
  GRAPEFRUIT JUICE
- Pentamidine Isethionate: increased risk of ventricular arrhythmias when
  ivabradine given with PENTAMIDINE ISETIONATE

Ivacaftor
- Antibacterials: plasma concentration of ivacaftor possibly increased by
  CLARITHROMYCIN, ERYTHROMYCIN and
  TELITHROMYCIN (see under Ivermectin, p. 257); plasma concentration of ivacaftor possibly reduced by
  RIFABUTIN—manufacturer of ivacaftor advises avoid concomitant use; plasma concentration of ivacaftor reduced by
  RIFAMPICIN—manufacturer of ivacaftor advises avoid concomitant use
- Antidepressants: plasma concentration of ivacaftor possibly reduced by
  ST JOHN’S WORT—manufacturer of ivacaftor advises avoid concomitant use
- Antiepileptics: plasma concentration of ivacaftor possibly increased by
  CARBAMAZEPINE, FOSFENOTHION,
  PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of ivacaftor advises avoid concomitant use
- Antifungals: plasma concentration of ivacaftor increased by
  FLUCONAZOLE and KETOCONAZOLE (see under Ivermectin, p. 257); plasma concentration of ivacaftor possibly increased
  by ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE (see under Ivermectin, p. 257)
- Anxiolytics and Hypnotics: ivacaftor increases plasma concentration of
  MIDAZOLAM
- Cardiac Glycosides: ivacaftor increases plasma concentration of
  DIGOXIN
- Grapefruit Juice: plasma concentration of ivacaftor possibly increased by
  GRAPEFRUIT JUICE—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: separating administration from
  ivacaftor by 12 hours advised by manufacturer of
  LOMITAPIDE
- Ivermectin
- Anthelmintics: plasma concentration of ivermectin possibly increased by
  LEVAMISOLE
- Anticoagulants: ivermectin possibly enhances anticoagulant
  effect of COUMARINS
- Japanese Encephalitis Vaccine see Vaccines
- Kaolin
- Analgesics: kaolin possibly reduces absorption of
  ASPRIN
- Antibacterials: kaolin possibly reduces absorption of
  TETRACYCLINES
- Antimalarials: kaolin reduces absorption of CHLOROQUINE and
  HYDROXYCHLOROQUINE
- Antipsychotics: kaolin possibly reduces absorption of
  PHENOTHIAZINES
- Ketoamine see Anaesthetics, General
- Ketoconazole see Antifungals, Imidazole
- Ketoprofen see NSAIDs
- Ketorolac see NSAIDs
- Ketotifen see Antihistamines
- Labetalol see Beta-blockers
- Lacidipine see Calcium-channel Blockers
- Lacosamide
- Antidepressants: anticonvulsant effect of antiepileptics
  possibly antagonised by MAOIs and TRICYCLIC-RELATED
  ANTIDEPRESSANTS (convulsive threshold lowered);
Interactions

Lacosamide
- Antidepressants (continued)
  - Anticonvulsant effect of antiepileptics antagonised by
    - SSRIS
  - TRICYCLICS (convulsive threshold lowered)
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by
  - ANTIPSYCHOTICS (convulsive threshold lowered)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with
  - ORLISTAT

Lactulose
- Anticoagulants: lactulose possibly enhances anticoagulant effect of COUMARINS

Lamivudine
- Antibacterials: plasma concentration of lamivudine increased by
  - TRIMETHOPRIM (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of EMTRICITABINE
- Antimyelomas: manufacturer of lamivudine advises avoid concomitant use with
  - CLADRIBINE
- Orlistat: absorption of lamivudine possibly reduced by
  - ORLISTAT

Lamotrigine
- Antibacterials: plasma concentration of lamotrigine reduced by
  - RIFAMPICIN
  - Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by
    - MAOI S
  - TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by
    - SSRIS
  - TRICYCLICS (convulsive threshold lowered)
  - Antiepileptics: plasma concentration of lamotrigine often reduced by
    - CARBAMAZEPINE, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by
      - FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; plasma concentration of lamotrigine increased by
        - SODIUM VALPROATE and
        - VALPROIC ACID (increased risk of toxicity—reduce lamotrigine dose)
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by
    - MELOQUINE
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by
    - ANTIPSYCHOTICS (convulsive threshold lowered)
  - Antivirals: plasma concentration of lamotrigine possibly reduced by
    - RITONAVIR
  - Oestrogens: plasma concentration of lamotrigine reduced by
    - OESTROGENS—consider increasing dose of lamotrigine
  - Orlistat: possible increased risk of convulsions when antiepileptics given with
    - ORLISTAT
  - Progestogens: plasma concentration of lamotrigine possibly increased by
    - DESGESTREL

Lanreotide
- Antidiabetics: lanreotide possibly reduces requirements for
  - ANTIDIABETICS
  - Ciclosporin: lanreotide reduces plasma concentration of
    - CICLOSPORIN

Lansoprazole
- see Proton Pump Inhibitors

Lanthanum
- Antibacterials: lanthanum possibly reduces absorption of
  - QUINOLONES (give at least 2 hours before or 4 hours after lanthanum)
- Antifungals: lanthanum possibly reduces absorption of
  - KETOCONAZOLE (give at least 2 hours apart)
- Antimalarials: lanthanum possibly reduces absorption of
  - CHLOROQUINE and HYDROXYCHLOROQUINE (give at least 2 hours apart)
  - Thyroid Hormones: lanthanum reduces absorption of
    - LEVOTHYROXINE (give at least 2 hours apart)

Lapatinib
- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with
  - RIFABUTIN, RIFAMPICIN and
  - TELITHROMYCIN
  - Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with
  - ST JOHN'S WORT
  - Antimalarials: manufacturer of lapatinib advises avoid concomitant use with
    - PAPAYLINDA
  - Antipsychotics: manufacturer of lapatinib advises avoid concomitant use with
    - CARBAMAZEPINE—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with
      - FOSPHENYTOIN and
      - PHENYTOIN
  - Antifungals: plasma concentration of lapatinib increased by
    - KETOCONAZOLE—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with
      - ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE
  - Antipsychotics: avoid concomitant use of cytotoxics with
    - CLOZAPINE (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with
      - PIMOZIDE
    - Antivirals: avoidance of lapatinib advised by manufacturer of
      - BOCEPREVIR; manufacturer of lapatinib advises avoid concomitant use with
        - RITONAVIR and SAQUINAVIR
  - Cytoxics: lapatinib increases plasma concentration of
    - PAZOPANIB; possible increased risk of neutropenia when lapatinib given with
      - DOCETAXEL; increased risk of neutropenia when lapatinib given with
        - PACLITAXEL; lapatinib increases plasma concentration of active metabolite of
          - IRINOTECAN—consider reducing dose of irinotecan
  - Grapefruit juice: manufacturer of lapatinib advises avoid concomitant use with
    - GRAPEFRUIT JUICE
  - Lipid-regulating Drugs: separating administration from lapatinib by 12 hours advised by manufacturer of
    - LOMITAPIDE
  - Ulcer-healing Drugs: absorption of lapatinib possibly reduced by
    - HISTAMINE H 2-ANTAGONISTS and PROTON PUMP INHIBITORS

Laronidase
- Antimalarials: effects of laronidase possibly inhibited by
  - CHLOROQUINE and HYDROXYCHLOROQUINE (manufacturer of laronidase advises avoid concomitant use)

Leflunomide
- NOTE: Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
  - Antifungals: plasma concentration of active metabolite of leflunomide possibly increased by
    - RIFAMPICIN
  - Anticoagulants: leflunomide possibly enhances anticoagulant effect of WARFARIN
  - Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of
    - TOLBUTAMIDE
  - Antiepileptics: leflunomide possibly increases plasma concentration of
    - FOSPHENYTOIN and PHENYTOIN
  - Antidepressants: leflunomide possibly increases plasma concentration of
    - HYDROXYCHLOROQUINE
- Cytoxics: risk of toxicity when leflunomide given with
  - METHOTREXATE
  - Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by
    - COLESTYRAMINE (enhanced elimination)—avoid unless drug elimination desired
  - Vaccines: risk of generalised infections when leflunomide given with live
    - VACCINES—avoid concomitant use

Lenalidomide
- Antifungals: plasma concentration of lenalidomide possibly increased by
  - CLARITHROMYCIN (increased risk of toxicity)
  - Antiepileptics: plasma concentration of lenalidomide possibly increased by
    - ITRACONAZOLE and KETOCONAZOLE (increased risk of toxicity)
  - Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by
    - VERAPAMIL (increased risk of toxicity)
  - Cardiac Glycosides: lenalidomide possibly increases plasma concentration of
    - DIGOXIN
  - Ciclosporin: plasma concentration of lenalidomide possibly increased by
    - CICLOSPORIN (increased risk of toxicity)

Lercanidipine
- see Calcium–channel Blockers

Leukoatriene Receptor Antagonists
- Aminophylline: zafirlukast possibly increases plasma concentration of
  - AMINOPHYLLINE, also plasma concentration of zafirlukast reduced
- Analgesics: plasma concentration of zafirlukast increased by
  - ASPIRIN
- Antifungals: plasma concentration of zafirlukast reduced by
  - ERYTHROMYCIN
Levodopa (continued) • Buproprion: increased risk of side effects when levodopa given with BUPROPION • Calcium-channel blockers: enhanced hypotensive effect when levodopa given with CALCIUM-CHANNEL BLOCKERS • Clonidine: enhanced hypotensive effect when levodopa given with CLONIDINE • Diazoxide: enhanced hypotensive effect when levodopa given with DIAZOXIDE • Diuretics: enhanced hypotensive effect when levodopa given with DIURETICS • Dopaminergics: enhanced effects and increased toxicity of levodopa when given with SELEGILINE (reduce dose of levodopa) • Iron salts: absorption of levodopa possibly reduced by oral IRON SALTS • Memantine: effects of dopaminergics possibly enhanced by MEMANTINE • Methylphenidate: enhanced hypotensive effect when levodopa given with METHYLPREDNISOLONE • Muscle relaxants: possible agitation, confusion and hallucinations when levodopa given with BACLOFEN • Nitrates: enhanced hypotensive effect when levodopa given with NITRATES • Vasodilators: Antihypertensives: enhanced hypotensive effect when levodopa given with HYDRAZINE, MINOXYDIL or SODIUM NITROPRUSSIDE • Vitamins: effects of levodopa reduced by PYRIDOXINE when given without dopa-decarboxylase inhibitor Levofoxaclin see Quinolones Levolofolic Acid see Folicates Levomepromazine see Antipsychotics Levonorgestrel see Progestogens Levothryoxine see Thyroid Hormones Lidocaine • NOTE Interactions less likely when lidocaine used topically • Anaesthetics, local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRilocaine or Ropivacaine • Anti-arrhythmics: increased myocardial depression with other ANTI-ARRHYTHMICS • Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ANTIPSYCHOTICS that prolong the QT interval • Antivirals: plasma concentration of lidocaine possibly increased by ATAZANAVIR and LOPINAVIR; plasma concentration of lidocaine possibly increased by DARUNAVIR and FOSAMPRENAVIR—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with SAQUNAVIR—avoid concomitant use; caution with intravenous lidocaine advised by manufacturer of TELAPREIV • Beta-blockers: increased myocardial depression when anti-arrhythmics given with BETA-BLOCKERS; possible increased risk of lidocaine toxicity when given with NADOLOL; increased risk of lidocaine toxicity when given with PROPRANOLOL • Diuretics: action of lidocaine antagonised by hydralazine caused by ACETAZOLAMIDE; LOOP DIURETICS or THIAZIDES AND RELATED DIURETICS • Muscle relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with SUXAMETHONIUM • Uter-healing drugs: plasma concentration of lidocaine increased by CIMETIDINE (increased risk of toxicity) Linagliptin see Antidiabetics Linezolid • NOTE Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs • Antibacterials: plasma concentration of linezolid reduced by RIFAMPICIN (possible therapeutic failure of linezolid) • Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF Liotyroidine see Thyroid Hormones
**Lipophilic Drugs** see Colesevelam, Colestipol, Colestevam, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins

**Liganduretics** see Antidiabetics

**Lidexamifetamine** see Symptomatomics

**Lisinopril** see ACE Inhibitors

**Lithium**
- ACE Inhibitors: excretion of lithium reduced by ACE INHIBITORS (increased plasma concentration)
- Aminophylline: excretion of lithium increased by AMINOPHYLLINE (reduced plasma concentration)
- Analgesics: excretion of lithium reduced by NSAIDS (increased risk of toxicity); excretion of lithium reduced by KETOROLAC (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by AMIODARONE (risk of ventricular arhythmias)
- Antacids: excretion of lithium increased by SODIUM BICARBONATE (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of AMIODARONE (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with METRONIDAZOLE
- Antidepressants: possible increased serotonergic effects when lithium given with VENLAFAXINE; increased risk of CNS effects when lithium given with SSRIS (lithium toxicity reported); risk of toxicity when lithium given with TRICYCLICS
- Anti-epileptics: neurotoxicity may occur when lithium given with CARBAMAZEPINE, PHENOTHYLAN or PHENYTOIN without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by TOPIRAMATE
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with CLOzapine, FLUPENTIXOL, HALOPERIDOL, PHENOTHIAZINES; RISPERIDONE or ZUCLOPENTIXOL; possible risk of toxicity when lithium given with OLanzapine; lithium possibly increases extrapyramidal side-effects of QUETIAPINE; increased risk of extrapyramidal side-effects when lithium given with SULPIRIDE
- Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with CLONAZEPAM
- Calcium-channel Blockers: neurotoxicity may occur when lithium given with DILTIAZEM or VERAPAMIL without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with ARSENIC TRIOXIDE
- Dapoxetine: possible increased risk of serotonergic effects when lithium given with DAPoxetine (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Diuretics: excretion of lithium increased by ACETAZOLAMIDE; excretion of lithium reduced by LOOP DIURETICS and THIURAM DERIVATIVES; diuretics; excretion of lithium reduced by POTASSIUM-SPARING DIURETICS and ALDOSTERONE ANTAGONISTS (increased plasma concentration and risk of toxicity)
- SAH, reuser of lithium: possible risk of toxicity when lithium given with SUMATRIPTAN
- Methylprena: neurotoxicity may occur when lithium given with METHYLPRENA without increased plasma concentration of lithium
- Muscle Relaxants: lithium enhances effects of MUSCLE RELAXANTS; hyperkinesis caused by lithium possibly aggravated by BACLOFEN
- Parasympathomimetics: lithium antagonises effects of NEOSTIGMINE

**Lithium** (continued)
- Theophylline: excretion of lithium increased by THEOPHYLLINE (reduced plasma concentration)

**Lixisenatide** see Antidiabetics

**Lofepramine** see Antidepressants, Tricyclic

**Lofexidine**
- Alcohol: increased sedative effect when lofexidine given with ALCOHOL
- Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with ANXIOLYSES AND HYPNOTICS

**Lomipstatted**
- Alcohol: manufacturer of lomitapide advises avoid concomitant use with ALCOHOL
- Anti-arrhythmics: manufacturer of lomitapide advises separating administration from AMIODARONE by 12 hours; manufacturer of lomitapide advises avoid concomitant use with DRONEDARONE (plasma concentration of lomitapide possibly increased)
- Anti-bacterials: manufacturer of lomitapide advises separating administration from AZITHROMYCIN and COPIAZINE by 12 hours; manufacturer of lomitapide advises avoid concomitant use with CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (plasma concentration of lomitapide possibly increased)
- Anticoagulants: lomitapide possibly enhances anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of lomitapide advises separating administration fromFLUKETINE and FLUVAXAMINE by 12 hours
- Antidiabetics: manufacturer of lomitapide advises separating administration from LINAGLITIPIN by 12 hours
- Anti-fungals: plasma concentration of lomitapide increased by KETONACAZOLE—avoid concomitant use; manufacturer of lomitapide advises avoid concomitant use with FRIAIZOLEs (plasma concentration of lomitapide possibly increased)
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SQUINAVIR, TELAPREVAR and TIPRANNRAVIR (plasma concentration of lomitapide possibly increased)
- Anxiolytics and Hypnotics: manufacturer of lomitapide advises separating administration from ALPRAZOLAM by 12 hours
- Calcium-channel Blockers: manufacturer of lomitapide advises separating administration from AMLODIPINE and LACIDIPINE by 12 hours; manufacturer of lomitapide advises avoid concomitant and with DILTIAZEM and VERAPAMIL (plasma concentration of lomitapide possibly increased)
- Ciclosporin: manufacturer of lomitapide advises separating administration from CICLOSPORIN by 12 hours
- Clostazol: manufacturer of lomitapide advises separating administration from CLOSTAZOL by 12 hours
- Cytotoxics: manufacturer of lomitapide advises separating administration from LAPATINIB, NILOTINIB and PAZOPANIB by 12 hours
- Fosaprepitant: manufacturer of lomitapide advises separating administration from FOSAPREPINT by 12 hours
- Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with GRAPEFRUIT JUICE
- Hormone Antagonists: manufacturer of lomitapide advises separating administration from BICALUTAMIDE by 12 hours
- Ivacaftor: manufacturer of lomitapide advises separating administration from IVACAOIT by 12 hours
- Lidipid-regulating Drugs: lomitapide increases plasma concentration of ATORVASTATIN—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; lomitapide increases plasma concentration of SIMVASTATIN (see under Simvastatin, p. 181); absorption of lomitapide possibly reduced by BILE ACID SEQUESTRANTS (gave at least 4 hours apart)
- Oestrogens: manufacturer of lomitapide advises separating administration from OESTROGENS by 12 hours
- Ranolazine: manufacturer of lomitapide advises separating administration from RANOLAZINE by 12 hours
- Tacrolimus: manufacturer of lomitapide advises separating administration from TACROLIMUS by 12 hours
- Ticagrelor: manufacturer of lomitapide advises separating administration from TICAGRELOR by 12 hours
Eltrombopag:

Corticosteroids: lopinavir possibly reduces plasma concentration of ELTROMBOPAG

Bosentan:

Corticosteroids: lopinavir possibly reduces plasma concentration of ELTROMBOPAG

Cytotoxic:

Interactions do not apply to small amounts of erythromycin used topically

Loratadine see Antihistamines

Lorazepam see Anxiolytics and Hypnotics

Losartan see Angiotensin-II Receptor Antagonists

Lurasidone see Antipsychotics

Lymecycline see Tetracyclines

Macitentan

NOTE Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

Macrolides

NOTE See also Telithromycin

Interactions do not apply to small amounts of erythromycin used topically

Amitriptyline: clarithromycin possibly increases plasma concentration of AMITRIPTYLINE; erythromycin increases plasma concentration of AMITRIPTYLINE (also erythromycin may reduce absorption of oral amitriptyline)

Analgesics: erythromycin increases plasma concentration of ALFENTANIL; clarithromycin possibly increases plasma concentration of FENTANYL

Antacids: absorption of erythromycin reduced by ANTAGICS

Anti-arrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with AMIODARONE—avoid concomitant use; azithromycin possibly increases plasma concentration of DISOPYRAMIDE (increased risk of toxicity); erythromycin increases plasma concentration of DISOPYRAMIDE (increased risk of toxicity); clarithromycin possibly increases plasma concentration of DISOPYRAMIDE (increased risk of toxicity); erythromycin increases plasma concentration of DRONEDARONE (increased risk of ventricular arrhythmias)—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with MOXIFLOXACIN—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with rifabutin clarify that clarithromycin increases plasma concentration of RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); clarithromycin and erythromycin possibly increase plasma concentration of BEDAQUILINE—avoid concomitant use if clarithromycin and erythromycin given for more than 14 days; possible increased risk of ventricular arrhythmias

Lopixil

Anxiolytics and Hypnotics

Loratadine see Antihistamines

Lorazepam see Anxiolytics and Hypnotics

Losartan see Angiotensin-II Receptor Antagonists

Lurasidone see Antipsychotics

Lymecycline see Tetracyclines

Macitentan

NOTE Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

Macrolides

NOTE See also Telithromycin

Interactions do not apply to small amounts of erythromycin used topically

Amitriptyline: clarithromycin possibly increases plasma concentration of AMITRIPTYLINE; erythromycin increases plasma concentration of AMITRIPTYLINE (also erythromycin may reduce absorption of oral amitriptyline)

Analgesics: erythromycin increases plasma concentration of ALFENTANIL; clarithromycin possibly increases plasma concentration of FENTANYL

Antacids: absorption of erythromycin reduced by ANTAGICS

Anti-arrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with AMIODARONE—avoid concomitant use; azithromycin possibly increases plasma concentration of DISOPYRAMIDE (increased risk of toxicity); erythromycin increases plasma concentration of DISOPYRAMIDE (increased risk of toxicity); clarithromycin possibly increases plasma concentration of DISOPYRAMIDE (increased risk of toxicity); erythromycin increases plasma concentration of DRONEDARONE (increased risk of ventricular arrhythmias)—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with MOXIFLOXACIN—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with rifabutin clarify that clarithromycin increases plasma concentration of RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); clarithromycin and erythromycin possibly increase plasma concentration of BEDAQUILINE—avoid concomitant use if clarithromycin and erythromycin given for more than 14 days; possible increased risk of ventricular arrhythmias
Macrolides
- Antibacterials (continued) when clarithromycin and erythromycin given with
  - DELAMANID; avoidance of clarithromycin and erythromycin advised by manufacturer of FIDAXOMICIN; plasma concentration of clarithromycin reduced by rifampicins
- Anticagulants: avoidance of clarithromycin advised by manufacturer of APIXABAN; clarithromycin and erythromycin enhance anticoagulant effect of COUMARINS; erythromycin possibly increases anticoagulant effect of COUMARINS; possible increased risk of bleeding when clarithromycin given with DABIGATRAN
- Antidepressants: avoidance of macrolides advised by manufacturer of REBOXETINE; avoidance of intravenous erythromycin advised by manufacturer of OTACLOPRAM and ESCITALOPRAM (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of TRAZODONE
- Antidiabetics: clarithromycin enhances effects of REPAGLINDINE
- Antiepileptics: clarithromycin increases plasma concentration of CARBAMAZEPINE (consider reducing dose of carbamazepine); erythromycin increases plasma concentration of CARBAMAZEPINE; clarithromycin inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased plasma concentration); erythromycin possibly inhibits metabolism of SODIUM VALPROATE and VALPROIC ACID (increased plasma concentration)
- Antibacterials: avoidance of concomitant clarithromycin in severe renal impairment advised by manufacturer of KETOCONAZOLE; avoidance of erythromycin advised by manufacturer of FLUCONAZOLE; clarithromycin increases plasma concentration of ITRACONAZOLE
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of LORATADINE; macrolides possibly inhibit metabolism of MILOZASTINE (avoid concomitant use); erythromycin inhibits metabolism of MILOZASTINE—avoid concomitant use
- Antimalarials: avoidance of macrolides advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; avoidance of macrolides advised by manufacturer of ARTENINOL WITH PIPERAQUNE (possible risk of ventricular arrhythmias)
- Antimuscarinics: erythromycin possibly increases plasma concentration of DAFENINAC; manufacturer of fosoterodine advises dose reduction when clarithromycin given with FOSTERODINE—consult product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of TOLERODINE
- Antipsychotics: avoidance of macrolides advised by manufacturer of DROPERIDOL (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with ZUCLOPENTHIXOL—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with AMISULPRIDE—avoid concomitant use; erythromycin possibly increases plasma concentration of clozapine (possible increased risk of convulsions); clarithromycin possibly increases plasma concentration of LURASIDONE—avoid concomitant use; erythromycin possibly increases the plasma concentration of LURASIDONE (see under Lurasidone, p. 515); increased risk of ventricular arrhythmias when clarithromycin given with PIMOZIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with PIMOZIDE—avoid concomitant use; clarithromycin possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use; erythromycin increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use; clarithromycin possibly increases plasma concentration of dalf lazatavir—reduce dose of dalf lazatavir (see under Dalf lazatavir, p. 544); plasma concentration of clarithromycin reduced by efavirenz, also plasma concentration of active

Macrolides
- Antivirals (continued) metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by ETARAVIRINE and NEVIRAPINE (but concentration of an active metabolite increased), also plasma concentration of etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of RUDANIPINE; clarithromycin increases plasma concentration of rilpivirine (possibly increased); clarithromycin increases plasma concentration of azithromycin and erythromycin possibly increased by RITONAVIR; plasma concentration of clarithromycin increased by RITONAVIR (reduce dose of clarithromycin in renal impairment); increased risk of ventricular arrhythmias when erythromycin given with SAQUINAVIR—avoid concomitant use; plasma concentration of both drugs possibly increased when clarithromycin given with SAQUINAVIR and TELAPREVIR (increased risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when erythromycin given with SIMPEPREVIR—manufacturer of simprevir advises avoid concomitant use; clarithromycin possibly increases plasma concentration of SIMPEPREVIR—manufacturer of simprevir advises avoid concomitant use; plasma concentration of both drugs possibly increased when erythromycin given with TELAPREVIR (increased risk of ventricular arrhythmias); plasma concentration of clarithromycin increased by TIPRANAVIR (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of ZIDOVIDINE (give at least 2 hours apart)
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of MIDAZOLAM (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of BUSPIRONE (reduce dose of busipirone); erythromycin inhibits the metabolism of ZOPICLONE
- Aprepitant: clarithromycin possibly increases plasma concentration of aprepitant
- Atomoxetine: increased risk of ventricular arrhythmias when parenteral erythromycin given with ATOMOXETINE
- Avanafil: clarithromycin possibly increases plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use; possible increased risk of erythromycin increased; plasma concentration of AVANAFIL—see under Avanafil, p. 698
- Calcium-channel Blockers: clarithromycin and erythromycin possibly inhibit metabolism of CALCIUM-CHANNEL BLOCKERS (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of LERANDIPINE
- Cardiac Glycosides: macrolides increase plasma concentration of DIGOXIN (increased risk of toxicity)
- Ciclosporin: macrolides possibly inhibit metabolism of CICLOSPORIN (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of CICLOSPORIN (increased plasma concentration)
- Cilostazol: clarithromycin possibly increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 206); erythromycin increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 206)
- Clomiprod: erythromycin possibly reduces antiplatelet effect of CLOPIDOGREL
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: erythromycin possibly inhibits metabolism of CORTICOSTEROIDS; erythromycin inhibits the metabolism of METHYLPPREDNISOLONE; clarithromycin possibly increases plasma concentration of METHYLPPREDNISOLONE
- Cyclosporin: macrolides possibly increase plasma concentration of cyclosporin
- Dapagliflozin: clarithromycin possibly increases plasma concentration of dapagliflozin
- Dapoxetine: macrolides possibly increase plasma concentration of dapoxetine
- Dapagliflozin: clarithromycin possibly increases plasma concentration of dapagliflozin
- Darbepoetin: macrolides increase plasma concentration of darbepoetin
- Daclatasvir; plasma concentration of daclatasvir increased; plasma concentration of daclatasvir reduced by
- Dabigatran; plasma concentration of dabigatran increased by
- Darbepoetin: macrolides increase plasma concentration of darbepoetin
- Dapoxetine: macrolides increase plasma concentration of dapoxetine
- Dapagliflozin: macrolides increase plasma concentration of dapagliflozin
- Dapagliflozin: clarithromycin increases plasma concentration of dapagliflozin
Macrolides
- Lipid-regulating Drugs (continued)
  - increased risk of myopathy when erythromycin given with
    - ATORVASTATIN; erythromycin increases plasma concentration of
    - ROSUVASTATIN; erythromycin reduces plasma concentration of
  - increased risk of myopathy when
  - clarithromycin or erythromycin given with
    - SIMVASTATIN (avoid concomitant use); separating administration from
    - azithromycin by 12 hours advised by manufacturer of
    - LOMITAPIDE; avoidance of clarithromycin and erythromycin
    - advised by manufacturer of
    - LOMITAPIDE (plasma concentration of lomitapide possibly increased)
  - Mirabegron: when given with clarithromycin avoid or reduce
dose of MIRABEGRON in hepatic or renal impairment—see
  - Mirabegron, p. 671
  - Oestrogens—erythromycin increases plasma concentration of
    - ESTRADIOL
  - Parasympathomimetics: erythromycin increases plasma concentration of
    - GALANTAMINE
  - Pentamidine isetionate: increased risk of ventricular
    - arrhythmias when parenteral erythromycin given with
    - PENTAMIDINE ISETIONATE
  - Progestogens: erythromycin increases plasma concentration of
    - DIENOGEST
  - Ranolazine: clarithromycin possibly increases plasma
    - concentration of
    - RANOLAZINE—manufacturer of ranolazine
    - advises avoid concomitant use
  - Sildenafil: clarithromycin increases plasma concentration of
    - SILDENAFIL—consider reducing initial dose of sildenafil
      for erectile dysfunction or reduce sildenafil dose frequency to
      once daily for pulmonary hypertension; erythromycin
      increases plasma concentration of
    - SILDENAFIL—reduce initial
dose of sildenafil for erectile dysfunction or reduce sildenafil
dose frequency to twice daily for pulmonary hypertension
  - Sirolimus: clarithromycin increases plasma concentration of
    - SIROLIMUS—avoid concomitant use; plasma concentration of
      both drugs increased when erythromycin given with
    - SIROLIMUS
  - Tacrolimus: clarithromycin and erythromycin increase plasma
    - concentration of
    - TACROLIMUS
  - Tadalafil: clarithromycin increases plasma concentration of
    - TADALAFIL
  - Theophylline: clarithromycin possibly increase plasma
    - concentration of THEOPHYLLINE; erythromycin increases
      plasma concentration of
    - THEOPHYLLINE (also theophylline
      may reduce absorption of oral erythromycin)
  - Ticagrelor: clarithromycin possibly increases plasma
    - concentration of
    - TICAGRELOR—manufacturer of ticagrelor
    - advises avoid concomitant use; erythromycin possibly
      increases plasma concentration of
    - TICAGRELOR
  - Ulcer-healing Drugs: plasma concentration of erythromycin
    increased by
    - CIMETIDINE (increased risk of toxicity, including
      deafness); plasma concentration of both drugs increased when
    - clarithromycin given with
      - OMEPRAZOLE
  - Ulipristal: avoidance of clarithromycin advised by
    - manufacturer of low-dose ULIPRISTAL; erythromycin increases
      plasma concentration of
    - ULIPRISTAL (consider reducing initial dose of
      vardenafil); erythromycin increases plasma concentration of
    - ULIPRISTAL (reduce dose of vardenafil)

Macrolides
- Macrolides (continued)
  - Macrolides: manufacturer of bosutinib advises avoid or consider reducing
dose of bosutinib; clarithromycin and erythromycin possibly increase plasma
  - concentration of
    - CABOZANTINIB; clarithromycin possibly increases plasma concentration of
    - EVEROLIMUS (consider reducing the dose of everolimus
      consult everolimus product literature); clarithromycin and
    - erythromycin advise avoid concomitant use; avoidance of
    - clarithromycin and erythromycin advised by manufacturer of
    - DASATINIB (plasma concentration of dasatinib possibly increased); erythromycin increases plasma concentration of
    - LORATADINE; clarithromycin possibly increases plasma concentration of
    - LORATADINE; clarithromycin possibly increases plasma concentration of
      - LEUKOTRIENE RECEPTOR ANTAGONISTS:
      - Lenalidomide: clarithromycin possibly increases plasma concentration of
      - LENALIDOMIDE (increased risk of toxicity)
      - Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of
        - ZAFIRILUKAST
      - Lipid-regulating Drugs: clarithromycin increases plasma concentration of
        - ATORVASTATIN and PRAVASTATIN; possible
Mannitol (continued)  
- Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with CICLOSPORIN

MAOIs  
- NOTE: For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor  
- ACE inhibitors: MAOIs possibly enhance hypotensive effect of ACE INHIBITORS  
- Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with ADRENERGIC NEURONE BLOCKERS  
  - Alcohol: MAOIs interact with tyramine found in some beverages containing ALCOHOL and some dealkoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect  
  - Alpha2-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of APRACLONIDINE and BRIMONIDINE  
  - Alpha-blockers: avoidance of MAOIs advised by manufacturer of INDORAMIN; enhanced hypotensive effect when MAOIs given with ALPHA-BLOCKERS  
  - Analgesics: possible increased serotonergic effects when MAOIs given with FENTANYL; CNS excitation or depression (hypertension or hypotension) when MAOIs given with • PETHIDINE—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with • TRAMADOL—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of • OPIOID ANALGESICS—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs  
  - Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS  
  - Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with • REBOXETINE (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start • CITOLOPRAM, • ESCITALOPRAM, • FLUOXAMINE, • PAROXETINE or • SERTRALINE for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start • FLUOXETINE for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start • DUOXETINE for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with • VENLAFAXINE (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other • MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start • MOXOLBEMIDE for at least 1 week; MAOIs increase CNS effects of • SSRIS (risk of serious toxicity); after stopping MAOIs do not start • MIRTAZAPINE for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start • TRICYCLIC-RELATED ANTIDEPRESSANTS for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with • TRICYCLICS, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine)  
  - Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of ANTIDIABETICS; MAOIs enhance hypoglycaemic effect of INSULIN, METFORMIN and SULFONYLUREAS  
  - Antiepileptics: MAOIs possibly antagonise anticonvulsant effect of ANTIPELITICS (convulsive threshold lowered);  

MAOIs  
- Antiepileptics (continued)  
  - avoidance for 2 weeks after stopping MAOIs advised by manufacturer of • CARBAMAZEPINE, also antagonism of anticonvulsant effect  
  - Antihistamines: avoidance of MAOIs advised by manufacturer of HYDROXYZINE; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of PROMETHAZINE; increased antimuscarinic and sedative effects when MAOIs given with ANTIHISTAMINES  
  - Antimalarias: avoidance of antidepressants advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE and • ARTEMIMOL WITH PIPERAQUINE  
  - Antimuscarinics: increased risk of antimuscarinic side–effects when MAOIs given with ANTIMUSCARINICS  
  - Antipsychotics: CNS effects of MAOIs possibly increased by • CLOZAPINE  
  - Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of BUSPIRONE; manufacturer of tranylcypromine advises avoid • BUSPIRONE for 14 days after stopping tranylcypromine  
  - Beta-blockers: enhanced hypotensive effect when MAOIs given with BETA-BLOCKERS  
  - Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of • BUPROPION  
  - Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with CALCIUM-CHANNEL BLOCKERS  
  - Clonidine: enhanced hypotensive effect when MAOIs given with CLONIDINE  
  - Dopamine: increased risk of serotonergic effects when MAOIs given with • DAPoxetine (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)  
  - Diazoxide: enhanced hypotensive effect when MAOIs given with DIAZoxide  
  - Diuretics: enhanced hypotensive effect when MAOIs given with DIURETICS  
  - Dopaminergics: risk of hypertensive crisis when MAOIs given with • CO-BENELDOPA, • CO-CARELDOPA or • LEVODOPA, avoid co-beneldopa, co-careldopa or levodopa for at least 2 weeks after stopping MAOIs; avoid concomitant use of non-selective MAOIs with • ENTACAPONE; risk of hypertensive crisis when MAOIs given with • RASAGILINE, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with • SELEGILINE—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with • TOLCAPONE  
  - Doxapram: MAOIs enhance effects of DOXAPRAM  
  - Histamine: avoidance of MAOIs advised by manufacturer of • HISTAMINE  
  - HT1-receptor Agonists: risk of CNS toxicity when MAOIs given with • RIZATRIPTAN or • SUMATRIPTAN (avoid rizatRIPTAN or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with • ZOMITRIPTAN (reduce dose of zolmitriptan)  
  - Methyldopa: avoidance of MAOIs advised by manufacturer of • METHYLDOPA  
  - Moxonidine: enhanced hypotensive effect when MAOIs given with MOXONIDINE  
  - Muscle Relaxants: phenelzine enhances effects of • SUXAMETHONIUM  
  - Nicorandil: enhanced hypotensive effect when MAOIs given with NIcorANDIIL  
  - Nitrates: enhanced hypotensive effect when MAOIs given with NITRATES  
  - Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of PHOLCODINE  
  - Sympathomimetics: risk of hypertensive crisis when MAOIs given with • ADRENALINE (EPINEPHRINE), • DOBUTAMINE, • DOPAMINE, • NORADRENALINE (norepinephrine) or • XYLOMETAZOLINE; risk of hypertensive crisis when MAOIs given with • DEXAMETASONE, • EPHEDRINE, • ISOMETHEPTINE,
MAOIs
- Symptomatics (continued)
  - **LISDEXAMFETAMINE**, **METARAMINOL**, **METHYLPHENIDATE**, **PHENYLEPHRINE** or **PSEUDOEPHEDRINE**, avoid dexamfetamine, ephedrine, isometheptene, lisdeexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with **OXMETAZOLINE**, some manufacturers advise avoid oxometazoline for at least 2 weeks after stopping MAOIs
  - **TETRABENAZINE** risk of CNS toxicity when MAOIs given with **TETRABENAZINE** (avoid tetrabenazine for 2 weeks after MAOIs)
  - Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with **HYDRAZINE**, **MINOXIDIL** or **SODIUM NITROPRUSSIDE**

MAOIs, reversible see Moclobemide

Maraviroc
- Antibacterials: plasma concentration of maraviroc possibly reduced by **CLARITHROMYCIN** and **TELITHROMYCIN** (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by **RIFAMPICIN**—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by **ST JOHN’S WORT**—avoid concomitant use
- Antifungals: plasma concentration of maraviroc increased by **KETOCONAZOLE** (consider reducing dose of maraviroc)
- Antivirals: plasma concentration of maraviroc increased by **AZAZANAVIR, BOCEPREVIR, DARUNAVIR, INDINAVIR, LOPINAVIR, SAQUINAVIR and TELAPREVIR** (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by **EFAVIRENZ**—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by **STRAVIRINE**, maraviroc reduces plasma concentration of **FOSAMPRENAVIR**—avoid concomitant use; plasma concentration of maraviroc increased by **RITONAVIR**
- Cobicistat: plasma concentration of maraviroc possibly increased by **Cobicistat** (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by **ORLISTAT**

Mebendazole
- Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by **CIMETIDINE** (increased plasma concentration)

Medroxyprogesterone see Progestogens

Mefenamic Acid see NSAIDs

Mefloquine (continued)
- **Atomoxetine**: increased risk of ventricular arrhythmias when mefloquine given with **ATOMOXETINE**
- Beta-blockers: increased risk of bradycardia when mefloquine given with Beta-blockers
- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with **CALCIUM-CHANNEL BLOCKERS**
- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with **DIGOXIN**
- Cytotoxics: possible increased risk of bradycardia when mefloquine given with **CRIZOTINIB**
- Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
- Ibradine: increased risk of ventricular arrhythmias when mefloquine given with **IBRADINE**
- Vaccines: antimalarials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF

Megestrol see Progestogens

Melatonin see Anxiolytics and Hypnotics

Meloxicam see NSAIDs

Melphalan
- Antibacterials: increased risk of melphalan toxicity when given with **NALIDIXIC ACID**
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: melphalan possibly reduces absorption of **DIGOXIN tablets**
- Ciclosporin: increased risk of nephrotoxicity when melphalan given with **CICLOSPORIN**
- Memantine: increased risk of CNS toxicity when memantine given with **CICLOSPORIN**
- Memantine possibly enhances effects of **WARFARIN**
- Antimuscarinics: memantine possibly enhances effects of **ANTIMUSCARINICS**
- Antipsychotics: memantine possibly reduces effects of **ANTIPSYCHOTICS**
- Dopaminergics: memantine possibly enhances effects of **DOPAMINERGICS and SELEGILINE**; increased risk of CNS toxicity when memantine given with **CLOZAPINE** (manufacturer of memantine advises avoid concomitant use)
- Muscle Relaxants: memantine possibly modifies effects of **BACLOfen and DANTROLENE**

Meningococcal Vaccines see Vaccines

Mepacrine
- Antimalarials: mepacrine increases plasma concentration of **PRIMAQUINE** (increased risk of toxicity)

Meprobamate see Anxiolytics and Hypnotics

Meptazinol see Opioid Analgesics

Mercaptopurine
- Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with **ALLOPURINOL** (reduce dose of mercaptopurine to one quarter of usual dose)
- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with **SULFAMETHOXAZOLE** (as cotrimoxazole); increased risk of haematological toxicity when mercaptopurine given with **TRIMETHOPRIM** (also with cotrimoxazole)
- Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of **COUMARINS**
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOZAPINE** (increased risk of agranulocytosis)
- Dairy Products: plasma concentration of mercaptopurine possibly reduced by **DAIRY PRODUCTS**—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
- Febuxostat: avoidance of mercaptopurine advised by manufacturer of **FEBUXOSTAT**
Methotrexate
- Antiepileptics: carbamazepine reduces plasma concentration of methotrexate.
- Iron Salts: increased risk of hyperbilirubinaemia when methotrexate given with iron salts.
- Cimetidine: increased anticoagulant effect when methotrexate given with cimetidine.
- Oral Anticoagulants: increased anticoagulant effect when methotrexate given with oral anticoagulants.
- Antiplatelets: increased risk of bleeding when methotrexate given with antiplatelets.
- Antidiabetics (gliclazide): increased risk of hypoglycaemia when methotrexate given with gliclazide.
- ACE Inhibitors: increased risk of hypotension when methyldopa given with ACE inhibitors.
- Adrenergic Neurone Blockers: increased hypotensive effect when methyldopa given with adrenergic neurone blockers.

Methyldopa (continued)
- Alcohol: enhanced hypotensive effect when methyldopa given with alcohol.
- Aldesleukin: enhanced hypotensive effect when methyldopa given with aldesleukin.
- Alpha-blockers: enhanced hypotensive effect when methyldopa given with alpha-blockers.
- Anaeasthetics, General: enhanced hypotensive effect when methyldopa given with general anaesthetic.
- Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs.
- Angiotensin II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with angiotensin II receptor antagonists.
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with MAOIs.
- Antipsychotics: enhanced hypotensive effect when methyldopa given with antipsychotics.
- Antiepileptics: enhanced hypotensive effect when methyldopa given with antiepileptics.
- Beta-blockers: enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
- Diuretics: enhanced hypotensive effect when methyldopa given with diuretics.
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics, increased risk of extrapyramidal side-effects when methyldopa given with amantadine.
- Enhanced hypotensive effect when methyldopa given with beta-blockers.
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when methyldopa given with clonidine.
- Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids.
- Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide.
Interactions

Methyldionium
- Antioxidants: possible dose of methyldionium and observe patient for up to 4 hours after administration
- Bupropion: possible risk of CNS toxicity when methyldionium given with bupropion—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldionium and observe patient for up to 4 hours after administration)

Metoclopramide
- Alcohol: metoclopramide possibly increases absorption of alcohol
- Anaesthetics, General: metoclopramide enhances effects of thiopental
- Analgesics: metoclopramide increases rate of absorption of aspirin (increased effect); effects of metoclopramide on gastro-intestinal activity antagonised by opioid analgesics; metoclopramide increases rate of absorption of paracetamol
- Antiarrhythmics: metoclopramide reduces plasma concentration of fosfomycin
- Antidepressants: CNS toxicity reported when metoclopramide given with SSRIs
- Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by antimuscarinics
- Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with antipsychotics
- Atovaquone: metoclopramide reduces plasma concentration of atovaquone—avoid concomitant use
- Cisoprin: metoclopramide increases plasma concentration of cisoprin
- Dopaminergics: metoclopramide antagonises hypoprolactinaemic effects of bromocriptine and cabergoline; metoclopramide antagonises antiparkinsonian effect of pergolide; avoidance of metoclopramide advised by manufacturer of ropinirole and rotigotine (antagonism of effect)
- Muscle Relaxants: metoclopramide enhances effects of suxamethonium
- Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with tetrabenazine

Metolazone
- See Diuretics

Metoprolol
- See Beta-blockers

Metronidazole
- Note Interactions do not apply to topical metronidazole preparations
- Alcohol: disulfiram-like reaction when metronidazole given with alcohol
- Anticoagulants: metronidazole enhances anticoagulant effect of coumarins
- Antiepileptics: metronidazole possibly inhibits metabolism of fosphenytoin and phenytoin (increased plasma concentration); metabolism of metronidazole accelerated by phenobarbital and primidone (reduced effect)
- Cytotoxics: metronidazole increases plasma concentration of
  - busulfan (increased risk of toxicity); metronidazole inhibits metabolism of capetitabine, fluoroouracil and tegafur (increased toxicity)
- Disulfiram: psychotic reaction reported when metronidazole given with disulfiram
- Lithium: metronidazole increases risk of lithium toxicity
- Mycophenolate: metronidazole possibly reduces bioavailability of mycopHENolate
- Ulcer-healing Drugs: metabolism of metronidazole inhibited by cimetidine (increased plasma concentration)
- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Mianserin
- See Antidepressants, Tricyclic (related)

Micafungin
- Antifungals: micafungin possibly increases plasma concentration of amphotericin; micafungin increases plasma concentration of itraconazole (consider reducing dose of itraconazole)
- Calcium-channel Blockers: micafungin increases plasma concentration of nifedipine

Micafungin (continued)
- Ciclosporin: micafungin possibly increases plasma concentration of ciclosporin
- Sirolimus: micafungin increases plasma concentration of sirolimus

Miconazole
- See Antifungals, Imidazoles

Midazolam
- See Anxiolytics and Hypnotics

Mifamurtide
- Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of NSAIDs
- Ciclosporin: manufacturer of mifamurtide advises avoid concomitant use with ciclosporin
- Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with corticosteroids
- Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with tacrolimus

Mifepristone
- Corticosteroids: mifepristone may reduce effect of corticosteroids (including inhaled corticosteroids) for 3–4 days

Milrinone
- See Phosphodiesterase Inhibitors

Minoxidine
- See Vasodilator Antihypertensives

Mirabegron
- Antibacterials: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with clarithromycin—see Mirabegron, p. 671
- Antifungals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with itraconazole and ketoconazole—see Mirabegron, p. 671
- Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with ritonavir—see Mirabegron, p. 671
- Beta-blockers: mirabegron increases plasma concentration of metoprolol
- Cardiac Glycosides: mirabegron increases plasma concentration of digoxin—reduce initial dose of digoxin

Mirtazapine
- Alcohol: increased sedative effect when mirtazapine given with alcohol
- Analgesics: possible increased serotonergic effects when mirtazapine given with tramadol
- Anticoagulants: mirtazapine enhances anticoagulant effect of warfarin
- Antidepressants: possible increased serotonergic effects when mirtazapine given with fluoxetine, fluvoxamine or venlafaxine; mirtazapine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start moclobemide for at least 1 week
- Antiepileptics: plasma concentration of mirtazapine reduced by carbamazepine, fosphenytoin and phenytoin
- Antifungals: plasma concentration of mirtazapine increased by ketoconazole
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and artemether with lumefantrine
- Antidepressants: possible increased risk of convulsions when antidepressants given with atomoxetine
- Clonidine: mirtazapine possibly antagonises hypotensive effect of clonidine
- Methylthionium: possible risk of CNS toxicity when mirtazapine given with methylthionium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
- Ulcer-healing Drugs: plasma concentration of mirtazapine increased by cimetidine

Mitomycin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Appendix 1 Interactions 1215

Mitotane
- Anticoagulants: mitotane possibly reduces anticoagulant effect of
  - COUMARINS
- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
- Diuretics: manufacturer of mitotane advises avoid concomitant use of SPIRONOLACTONE (antagonism of effect)

Mitoxantrone
- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
- Ciclosporin: excretion of mitoxantrone reduced by CICLOSPORIN (increased plasma concentration)

Mivacurium see Muscle Relaxants

Mizolastine see Antihistamines

MMR Vaccine see Vaccines

Moclobemide
- Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with
  - DEXTROMETHORPHAN or PETHIDINE—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with OPIOD ANALGESICS—manufacturer of moclobemide advises consider reducing dose of opioid analgesics
- Antidepressants: moclobemide should not be started for at least 1 week after stopping MAOIS, SSRi-RELATED ANTIDEPRESSANTS, FLUOXETINE, FLUVAXMINE, MIRTAZAPINE, PAROXETINE, SERTRALINE, TRICYCLIC-RELATED ANTIDEPRESSANTS or TRICYCLICS; increased risk of CNS toxicity when moclobemide given with ESCITALOPRAM, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping FLUOXETINE; possible increased serotonergic effects when moclobemide given with
  - DULOXETINE
- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE and ARTEMISOL WITH PIPERAQUINE
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE
- Bupropion: avoidance of moclobemide advised by manufacturer of BUPROPION
- Diazoxide: enhanced hypotensive effect when moclobemide given with
  - MEXITIL
- Dopaminergics: increased risk of side-effects when moclobemide given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA; caution with moclobemide advised by manufacturer of ENTACAPONE; avoid concomitant use of moclobemide with
  - SELEGILINE
- SfH, receptor Agonists: risk of CNS toxicity when moclobemide given with RIZATRIPTAN or SUMATRIPTAN (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with ZOLMITRIPTAN (reduce dose of zolmitriptan)
- Sympathomimetics: risk of hypertensive crisis when moclobemide given with SYMPATHOMIMETICS
- Uterus—uterine contraction: increased by CYMELODINE (halve dose of moclobemide)

Modafinil
- Antiepileptics: modafinil possibly increases plasma concentration of FOSPHENYTOIN and PHENYTOIN
- Ciclosporin: modafinil reduces plasma concentration of CICLOSPORIN
- Ciclosporin: modafinil reduces plasma concentration of BOsUTINIB—manufacturer of bosutinib advises avoid concomitant use
- Oestrogens: modafinil accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)

Moxepril see ACE Inhibitors

Mometasone see Corticosteroids

MonoBactams see Aztreonam

Monoclonal antibodies see individual drugs

Montelukast see Leukotriene Receptor Antagonists

Morphine see Opioid Analgesics

Moxifloxacin see Quinolones

Moxisylyte
- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE INHIBITORS
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with ALPHA-BLOCKERS
- Antidepressants: increased risk of agranulocytosis when moxisylyte given with MAOIS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Beta-blockers: possible severe postural hypotension when moxisylyte given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with CALCIUM-CHANNEL BLOCKERS
- Corticosteroids: enhanced hypotensive effect of moxisylyte antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when moxisylyte given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when moxisylyte given with DIURETICS
- Methyldopa: enhanced hypotensive effect when moxisylyte given with METHYLDOPA
- Moxonidine: enhanced hypotensive effect when moxisylyte given with MOXONIDINE
- Nitrate: enhanced hypotensive effect when moxisylyte given with NITRATES
- Vasodilators: enhanced hypotensive effect when moxisylyte given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Moxonidine
- ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when moxonidine given with ALCOHOL
- Aidesleukin: enhanced hypotensive effect when moxonidine given with AIDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when moxonidine given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when moxonidine given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of moxonidine antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIS; hypotensive effect of moxonidine possibly antagonised by TRICYCLICS (manufacturer of moxonidine advises avoid concomitant use)
- Antipsychotics: enhanced hypotensive effect when moxonidine given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with ANXIOLYTICS AND HYPNOTICS; sedative effects possibly increased when moxonidine given with BENZODIAZEPINES
- Beta-blockers: enhanced hypotensive effect when moxonidine given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when moxonidine given with CLONIDINE
- Corticosteroids: enhanced hypotensive effect of moxonidine antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when moxonidine given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Methyldopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when moxonidine given with MOXISYLYTE
Appendix 1 Interactions

Moxonidine (continued)

Muscle Relaxants: enhanced hypotensive effect when moxonidine given with BACLOFEN or TIZANIDINE
Nitrites: enhanced hypotensive effect when moxonidine given with NITRATES
Oestrogens: hypotensive effect of moxonidine antagonised by OESTROGENS
Prostaglandins: enhanced hypotensive effect when moxonidine given with ALPROSTADIL
Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Muscle Relaxants

ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE INHIBITORS
Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with ADRENERGIC NEURONE BLOCKERS
Alcohol: increased sedative effect when baclofen, methohexital or tizanidine given with ALCOHOL
Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with ALPHA-BLOCKERS
● Anaesthetics, General: effects of atracurium enhanced by KETAMINE; increased risk of myocardial depression and bradycardia when suxamethonium given with PROPFOFOL; effects of non-depolarising muscle relaxants and suxamethonium enhanced by VOLATILE LIQUID GENERAL ANAESTHETICS
● Analgesics: excretion of baclofen possibly reduced by NSAIDS; (increased risk of toxicity) excretion of baclofen reduced by IBUPROFEN (increased risk of toxicity); increased sedative effect when baclofen given with FENTANYL or MORPHINE
● Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
● Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with LIDOCAINE
● Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by PIPERACILLIN; plasma concentration of tizanidine possibly increased by NORFLOXACIN (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by RIFAMPICIN; effects of non-depolarising muscle relaxants and suxamethonium enhanced by AMINOGLYCOSIDES; effects of non-depolarising muscle relaxants and suxamethonium enhanced by CLINDAMYCIN; plasma concentration of tizanidine possibly increased by POLYMYXIN; effects of suxamethonium enhanced by VANCOMYCIN
● Antidepressants: plasma concentration of tizanidine increased by FLUVORAMINE (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by PHENELZINE; muscle relaxant effect of baclofen enhanced by TRICYCLICS
● Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by CARBAMAZEPINE (accelerated recovery from neuromuscular blockade); effects of non-depolarising muscle relaxants reduced by long-term use of FOSPHENYTOIN and PHENYTOIN (but effects of non-depolarising muscle relaxants might be increased by acute use of fosphenytoin and phenytoin)
● Antimalarials: effects of suxamethonium possibly enhanced by QUININE
● Antipsychotics: effects of suxamethonium possibly enhanced by PROMAZINE
● Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with ANXIOLYTICS and HYPNOTICS
● Beta-blockers: enhanced hypotensive effect when baclofen given with BETA-BLOCKERS; possible enhanced hypotensive effect and bradycardia when tizanidine given with BETA-BLOCKERS; effects of muscle relaxants enhanced by PROPRANOLOL
● Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with CALCIUM-CHANNEL BLOCKERS; effects of non-depolarising muscle relaxants possibly enhanced by CALCIUM-CHANNEL BLOCKERS; possible increased risk of ventricular arrhythmias when intravenous dantrolene given with DILTIAZEM—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by VERAPAMIL; avoidance of intravenous dantrolene advised by manufacturer of VERAPAMIL
● Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with CARDIAC GLYCOSIDES; risk of ventricular arrhythmias when suxamethonium given with CARDIAC GLYCOSIDES
● Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with CLONIDINE
● Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by CORTICOSTEROIDS
● Cytoxicities: effects of suxamethonium enhanced by CYCLOPHOSPHAMIDE and THIOPETA
● Deferasirox: avoidance of tizanidine advised by manufacturer of DEFERASIROX
● Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with DIAZOXIDE
● Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with DIURETICS
● Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with CO-BENEDOLPA, CO-CARDELPOPA or LEVODOPA
● Lithium: effects of muscle relaxants enhanced by LITHIUM; baclofen possibly aggravates hyperkinesia caused by LITHIUM
● Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by PARENTERAL MAGNESIUM
● Memantine: effects of baclofen and dantrolene possibly modified by MEMANTINE
● Methylxyp: enhanced hypotensive effect when baclofen or tizanidine given with METHYLPAPA
● Metoclopramide: effects of suxamethonium enhanced by METOCLOPRAMIDE
● Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with MOXONIDINE
● Nitrites: enhanced hypotensive effect when baclofen or tizanidine given with NITRATES
● Oestrogens: plasma concentration of tizanidine possibly increased by OESTROGENS (increased risk of toxicity)
● Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by DONEPEZIL; effects of suxamethonium possibly enhanced by DONEPEZIL; effects of suxamethonium enhanced by GALANTAMINE, NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE; effects of non-depolarising muscle relaxants antagonised by NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE
● Progestogens: plasma concentration of tizanidine possibly increased by PROGESTOGENS (increased risk of toxicity)
● Symptomimetics, Beta2: effects of suxamethonium enhanced by BAMBUTEROL
● Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with HYDRAZINE; enhanced hypotensive effect when baclofen or tizanidine given with MINOXIDIL; enhanced hypotensive effect when baclofen or tizanidine given with SODIUM NITROPRUSSIDE

Muscle Relaxants, depolarising

See Muscle Relaxants

Muscle Relaxants, non-depolarising

See Muscle Relaxants

Mycophenolate

Antacids: absorption of mycophenolate reduced by ANTACIDS
● Antibacterials: bioavailability of mycophenolate possibly reduced by METRONIDAZOLE and NORFLOXACIN; plasma concentration of mycophenolate possibly reduced by CO-AMOXICLAV; plasma concentration of active metabolite of mycophenolate reduced by Rifampicin
● Antivirals: mycophenolate increases plasma concentration of ACICLOVIR and VALACICLOVIR, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of...
Mycophenolate

Antivirals (continued)

**GANCICLOVIR** and **VALGANCICLOVIR**, also plasma concentration of inactive metabolite of mycophenolate possibly increased

- **Colestilan**: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 5 hours after **COLESTILAN**
- **Iron Salts**: absorption of mycophenolate reduced by oral **IRON SALTS**
- **Lipid-regulating Drugs**: absorption of mycophenolate reduced by **COLESTYRAMINE**
- **Sevelamer**: plasma concentration of mycophenolate possibly reduced by **SEVELAMER**

**Nabumetone** see NSAIDs

**Nadolol** see Beta-blockers

**Nalidixic Acid** see **Aminoglycosides**

**Naloxone** see Quinolones

**Naltrexone**

- Analgesics: manufacturer of naloxone advises avoid concomitant use with **OPIOID ANALGESICS**

**Nandrolone** see Anabolic Steroids

**Naproxen** see NSAIDs

**Naratriptan** see **SHT-receptor Agonists (under HT)**

**Natalizumab**

- Antipsychotics: avoid concomitant use of cytoxotics with **CLOzapine** (increased risk of agranulocytosis)
- **Vaccines**: risk of generalised infections when monoclonal antibodies given with live **VACCINES**—avoid concomitant use

**Nateglinide** see Antidiabetics

**Nebivolol** see Beta-blockers

**Nefopam**

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with **MAOIs**; side-effects possibly increased when nefopam given with **TRICYCLICS**
- Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with **ANTIMUSCARINICS**

**Neomycin** see Aminoglycosides

**Neostigmine** see Parasympathomimetics

**Nevirapine**

- Analgesics: nevirapine possibly reduces plasma concentration of METHADONE
- **Antibacterials**: nevirapine reduces plasma concentration of **CLARITHROMYCIN** (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of **RIFABUTIN**; plasma concentration of nevirapine reduced by **RIFAMPICIN**—avoid concomitant use
- **Anticoagulants**: nevirapine may enhance or reduce anticoagulant effect of **WARFARIN**
- **Antidepressants**: plasma concentration of nevirapine reduced by **ST JOHN’S WORT**—avoid concomitant use
- Antiepileptics: plasma concentration of nevirapine reduced by **CARRABAMAZEPINE**
- Antifungals: nevirapine reduces plasma concentration of **KETOCONAZOLE**—avoid concomitant use; plasma concentration of nevirapine reduced by **FLUCONAZOLE**; nevirapine possibly reduces plasma concentration of **CASPOFUNGIN** and **ITRACONAZOLE**—consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of **ARIPIPRAZOLE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)
- Antivirals: nevirapine possibly reduces plasma concentration of **ATAZANAVIR** and **ETRAVIRINE**—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with **BOCEPREVIR** and **RILPIVIRINE**; avoidance of nevirapine advised by manufacturer of **DACLATASVIR** (plasma concentration of daclatasvir possibly reduced); nevirapine possibly reduces the plasma concentration of **DOLUTEGRAVIR** (see under Dolutegravir, p. 557); nevirapine reduces plasma concentration of **EFAVIRENZ**—avoid concomitant use; avoidance of nevirapine advised by manufacturer of **ELVITEGRAVIR**; nevirapine possibly reduces plasma concentration of **FOSAMPRENAVIR**—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of **INDINAVIR**; nevirapine possibly reduces plasma concentration of **LOPINAVIR** and **TELAPREVIR**—consider increasing dose of lopinavir and telaprevir; nevirapine possibly reduces plasma concentration of **SIMEPREVIR**—manufacturer of simeprevir advises avoid concomitant use; increased risk of granulocytopenia when nevirapine given with **ZIDOVUDINE**
- Colestipol: manufacturer of nevirapine advises avoid concomitant use with **COLESTIPOL**
- Oestrogens: nevirapine accelerates metabolism of **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see **Contraceptive Interactions in BNF**)
- Oralstat: absorption of nevirapine possibly reduced by **ORLISTAT**
- Progestogens: nevirapine accelerates metabolism of **PROGESTOGENS** (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see **Contraceptive Interactions in BNF**)

**Nicardipine** see Calcium-channel Blockers

**Niconorandil**

- Alcohol: hypotensive effect of nicorandil possibly enhanced by **ALCOHOL**
- Antidepressants: enhanced hypotensive effect when nicorandil given with **MAOIs**; hypotensive effect of nicorandil possibly enhanced by **TRICYCLICS**
- **Avanafil**: hypotensive effect of nicorandil significantly enhanced by **AVANafil** (avoid concomitant use)
- Sildenafil: hypotensive effect of nicorandil significantly enhanced by **SILDENAFIL** (avoid concomitant use)
- **Tadalafil**: hypotensive effect of nicorandil significantly enhanced by **TADALAFIL** (avoid concomitant use)
- **Vardenafil**: possible increased hypotensive effect when nicorandil given with **VARDENAFIL**—avoid concomitant use
- Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with **HYDRALAZINE, MINOXIDIL, or SODIUM NITROPRUSSIODE**

**Nicotine**

- Anti-arrhythmics: nicotine possibly enhances effects of **ADRENOSINE**

**Nicotinic Acid**

- **Lipid-regulating Drugs**: increased risk of myopathy when nicotinic acid given with **STATINS** (applies to lipid regulating doses of nicotinic acid)

**Nifedipine** see Calcium-channel Blockers

**Nilotinib**

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with **CLARITHROMYCIN** and **TELITHROMYCIN**; plasma concentration of nilotinib reduced by **RIFAMPICIN**—avoid concomitant use
- **Antifungals**: plasma concentration of nilotinib increased by **KETOCONAZOLE**—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with **ITRACONAZOLE** and **VORICONAZOLE**
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOzapine** (Increased risk of agranulocytosis)
- **Antivirals**: avoidance of nilotinib advised by manufacturer of **BOCEPREVIR**; plasma concentration of nilotinib possibly increased by **RITONAVIR**—manufacturer of nilotinib advises avoid concomitant use
- **Anxiolytics and Hypnotics**: nilotinib increases plasma concentration of **MILODILAM**
- **Grapefruit Juice**: manufacturer of nilotinib advises avoid concomitant use with **GRAPEFRUIT JUICE**
- **Lipid-regulating Drugs**: separating administration from nilotinib by 12 hours advised by manufacturer of **LOMITAPIDE**

**Nintedanib** see Calcium-channel Blockers

**Norethandrolone**

- Antibacterials: plasma concentration of norethandrolone reduced by **RIFAMPICIN**—avoid concomitant use
- Antifungals: plasma concentration of norethandrolone increased by **KETOCONAZOLE**

**Naproxen**

- Antivirals (continued)

**Nevirapine**

- Antivirals (continued)

**Naproxen**

- Antivirals (continued)

**Nevirapine**

- Antivirals (continued)
Interactions | Appendix 1

**Nitrazepam** see Anxiolytics and Hypnotics

**Nitrofurantoin**
- Antacids: absorption of nitrofurantoin reduced by ORAL MAGNESIUM SALTS (as magnesium trilisylcate)
- Antibacterials: nitrofurantoin possibly antagonises effects of NALIDIXIC ACID
- Sulfipyrazone: excretion of nitrofurantoin reduced by SULFONYLUREAS (increased risk of toxicity)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

**Nitromidazoles** see Metronidazole and Tinidazole

**Nitrous Oxide** see Anaesthetics, General

**Nitrate Antagonists**
- Analgesics: enhanced hypotensive effect when nitrates given with ACETAMINOPHEN
- Antiarrhythmics: enhanced hypotensive effect when nitrates given with AMIODARONE
- Antiarrhythmics: enhanced hypotensive effect when nitrates given with DIGITALIS
- Asthma: enhanced hypotensive effect when nitrates given with beta-blockers
- Asthma: enhanced hypotensive effect when nitrates given with beta-blockers
- Caoids: enhanced hypotensive effect when nitrates given with clofibrate
- Calcium-channel blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when nitrates given with clonidine
- Corticosteroids: enhanced hypotensive effect of nitrates antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide
- Diuretics: enhanced hypotensive effect when nitrates given with diuretics
- Dopamine: enhanced hypotensive effect when nitrates given with dopamine
- Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa
- Moxisylyte: enhanced hypotensive effect when nitrates given with moxisylyte
- Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine
- Muscle relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine
- Oestrogens: enhanced hypotensive effect of nitrates antagonised by oestrogens
- Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil
- Riociguat: possible enhanced hypotensive effect when nitrates given with riociguat
- Sildenafil: hypotensive effect of nitrates significantly enhanced by sildenafil
- Tadalafil: enhanced hypotensive effect of nitrates significantly enhanced by tadalafil
- Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil
- Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

**Nitrates**
- ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE INHIBITORS
- ADRENERGIC NEURONE BLOCKERS: enhanced hypotensive effect when nitrates given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when nitrates given with alcohol
- Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin
- Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers
- Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics
- Analgesics: hypotensive effect of nitrates antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists
- Antiarrhythmics: effects of sublingual tablets of nitrates reduced by failure to dissolve under tongue owing to dry mouth
- Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of heparin
- Antidepressants: enhanced hypotensive effect when nitrates given with MAOIS; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants
- Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics
- Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines
- Anxiety and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics
- Avanafil: hypotensive effect of nitrates significantly enhanced by avanafil (avoid concomitant use)
- Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers
- Calcium-channel blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when nitrates given with clonidine
- Corticosteroids: enhanced hypotensive effect of nitrates antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide
- Diuretics: enhanced hypotensive effect when nitrates given with diuretics
- Dopamine: enhanced hypotensive effect when nitrates given with dopamine
- Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa
- Moxisylyte: enhanced hypotensive effect when nitrates given with moxisylyte
- Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine
- Muscle relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine
- Oestrogens: enhanced hypotensive effect of nitrates antagonised by oestrogens
- Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil
- Riociguat: possible enhanced hypotensive effect when nitrates given with riociguat
- Sildenafil: hypotensive effect of nitrates significantly enhanced by sildenafil
- Tadalafil: enhanced hypotensive effect of nitrates significantly enhanced by tadalafil
- Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil
- Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

**Nitroimidazoles** see Metronidazole and Tinidazole

**Nitrous Oxide** see Anaesthetics, General

**Nizatidine** see Histamine H2-antagonists

**Nobilegestromin** see Progestogens

**Noradrenaline (norepinephrine)** see Sympathomimetics

**Norfenephrine** note norfenephrine interactions as for noradrenaline, see under sympathomimetics

**Norfloxacin** see Quinolones

**Noroxicin** see Progestogens

**Norgestrel** see Progestogens

**Normal Immunoglobulin** see Immunoglobulins

**Nortriptyline** see Antidepressants, Tricyclic

**NSAIDs**
- **NOTE**: see also aspirin. Interactions do not generally apply to topical NSAIDs
- ACE inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hypotensive effect antagonised
- Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers
- Allikiren: NSAIDs possibly antagonise hypotensive effect of allikiren
- Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers
- Analgesics: avoid concomitant use of NSAIDs with NSAI or aspirin (increased side-effects); avoid concomitant use of NSAIDs with ketorolac (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of aspirin
- Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with angiotensin-II receptor antagonists, also hypotensive effect antagonised
- Antacids: absorption of acetaminophen possibly reduced by antacids
- Antibacterials: indomethacin possibly increases plasma concentration of amikacin and gentamicin in neonates; plasma concentration of cefoxitin, diclofenac and etoricoxib reduced by rifampicin; possible increased risk of convulsions when NSAIDs given with quinolones
- Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with anticoagulants (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with anticoagulants (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of coumarins and phenindione; possible increased risk of bleeding when NSAIDs given with dabigatran or heparins
- Antidepressants: increased risk of bleeding when NSAIDs given with SSRIs or venlafaxine
- Antidiabetics: NSAIDs possibly enhance effects of sulfonylureas
- Antiepileptics: acetaminophen possibly reduces excretion of fosphenytoin and phenytoin (increased risk of toxicity)
- Antifungals: plasma concentration of parecoxib increased by fluconazole (reduce dose of parecoxib); plasma concentration of cefoxitin increased by fluconazole (halve dose of cefoxitin); plasma concentration of flurbiprofen and ibuprofen increased by fluconazole; plasma concentration of diclofenac and ibuprofen increased by voriconazole
- Antipsychotics: possible severe drowsiness when acetaminophen or indomethacin given with haloperidol

<tr>
<td>- Clopidogrel: increased risk of bleeding when NSAI*DS given with Clopidogrel</td>
<td></td>
</tr>
<tr>
<td>- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAI*DS given with Corticosteroids</td>
<td></td>
</tr>
<tr>
<td>- Cytoxotics: NSAI<em>DS probably reduce excretion of Methotrexate (increased risk of toxicity); di clofenac, ibuprofen, indomethacin, ketoprofen, meloxicam and naproxen reduce excretion of Methotrexate (increased risk of toxicity); NSAI</em>DS possibly reduce renal excretion of Pemetermin—consult product literature; increased risk of bleeding when NSAI<em>DS given with Erol tinib; avoidance of mefenamic acid advised by manufacturer of Regorafenib; Diclofenac enhances effects of Iloprost (increased risk of toxicity); Diazoxide: NSAI</em>DS antagonise hypnotic effect of Diazoxide</td>
<td></td>
</tr>
<tr>
<td>- Dimethyl sulfoxide: avoid concomitant use of sulindac with</td>
<td></td>
</tr>
<tr>
<td>- Diuretics: risk of nephrotoxicity of NSAI<em>DS increased by Diuretics, also antagonism of diuretic effect; indomethacin and ketorolac antagonise effects of Diuretics; excretion of acetaminophen possibly increased by Fluconazole; NSAI</em>DS possibly antagonise diuretic effect of Potassium Canrenoate; occasional reports of reduced renal function when indomethacin given with Triam terene—avoid concomitant use; possible increased risk of hyperkalaemia when NSAI*DS given with Potassium-Sparing Diuretics and Aldosterone Antagonists; increased risk of hyperkalaemia when indomethacin given with Potassium-Sparing Diuretics and Aldosterone Antagonists</td>
<td></td>
</tr>
<tr>
<td>- Iloprost: increased risk of bleeding when NSAI*DS given with Iloprost</td>
<td></td>
</tr>
<tr>
<td>- Lipid-regulating Drugs: excretion of meloxicam increased by Colestyramine</td>
<td></td>
</tr>
<tr>
<td>- Lithium: NSAI*DS reduce excretion of Lithium (increased risk of toxicity); ketorolac reduces excretion of Lithium (increased risk of toxicity)—avoid concomitant use</td>
<td></td>
</tr>
<tr>
<td>- Methyl dopa: NSAI*DS antagonise hypnotic effect of Methyl dopa</td>
<td></td>
</tr>
<tr>
<td>- Mifamurtide: avoidance of high doses of NSAI*DS advised by manufacturer of Mifamurtide</td>
<td></td>
</tr>
<tr>
<td>- Moxonidine: NSAI*DS antagonise hypnotic effect of Moxonidine</td>
<td></td>
</tr>
<tr>
<td>- Muscle Relaxants: ibuprofen reduces excretion of Baclofen (increased risk of toxicity); NSAI*DS possibly reduce excretion of Baclofen (increased risk of toxicity)</td>
<td></td>
</tr>
<tr>
<td>- Nitrates: NSAI*DS antagonise hypnotic effect of Nitrates</td>
<td></td>
</tr>
<tr>
<td>- Oestrogens: etoricoxib increases plasma concentration of Ethinylestradiol</td>
<td></td>
</tr>
<tr>
<td>- Pencillamine: possible increased risk of nephrotoxicity when NSAI*DS given with Pencillamine</td>
<td></td>
</tr>
<tr>
<td>- Pentoxifylline: possible increased risk of bleeding when NSAI*DS given with Pentoxifylline; increased risk of bleeding when ketorolac given with Pentoxifylline (avoid concomitant use)</td>
<td></td>
</tr>
<tr>
<td>- Prasugrel: possible increased risk of bleeding when NSAI*DS given with Prasugrel</td>
<td></td>
</tr>
<tr>
<td>- Tacrolimus: possible increased risk of nephrotoxicity when NSAI*DS given with Tacrolimus; increased risk of nephrotoxicity when ibuprofen given with Tacrolimus</td>
<td></td>
</tr>
<tr>

<tr>
<td>- Adrenergic Neurone Blockers: oestrogens antagonise hypnotic effect of Adrenergic Neurone Blockers</td>
<td></td>
</tr>
<tr>
<td>- Alpha-blockers: oestrogens antagonise hypnotic effect of Alpha-blockers</td>
<td></td>
</tr>
<tr>
<td>- Aminophylline: oestrogens increase plasma concentration of Aminophylline (consider reducing dose of aminophylline)</td>
<td></td>
</tr>
<tr>
<td>- Analgesics: plasma concentration of ethinylestradiol increased by Etoricoxib</td>
<td></td>
</tr>
<tr>
<td>- Angiotensin-II Receptor Antagonists: oestrogens antagonise hypnotic effect of Angiotensin-II Receptor Antagonists</td>
<td></td>
</tr>
<tr>
<td>- Antibacterials: plasma concentration of estradiol increased by Erythromycin; metabolism of oestrogens accelerated by Rifamycins (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)</td>
<td></td>
</tr>
<tr>
<td>- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of Coumarins; oestrogens antagonise anticoagulant effect of Phenindione</td>
<td></td>
</tr>
<tr>
<td>- Antidepressants: contraceptive effect of oestrogens reduced by St John’s wort (avoid concomitant use); oestrogens antagonise antidepressant effect of Tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)</td>
<td></td>
</tr>
<tr>
<td>- Antibiotics: oestrogens antagonise hyperoxygenic effect of Antibiotics</td>
<td></td>
</tr>
<tr>
<td>- Antiepileptics: metabolism of oestrogens accelerated by Carbamazepine, Eslicarbazepine, Fosphenytoin, Oxcarbazepine, Pheno barbital, Phenytoin, Primidone, Rufinamide and Topiramate (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF); oestrogens reduce plasma concentration of Lamotrigine—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of Sodium Valproate and Valproic Acid</td>
<td></td>
</tr>
<tr>
<td>- Antiinflamas: oestrogens increase plasma concentration of Voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with Griseofulvin; anecdotal reports of contraceptive failure when oestrogens given with Midazolam; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with Terbinafine</td>
<td></td>
</tr>
<tr>
<td>- Antivirals: plasma concentration of ethinylestradiol increased by Atazanavir; metabolism of oestrogens accelerated by Nevirapine and Ritonavir (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF); plasma concentration of ethinylestradiol possibly reduced by Clozapine—manufacturer of telaprevir advises additional contraceptive precautions</td>
<td></td>
</tr>
<tr>
<td>- Anxiolytics and Hypnotics: oestrogens possibly increase plasma concentration of Chlor Diazepoxide, Diazepam and Nitrazepam; oestrogens possibly reduce plasma concentration of Lorazepam, Oxazepam and Temazepam; oestrogens increase plasma concentration of Melatonin</td>
<td></td>
</tr>
</tbody>
</table>
Interactions

**Appendix 1**

**Oestrogens** (continued)

- Aprepitant: possible contraceptive failure of hormonal contraceptives involving oestrogens when given with β-blockers; oestrogens antagonise hypotensive effect of β-blockers
- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with bosentan (alternative contraception recommended)
- Calcium-channel blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers
- Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin
- Clonidine: oestrogens antagonise hypotensive effect of clonidine
- Cobicistat: metabolism of oestrogens accelerated by Cobicistat (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids
- Cytotoxics: possible reduction in contraceptive effect of oestrogens advised by manufacturer of CRIZOTINIB and vemurafenib; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of dabrafenib (alternative contraception recommended)
- Diuretics: oestrogens antagonise diuretic effect of diuretics
- Dopaminergics: oestrogens increase plasma concentration of dopaminergics
- Fosaprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens advised by manufacturer of aprepitant
- Lipid-regulating Drugs: absorption of ethinylestradiol reduced by colesvelam; plasma concentration of ethinylestradiol increased by atorvastatin and rosuvastatin; separating administration from oestrogens by 12 hours advised by manufacturer of lomitapide
- Methyl dopa: oestrogens antagonise hypotensive effect of methyl dopa
- Modafinil: metabolism of oestrogens accelerated by modafinil (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Moxonidine: oestrogens antagonise hypotensive effect of moxonidine
- Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)
- Nitrates: oestrogens antagonise hypotensive effect of nitrates
- Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin
- Tacrolimus: ethinylestradiol possibly increases plasma concentration of tacrolimus
- Teriflunomide: plasma concentration of ethinylestradiol increased by teriflunomide
- Theophylline: oestrogens increase plasma concentration of theophylline (consider reducing dose of theophylline)
- Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism
- Vasodilators: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

**Oestrogens, conjugated** see Oestrogens

**Ofatumumab**

- Antipsychotics: avoid concomitant use of cytoxics with ofatumumab
- Clozapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use

**Ofoxacin** see Quinolones

**Olanzapine** see Antipsychotics

**Olmesartan** see Angiotensin-II Receptor Antagonists

**Olodaterol** see Sympathomimetics, Beta2

**Omeprazole** see Proton Pump Inhibitors

**Ondansetron** see 5HT-3 Receptor Antagonists (under HT)

**Opioid Analgesics**

- Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with alcohol
- Anaesthetics, General: fentanyl inhibits metabolism of etomidate, (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of intravenous general anaesthetics and volatile liquid general anaesthetics
- Analgesics: avoidance of buprenorphine advised by manufacturer of fentanyl; manufacturer of fentanyl advises avoid concomitant use with pentazocine
- Antibacterials: plasma concentration of fentanyl possibly increased by clarithromycin; plasma concentration of allantoin increased by erythromycin; metabolism of allantoin, codeine, fentanyl, methadone and morphine accelerated by rifampicin (reduced effect); metabolism of oxycodone possibly accelerated by rifampicin; increased risk of ventricular arrhythmias when methadone given with delamanid; manufacturer of pethidine advises avoid concomitant use with isoniazid; metabolism of oxycodone inhibited by telithromycin; possible increased risk of ventricular arrhythmias when methadone given with telithromycin
- Anticoagulants: tramadol enhances anticoagulant effect of coumarins
- Antidepressants: plasma concentration of methadone possibly increased by fluoxetine, fluvoxamine, paroxetine and sertraline; possible increased serotoninergic effects when pethidine or tramadol given with duloxetine; possible increased serotoninergic effects when tramadol given with mirtazapine or venlafaxine; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotoninergic effects and increased risk of convulsions when tramadol given with MAOIs—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with MAOIs—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotoninergic effects when fentanyl given with MAOIs, SSRI-RELATED ANTIDEPRESSANTS OR SSRIS; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with moclobemide—moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dexamethorphan or pethidine given with moclobemide—avoid concomitant use; increased risk of CNS toxicity when tramadol given with SSRIS or tricyclics; plasma concentration of methadone possibly reduced by St John’s Wort; sedative effects possibly increased when opioid analgesics given with tricyclics
- Antiepileptics: effects of tramadol reduced by carbamazepine; plasma concentration of methadone reduced by carbamazepine, phenobarbital and primidone; metabolism of fentanyl possibly accelerated by carbamazepine, fosphenytoin and phenytoin (reduced effect); dextropropoxyphene enhances effects of carbamazepine; metabolism of methadone accelerated by fosphenytoin and phenytoin (reduced effect and risk of withdrawal effects); possible increased risk of pethidine toxicity when given with fosphenytoin and phenytoin; morphine increases bioavailability of gabapentin
- Antifungals: metabolism of buprenorphine inhibited by ketoconazole (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when methadone given with ketoconazole—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of oxycodone increased by itraconazole and ketoconazole and voriconazole; metabolism of allantoin inhibited by fluconazole (risk of prolonged or delayed respiratory depression); plasma concentration of methadone increased by fluconazole; metabolism of allantoin possibly inhibited by itraconazole; plasma concentration of methadone...
Opioid Analgesics
- Antifungals (continued) possibly increased by:itraconazole (increased risk of ventricular arrhythmias); plasma concentration of alfentanil and methadone increased by:voriconazole (consider reduced dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by:triazoles
- Antihistamines: sedative effects possibly increased when opioid analgesics given with:sedating antihistamines
- Antimicrobials: avoidance of methadone advised by manufacturer of:artemisinil with piperaquine (possible risk of ventricular arrhythmias)
- Antimuscarinics: possibility increased risk of antimuscarinic side-effects when codeine given with:antimuscarinics
- Antidepressants: enhanced hypotensive and sedative effects when opioid analgesics given with:antipsychotics; increased risk of ventricular arrhythmias when methadone given with:antipsychotics that prolong the QT interval; increased risk of convulsions when tramadol given with:antipsychotics; increased risk of ventricular arrhythmias when methadone given with:amisulpride—avoid concomitant use
- Antivirals: plasma concentration of methadone possibly reduced by:abacavir, nevirapine and rifampirine; plasma concentration of methadone possibly affected by:boceprevir; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with:boceprevir; methadone possibly reduces plasma concentration of:didanosine; plasma concentration of methadone reduced by:efavirenz, fosamprenavir and ritonavir; plasma concentration of buprenorphine possibly increased by:ritonavir; plasma concentration of alfentanil and fentanyl increased by:ritonavir; plasma concentration of pethidine reduced by:ritonavir, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); plasma concentration of morphine possibly reduced by:ritonavir; plasma concentration of dextropropoxyphene increased by:ritonavir (risk of toxicity)—avoid concomitant use; increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with:saqunivarin—avoid concomitant use; caution with methadone advised by manufacturer of:telaprevir (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of:tipranavir; methadone possibly increases plasma concentration of:zidovudine
- Antiepileptics: increased sedative effect when opioid analgesics given with:anxiolytics and hypnotics; fentanyl possibly inhibits metabolism of:miazolam
- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with:atomoxetine; possible increased risk of convulsions when tramadol given with:atomoxetine
- Beta-blockers: morphine possibly increases plasma concentration of:esmolol
- Calcium-channel Blockers: metabolism of alfentanil inhibited by:diltiazem (risk of prolonged or delayed respiratory depression)
- Cytoxotics: possible increased risk of ventricular arrhythmias when methadone given with:busuliniib; caution with alfentanil and fentanyl advised by manufacturer of:crizotinib; possible increased risk of ventricular arrhythmias when methadone given with:vandetanib—avoid concomitant use
- Dapoxetine: possible increased risk of sexualerogenic effects when tramadol given with:dapoxetine (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Dopaminedon: opioid analgesics antagoing effects of:domperidone on gastrointestinal activity
- Dopaminergics: avoid concomitant use of dextromethorphan with:rassagline; risk of CNS toxicity when pethidine given with:rassagline (avoid pethidine for 2 weeks after rasagline); avoidance of opioid analgesics advised by manufacturer of:selegiline; hyperpyrexia and CNS toxicity reported when pethidine given with:selegiline (avoid concomitant use)

Opioid Analgesics (continued)
- Hormone Antagonists: plasma concentration of dextromethorphan increased by:abiraterone
- SH2-receptor Antagonists: effects of tramadol possibly antagonised by:ondansetron
- Memantine: increased risk of CNS toxicity when dextromethorphan given with:memantine (manufacturer of memantine advises avoid concomitant use)
- Metoclopramide: opioid analgesics antagonise effects of:metoclopramide on gastrointestinal activity
- Muscle Relaxants: increased sedative effect when fentanyl or morphine given with:baclofen
- Nalmefene: avoidance of opioid analgesics advised by manufacturer of:nalmefene
- Sodium Oxylate: opioid analgesics enhance effects of:sodium oxybate (avoid concomitant use)
- Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by: CIMETIDINE (increased plasma concentration)

Oritavancin
- Anticoagulants: oritavancin possibly increases plasma concentration of:warfarin
- Vaccines: antibiotics inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Orlistat
- Anti-arrhythmics: orlistat possibly reduces plasma concentration of:amiodarone
- Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of:coumarins
- Antidietetics: manufacturer of orlistat advises avoid concomitant use with:acarbose
- Antiparkinsonism: increased risk of convulsions when orlistat given with:antiepileptics
- Antivirals: orlistat possibly reduces absorption of:abacavir, atazanavir, darunavir, didanosine, efavirenz, elvitegravir, emtricitabine, enfuvirtide, etravirine, fosamprenavir, indinavir, lamivudine, lopinavir, maraviroc, nevirapine, raltegravir, rifampirine, ritonavir, saquinavir, stavudine, tenofovir, tipranavir and:ZIDOVUDINE
- Ciclosporin: orlistat possibly reduces absorption of:ciclosporin
- Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with:levothyroxine

Orphenadrine see Antimuscarinics Oxaliplatin see Platinum Compounds Oxandrolone see Anabolic Steroids Oxazepam see Anxiolytics and Hypnotics

Oxcarbazepine
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by:MAOIs and:TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by:SSRIs and:TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of:carbamazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of:eslicarbazepine; oxcarbazepine increases plasma concentration of:fosphenytoin, phenobarbital, phenytoin and primidone, also plasma concentration of an active metabolite of oxcarbazepine reduced; oxcarbazepine reduces plasma concentration of:perampanel (see under Perampanel, p. 398); plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by:sodium valproate and valproic acid
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by:mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by:antipsychotics (convulsive threshold lowered)
- Antivirals: oxcarbazepine possibly reduces plasma concentration of:daclatasvir and:simeprevir—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of oxcarbazepine advised by
Oxcarbazepine
- Antivirals (continued)
  manufacturer of Dolutegravir and Sofosbuvir; avoidance of
  oxcarbazepine advised by manufacturer of Ribavirine
  (plasma concentration of ribavirine possibly reduced)
- Ciclosporin: oxcarbazepine possibly reduces plasma
  concentration of Ciclosporin
- Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect
  of Clopidogrel
- Cytotoxics: oxcarbazepine reduces plasma concentration of
  Imatinib—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of
  Oestrogens (reduced contraceptive effect with combined
  oral contraceptives, contraceptive patches, and vaginal
  rings—see Contraceptive Interactions in BNF)
- Orlisat: possible increased risk of convulsions when
  antiepileptics given with Orlisat
- Progestogens: oxcarbazepine accelerates metabolism of
  Progestogens (reduced contraceptive effect with combined
  oral contraceptives, progestogen-only oral contraceptives,
  contraceptive patches, vaginal rings, etonogestrel-releasing
  implant, and emergency hormonal contraception—see
  Contraceptive Interactions in BNF)
Oxeprenolol see Beta-blockers
Oxybutynin see Antimuscarinics
Oxycodone see Opioid Analgesics
Oxymetazoline see Sympathomimetics
Oxytetracycline see Tetracyclines
Oxytocin
- Anaesthetics, General: oxytocin effect possibly reduced, also
  enhanced hypotensive effect and risk of arrhythmias when
  oxytocin given with Volatile Liquid General Anaesthetics
- Prostaglandins: uterotonic effect of oxytocin potentiated by
  Prostaglandins
- Sympathomimetics: risk of hypertension when oxytocin given
  with Vasoconstrictor Sympathomimetics (due to enhanced
  vasopressor effect)
Paclitaxel
- Antipsychotics: avoid concomitant use of cytotoxics with
  clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of paclitaxel increased by
  Ritonavir
- Cytotoxics: increased risk of neutropenia when paclitaxel
  given with Lapatinib
Paliperidone see Antipsychotics
Pamidronate Disodium see Bisphosphonates
Pancreatin
- Antidiabetics: pancreatin antagonises hypoglycaemic effect of
  Acarbose
Pancuronium see Muscle Relaxants
Panitumumab
- Antipsychotics: avoid concomitant use of cytotoxics with
  clozapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal
  antibodies given with live Vaccines—avoid concomitant use
Pantoprazole see Proton Pump Inhibitors
Papaveretum see Opioid Analgesics
Paracetamol
- Anticoagulants: prolonged regular use of paracetamol possibly
  enhances anticoagulant effect of Coumarins
- Antidiabetics: absorption of paracetamol possibly reduced when
  given 1 to 4 hours after Lixisenatide
- Antiepileptics: metabolism of paracetamol possibly accelerated by
  Carbamazepine, fosphenytoin, phenobarbital, phenytoin
  and Primidone (also isolated reports of hepatotoxicity)
- Antifungals: avoidance of paracetamol advised by
  manufacturer of Ketoconazole
- Cytotoxics: paracetamol possibly inhibits metabolism of
  Intravenous Busulfan (manufacturer of Intravenous busulfan
  advises caution within 72 hours of paracetamol); caution
  with paracetamol advised by manufacturer of Imatinib
- Lipid-regulating Drugs: absorption of paracetamol reduced by
  Colestyramine
- Metoclopramide: rate of absorption of paracetamol increased by
  Metoclopramide
Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with
  Alcohol
- Disulfiram: risk of toxicity when paraldehyde given with
  Disulfiram
Parasympathomimetics
- Anti-arrhythmics: effects of neostigmine and pyridostigmine
  possibly antagonised by Propafenone
- Antibacterials: plasma concentration of galantamine increased
  by erythromycin; effects of neostigmine and pyridostigmine
  antagonised by AMINOLACTONES; effects of neostigmine
  and pyridostigmine antagonised by clindamycin; effects of
  neostigmine and pyridostigmine antagonised by
  PolyMyxins
- Antidepressants: plasma concentration of galantamine
  increased by Paroxetine
- Antifungals: plasma concentration of galantamine increased by
  Ketoconazole
- Antimalarias: effects of neostigmine and pyridostigmine may
  be diminished because of potential for Chloroquine to
  increase symptoms of myasthenia gravis; effects of
  neostigmine and pyridostigmine may be diminished because of
  potential for Hydroxychloroquine to increase symptoms of
  myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised
  by Antimuscarinics
- Beta-blockers: increased risk of arrhythmias when picoephine
  given with Beta-blockers; effects of neostigmine and
  pyridostigmine antagonised by Propafenone
- Cytotoxics: possible increased risk of bradycardia when
  picoephine given with Crizotinib
- Lithium: effects of neostigmine antagonised by Lithium
- Muscle Relaxants: donepezil possibly enhances effects of
  Succinimides; galantamine, neostigmine, pyridostigmine and
  rivastigmine enhance effects of Succinimides; neostigmine,
  pyridostigmine and rivastigmine antagonise effects of
  NON-DEPOLARISING MUSCLE RELAXANTS; donepezil
  possibly antagonises effects of NON-DEPOLARISING MUSCLE
  RELAXANTS
Perazocin see NSAIDs
Paricalcitol see Vitamins
Paroxetine see Antidepressants, SSRI
Pasireotide
- Antidiabetics: pasireotide possibly reduces requirements for
  Antidiabetics.
- Antifungals: avoidance of pasireotide advised by manufacturer of
  Ketoconazole
- Antimuscarinics: possible increased risk of bradycardia when
  pasireotide given with Ipratropium or Oxbutynin
- Beta-blockers: possible increased risk of bradycardia when
  pasireotide given with Carvedilol, Metoprolol, Propranolol
  or Sotalol
- Calcium-channel Blockers: possible increased risk of
  bradycardia when pasireotide given with Diltiazem or
  Verapamil
- Ciclosporin: pasireotide possibly reduces plasma concentration of
  Ciclosporin
Pazopanib
- Antibacterials: plasma concentration of pazopanib possibly
  increased by Clarithromycin and Telithromycin (reduce
dose of pazopanib); plasma concentration of pazopanib possibly
  reduced by Rifampicin
- Antifungals: plasma concentration of pazopanib increased by
  Ketoconazole (reduce dose of pazopanib); plasma
  concentration of pazopanib possibly increased by
  Itraconazole and Voriconazole (reduce dose of pazopanib)
- Antipsychotics: avoid concomitant use of cytotoxics with
  Clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of pazopanib possibly
  increased by Atazanavir, Indinavir and Ritonavir
  (reduce dose of pazopanib); avoidance of pazopanib
  advised by manufacturer of Boceprevir; increased risk of
  ventricular arrhythmias when pazopanib given with
  Saquinavir—avoid concomitant use
Pazopanib (continued)  
▶ Cytotoxics: plasma concentration of pazopanib increased by  
  • LAPATINIB  
  • Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with  
  • GRAPEFRUIT JUICE  
  • Lipid-regulating Drugs: separating administration from pazopanib by 12 hours advised by manufacturer of  
  • LOMITAPIDE  
  • Ulcer-healing Drugs: absorption of pazopanib possibly reduced by  
  • HISTAMINE H2-ANTAGONISTS—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after  
  • histamine H2-antagonists; absorption of pazopanib possibly reduced by  
  • PROTON PUMP INHIBITORS—manufacturer of pazopanib advises give at the same time as proton pump inhibitors  

Pegfilgrastim  
▶ Cytotoxics: neutropenia possibly exacerbated when pegfilgrastim given with  
  • CAPECITABINE, FLUOROURACIL or  
  • TEGAFUR  

Pegloticase Alfa see Interferons

Penicillamine  
▶ Analgesics: renal excretion of penicillamine possibly reduced by  
  • NSAIDS and ASPIRIN—consult product literature  
  • Antimalarials: antifolate effect of penicillamine increased by  
  • SULFINPYRAZONE  
  • Antipsychotics: avoid concomitant use of penicillamines with  
  • LIOTHERAPY  
  • Antidyspepsics: absorption of penicillamine reduced by  
  • TACAMIDINE  
  • Antipsychotics: avoid concomitant use of penicillamines with  
  • CITALOPRAM (increased risk of agranulocytosis)  

Penicillin  
▶ Analgesics: possible increased risk of nephrotoxicity when penicillin given with  
  • NSAIDS  
  • Antidepressants: absorption of penicillin reduced by  
  • ANTACIDS  
  • Antipsychotics: avoid concomitant use of penicillamines with  
  • CITALOPRAM (increased risk of agranulocytosis)  
  • Cardiac Glycosides: penicillin possibly reduces plasma concentration of  
  • DIGOXIN  
  • Iron Salts: absorption of penicillin reduced by  
  • ORAL IRON SALTS  
  • Sodium Aurothiomalate: manufacturer of penicillamine advises avoid concomitant use with  
  • SODIUM AUROTHIOMALATE (increased risk of toxicity)  
  • Zinc: penicillamine reduces absorption of  
  • ZINC, also absorption of penicillamine reduced by zinc  

Penicillins  
▶ Allopurinol: increased risk of rash when allopurinol, ampicillin or  
  • co-amoxiclav given with  
  • ANTACIDS  
  • Antibacterials: absorption of phenoxymethylpenicillin reduced by  
  • NEOMYCIN; effects of penicillins possibly antagonised by  
  • TETRACYCLINES  
  • Anticoagulants: an interaction between broad-spectrum penicillins and  
  • CUMINARINS and  
  • PHENIDINONE has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered  
  • Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with  
  • SODIUM VALPROATE and  
  • VALPROIC ACID  
  • Cytotoxics: penicillin reduces excretion of  
  • METHOTREXATE (increased risk of toxicity)  
  • Muscle Relaxants: piperacillin enhances effects of  
  • NON-DEPOLARISING MUSCLE RELAXANTS and  
  • SUXAMETHONIUM  
  • Mycophenolate: co-amoxiclav possibly reduces plasma concentration of  
  • MYCOPHENOLATE  
  • Sulfinpyrazone: excretion of penicillins reduced by  
  • SULFINPYRAZONE  
  • Vaccines: antibacterials inactivate  
  • ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF  

Penicillamine Isotenate  
▶ Anti-arrhythmics: increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • AMIODARONE—avoid concomitant use; possible increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • DISOPRIMIDE  
  • Antibacterials: increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • ERYTHROMYCIN; increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • MOXIPRAZACIN—

Pentamidine Isetenate  
▶ Anticholinergic: increased risk of ventricular arrhythmias when pentamidine isetenate given with  
  • AINSAMANID; possible increased risk of ventricular arrhythmias when pentamidine isetenate given with  
  • TETRACYCLES  
  ■ Antidepressants: avoidance of pentamidine isetenate advised by manufacturer of  
  • CITALOPRAM and  
  • ESCITALOPRAM (risk of ventricular arrhythmias); limited risk of ventricular arrhythmias when penicillamine isetionate given with  
  • DISOPRIMIDE  
  ▶ Antifungals: possible increased risk of nephrotoxicity when  
  • PENICILLAMINE or  
  • PENTAMINIDINE isetionate given with  
  • AMPHOTERICIN B  
  ▶ Antimalarials: avoidance of pentamidine isetenate advised by manufacturer of  
  • ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)  
  ▶ Antipsychotics: increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • AMISULPRIDE or  
  • DROPERIDOL; avoid concomitant use; increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • PHENOTHIAZINES  
  ▶ Antivirals: increased risk of hypocalcaemia when  
  • AINAMIDANID isetionate given with  
  • FOSCARIN; increased risk of ventricular arrhythmias when penicillamine isetionate given with  
  • SAQUINAVIR—avoid concomitant use  
  ▶ Cytotoxics: possible increased risk of ventricular arrhythmias when pentamidine isetenate given with  
  • VANETANID—avoid concomitant use  
  ▶ Ibuprofen: increased risk of ventricular arrhythmias when pentamidine isetenate given with  
  • IBUPROFEN  

Penkacin  see Opioid Analgesics

Pentazocine  
▶ Antipsychotics: avoid concomitant use of cyctoxics with  
  • CITALOPRAM (increased risk of agranulocytosis)  
  ▶ Cytotoxics: increased toxicity when pentazocine given with  
  • CYCLOPHOSPHAMIDE—avoid concomitant use; increased pulmonary toxicity when pentazocine given with  
  • FLUDARABINE (unacceptably high incidence of fatalities)  

Pentoxifylline  
▶ Aminophylline: pentoxifylline increases plasma concentration of  
  • AINAMIDANID  
  ▶ Analgesics: possible increased risk of bleeding when  
  • PENICILLAMINE given with  
  • NSAIDS; increased risk of bleeding  
  • KETOROLAC (avoid concomitant use)  
  ▶ Theophylline: pentoxifylline increases plasma concentration of  
  • THEOPHYLLINE  

Perampanel  
▶ Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by  
  • MAOIS and  
  • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered);  
  • Anticonvulsant effect of antiepileptics antagonised by  
  • SSNIS and  
  • TRICYCLICS (convulsive threshold lowered)  
  ▶ Antiepileptics: plasma concentration of perampanel reduced by  
  • CARBAMAZEPINE,  
  • FOSPHENTOIN,  
  • OXCARBAZEPINE and  
  • PHENYTOIN (see under Perampanel, p. 398); plasma concentration of perampanel reduced by  
  • TOPIRAMATE  
  ▶ Antifungals: plasma concentration of perampanel increased by  
  • KETOCONAZOLE  
  ▶ Antimalarials: anticonvulsant effect of antiepileptics antagonised by  
  • MELOQUINE  
  ▶ Antipsychotics: anticonvulsant effect of antiepileptics antagonised by  
  • ANTIPSYCHOTICS (convulsive threshold lowered)  
  ▶ Anxiolytics and Hypnotics: perampanel reduces plasma concentration of  
  • MIDAZOLAM  
  ▶ Orlistat: possible increased risk of convulsions when  
  • PENTAMINIDINE isetionate given with  
  • ORLISTAT  
  ▶ Progestogens: perampanel accelerates metabolism of  
  • PROGESTGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)  

PROTEINS
Phenindione

- Antipsychotics: effects of phenindione antagonised by
  - **ANTIPSYCHOTICS**
  - Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
  - Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
  - Metoclopramide: antiparkinsonian effect of dopaminergics antagonised by METOCLOPRAMIDE

Percyazine

- see Antipsychotics
- Perindopril: see ACE Inhibitors
- Perphenazine: see Antipsychotics

Pertuzumab

- Antipsychotics: avoid concomitant use of cytotoxics with
  - **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live **VACCINES**—avoid concomitant use

Pethidine

- see Opioid Analgesics

Phenelzine

- see MAOIs

Phenindione

**Note:** Change in patient’s clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control.

- **Alcohol:** anticoagulant control with phenindione may be affected by major changes in consumption of **ALCOHOL**
- **Anabolic Steroids:** anticoagulant effect of phenindione enhanced by **ANABOLIC STEROIDS**
- **Analgesics:** anticoagulant effect of phenindione possibly enhanced by **NSAIDS**; increased risk of haemorrhage when anticoagulants given with **intravenous DICLOFENAC** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **METOMOLAC** (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with **ASPIRIN** (due to antiplatelet effect)
- **Anti-arrhythmics:** metabolism of phenindione inhibited by
  - **AMIODARONE** (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by **DROKEDARONE**
- **Antibacterials:** experience in anticoagulant clinics suggests that **INR** possibly altered when phenindione is given with **NEOMYCIN** (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by **LEVOLOXACIN** and **TRETACYCLINES**; an interaction between phenindione and broad-spectrum **PENICILLINS** has not been demonstrated in studies, but common experience in anticoagulant clinics is that **INR** can be altered; metabolism of phenindione possibly inhibited by **SULFONAMIDES**
- **Anticonvulsants:** increased risk of haemorrhage when other anticoagulants given with **APIXABAN**, **DARIGATAN** and **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- **Antivirals:** anticoagulant effect of phenindone possibly enhanced by **RITONAVIR**
- **Clopidogrel:** anticoagulant effect of phenindone enhanced due to antiplatelet action of **CLOPIDOGREL**
- **Corticosteroids:** anticoagulant effect of phenindone may be enhanced or reduced by **CORTICOSTEROIDS**
- **Cytotoxics:** avoidance of phenindione advised by manufacturer of **IBUTINIB**
- **Dipyridamole:** anticoagulant effect of phenindone enhanced due to antiplatelet action of **DIPYRIDAMOLE**
- **Enteral Foods:** anticoagulant effect of phenindone antagonised by vitamin K (present in some **ENTERAL FEEDS**)**
- **Hloprost:** increased risk of bleeding when phenindone given with **HLOPROST**
- **Lipid-regulating Drugs:** anticoagulant effect of phenindone may be enhanced or reduced by **COLESTYRAMINE**; anticoagulant effect of phenindone possibly enhanced by **ROSUVASTATIN**; anticoagulant effect of phenindone enhanced by **FIBRATES**

**Phenindione (continued)**

- **Oestrogens:** anticoagulant effect of phenindone antagonised by **OESTROGENS**
- **Prasugrel:** possible increased risk of bleeding when phenindione given with **PRAUGREL**
- **Progestogens:** anticoagulant effect of phenindone antagonised by **PROGESTOGENS**
- **Testolactone:** anticoagulant effect of phenindone enhanced by **TESTOLACTONE**
- **Testosterone:** anticoagulant effect of phenindone enhanced by **TESTOSTERONE**
- **Thyroid Hormones:** anticoagulant effect of phenindone enhanced by **THYROID HORMONES**
- **Vitamins:** anticoagulant effect of phenindone antagonised by **VITAMIN K**

**Phenobarbital**

- **Alcohol:** increased sedative effect when phenobarbital given with **ALCOHOL**
- **Aminophylline:** phenobarbital accelerates metabolism of **AMINOPHYLLINE** (reduced effect)
- **Analgesics:** phenobarbital reduces plasma concentration of **METADOLE** and **FABADOLANET**—consider increasing albenzadole and praziquantel dose when given for systemic infections
- **Antiepileptics:** metabolism of phenobarbital accelerated by **DIPHTYRAMIDE** (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of **DROKEDARONE**—avoid concomitant use; phenobarbital possibly accelerates metabolism of **PROPANE**
- **Antibacterials:** phenobarbital accelerates metabolism of **DISOPYRAMIDE** (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of **RIFAMPICIN**; phenobarbital accelerates metabolism of **DOXYCYCLINE** (reduced plasma concentration); phenobarbital possibly accelerates metabolism of **CHLORAPHEXATIC** (reduced plasma concentration); phenobarbital reduces plasma concentration of **TELITHROMYCIN** (avoid during and for 2 weeks after phenobarbital)
- **Anticoagulants:** phenobarbital possibly reduces plasma concentration of **APIXABAN**; phenobarbital accelerates metabolism of **COUMARINS** (reduced anticoagulant effect); phenobarbital possibly reduces plasma concentration of **RIVAROXABAN**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidepressants:** phenobarbital reduces plasma concentration of **REDOBOTINE**; phenobarbital reduces plasma concentration of **PAROXETINE**; phenobarbital accelerates metabolism of **MIANDERON** (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by **MAOIS** and **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptic antagonised by **SSRIS** and **TRICYCLICS** (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by **ST JOHN’S WORT**—avoid concomitant use; phenobarbital possibly accelerates metabolism of **TRICYCLICS** (reduced plasma concentration)
- **Antiepileptics:** plasma concentration of phenobarbital possibly increased by **CARBAMAZEPINE**; phenobarbital possibly reduces plasma concentration of **ETHOSUXIMIDE**, **RUFINAMIDE** and **TOPRAMES**; plasma concentration of phenobarbital often increased by **PHOSPHETON** and **PHNETOIN**, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; phenobarbital reduces plasma concentration of **LAMOTRIPINE**, **TAPIAGINE** and **ZONISAMIDE**; plasma concentration of phenobarbital increased by **OXYCARBAPINE**; also plasma concentration of an active metabolite of oxcarbapene reduced and broad-spectrum of phenobarbital increased by **SODIUM VALPROATE** and **VALPROIC ACID** (also plasma concentration of sodium valproate and valproic acid reduced); plasma concentration of phenobarbital increased by **STRIPENAL**
- **Antifungals:** phenobarbital possibly reduces plasma concentration of **ITRAVONAZOLE** and **POSACZANOME**.
Phenobarbital

- Antifungals (continued)
  - Phenobarbital possibly reduces plasma concentration of voriconazole—avoid concomitant use; phenobarbital reduces absorption of griseofulvin (reduced effect).
  - Antimicrobials: avoidance of phenobarbital advised by manufacturer of arteminol with piperaquine; anticonvulsant effect of antiepileptics antagonised by mefloquine.
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of clozapine; phenobarbital possibly reduces plasma concentration of lurasidone—avoid concomitant use.
  - Antibiotics: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir, indinavir, lopinavir and saquinavir; avoidance of phenobarbital advised by manufacturer of boceprevir and rilpivirine (plasma concentration of boceprevir and rilpivirine possibly reduced); phenobarbital possibly reduces plasma concentration of daclatasvir and simprevir—manufacturer of daclatasvir and simprevir advises avoid concomitant use; avoidance of phenobarbital advised by manufacturer of dolasetron, etravirine, fos fosfubuvir and telaprevir.
  - Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with anxiolytics and hypnotics; phenobarbital often reduces plasma concentration of clonazepam.
  - Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant.
  - Avanafil: phenobarbital possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use.
  - Beta-blockers: phenobarbital possibly reduces plasma concentration of propranolol.
  - Caffeine citrate: effects of phenobarbital possibly antagonised by caffeine citrate.
  - Calcium-channel Blockers: phenobarbital probably reduces effects of calcium-channel blockers; avoidance of phenobarbital advised by manufacturer of isradipine; avoidance of phenobarbital advised by manufacturer of nimodipine (plasma concentration of nimodipine reduced).
  - Cannabinoids: phenobarbital possibly reduces plasma concentration of cannabis extract—manufacturer of cannabis extract advises avoid concomitant use.
  - Ciclosporin: phenobarbital accelerates metabolism of ciclosporin (reduced plasma concentration).
  - Ciclosporin: phenobarbital possibly reduces plasma concentration of ciclosporin—manufacturer of ciclosporin advises avoid concomitant use.
  - Corticosteroids: phenobarbital accelerates metabolism of corticosteroids (reduced effect).
  - Cytotoxic: phenobarbital possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); phenobarbital possibly reduces plasma concentration of bortezomib, bosutinib, crizotinib and ponatinib—manufacturer of bortezomib, bosutinib, crizotinib and ponatinib advises avoid concomitant use; phenobarbital possibly reduces plasma concentration of cabozantinib—avoid concomitant use; avoidance of phenobarbital advised by manufacturer of cabazitaxel, dabrafenib and gefitinib; avoidance of phenobarbital advised by manufacturer of dabrafenib and vemurafenib (plasma concentration of dasatinib and vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenobarbital given with procarbazine.
  - Diuretics: phenobarbital reduces plasma concentration of eplerenone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors.
  - Fosaprepitant: phenobarbital possibly reduces plasma concentration of fosaprepitant.
  - Hormone Antagonists: phenobarbital possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; phenobarbital accelerates metabolism of toremifene (reduced plasma concentration).
  - Ivermectin: phenobarbital possibly reduces plasma concentration of ivermectin.
  - Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of montelukast.
  - Oestrogens: phenobarbital accelerates metabolism of oestrogens (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF).
  - Orlastat: possible increased risk of convulsions when antiepileptics given with orlistat.
  - Progestogens: phenobarbital accelerates metabolism of progestogens (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, eutogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF).
  - Roflumilast: phenobarbital possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use).
  - Sodium Oxybate: avoidance of phenobarbital advised by manufacturer of sodium oxybate.
  - Sympathomimetics: plasma concentration of phenobarbital possibly increased by methylphenidate.
  - Tacrolimus: phenobarbital reduces plasma concentration of tacrolimus.
  - Theophylline: phenobarbital accelerates metabolism of theophylline (reduced effect).
  - Thyroid Hormones: phenobarbital accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism).
  - Ticagrelor: phenobarbital possibly reduces plasma concentration of ticagrelor.
  - Ulipristal: avoidance of phenobarbital advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced).
  - Vitamins: phenobarbital possibly increases requirements for alfalcalfirol, calcitriol, colcabliciferol, dihydroxachysteryl, ergocalciferol, paricalcitol or vitamin D.

Phenothiazines see Antipsychotics.
Phenobarbital (continued)

- Cytotoxics (continued)
  - Diuretics: phenobarbital reduces plasma concentration of eplerenone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors.
  - Fosaprepitant: phenobarbital possibly reduces plasma concentration of fosaprepitant.
  - Hormone Antagonists: phenobarbital possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; phenobarbital accelerates metabolism of toremifene (reduced plasma concentration).
  - Ivermectin: phenobarbital possibly reduces plasma concentration of ivermectin.
  - Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of montelukast.
  - Oestrogens: phenobarbital accelerates metabolism of oestrogens (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF).
  - Orlastat: possible increased risk of convulsions when antiepileptics given with orlistat.
  - Progestogens: phenobarbital accelerates metabolism of progestogens (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, eutogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF).
  - Roflumilast: phenobarbital possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use).
  - Sodium Oxybate: avoidance of phenobarbital advised by manufacturer of sodium oxybate.
  - Sympathomimetics: plasma concentration of phenobarbital possibly increased by methylphenidate.
  - Tacrolimus: phenobarbital reduces plasma concentration of tacrolimus.
  - Theophylline: phenobarbital accelerates metabolism of theophylline (reduced effect).
  - Thyroid Hormones: phenobarbital accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism).
  - Ticagrelor: phenobarbital possibly reduces plasma concentration of ticagrelor.
  - Ulipristal: avoidance of phenobarbital advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced).
  - Vitamins: phenobarbital possibly increases requirements for alfalcalfirol, calcitriol, colcabliciferol, dihydroxachysteryl, ergocalciferol, paricalcitol or vitamin D.

Phenothiazines see Antipsychotics.
Phenobarbital (continued)

- Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of alcohol.
- Aminophylline: plasma concentration of both drugs reduced when phenytoin given with aminophylline.
- Analgesics: excretion of phenytoin possibly reduced by acetaminophen (increased risk of toxicity); phenytoin possibly accelerates metabolism of fentanyl (reduced effect); phenytoin accelerates metabolism of methadone (reduced effect and risk of withdrawal effects); phenytoin possibly increases risk of pethidine toxicity; effects of phenytoin enhanced by aspirin; phenytoin possibly accelerates...
Phenytoin

- Analgesics (continued)
  - metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)

- Antacids: absorption of phenytoin reduced by ANTACIDS

- Antidepressants: phenytoin reduces plasma concentration of ALBENDAZOLE and PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections; plasma concentration of phenytoin possibly increased by LIVESOL

- Anti-arrhythmics: metabolism of phenytoin inhibited by AMIODARONE (increased plasma concentration); phenytoin reduces plasma concentration of DOPSYPARIDE; phenytoin possibly reduces plasma concentration of DRONEDARONE—avoid concomitant use

- Antibacterials: metabolism of phenytoin inhibited by CLARITHROMYCIN (increased plasma concentration); metabolism of phenytoin possibly inhibited by METRONIDAZOLE (increased plasma concentration); plasma concentration of phenytoin increased or decreased by CIPROFLOXACIN; phenytoin accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); phenytoin possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of phenytoin increased by CHLORAMPHENICOL (increased risk of toxicity); metabolism of phenytoin possibly inhibited by ISONIAZID (increased risk of toxicity); metabolism of phenytoin accelerated by RIFAMYCINS (reduced plasma concentration); plasma concentration of phenytoin possibly increased by SULFONAMIDES; phenytoin reduces plasma concentration of TELITHROMYCIN (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by TRIMETHOPRIM (also increased antifolate effect)

- Anticonvulsants: phenytoin possibly reduces plasma concentration of APIXABAN; phenytoin accelerates metabolism of COUMARINS (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of DARIGATAN—manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis

- Antidepressants: plasma concentration of phenytoin increased by BUPROPION and FLUOXETINE; plasma concentration of MIANSERIN, MIRTAZAPINE and PAROXETINE; plasma concentration of phenytoin possibly increased by SERTRALINE, also increased antifolate effect; plasma concentration of phenytoin possibly increased by TRICYCLIC-RELATED ANTIDEPRESSANTS (convasive threshold lowered); anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and a TRICYCLIC-RELATED ANTIDEPRESSANTS (convasive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convasive threshold lowered); plasma concentration of phenytoin possibly reduced by ST JOHN’S WORT—avoid concomitant use; phenytoin possibly reduces plasma concentration of TRICYCLICS

- Antidiabetics: plasma concentration of phenytoin transiently increased by TOLBUTAMIDE (possibility of toxicity)

- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with CARBAMAZEPINE, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of ESLICARBAPZEPINE, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin possibly increased by ETHOSUXIMIDE, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of LAMOTRIGINE, TIAGABINE and Zonisamide; plasma concentration of phenytoin increased by OXCARBZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin reduces plasma concentration of PERAMAPANEL (see under Perampanel, p. 398); phenytoin often increases plasma concentration of PHENOBARBITAL and PRIMIDONE, plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of RETIGABINE;

Phenytoin

- Antiepileptics (continued)
  - phenytoin possibly reduces plasma concentration of RUFINAMIDE, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased or possibly reduced when given with SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of phenytoin increased by STRIPENTOL; plasma concentration of phenytoin increased by TOPiramate (also plasma concentration of topiramate reduced); plasma concentration of phenytoin reduced by VIGABATRIN

- Antifungals: phenytoin reduces plasma concentration of KETOCONAZOLE and POSACONAZOLE; anticonvulsant effect of phenytoin enhanced by MICONAZOLE (plasma concentration of phenytoin increased by FLUCONAZOLE (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of ITRACONAZOLE—avoid concomitant use; plasma concentration of phenytoin increased by VORICONAZOLE, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of CASPOFUNGIN—consider increasing dose of caspofungin

- Antimalarias: avoidance of phenytoin advised by manufacturer of ARTENIOL WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by MELLOQUINE; anticonvulsant effect of phenytoin antagonised by PYRIMETHAMINE, also increased antifolate effect

- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTI PSYCHOTICS (convasive threshold lowered); phenytoin possibly reduces plasma concentration of HALOPERIDOL; plasma concentration of phenytoin possibly increased or decreased by CHLORPROMAZINE; phenytoin possibly reduces plasma concentration of AMIPO PRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenytoin accelerates metabolism of CLOzapINE and QUETiapINE (reduced plasma concentration); phenytoin possibly reduces plasma concentration of Lurasidone—avoid concomitant use

- Antivirals: phenytoin possibly reduces plasma concentration of ABACAVIR, DARUNAVIR, LOPINAVIR and SAQUINAVIR; avoidance of phenytoin recommended

- Antibacterials: plasma concentration of phenytoin possibly inhibited by APREPITANT and RILPIVIRINE (plasma concentration of boceprevir and rilpivirine possibly reduced); phenytoin possibly reduces plasma concentration of DA LCATASIV and SIMEPREVIR—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of phenytoin advised by manufacturer of DOLUTEGRAVIR, ELVITEGRAVIR, ETARVIRINE, SOFOSBUVIR and TELAPREVI; phenytoin possibly reduces plasma concentration of INDINAVIR, also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of RITONAVIR, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by ZIDOVUDINE

- Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of CLONAZEPAM; plasma concentration of phenytoin increased or decreased by DIAZEPAM; plasma concentration of phenytoin possibly increased or decreased by BENZODIAZEPINES

- Aprepitant: phenytoin possibly reduces plasma concentration of APREPI TANT

- Bupropion: phenytoin reduces plasma concentration of BUPROPION

- Caffeine citrate: phenytoin reduces plasma concentration of CAFFEINE CITRATE

- Calcium-channel Blockers: phenytoin reduces effects of FELODIPINE and VERAPAMIL; avoidance of phenytoin advised by manufacturer of ISRADIPINE; avoidance of phenytoin advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); plasma
Phenytoin (continued)

▶ Lithium: neurotoxicity may occur when phenytoin given with LITHIUM without increased plasma concentration of lithium
▶ Macitentan: avoidance of phenytoin advised by manufacturer of MACITENTAN
▶ Modafinil: plasma concentration of phenytoin possibly increased by MODAFINIL
▶ Muscle Relaxants: long-term use of phenytoin reduces effects of NON-DEPOLARISING MUSCLE RELAXANTS (but acute use of phenytoin might increase effects of non-depolarising muscle relaxants)
▶ Oestrogens: phenytoin accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
▶ Oral: possible increased risk of convulsions when antiepileptics given with ORLISTAT
▶ Progestogens: phenytoin accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
▶ Rosuvastatin: phenytoin possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
▶ Sulfonpyrazone: plasma concentration of phenytoin increased by SULFONPYRAZONE
▶ Symphathomimetics: plasma concentration of phenytoin increased by METHYLPHENIDATE
▶ Tacrolimus: phenytoin reduces plasma concentration of TACROLIMUS, also plasma concentration of phenytoin possibly increased
▶ Theophylline: plasma concentration of both drugs reduced when phenytoin given with THEOPHYLLINE
▶ Thyroid Hormones: phenytoin accelerates metabolism of THYROID HORMONES (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
▶ Tibolone: phenytoin accelerates metabolism of TIBOLONE
▶ Ticagrelor: phenytoin possibly reduces plasma concentration of TICAGRELOR
▶ Ulcer-healing Drugs: metabolism of phenytoin inhibited by Cimetidine (increased plasma concentration); effects of phenytoin enhanced by ISOMEPRAZOLE; effects of phenytoin possibly enhanced by OMEPRAZOLE; absorption of phenytoin reduced by SUCRALFATE
▶ Ulipristal: avoidance of phenytoin advised by manufacturer of ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
▶ Vaccines: effects of phenytoin enhanced by INFLUENZA VACCINE
▶ Vitamins: phenytoin possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLCACLIFEROL, DIHYDROTACHYSTEROL, ERGOCLIFEROL, PARICALCITOL or VITAMIN D

Phenolamine
▶ Antidepressants: manufacturer of phenoxyamine advises avoid for 2 weeks after stopping MAOIs

Phosphodiesterase Type 3 Inhibitors
▶ Angrenide: avoidance of enoximone and milrinone advised by manufacturer of ANGRELIDE

Pilocarpine see Parasympathomimetics

Pimozone see Antipsychotics

Pindolol see Beta-blockers

Pioglitazone see Antidiabetics

Piperacillin see Piperacillin

Piperazine see Artesin, Arthritis with Piperaquine

Pipitone see Antipsychotics

Pirfenidone
▶ Antibacterials: plasma concentration of pirfenidone increased by CIPROFLOXACIN—see under Pirfenidone, p. 260
▶ Antidepressants: plasma concentration of pirfenidone increased by FLUVOXAMINE—manufacturer of pirfenidone advises avoid concomitant use
▶ Grapefruit Juice: manufacturer of pirfenidone advises avoid concomitant use with GRAPEFRUIT JUICE
Piroxicam see NSAIDs
Pimecrolimus see Pimecrolimus
Pipamperone
- Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when pipamperone given with live VACCINES—avoid concomitant use

Pizotifen
- Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of ADRENERGIC NEURONE BLOCKERS

Platinum Compounds
- Aldesleukin: avoidance of cisplatin advised by manufacturer of ALDESLLEUKIN
- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with AMINOGlicosIDES or POLYMXYINS; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with CAPREOMYCIN; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with VANCOMYCIN
- Antiepileptics: cisplatin possibly reduces plasma concentration of CICLOSPORIN and PHENTYON
- Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
- Anticoagulants: plasma concentration of ponatinib possibly reduced by INHANIVAR, RITONAVIR and SAQUINAVIR—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814)
- Antifungals: plasma concentration of ponatinib increased by KETOCONAZOLE; plasma concentration of ponatinib possibly increased by ITRACONAZOLE and VORICONAZOLE—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814)
- Antivirals: plasma concentration of ponatinib possibly increased by INDINAVIR, RITONAVIR and SAQUINAVIR—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814)
- Grapefruit juice: plasma concentration of ponatinib possibly increased by GRAPFRUIT JUICE

Pneumococcal Vaccine see Vaccines
Polymyxins
- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with AMINOGLicosIDES; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with CAPREOMYCIN; increased risk of nephrotoxicity when polymyxins given with VANCOMYCIN; increased risk of nephrotoxicity and ototoxicity when colistimethate sodium given with VANCOMYCIN
- Antifungals: increased risk of nephrotoxicity when polymyxins given with AMPHOTERICIN
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with CICLOSPORIN
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with PLATINUM COMPOUNDS
- Diuretics: increased risk of ototoxicity when polymyxins given with LOOP DIURETICS
- Muscle Relaxants: polymyxins enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM
- Parasympathomimetics: polymyxins antagonise effects of NEOSTIGMINE and PYRIDOSTIGMINE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Potassium Bicarbonate see Potassium Salts
Potassium Chloride see Potassium Salts
Potassium Citrate see Potassium Salts
Potassium Salts
- NOTE Includes salt substitutes
- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with ACE INHIBITORS
- Aloxilren: increased risk of hyperkalaemia when potassium salts given with ALOXILREN
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: avoid concomitant use of potassium citrate with METHENAMINE
- Ciclosporin: increased risk of hyperkalaemia when potassium salts given with CICLOSPORIN
- Diuretics: increased risk of hyperkalaemia when potassium salts given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with TACROLIMUS
- Ulcer-healing Drugs: avoidance of potassium citrate advised by manufacturer of SUCRALFATE

Pramipexole
- Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of ANTIPSYCHOTICS (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by METHYLODOA
- Ulcer-healing Drugs: excretion of pramipexole reduced by CIMETIDINE (increased plasma concentration)

Prazosin
- Analgesics: possible increased risk of bleeding when prasugrel given with NSAIDS
- Anticoagulants: possible increased risk of bleeding when prasugrel given with COUMARINS or PHENINDIONE
- Clopogrel: possible increased risk of bleeding when prasugrel given with CLOPIDOGREL

Pravastatin see Statins
Praziquantel
- Antibacterials: plasma concentration of praziquantel reduced by rifampicin
- Antiepileptics: plasma concentration of praziquantel reduced by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone—consider increasing praziquantel dose when given for systemic infections
- Antifungals: plasma concentration of praziquantel increased by KETOCONAZOLE
Praziquantel (continued)
- Antimalarials: plasma concentration of praziquantel reduced by
  - CHLOROQUINE—consider increasing praziquantel dose when given for systemic infections
- Corticosteroids: plasma concentration of praziquantel possibly reduced by continuous use of DEXAMETHASONE
- Grapefruit Juice: plasma concentration of praziquantel increased by GRAPEFRUIT JUICE
- Ulcer-healing Drugs: plasma concentration of praziquantel increased by Cimetidine

Prazosin see Alpha-blockers
Prednisolone see Corticosteroids
Prednisone see Corticosteroids
Pregabalin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered);
- Anticholinergics: anticonvulsant effect of antiepileptics antagonised by ATROPINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIHYPERGLYCEMIC DRUGS
- Antiepileptics: plasma concentration of primidone possibly reduced by SSRIs and TRICYCLICS (convulsive threshold lowered);
- Antihistamines: plasma concentration of primidone possibly reduced by ST JOHN’S WORT—avoid concomitant use; primidone possibly accelerates metabolism of TRICYCLICS (convulsive threshold lowered);
- Antiepileptics: plasma concentration of primidone possibly increased by CARBARbamazepine; primidone possibly reduces plasma concentration of ETHOSUXIMIDE, RUFINAMIDE and TOPIRAMATE; plasma concentration of primidone often increased by FOSPHENytoin and PHENytoin, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; primidone reduces plasma concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of primidone increased by oxicABAZEPINE, also plasma concentration of an active metabolite of oxcABAZEPINE reduced; plasma concentration of primidone increased by SAPROFEN; primidone possibly reduces plasma concentration of LAMOTRIGINE.
- Antiepileptics: plasma concentration of primidone possibly increased by trICARAZOLE and POSACOAzoLE—avoid concomitant use; primidone reduces absorption of GISeOFULVIn (reduced effect)
- Antimalarials: avoidance of primidone advised by manufacturer of ARTEMether with LUMEFANTRINE
- Histamine: avoidance of antimalarials advised by manufacturer of NIFEDIPINE
- Mepacrine: plasma concentration of primaquine increased by PRIMAQUINE; avoidance of antimalarials advised by manufacturer of PLASMA.
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Primidone
- Alcohol: increased sedative effect when primidone given with ALCOHOL.
- Aminophylline: primidone accelerates metabolism of AMINOPHYLLINE (reduced effect).
- Analgesics: primidone reduces plasma concentration of METHADONE; primidone possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity).
- Antihistamines: primidone reduces plasma concentration of ALBENDAZOLE and PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections.
- Antihistamines: primidone accelerates metabolism of DISOPYRAMIDE (reduced plasma concentration); primidone possibly reduces plasma concentration of DRONEDARONE—avoid concomitant use; primidone possibly accelerates metabolism of PROPafenONE.
- Antihistamines: primidone accelerates metabolism of METRONIDAZOLE (reduced effect); primidone possibly reduces plasma concentration of Rifampicin; primidone accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); primidone possibly accelerates metabolism of CHLORAMPHENICOL (reduced plasma concentration); primidone reduces plasma concentration of APIXABAN; primidone accelerates metabolism of COUMARINS (reduced anticoagulant effect); primidone possibly reduces plasma concentration of Rivaroxaban; primidone accelerates metabolism of APOTHEKIRIN; primidone accelerates plasma concentration of REBOXETINE; primidone reduces plasma concentration of PAROXETINE; primidone accelerates metabolism of MANSERIN (reduced plasma concentration);
- Antidepressants: primidone possibly reduces plasma concentration of reBOXETINE; primidone reduces plasma concentration of parOXETINE; primidone accelerates metabolism of mANSERIN (reduced plasma concentration);
- Antipsychotics: primidone possibly reduces plasma concentration of LURASIDONE—avoid concomitant use.
- Antivirals: primidone possibly reduces plasma concentration of ABACAVIR, DURANAVIR, FOSSAPRENAVIR, INIDINAVIR, LOpinavIR and SAQUINAVIR; avoidance of primidone advised by manufacturer of BOCERVIR and SIMEPREVIR (plasma concentration of boceprevir and rilpivirine possibly reduced); primidone possibly reduces plasma concentration of DACLATASVIR and SIMEPREVIR—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; avoidance of primidone advised by manufacturer of DULTEGRAVIR, ELVITEGRAVIR, ETVIRINE, SOFOSBUVIR and TELAPREVIR.
- Anxiolytics and Hypnotics: increased sedative effect when primidone given with ANXIOLYTICS AND HYPNOTICS; primidone often reduces plasma concentration of CLONAZEPAM.
- Antipsychotics: primidone possibly reduces plasma concentration of FLUPERCHANT.

Primodone (continued)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered);
- Anticholinergics: anticonvulsant effect of antiepileptics antagonised by ATROPINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIHYPERGLYCEMIC DRUGS
- Antiepileptics: plasma concentration of primidone possibly reduced by SSRIs and TRICYCLICS (convulsive threshold lowered);
- Antihistamines: plasma concentration of primidone possibly reduced by ST JOHN’S WORT—avoid concomitant use; primidone possibly accelerates metabolism of TRICYCLICS (convulsive threshold lowered);
- Antiepileptics: plasma concentration of primidone possibly increased by CARBARbamazepine; primidone possibly reduces plasma concentration of ETHOSUXIMIDE, RUFINAMIDE and TOPIRAMATE; plasma concentration of primidone often increased by FOSPHENytoin and PHENytoin, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; primidone reduces plasma concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of primidone increased by oxicABAZEPINE, also plasma concentration of an active metabolite of oxcABAZEPINE reduced; plasma concentration of primidone increased by SAPROFEN; primidone possibly reduces plasma concentration of LAMOTRIGINE.
- Antiepileptics: plasma concentration of primidone possibly increased by trICARAZOLE and POSACOAzoLE—avoid concomitant use; primidone reduces absorption of GISeOFULVIn (reduced effect)
- Antimalarials: avoidance of primidone advised by manufacturer of ARTEMether with LUMEFANTRINE
- Histamine: avoidance of antimalarials advised by manufacturer of NIFEDIPINE
- Mepacrine: plasma concentration of primaquine increased by PRIMAQUINE; avoidance of antimalarials advised by manufacturer of PLASMA.
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Pregabalin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered);
- Anticonvulsants: anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered);
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ST JOHN’S WORT—avoid concomitant use; primidone possibly accelerates metabolism of TRICYCLICS (convulsive threshold lowered);
- Antiepileptics: plasma concentration of primidone possibly increased by CARBARbamazepine; primidone possibly reduces plasma concentration of ETHOSUXIMIDE, RUFINAMIDE and TOPIRAMATE; plasma concentration of primidone often increased by FOSPHENytoin and PHENytoin, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; primidone reduces plasma concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of primidone increased by oxicABAZEPINE, also plasma concentration of an active metabolite of oxcABAZEPINE reduced; plasma concentration of primidone increased by SAPROFEN; primidone possibly reduces plasma concentration of LAMOTRIGINE.
- Antiepileptics: plasma concentration of primidone possibly increased by trICARAZOLE and POSACOAzoLE—avoid concomitant use; primidone reduces absorption of GISeOFULVIn (reduced effect)
- Antimalarials: avoidance of primidone advised by manufacturer of ARTEMether with LUMEFANTRINE
- Histamine: avoidance of antimalarials advised by manufacturer of NIFEDIPINE
- Mepacrine: plasma concentration of primaquine increased by PRIMAQUINE; avoidance of antimalarials advised by manufacturer of PLASMA.
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
Primidone (continued)
- Cobicistat: primidone reduces plasma concentration of cobicistat - manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: primidone accelerates metabolism of corticosteroids (reduced effect)
- Cytotoxics: primidone possibly decreases plasma concentration of cytotoxics (increase dose of cytotoxics — consult cytotoxics product literature); primidone possibly reduces plasma concentration of bortezomib, bosutinib, crizotinib and ponatinib — manufacturer of bortezomib, bosutinib, crizotinib and ponatinib advises avoid concomitant use; primidone possibly reduces plasma concentration of carboxysteroids (reduced effect)
- Diuretics: primidone reduces plasma concentration of diuretics; primidone reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when primidone given with procarbazine
- Folic acid: primidone reduces plasma concentration of folic acid; primidone reduces plasma concentration of etoposide in association with irinotecan and its active metabolite; increased risk of osteomalacia when primidone given with folic acid
- IVacaftor: primidone possibly reduces plasma concentration of ivacaftor — manufacturer of ivacaftor advises avoid concomitant use
- Leukotriene receptor antagonists: primidone reduces plasma concentration of leukotriene receptor antagonists
- Hormone antagonists: primidone possibly reduces plasma concentration of hormone antagonists — manufacturer of abiraterone advises avoid concomitant use; primidone accelerates metabolism of toremifene — reduced plasma concentration
- Progestogens: primidone possibly reduces plasma concentration of progestogens — manufacturer of abiraterone advises avoid concomitant use; primidone accelerates metabolism of progestogens — reduced plasma concentration
- Vincristine: primidone reduces plasma concentration of vincristine
- Etosposes: primidone reduces plasma concentration of etosposes - manufacturer of abiraterone advises avoid concomitant use
- Progestogens: primidone possibly reduces plasma concentration of progestogens — manufacturer of abiraterone advises avoid concomitant use; primidone accelerates metabolism of progestogens — reduced plasma concentration
- Roflumilast: primidone possibly inhibits effects of roflumilast — manufacturer of roflumilast advises avoid concomitant use
- Sodium Oxybate: avoidance of primidone advised by manufacturer of sodium oxybate
- Sympathomimetics: plasma concentration of primidone possibly increased by methylphenidate
- Tacrolimus: primidone reduces plasma concentration of tacrolimus
- Theophylline: primidone accelerates metabolism of theophylline (reduced effect)
- Thyroid Hormones: primidone accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)
- Ticagrelor: primidone possibly reduces plasma concentration of ticagrelor
- Ulipristal: avoidance of primidone advised by manufacturer of ulipristal — (contraceptive effect of ulipristal possibly reduced)

Primidone (continued)
- Vitamins: primidone possibly increases requirements for alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D

Procarbazine
- Alcohol: disulfiram-like reaction when procarbazine given with alcohol
- Antiepileptics: manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when given with carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone
- Antipsychotics: avoidance of concomitant use of cytoprotects with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: procarbazine possibly reduces absorption of digoxin tablets

Prochlorperazine
- see Antipsychotics

Procyclidine
- see Antimuscarinics

Progesterone
- see Progestogens

Progestogens
- Antibacterials: plasma concentration of dienogest increased by erythromycin — metabolism of progestogens accelerated by rifamycins (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception — see Contraceptive Interactions in BNF)
- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of coumarins; progestogens antagonise anticoagulant effect of phenindione
- Antidepressants: contraceptive effects of progestogens reduced by st john’s wort (avoid concomitant use)
- Antidiabetics: progestogens antagonise hypoglycaemic effect of antidiabetics
- Antiepileptics: metabolism of progestogens accelerated by carbamazepine, edicatecarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, Rufinamide and topiramate (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception — see Contraceptive Interactions in BNF); desogestrel possibly increases plasma concentration of lamotrigine
- Antifungals: progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with griseofulvin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbinafin
- Antivirals: plasma concentration of norethisterone increased by atazanavir; plasma concentration of drospirenone increased by boceprevir (increased risk of toxicity); contraceptive effect of progestogens possibly reduced by efavirenz; plasma concentration of norgestimate increased by elvitegravir; metabolism of progestogens accelerated by nevirapine (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception — see Contraceptive Interactions in BNF)
- Anxiety and Hypnotics: progestogens possibly increase plasma concentration of chlor Diazepoxide, diazepam and nitrazepam; progestogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with aprepitant (alternative contraception recommended)
- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with bosentan (alternative contraception recommended)
- Ciclosporin: progestogens possibly increase plasma concentration of ciclosporin
- Cobicistat: plasma concentration of norgestimate increased by cobicistat
Propafenone
- Antivirals (continued)
  - Propafenone advised by manufacturer of TELAPREVIR (risk of ventricular arrhythmias)
- Beta-blockers; increased myocardial depression when anti-arrhythmics given with BETA-BLOCKERS; propafenone increases plasma concentration of METOPROLOL and PROPRANOLOL
- Cardiac Glycosides: propafenone increases plasma concentration of DIGOXIN (halve dose of digoxin)
- Cisopropin: propafenone possibly increases plasma concentration of CICLOSPORIN
- Parasympathomimetics: propafenone possibly antagonises effects of NEOSTIGMINE and PYRIDOSTIGMINE
- Theophylline: propafenone increases plasma concentration of THEOPHYLLINE
- Ulcer-healing Drugs: plasma concentration of propafenone increased by CIMETIDINE

Propantheline see Antimuscarinics
Propiverine see Antimuscarinics
Propropofol see Anaesthetics, General
Propranolol see Beta-blockers

Prostaglandins
- ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with ALPHA-BLOCKERS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Beta-blockers: enhanced hypotensive effect when alprostadil given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when alprostadil given with CLONIDINE
- Diazoxide: enhanced hypotensive effect when alprostadil given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when alprostadil given with DIURETICS
- Methyldopa: enhanced hypotensive effect when alprostadil given with METHYLDOPA
- Moxonidine: enhanced hypotensive effect when alprostadil given with MOXONIDINE
- Nitrates: enhanced hypotensive effect when alprostadil given with NITRATES
- Oxytocin: prostanoids potentiate uterorecific effect of OXYTOCIN
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Protein Kinase Inhibitors see individual drugs

Proton Pump Inhibitors
- Antacids: absorption of lansoprazole possibly reduced by ANTACIDS
- Antibacterials: plasma concentration of both drugs increased when omeprazole given with CLARITHROMYCIN
- Anticagulants: pantoprazole might enhance the anticoagulant effect of COUMARINS; esomeprazole and omeprazole possibly enhance anticoagulant effect of COUMARINS
- Antidepressants: omeprazole increases plasma concentration of ESCITALOPRAM; plasma concentration of lansoprazole possibly increased by FLUVOXAMINE; plasma concentration of omeprazole possibly reduced by ST JOHN’S WORT
- Antiepileptics: omeprazole possibly enhances effects of FOSPHENYToin and PHYTON; esomeprazole enhances effects of FOSPHENYTin and PHYTON
- Antifungals: proton pump inhibitors reduce absorption of ITRACONAZOLE and KETOCONAZOLE; esomeprazole reduces plasma concentration of POSaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole
Pyrazinamide

Antifungals (continued)
possibly reduce plasma concentration of Pyrazinamide—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of fosfomycin possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)

Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine

Antivirals: proton pump inhibitors reduce plasma concentration of azithromycin—avoid or adjust dose of both drugs (consult product literature); omeprazole increases plasma concentration of raltegravir; avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of rilpivirine (plasma concentration of rilpivirine possibly reduced); omeprazole reduces plasma concentration of rilpivirine—avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use; omeprazole increases plasma concentration of saquinavir—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by tiprofanesi.

Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of diazepam (increased plasma concentration)

Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of digoxin

Ciclosporin: omeprazole possibly affects plasma concentration of ciclosporin

Clotazol: omeprazole increases plasma concentration of clotazol (see under Clotazol, p. 206)

Clopidogrel: esomeprazole and omeprazole reduce antplatelet effect of clopidogrel; lansoprazole, pantoprazole and rabeprazole possibly reduce antplatelet effect of clopidogrel

Cytotoxics: proton pump inhibitors possibly reduce excretion of methotrexate (increased risk of toxicity); lansoprazole reduces plasma concentration of bosutinib; avoidance of proton pump inhibitors advised by manufacturer of dabrafenib (plasma concentration of dabrafenib possibly reduced); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of erlotinib; omeprazole reduces plasma concentration of erlotinib—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of lapatinib; proton pump inhibitors possibly reduce absorption of pazopanib

Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by sucralfate

Pseudoephedrine see Sympathomimetics

Pyrazinamide

Sulfispyrazone: pyrazinamide antagonises effects of sulfispyrazone

Vaccines: antimalarials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Pyridostigmine see Parasympathomimetics

Pyridoxine see Vitamins

Pyrimethamine

Antibacterials: increased antifolate effect when pyrimethamine given with sulfonamides or trimethoprim

Antiepileptics: pyrimethamine antagonises anticonvulsant effect of fosphenytoin and phenytoin, also increased antifolate effect

Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine; increased antifolate effect when pyrimethamine given with proguanil

Antivirals: increased antifolate effect when pyrimethamine given with zidovudine

Pyrimethamine (continued)

Cytotoxics: pyrimethamine increases antifolate effect of methotrexate and pemtrexed

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Vaccines: antimalarials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Quetiapine see Antipsychotics

Quinidine

Antibacterials: increased risk of ventricular arrhythmias when quinidine given with amiodarone—avoid concomitant use; quinidine increases plasma concentration of flecainide

Antibacterials: increased risk of ventricular arrhythmias when quinidine given with moxifloxacin—avoid concomitant use

Antimalarials: increased risk of ventricular arrhythmias when quinidine given with quinine increased by antiplatelet agents; plasma concentration of quinine increased by cimetidine; increased risk of ventricular arrhythmias when quinine given with warfarin

Antidepressants: possible increased risk of ventricular arrhythmias when quinine given with citalopram or escitalopram—avoid concomitant use

Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine; increased risk of ventricular arrhythmias when quinine given with quinine or moxifloxacin, norfloxacin and ofloxacin reduced by ritonavir

Anticoagulants: plasma concentration of both drugs increased when quinine given with warfarin

Antplatelet agents: increased risk of ventricular arrhythmias when quinine given with quinine or moxifloxacin, norfloxacin and ofloxacin reduced by ritonavir

Antipsychotics: increased risk of ventricular arrhythmias when quinidine given with erlotinib or pazopanib—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinidine given with haloperidol—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinidine given with quinidine or moxifloxacin, norfloxacin and ofloxacin reduced by ritonavir

Cardiac Glycosides: quinidine increases plasma concentration of digoxin

Dopaminergics: quinidine increases plasma concentration of amantadine

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Muscle Relaxants: quinidine possibly enhances effects of succinylcholine

Ulcer-healing Drugs: metabolism of quinidine inhibited by cimetidine (increased plasma concentration)

Vaccines: antimalarials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF

Quinolones

Aminoglycosides: possible increased risk of convulsions when quinolones given with amikacin; ciprofloxacin and norfloxacin increase plasma concentration of amikacin

Analgesics: possible increased risk of convulsions when quinolones given with nonsteroidal antiinflammatory agents

Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by antacids

Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with disopyramide—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with parenteral erythromycin—avoid concomitant use; ciprofloxacin possibly increases plasma concentration of moxifloxacin
Quinolones
- Antibacterials (continued)
  concentration of **BEDAQUILINE**—avoid concomitant use if ciprofloxacin given for more than 14 days; avoidance of moxifloxacin advised by manufacturer of **BEDAQUILINE**;
  increased risk of ventricular arrhythmias when moxifloxacin given with **DELAMANID**; effects of nalidixic acid possibly antagonised by **NITROFURANTOIN**; possible increased risk of ventricular arrhythmias when moxifloxacin given with **TELITHROMYCIN**.
- Anticoagulants: nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of **COUMARINS**; ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of **COUMARINS**; levofloxacin possibly enhances anticoagulant effect of **PHENINDIONE**.
- Antidepressants: avoidance of moxifloxacin advised by manufacturer of **CITALOPRAM** and **ESCITALOPRAM** (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of **DULOXETINE**—avoid concomitant use; avoidance of moxifloxacin advised by manufacturer of **AGOMELATINE**; increased risk of ventricular arrhythmias when moxifloxacin given with **TRICYCLES**—avoid concomitant use.
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with **MILOZUSTINE**—avoid concomitant use.
- Antimalarials: avoidance of quinolones advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of moxifloxacin advised by manufacturer of **ARTEMISOL WITH PIDAPERINE** (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when moxifloxacin given with **CHLOROQUINE**.
- Anti-psychotics: ciprofloxacin increases plasma concentration of **FOSPHENYTOIN** and **PHENOTHIAZINES**.
- Antihypertensives: avoidance of quinolones advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of moxifloxacin advised by manufacturer of **AGOMELATINE**; increased risk of ventricular arrhythmias when moxifloxacin given with **TRICYCLES**—avoid concomitant use.
- Antidiabetics: norfloxacin possibly enhances effects of **GLIBENCLAMIDE**.
- Antiepileptics: ciprofloxacin increases or decreases plasma concentration of **FOSPHENYTOIN** and **PHENOTHIAZINES**.
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with **BENPERIDOL**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with **DROPERIDOL**.
- Antidepressants: increased risk of ventricular arrhythmias when moxifloxacin given with **MELANOSTINE**—avoid concomitant use.
- Antidepressants: increased risk of ventricular arrhythmias when moxifloxacin given with **THERAPY**—avoid concomitant use.
- Anticoagulants: avoidance of moxifloxacin advised by manufacturer of **CITALOPRAM** and **ESCITALOPRAM** (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of **DULOXETINE**—avoid concomitant use; avoidance of moxifloxacin advised by manufacturer of **AGOMELATINE**; increased risk of ventricular arrhythmias when moxifloxacin given with **TRICYCLES**—avoid concomitant use.
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with **MILOZUSTINE**—avoid concomitant use.
- Antimalarials: avoidance of quinolones advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of moxifloxacin advised by manufacturer of **ARTEMISOL WITH PIDAPERINE** (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when moxifloxacin given with **CHLOROQUINE**.
- Anti-psychotics: ciprofloxacin increases plasma concentration of **FOSPHENYTOIN** and **PHENOTHIAZINES**.
- Antihypertensives: avoidance of quinolones advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of moxifloxacin advised by manufacturer of **AGOMELATINE**; increased risk of ventricular arrhythmias when moxifloxacin given with **TRICYCLES**—avoid concomitant use.
- Antidiabetics: norfloxacin possibly enhances effects of **GLIBENCLAMIDE**.
- Antiepileptics: ciprofloxacin increases plasma concentration of **FOSPHENYTOIN** and **PHENOTHIAZINES**.
- Antipsychotics: ciprofloxacin increases plasma concentration of **FOSPHENYTOIN** and **PHENOTHIAZINES**.
Ranolazine (continued)

- Antifungals: plasma concentration of ranolazine possibly increased by
  - FLUCONAZOLE—avoid concomitant use; plasma concentration of ranolazine increased by
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with
  - SOTALOL
- Calcium-channel Blockers: plasma concentration of ranolazine increased by
  - DILTIAZEM and VERAPAMIL (consider reducing dose of ranolazine)
- Cardiac Glycosides: ranolazine increases plasma concentration of
  - DIGOXIN
- Ciclosporin: plasma concentration of both drugs may increase when ranolazine given with
  - CICLOSPORIN
- Grapefruit juice: plasma concentration of ranolazine possibly increased by
  - GRAPEFRUIT JUICE—manufacturer of ranolazine advises avoid concomitant use
- Lipid-regulating Drugs: ranolazine increases plasma concentration of
  - SIMVASTATIN (see under Simvastatin, p. 181); separating administration from ranolazine by 12 hours advised by manufacturer of LOMITAPIDE
- Tacrolimus: ranolazine increases plasma concentration of
  - TACROLIMUS

Rasagiline

- Note Rasagiline is a MAO-B inhibitor
- Analgesics: avoid concomitant use of rasagline with
  - DEXTROMETHORPHAN; risk of CNS toxicity when rasagline given with
  - Pethidine (avoid pethidine for 2 weeks after rasagline)
- Antifungals: plasma concentration of rasagline increased by
  - CIPROFLOXACIN
- Antidepressants: after stopping rasagline do not start
  - FLUOXETINE for 2 weeks, also rasagline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagline do not start
- FLUVAXAMINE for 2 weeks; risk of hypertensive crisis when rasagline given with
- MEFLOQUINE, avoid MAOIs for at least 2 weeks after stopping rasagline; increased risk of CNS toxicity when rasagline given with
  - SSRI S or TRICYCLICS
- Dopaminergics: plasma concentration of rasagline possibly reduced by
  - MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by
  - METHYLDOPA
- Sympathomimetics: avoid concomitant use of rasagline with
  - SYMPATHOMIMETICS

Reboxetine

- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with
  - MACROLIDES
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with
  - FLUVAXAMINE; increased risk of hypertension and CNS excitation when reboxetine given with
  - MAOIS (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- Antiepileptics: plasma concentration of reboxetine possibly reduced by
  - CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE
- Antifungals: manufacturer of reboxetine advises avoid concomitant use with
  - IMIDAZOLES and TRIAZOLES

Reboxetine (continued)

- Antimalarials: avoidance of antidepressants advised by
  - ARTEMETER WITH LUMEFANTRINE and
  - ARTEMETOMOLL WITH PIPERAZINE
- Atorvastatin: possible increased risk of convulsions when
  - antidepressants given with
- Atorvastatin: possible increased risk of hypokalaemia when reboxetine given with
  - LOOP DIURETICS and THIAZIDES AND RELATED DIURETICS
- Ergot Alkaloids: possible risk of hypertension when reboxetine given with
  - ERGOTAMINE

Regorafenib

- Analgesics: manufacturer of regorafenib advises avoid concomitant use with
  - MEFENAMIC ACID
- Antibacterials: plasma concentration of regorafenib reduced by
  - RIFAMPIN—manufacturer of regorafenib advises avoid concomitant use
- Anticoagulants: increased risk of bleeding when regorafenib given with
  - WARFARIN
- Antifungals: plasma concentration of regorafenib increased by
  - KETOCONAZOLE—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
  - Cytotoxics: regorafenib increases plasma concentration of
  - IRINOTECAN

Remifentanil see Opioid Analgesics

Regapride see Antidiabetics

Retigabine

- Alcohol: increased risk of blunted vision when retigabine given with
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by
  - MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by
  - SSRI S and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of retigabine possibly reduced by
  - CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by
  - MELOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by
  - ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with
  - ORLISTAT

Retinoids

- Alcohol: etretinate formed from acitretin in presence of
  - ALCOHOL (increased risk of teratogenicity in women of child-bearing potential)
- Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with
  - TETRACYCLINES (avoid concomitant use)
- Anticoagulants: acitretin possibly reduces anticoagulant effect of
  - COUMARINS
- Antiepileptics: isoretinoin possibly reduces plasma concentration of
  - CARBAMAZEPINE
- Antifungals: plasma concentration of alitretinoin increased by
  - KETOCONAZOLE; possible increased risk of tretinoin toxicity when given with
  - FLUCONAZOLE, KETOCONAZOLE and
  - VORICONAZOLE
- Cytotoxics: acitretin increases plasma concentration of
  - METHOTREXATE (also increased risk of hepatotoxicity)—avoid concomitant use
- Lipid-regulating Drugs: alitretinoin reduces plasma concentration of
  - SIMVASTATIN
- Vitamins: risk of hypervitaminosis A when retinoids given with
  - VITAMIN A—avoid concomitant use

Ribavirin

- Antivirals: effects of ribavirin possibly reduced by
  - ABACAVIR; increased risk of side-effects when ribavirin given with
  - DIDANOINES—avoid concomitant use; increased risk of toxicity when ribavirin given with
  - STAVUDINE; increased risk of anaemia when ribavirin given with
  - ZIDOVUDINE—avoid concomitant use
- Azathioprine: ribavirin possibly enhances myelosuppressive effects of
  - AZATHIOPRINE
Rifabutin see Rifamycins
Rifampicin see Rifamycins

Rifamycins

NOTE Interactions do not apply to rifaximin

ACE inhibitors: rifampicin reduces plasma concentration of active metabolite of IMIDAPRIL (reduced antihypertensive effect)

> Aliskiren: rifampicin reduces plasma concentration of ALISKIREN

> Ambisentan: rifampicin possibly increases plasma concentration of AMBISENTAN

> Aminophylline: rifampicin accelerates metabolism of AMINOPHYLLINE (reduced plasma concentration)

> Analgesics: rifampicin reduces plasma concentration of CELECOXIB, DICLOFENAC and ETORICOXIB; rifampicin accelerates metabolism of METHADONE and MORPHINE (reduced effect); rifampicin possibly accelerates metabolism of OXYCODONE

> Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of LOSARTAN and its active metabolite

> Antacids: rifampicin reduces plasma concentration of RANITIDINE

> Anthelmintics: rifampicin accelerates metabolism of PRAZIQANTEL—avoid concomitant use; rifampicin possibly accelerates metabolism of PROPafenONE (reduced effect)

> Antibacterials: increased risk of side-effects including neutropenia when rifabutin given with AZITHROMYCIN; rifampicin reduces plasma concentration of clarithromycin and DOXOPHENE; plasma concentration of rifabutin reduced by CLARITHROMYCIN—increased risk of toxicity—reduce rifabutin dose); rifampicin possibly reduces plasma concentration of TINIDAZOLE and TRIMEITHROM; rifampicin reduces plasma concentration of DOXYCYCLINE—consider increasing dose of doxycycline; rifampicin possibly reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; rifampicin reduces plasma concentration of BEDAQUILINE—manufacturer of bedaquiline advises avoid concomitant use; rifampicin accelerates metabolism of aripiprazole and its active metabolite of aripiprazole (avoid concomitant use; rifampicin possibly increases plasma concentration of ARIMIPRONE and its active metabolite (increase dose of arimiprone; consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of clozapine; rifampicin reduces plasma concentration of URBANSIDE—avoid concomitant use; rifampicin possibly reduces plasma concentration of ABACAVIR; plasma concentration of rifabutin increased by ATAZANAVIR, DURANAVIR, FOSAMPRENAVIR and ELVITEGRAVIR—manufacturer of elvitegravir and simprevir advises avoid concomitant use; rifampicin possibly reduces plasma concentration of EFVIRENZE—increase dose of efavirenz; plasma concentration of rifabutin reduced by EFVIRENZE—increase dose of rifabutin; avoidance of rifampicin advised by manufacturer of rilpivirine (see under RILPIVIRINE)
Interactions Appendix 1

Cytotoxics:
- Cobicistat:
- Ciclosporin:
- Cardiac Glycosides:
- ▶ Simprevir—manufacturer of simprevir advises avoid concomitant use; avoidance of rifabutin advised by manufacturer of sofosbuvir and telaprevir; rifampicin possibly reduces plasma concentration of tigapan—avoid concomitant use
- Anxiolytics and Hypnotics: rifampicin accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone; rifampicin significantly reduces plasma concentration of zoleifolol (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone—aprepitant: rifampicin reduces plasma concentration of aprepitant
- Ato伐酮 (also known as atovaquone): avoidance of concomitant rifabutin advised by manufacturer of atovaquone (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of atovaquone (and concentration of rifampicin increased—avoid concomitant use
- Avanafil: rifampicin possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Betablockers: rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol; rifampicin possibly reduces plasma concentration of oral timolol
- Bosentan: rifampicin reduces plasma concentration of bosentan—avoid concomitant use
- Calcium-channel blockers: rifampicin possibly reduces plasma concentration of felodipine; rifampicin possibly accelerates metabolism of isradipine and nicardipine (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of diltiazem, nifedipine, nimodipine and verapamil (plasma concentration significantly reduced)
- Cannabin Extract: rifampicin reduces plasma concentration of cannabis extract—manufacturer of cannabis extract advises avoid concomitant use
- Cardiac Glycosides: rifampicin possibly reduces plasma concentration of digoxin
- Ciclosporin: rifampicin accelerates metabolism of ciclosporin (reduced plasma concentration)
- Cobicistat: rifabutin reduces plasma concentration of cobicistat—adjust dose—consult product literature; rifampicin possibly reduces plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: rifamycins accelerate metabolism of corticosteroids (reduced effect)
- Cytotoxics: rifampicin possibly reduces effects of brentuximab vedotin; rifampicin reduces plasma concentration of afatinib, paxilortinib, sorafenib and trabectedin; rifabutin possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); rifampicin decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature)
- DASATINIB (reduced plasma concentration—avoid concomitant use; avoidance of rifampicin advised by manufacturer of dasatinib—lapatinib and vemurafenib—rifampicin accelerates metabolism of dasatinib (reduced plasma concentration); rifampicin reduces plasma concentration of everolimus (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature); avoidance of rifabutin advised by manufacturer of cabazitaxel, lapatinib and vemurafenib; rifampicin possibly reduces plasma concentration of eribulin and pazopanib; rifampicin reduces plasma concentration of active metabolite of temsirolimus—avoid concomitant use; rifampicin possibly reduces plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of vismodegib (plasma concentration of vismodegib possibly reduced)
- Deferasirox: rifampicin reduces plasma concentration of deferasirox
- Diuretics: rifampicin reduces plasma concentration of eplerenone—avoid concomitant use
- Fosaprepitant: rifampicin reduces plasma concentration of fosaprepitant
- Hormone Antagonists: rifabutin possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; rifampicin reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of enzalutamide; rifampicin reduces plasma concentration of exemestane; rifampicin accelerates metabolism of tamoxifen (reduced plasma concentration)
- SHT-receptor Antagonists: rifampicin accelerates metabolism of ondansetron (reduced effect)
- Ivacafort: rifabutin possibly reduces plasma concentration of ivacaftor—manufacturer of ivacaftor advises avoid concomitant use; rifampicin reduces plasma concentration of ivacaftor—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide: rifampicin possibly increases plasma concentration of active metabolite of leflunomide
- Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of atorvastatin—manufacturer of atorvastatin—manufacturer of atorvastatin—manufacturer of atorvastatin—manufacturer of atorvastatin (plasma concentration of atorvastatin possibly reduced—manufacturer of atorvastatin advises avoid concomitant use)
- Gefitinib and lapatinib—rifampicin reduces plasma concentration of gefitinib and lapatinib—rifampicin reduces plasma concentration of gefitinib and lapatinib—rifampicin reduces plasma concentration of gefitinib and lapatinib—rifampicin reduces plasma concentration of gefitinib and lapatinib—rifampicin reduces plasma concentration of gefitinib and lapatinib (also known as erlotinib and sunitinib)
- Ranolazine: rifampicin reduces plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Roflumilast: rifampicin inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use)
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of sirolimus—avoid concomitant use
Rilpivirine

- Rifamycins: rifapentine possibly reduces plasma concentration of TACROLIMUS; rifampicin reduces plasma concentration of
  - TACROLIMUS
  - Tadalafil; rifampicin reduces plasma concentration of
    - TADALAFIL—manufacturer of tadalafil advises avoid concomitant use
  - Teriflunomide: rifampicin reduces plasma concentration of
    - TERIFLUNOMIDE
  - Thiabendazole: rifampicin accelerates metabolism of THEOPHYLLINE (reduced plasma concentration)
  - Thyroid Hormones: rifampicin accelerates metabolism of LEVOTHYROXINE (may increase requirements for levothyroxine in hypothyroidism)
  - Tizanidine: rifampicin accelerates metabolism of TIBOLONE (reduced plasma concentration)
  - Ticagrelor: rifampicin reduces plasma concentration of
    - TICAGRELOR
  - Tolvaptan: rifampicin reduces plasma concentration of
    - TOLVAPTAN
  - Ulcer-healing Drugs: rifampicin accelerates metabolism of
    - Cimetidine (reduced plasma concentration)
  - Ulipristal: avoidance of rifampicin advised by manufacturer of
    - ULPRISTRAL (contraceptive effect of ulipristal possibly reduced)
  - Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Rilpirivine

- Analgesics: rilpirivine possibly reduces plasma concentration of METHADONE
  - Antacids: manufacturer of rifampicin advises give ANTACIDS 2 hours before or 4 hours after rilpirivine
  - Antibacterials: manufacturer of rifampicin advises avoid concomitant use with
    - CLARITHROMYCIN and ERYTHROMYCIN (plasma concentration of rifpirivine possibly increased); plasma concentration of rifpirivine decreased by
    - RIFABUTIN (increase dose of rifpirivine—consult rifpirivine product literature); plasma concentration of rifpirivine reduced by
    - RIFAMPICIN—avoid concomitant use
    - Anticoagulants: rifpirivine possibly increases plasma concentration of DABIGATRAN
  - Antidepressants: manufacturer of rifpirivine advises avoid concomitant use with
    - ST JOHN’S WORT (plasma concentration of rifpirivine possibly reduced)
    - Antiepileptics: manufacturer of rifpirivine advises avoid concomitant use with
      - CARBAMAZEPINE, FOSPHENTOIN, OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (plasma concentration of rifpirivine possibly reduced)
    - Antivirals: manufacturer of rifpirivine advises avoid concomitant use with
      - DIDANOSINE 2 hours before or 4 hours after rifpirivine; avoidance of rifpirivine advised by manufacturer of NEVIRAPINE
    - Calcium Salts: manufacturer of rifpirivine advises give CALCIUM SALTS 2 hours before or 4 hours after rifpirivine
    - Corticosteroids: manufacturer of rifpirivine advises avoid concomitant use with
      - DEXAMETHASONE (except when given as a single dose)
    - Orlistat: absorption of rifpirivine possibly reduced by
    - Orlistat
  - Ulcer-healing Drugs: manufacturer of rifpirivine advises avoid concomitant use with
    - ESOMEPRAZOLE, LANSOPRAZOLE, PANTOPRAZOLE and RABEPRAZOLE (plasma concentration of rifpirivine possibly reduced); plasma concentration of rifpirivine reduced by
      - OMEPRAZOLE—avoid concomitant use; manufacturer of rifpirivine advises avoid HISTAMINE H2-ANTAGONISTS for 12 hours before or 4 hours after rifpirivine—consult product literature

Riociguat

- Antacids: absorption of riociguat reduced by
    - ANTACIDS (give at least 2 hours before or 1 hour after riociguat)
  - Antifungals: manufacturer of riociguat advises avoid concomitant use with
    - ITRACONAZOLE, KETOCONAZOLE and VORICONAZOLE
  - Antivirals: manufacturer of riociguat advises avoid concomitant use with RITONAVIR

Riociguat (continued)

- Analgesics: riociguat possibly reduces plasma concentration of
  - ALFENTANIL
  - Aminophylline: riociguat accelerates metabolism of
    - AMINOPHYLLINE (reduced plasma concentration)
  - Analgesics: riociguat possibly increases plasma concentration of
    - NSAIDS and BUPRENORPHINE; riociguat increases plasma concentration of
      - DEXTROPROPOXYPHENE and PIROXICAM (risk of toxicity)—avoid concomitant use; riociguat increases plasma concentration of
        - ALFENTANIL and FENTANYL; riociguat reduces plasma concentration of METHADONE; riociguat possibly reduces plasma concentration of
          - MORPHINE; riociguat reduces plasma concentration of
            - PETHIDINE, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
  - Anthelmintics: riociguat possibly reduces plasma concentration of active metabolite of
    - ALBENDAZOLE—consider increasing albendazole dose when given for systemic infections
  - Anti-arrhythmics: riociguat increases plasma concentration of
    - AMIODARONE and PROPAFENONE (increased risk of ventricular arrhythmias—avoid concomitant use); riociguat possibly increases plasma concentration of
      - DISOPYRAMIDE (increased risk of toxicity); avoidance of riociguat advised by manufacturer of
        - DRONEDARONE; riociguat possibly increases plasma concentration of
          - FLECAINIDE (increased risk of ventricular arrhythmias—avoid concomitant use)
  - Antibacterials: riociguat possibly increases plasma concentration of
    - AZITHROMYCIN and ERYTHROMYCIN; riociguat increases plasma concentration of
      - CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment); riociguat increases plasma concentration of
        - RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); plasma concentration of riociguat reduced by
          - RIFAMPICIN; riociguat possibly increases plasma concentration of BEDAULUNILE—avoid concomitant use if riociguat given for more than 14 days; riociguat increases plasma concentration of
            - DELAMANIDE; plasma concentration of both drugs increased when riociguat given with
              - FUSIDIC ACID—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of
                - TELITHROMYCIN
  - Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of
    - WARFARIN; avoidance of ritonavir advised by manufacturer of
      - APIXABAN; rifampicin possibly enhances anticoagulant effect of
        - QUINARINS and PHENINDIONE; ritonavir increases plasma concentration of
          - RIVAROXABAN—avoid concomitant use
  - Antidepressants: ritonavir possibly reduces plasma concentration of
    - PAROXETINE; ritonavir increases plasma concentration of
      - Trazodone (increased risk of toxicity); ritonavir possibly increases plasma concentration of
        - SSRISS and TRICYCLICS; plasma concentration of ritonavir reduced by
          - ST JOHN’S WORT—avoid concomitant use
  - Antidiabetics: riociguat possibly increases plasma concentration of
    - TOBUTAMIDE
  - Antiepileptics: riociguat possibly increases plasma concentration of
    - CARBAMAZEPINE; plasma concentration of ritonavir possibly reduced by
      - FOSPHENTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly affected; ritonavir possibly reduces plasma
Ritonavir

- Antiepileptics (continued)
  - concentration of LAMOTRIGINE, SODIUM VALPROATE and VALPROIC ACID
  - Antifungal: ritonavir increases plasma concentration of KETOCONAZOLE (reduce dose of ketoconazole); plasma concentration of ritonavir increased by FLUCONAZOLE; combination of ritonavir with KETOCONAZOLE may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of VORICONAZOLE—avoid concomitant use
  - Antihistamines: ritonavir possibly increases plasma concentration of NON-SEDATING ANTIHISTAMINES
  - Antimalarials: caution with ritonavir advised by manufacturer of ARTEMETHER WITH LUMECANTRINE; plasma concentration of ritonavir possibly reduced by METHOLOQUINE; ritonavir increases plasma concentration of QUININE (increased risk of toxicity)
  - Antimycosins: avoidance of ritonavir advised by manufacturer of DARIFENACIN and TOLERTODINE; manufacturer of fosoterodine advises dose reduction when ritonavir given with FOSTERODINE—consult fosoterodine product literature; ritonavir possibly increases plasma concentration of SOLIFENACIN—see under Solifenacin, p. 670
  - Antipsychotics: ritonavir possibly increases plasma concentration of ANTI PSYCHOTICS; ritonavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with CLOZAPINE (increased risk of toxicity); ritonavir possibly increases plasma concentration of LURASIDONE—avoid concomitant use; ritonavir reduces plasma concentration of OLANZAPINE—consider increasing dose of olanzapine; ritonavir increases plasma concentration of FINOELOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of GLEPREDON—manufacturer of gelt普惠in advises avoid concomitant use; ritonavir possibly reduces plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
  - Antivirals: plasma concentration of both drugs reduced when ritonavir given with RIBAVIRIN; manufacturer of ritonavir advises ritonavir and DIDANOINE should be taken 2.5 hours apart; ritonavir increases the toxicity of EFAVIRENZ, monitor liver function tests—manufacturer of ATRIPHLA advises avoid concomitant use with high-dose ritonavir; ritonavir increases plasma concentration of INDINAVIR, MARAVIROC and SULINDAC; ritonavir increases plasma concentration of SIMPREVIR—manufacturer of simprevir advises avoid concomitant use; ritonavir possibly reduces plasma concentration of TELAPREVIN
  - Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of ANXIOLYTICS AND HYPNOTICS; ritonavir possibly increases plasma concentration of ALPROZAMOL, DIAZAPAM, FLURAZEPAM and ZOLPIDEM (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of BUSPIONINE (increased risk of toxicity)
  - Aprepitant: ritonavir possibly increases plasma concentration of APERPITANT
  - Atorvastatin: ritonavir possibly reduces plasma concentration of ATOVASTATIN—manufacturer of atovaquone advises avoid concomitant use
  - Avanafil: ritonavir significantly increases plasma concentration of AVANAFIL—avoid concomitant use
  - Bosentan: ritonavir increases plasma concentration of BOSENTAN (consider reducing dose of bosentan)
  - Bupropion: ritonavir reduces plasma concentration of BUPROPION
  - Calcium-channel blockers: ritonavir possibly increases plasma concentration of CALCIUM-CHANNEL BLOCKERS; avoidance of ritonavir advised by manufacturer of LERCANIDIPINE
  - Cardiac Glycosides: ritonavir possibly increases plasma concentration of DIGOXIN
  - Ciclosporin: ritonavir possibly increases plasma concentration of CYCLOSPORIN
  - Ciclosporin (continued)
    - Cilostazol: ritonavir possibly increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 206)
    - Colchicine: ritonavir possibly increases risk of COCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
    - Corticosteroids: ritonavir possibly increases plasma concentration of CORTICOSTEROIDS—increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of BUDESONIDE (including inhaled, intranasal, and rectal budesonide)—increased risk of adrenal suppression; ritonavir increases plasma concentration of inhaled and intranasal FLUTICASONE—increased risk of adrenal suppression
    - Cytostatics: ritonavir increases the plasma concentration of AFINITIN—manufacturer of afinitin advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of AXITINIB (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases plasma concentration of BOSONITIN and CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of CABOZANTINIB and VIBLASTINE; ritonavir possibly increases plasma concentration of CRIZOTINIB, EVEROLIMUS, NILOTINIB and VINFLUNINE—manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of DASATINIB (plasma clearance of dasatinib possibly increased); ritonavir possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of ritonavir advised by manufacturer of LAPITINIB; ritonavir possibly increases plasma concentration of PIAZAPANIB (reduce dose of pazopanib); ritonavir possibly increases plasma concentration of PONITINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when ritonavir given with RUXOLITINIB—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; ritonavir increases plasma concentration of PACITAXEL
    - Dapoxetine: avoidance of ritonavir advised by manufacturer of DAPOXETINE (increased risk of toxicity)
    - Diuretics: ritonavir increases plasma concentration of EPLERENEONE—avoid concomitant use
    - Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with DOMPERIDONE—avoid concomitant use
    - Ergot Alkaloids: increased risk of ergotism when ritonavir given with ERGOTEMINE or ERGOTAMINE—avoid concomitant use
    - Fosaprepitant: ritonavir possibly increases plasma concentration of FOSAPREPTANT
    - 5HT1-receptor Agonists: ritonavir increases plasma concentration of ELETRIPITAN (risk of toxicity)—avoid concomitant use
    - Ibprofene: ritonavir possibly increases plasma concentration of IBRUPANIB—avoid concomitant use
    - Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with ATORVASTATIN; possible increased risk of myopathy when ritonavir given with ROSUVASTATIN—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with SIMVASTATIN (avoid concomitant use); avoidance of ritonavir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
    - Mirabegron: when given with ritonavir advise to reduce dose of MIRABEGRON in hepatic or renal impairment—see Mirabegron, p. 671
    - Oestrogens: ritonavir accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
Ritonavir (continued)
- Orlistat: absorption of ritonavir possibly reduced by • ORLISTAT
- Ranolazine: ritonavir possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Riociguat: avoidance of ritonavir advised by manufacturer of • RIOCIGUAT
- Sildenafil: ritonavir significantly increases plasma concentration of • SILDENAFIL—avoid concomitant use
- Symptomatics: ritonavir possibly increases plasma concentration of • DEXAMETHASONE
- Symptomimetics, Beta₂: manufacturer of ritonavir advises avoid concomitant use with • SALMETEROL
- Tacrolimus: ritonavir possibly increases plasma concentration of • TACROLUSM
- Tadalafil: ritonavir increases plasma concentration of • TADALAFIL—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ritonavir accelerates metabolism of • THEOPHYLINE (reduced plasma concentration)
- Ticagrelor: ritonavir possibly increases plasma concentration of • TICAGRELOR—manufacturer of ticagrelor advises avoid concomitant use
- Ulipristal: avoidance of ritonavir advised by manufacturer of • ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: ritonavir increases plasma concentration of • VARDENAFIL—avoid concomitant use

Rituximab
- Antipsychotics: avoid concomitant use of cytoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Rivaroxaban
- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous • DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with • KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: manufacturer of rivaroxaban advises avoid concomitant use with • DRONERADONE
- Antibacterials: plasma concentration of rivaroxaban reduced by • RIFAMPICIN—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other • ANTI-HAEMORRHAGIC (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with • APIXABAN and • DABIGATRAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of rivaroxaban possibly reduced by • ST JOHN'S WORT—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antiepileptics: plasma concentration of rivaroxaban possibly reduced by • CARBAMAZEPINE, • PHENYTOIN, • PHENO- BARBITAL, • PHENYTOIN and • PRIMIDONE—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antifungals: plasma concentration of rivaroxaban increased by • KETOCONAZOLE—avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with • ITRACONAZOLE, • POSA CONAZOLE and • VORICONAZOLE
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with • ATAZANAVIR, • DARUNAVIR, • FOSAMPRENAVIR, • INIDINAVIR, • SQUINAVIR and • TIRPARAVIR; manufacturers advise avoid concomitant use of rivaroxaban with • LOPINAVIR; plasma concentration of rivaroxaban increased by • RITONAVIR—avoid concomitant use
- Cobicistat: anticoagulant effect of rivaroxaban possibly enhanced by • COBICISTAT—avoid concomitant use

Rivastigmine see Parasympathomimetics

Rizatriptan see 5HT₁-receptor Agonists (under HT)

Rocuronium see Muscle Relaxants

Roflumilast
- Aminophylline: manufacturer of roflumilast advises avoid concomitant use with • AMINOPHYLLINE
- Antibacterials: effects of roflumilast inhibited by • RIFAMPICIN (manufacturer of roflumilast advises avoid concomitant use)
- Antidepressants: metabolism of roflumilast inhibited by • FLUVOXAMINE
- Antiepileptics: effects of roflumilast possibly inhibited by • CARBAMAZEPINE, • PHENYTOIN, • PHENO- BARBITAL, • PHENYTOIN and • PRIMIDONE (manufacturer of roflumilast advises avoid concomitant use)
- Theophylline: manufacturer of roflumilast advises avoid concomitant use with • THEOPHYLINE
- Ulcer-healing Drugs: metabolism of roflumilast inhibited by • CIMETIDINE

Ropinirole
- Antibacterials: metabolism of ropinirole inhibited by • CIPROFLOXACIN (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of • ANTI-PSYCHOTICS (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by • MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by • METHYLDOPA
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of • METOCLOPRAMIDE (antagonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by • OESTROGENS

Rosuvastatin see Statins

Rotavirus Vaccine see Vaccines

Rotigotine
- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of • ANTI-PSYCHOTICS (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by • MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by • METHYLDOPA
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of • METOCLOPRAMIDE (antagonism of effect)

Rufinamide
- Antidepressants: anticonvulsant effect of anti-epileptics possibly antagonised by • MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of anti-epileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with • CARBAMAZEPINE; plasma concentration of rufinamide possibly reduced by • FOSPHENYTOIN and • PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of rufinamide possibly reduced by • PHENO- BARBITAL and • PRIMIDONE; plasma concentration of rufinamide possibly increased by • SODIUM VALPROATE and • VALPROIC ACID (reduce dose of rufinamide)
- Antimalarials: anticonvulsant effect of anti-epileptics antagonised by • MFLOQUINE
- Antipsychotics: anticonvulsant effect of anti-epileptics antagonised by • ANTI-PSYCHOTICS (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of • OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: rufinamide accelerates metabolism of • PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives,
Interactions

Appendix 1 Interactions

St John’s Wort

Appendix 1

Antivirals:

Antifungals:

Antidepressants:

Anticoagulants:

Analgesics:

Antipsychotics:

Progestogens

Rufinamide

Concentration of rufinamide reduces plasma concentration of ruxolitinib.

St John’s Wort reduces plasma concentration of tadalafil.

St John’s Wort

Antivirals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with aminophylline.

Interactions

St John’s Wort

SOFOSBUVIR

LOPINAVIR

TACROLIMUS

MACITENTAN

APREPIANT

SERUM

FOSPHENYTOIN

THELITOMYCIN

PLASMA COUMARINS

THERAPY

PLASMA
St John’s Wort (continued)
- Theophylline: St John’s wort possibly reduces plasma concentration of THEOPHYLLINE.
- Ulcer-healing Drugs: St John’s wort possibly reduces plasma concentration of OMEPRAZOLE.
- Ultrasound: Avoidance of St John’s wort advised by manufacturer of ULIPRISTAL.

Salbutamol see Sympathomimetics, Beta2.
Salmeterol see Sympathomimetics, Beta2.

Saquinavir
- Analgesics: increased risk of ventricular arrhythmias when saquinavir given with - ALFENTANIL, - FENTANYL or
- METHADONE—avoid concomitant use
- Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with - AMIODARONE, - DISOPRIMIDE, - DRONEDARONE, - FLECAINIDE, - LIDOCAIN or
- PROPafenone—avoid concomitant use
- Antibacterials: plasma concentration of both drugs possibly increased when saquinavir given with - CLARITHROMYCIN (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with - DAPSONE, - ERTHROMYCIN or - MOXIFLAXACIN—avoid concomitant use; saquinavir increases plasma concentration of - RIFABUTIN (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; plasma concentration of saquinavir significantly reduced by - RIFAMPICIN, also risk of hepatotoxicity—avoid concomitant use; increased risk of ventricular arrhythmias when saquinavir given with - DELAMINIC; plasma concentration of both drugs may increase when saquinavir given with - FUSIDIC ACID; avoidance of saquinavir advised by manufacturer of - TELITHROMYCIN (risk of ventricular arrhythmias)
- Anti-coagulants: saquinavir possibly enhances anticoagulant effect of WARFARIN; avoidance of saquinavir advised by manufacturer of - APLIKABAN and RIVAROBAKAN.
- Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with - TRAZODONE or - TRICYCLICS—avoid concomitant use; plasma concentration of saquinavir reduced by ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of saquinavir possibly reduced by CARBAMAZEPINE, FOSHENONYNOIN, - PHENOBARBITAL, - PHENETYLL and - PRIMIDONE
- Antifungals: plasma concentration of saquinavir increased by - KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of saquinavir possibly increased by - IMIDAZOLE and - TRIAZOLE.
- Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with - MIZOLASTINE—avoid concomitant use
- PONATINIB—avoid concomitant use; caution with saquinavir given with - ARTEMETHER with LUMEFANTRINE; avoidance of saquinavir advised by manufacturer of - ARTENIMOL with PIPERAQUIN (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with - CLOZAPINE, - HALOPERIDOL or - PHENOTHIAZINES—avoid concomitant use; saquinavir possibly increases plasma concentration of - ARIPPIRAZOLE (reduce dose of ariprazole—consult ariprazole product literature); saquinavir possibly increases plasma concentration of - LURASIDONE—avoid concomitant use; saquinavir possibly increases plasma concentration of - PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir possibly increases plasma concentration of - QUETIPARINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with - AZATANAVIR or - LOPINAVIR—avoid concomitant use; saquinavir reduces plasma concentration of DARUNAVIR; plasma concentration of saquinavir significantly reduced by EFAVIRENZ; plasma concentration of saquinavir increased by INDINAVIR and - RITONAVIR; saquinavir increases plasma concentration of - MARAVIRIOCO (consider reducing dose of maraviroc); plasma concentration of saquinavir reduced by - TIPRANAVIR
- Anxiolytics and Hypnotics: saquinavir increases plasma concentration of - MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avasuflatin: saquinavir possibly increases plasma concentration of - AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with - SOTALOL—avoid concomitant use
- Ciclosporin: plasma concentration of both drugs increases when saquinavir given with - CICLOSPORIN
- Corticosteroids: plasma concentration of saquinavir possibly reduced by DEXAMETHASONE
- Cytoxics: saquinavir possibly increases the plasma concentration of - AFINATIN—manufacturer of afinatin advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of - AXITINIB (reduce dose of axitinib—consult axitinib product literature); saquinavir possibly increases the plasma concentration of - BOSUTINIB and - CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of ORALZOLE; - CRIZOTINIB and - EVEROLUSM—manufacturer of crizotinib and everolimus advises avoid concomitant use; saquinavir possibly increases the plasma concentration of - IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 809); avoidance of saquinavir advised by manufacturer of - LAPATINIB; increased risk of ventricular arrhythmias when saquinavir given with - PAZOPANIB—avoid concomitant use; saquinavir possibly increases plasma concentration of - DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Dapoxetine: avoidance of saquinavir advised by manufacturer of - DAPOXETINE (increased risk of toxicity)
- Diclofenac: saquinavir increases plasma concentration of - EPLERENONE (reduce dose of eplerenone)
- Domperidone: possibly increased risk of ventricular arrhythmias when saquinavir given with - DOMPERIDONE—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with - ERGOTAMINE—avoid concomitant use
- Lipid-regulating Drugs: possibly increased risk of myopathy when saquinavir given with - ATORVASTATIN; possible increased risk of myopathy when saquinavir given with - ROSUVASTATIN—manufacturer of rosvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with - SIMVASTATIN (avoid concomitant use); avoidance of saquinavir advised by manufacturer of - LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of saquinavir possibly reduced by - ORLISTAT
- Pentamidine: isetionate: increased risk of ventricular arrhythmias when saquinavir given with - PENTAMIDINE ISETIONATE—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of - RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: saquinavir increases risk of ventricular arrhythmias when saquinavir given with - SILDENAFIL—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of - TACROLIMUS (consider reducing dose of tacrolimus)
- Tadalafil: saquinavir increases risk of ventricular arrhythmias when saquinavir given with - TADALAFIL—avoid concomitant use

Appendix 1 Interactions
Saxagliptin see Antidiabetics

Selegiline

NOTE Selegiline is a MAO-B inhibitor

— Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with • PETHIDINE (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with OPIOID ANALGESICS

— Antidepressants: manufacturer of selegiline advises avoid concomitant use with CITALOPRAM and ESCITALOPRAM; increased risk of hypertension and CNS excitation when selegiline given with • FLUOXETINE (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with • SERTRALINE or • VENLAFAXINE (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with • METHYLDOPA; • PROGRESTGENS — manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with • MOCLOBEMIDE; CNS toxicity reported when selegiline given with • TRICYCLICS

— Dopaminergics: selegiline enhances effects and increases toxicity of • CO-BENELDOPA, CO-CARELDOPA or LEVODOPA (reduce dose of co–benelodopa, co-careldopa or levodopa; max. dose of 10 mg selegline advised by manufacturer of ENTACAPONE if used concomitantly

— SHT-receptor Agonists: manufacturer of selegiline advises avoid concomitant use with • SHT, AGONISTS

— Sympathomimetics: effects of dopaminergics and selegiline possibly enhanced by • MEMANTINE

— Methyldopa: antiparkinsonian effect of dopaminergics antagonised by • METHYLDOPA

— Oestrogens: plasma concentration of selegline increased by • OESPROGOST — manufacturer of selegline advises avoid concomitant use

— Progestogens: plasma concentration of selegline increased by • PROGRESTGENS — manufacturer of selegline advises avoid concomitant use

— Sympathomimetits: manufacturer of selegline advises avoid concomitant use with • SYMPATHOMIMETICS; risk of hypertensive crisis when selegline given with • DOPAMINE

Selenium

— Eltrombopag: selenium possibly reduces absorption of ELTROMBOPAG (give at least 4 hours apart)

— Vitamins: absorption of selenium possibly reduced by • ASCORBIC ACID (give at least 4 hours apart)

Sertraline see Antidepressants, SSRI

Sevelamer

— Antibacterials: sevelamer reduces bioavailability of • CIPOFLOXAXIN

— Ciclosporin: sevelamer possibly reduces plasma concentration of • CICLOSPORIN

— Mycophenolate: sevelamer possibly reduces plasma concentration of • MYCOPHENOLATE

— Tacrolimus: sevelamer possibly reduces plasma concentration of • TACROLIMUS

— Thyroid Hormones: sevelamer possibly reduces absorption of • LEVOTHYROXINE

Sildenafil

— Alpha-blockers: enhanced hypotensive effect when sildenafil given with • ALPHA-BLOCKERS (avoid alpha-blockers for 4 hours after sildenafil)—when patient is stable on the alpha blocker initiate sildenafil at the lowest possible dose

— Anti-arrhythmics: avoidance of sildenafil advised by manufacturer of DISOFYPYRAMIDE (risk of ventricular arrhythmias)

— Antibacterials: plasma concentration of sildenafil increased by • CLARITHROMYCIN — consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; plasma concentration of sildenafil increased by • ERYTHROMYCIN — reduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension; plasma concentration of sildenafil possibly increased by • TELITHROMYCIN — consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension

— Antifungals: plasma concentration of sildenafil increased by • KETOCONAZOLE — reduce initial dose of sildenafil for erectile dysfunction and avoid sildenafil for pulmonary hypertension; plasma concentration of sildenafil increased by • ITRACONAZOLE — reduce initial dose of sildenafil

— Antivirals: side-effects of sildenafil possibly increased by • ATAZANAVIR; plasma concentration of sildenafil reduced by • ETRAVIRINE; plasma concentration of sildenafil possibly increased by • FOSAMPRENARVIR; plasma concentration of sildenafil increased by • INDINAVIR — reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by • Ritonavir — avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with • SORAFENIB — avoid concomitant use; avoidance of sildenafil advised by manufacturer of • TELAPREIVIR; avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of • TIPRANAVIR

— Bosentan: plasma concentration of sildenafil reduced by • BOSENTAN, also plasma concentration of bosentan increased

— Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with • AMLODIPINE

— Cobicistat: plasma concentration of sildenafil possibly increased by • Cobicistat — manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction — consult cobicistat product literature

— Cytoxotics: avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of • IDEALISIB

— Dapoxetine: avoidance of sildenafil advised by manufacturer of • DAPoxetine

— Grapefruit Juice: plasma concentration of sildenafil possibly increased by • Grapefruit Juice

— Nicorandil: sildenafil significantly enhances hypotensive effect of • NICORANDIL (avoid concomitant use)

— Nitrates: sildenafil significantly enhances hypotensive effect of • NITRATES (avoid concomitant use)

— Riociguat: enhanced hypotensive effect when sildenafil given with • Riociguat — avoid concomitant use

— Ulcer-healing Drugs: plasma concentration of sildenafil increased by • SEVLEMAFIX — consider reducing dose of sildenafil for erectile dysfunction

Silodosin

— Antibacterials: sevelamer reduces bioavailability of • CIPOFLOXAXIN

— Ciclosporin: sevelamer possibly reduces plasma concentration of • CICLOSPORIN

— Mycophenolate: sevelamer possibly reduces plasma concentration of • MYCOPHENOLATE

— Tacrolimus: sevelamer possibly reduces plasma concentration of • TACROLIMUS

— Thyroid Hormones: sevelamer possibly reduces absorption of • LEVOTHYROXINE

Sevelamer (continued)

— Vitamins: sevelamer reduces absorption of • CALCITRIOL (give at least 1 hour before or 3 hours after sevelamer)

Sevoflurane see Anaesthetics, General

Simeprevir

— Alpha-blocking antibodies given with live VACCINES; risk of generalised infections when monoclonal antibodies given with live VACCINES — avoid concomitant use

— Antibacterials: plasma concentration of simeprevir possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN —
Sirolimus (continued)

> Ciclosporin: plasma concentration of sirolimus increased by CYCLOSPORIN

> Cytoxics: caution with sirolimus advised by manufacturer of CYCLOSPORIN

> Grapefruit Juice: plasma concentration of sirolimus increased by GRAPEFRUIT JUICE—avoid concomitant use

Sitaiglipin see Antidiabetics

Smallpox Vaccine see Vaccines

Sodium Aurothiomolate

> ACE Inhibitors: flushing and hypotension reported when sodium aurothiomolate given with ACE INHIBITORS

> Penicillamine: avoidance of sodium aurothiomolate advised by manufacturer of PENICILLAMINE (increased risk of toxicity)

Sodium Benzoate

> Antiepileptics: effects of sodium benzoate possibly reduced by SODIUM VALPROATE and VALPROIC ACID

> Antipsychotics: effects of sodium benzoate possibly reduced by HALOPERIDOL

Sodium Bicarbonate see Antacids

Sodium Citrate

> Antibacterials: avoid concomitant use of sodium citrate with METHENAMINE

Sodium Nitroprusside see Vasodilator Antihypertensives

Sodium Oxybate

> Analgesics: effects of sodium oxybate enhanced by OPIOID ANALGESICS (avoid concomitant use)

> Antidepressants: increased risk of side-effects when sodium oxybate given with TRICYCLICS

> Antiepileptics: manufacturer of sodium oxybate advises avoid concomitant use with PHENOBARBITAL and PRIMIDONE; plasma concentration of sodium oxybate increased by SODIUM VALPROATE and VALPROIC ACID (see under Sodium Oxybate, p. 425)

> Antipsychotics: effects of sodium oxybate possibly enhanced by ANTIPSYCHOTICS

> Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by ANTIPSYCHOTICS

Sodium Phenylbutyrate

> Antiepileptics: effects of sodium phenylbutyrate possibly reduced by SODIUM VALPROATE and VALPROIC ACID

> Antipsychotics: effects of sodium phenylbutyrate possibly reduced by HALOPERIDOL

> Corticosteroids: effects of sodium phenylbutyrate possibly reduced by CORTICOSTEROIDS

Sodium Stibogluconate

> Antifungals: possible increased risk of arrhythmias when sodium stibogluconate given before AMPHOTERICIN—manufacturer of sodium stibogluconate advises giving 14 days apart

Sodium Valproate

> Analgesics: effects of sodium valproate enhanced by ASPIRIN

> Antidepressants: increased risk of side-effects; sodium valproate increases or possibly enhances ANTIPSYCHOTICS

> Anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)

> Antiepileptics: plasma concentration of sodium valproate reduced by CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; sodium valproate possibly increases plasma concentration of ETHOSUXIMIDE; sodium valproate increases or possibly
Interactions
Sorafenib (continued)
• Antipsychotics: avoid concomitant use of cytoxics with
  • CLOZAPINE (increased risk of agranulocytosis)
• Antivirals: avoidance of sorafenib advised by manufacturer of
  • BOCEPREVIR
  • Cytototics: sorafenib increases plasma concentration of
    • DOCEtaxEL and DOXOribUrin; sorafenib possibly increases
      plasma concentration of IRINOteCAn
  • SpironOlaCTone see Diuretics
Statins
• Antacids: absorption of rosuvastatin reduced by ANTACIDS
  • Anti-arrhythmics: increased risk of myopathy when simvastatin
    given with • AMIODARONE (see under Simvastatin, p. 181);
    plasma concentration of rosuvastatin increased by
    • DRONERADONE—adjust dose of rosuvastatin (consult product
      literature); increased risk of myopathy when simvastatin
      given with • DRONERADONE; plasma concentration of
      atorvastatin possibly increased by DRONERADONE
• Antibacterials: plasma concentration of atorvastatin and
  pravastatin increased by • PHENYTOIN; increased risk of
  myopathy when simvastatin given with • CLARITHRMYCIN,
  • ERYTHROMYCIN or • TELITHRMYCIN (avoid concomitant use);
  plasma concentration of rosuvastatin reduced by
  • ERYTHROMYCIN; possible increased risk of myopathy when
    atorvastatin given with • ERYTHROMYCIN; plasma concentration
    of pravastatin increased by • ERYTHROMYCIN; plasma
    concentration of atorvastatin and simvastatin possibly
    reduced by • RIFAMPICIN; metabolism of fluvastatin accelerated
    by • RIFAMPICIN (reduced effect); increased risk of myopathy
    when statins given with • CLOBAZAM; possibly increased risk
    of myopathy when myopathy present at start of treatment
    with • TELITHRMYCIN
• Anticoagulants: atorvastatin may transiently reduce
  anticoagulant effect of WARfarin; rosuvastatin possibly
  enhances anticoagulant effect of • COUMARINS and
  • PHENINDION; simvastatin can enhance the anticoagulant
    effect of COUMARINS; fluvastatin enhances anticoagulant
    effect of • COUMARINS
  • Antidepressants: plasma concentration of simvastatin reduced
    by ST JOHN’S WORT
  • Antidiabetic: fluvastatin possibly increases plasma
    concentration of • GLIBENCLAMIDE
• Antiepileptics: plasma concentration of simvastatin reduced by
  • CARBAMAZEPINE and • ESICARBZEPINE—consider increasing
    dose of simvastatin; plasma concentration of rosuvastatin
    reduced by • ESICARBZEPINE; combination of fluvastatin with
    • FOSPHEnyTOIN or PHENYTOIN may increase plasma
    concentration of either drug (or both)
• Antifungals: possible increased risk of myopathy when
  atorvastatin given with • KETOCONAZOLE—manufacturer of
  ketoconazole advises avoid concomitant use; increased risk
  of myopathy when simvastatin given with • ITRACNAZOLE,
  • KETOCONAZOLE or • POSACONAZOLE (avoid concomitant use);
    possible increased risk of myopathy when simvastatin given with
    • FLUCONAZOLE or • MICNAZOLE; possible increased risk
    of myopathy when atorvastatin given with • FLUCONAZOLE or
    • IMIDAZOLES; plasma concentration of fluvastatin increased by
    • FLUCONAZOLE—possible increased risk of myopathy; plasma
    concentration of rosuvastatin increased by • ITRACNAZOLE—
    adjust dose of rosuvastatin (consult product literature); increased
    risk of myopathy when atorvastatin given with • ITRACNAZOLE,
    • POSACONAZOLE or • VORICONAZOLE;
    increased risk of myopathy when simvastatin given with • VORICONAZOLE
• Antivirals: possible increased risk of myopathy when
  atorvastatin or pravastatin given with • ATAZANAVIR; plasma
  concentration of rosuvastatin increased by • ATAZANAVIR,
  • DARUNAVIR, • LOPINAVIR and • TIPRANAVIR—adjust dose
    of rosuvastatin (consult product literature); increased risk
    of myopathy when simvastatin given with • ATAZANAVIR,
Statins
- Lipid-regulating Drugs (continued)
  - when simvastatin given with • CIPROFIBRATE (see under Simvastatin, p. 181); when given with statins reduce maximum dose of FENOIBRATE—see under Fenofibrate, p. 172; increased risk of myopathy when atorvastatin, fluvastatin or pravastatin given with • GEMFIBROZIL (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with • GEMFIBROZIL (avoid concomitant use); plasma concentration of rosuvastatin increased by • EZEtimibe—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when statins given with • FIBRATES; increased risk of myopathy when rosuvastatin given with • FIBRATES (see under Rosuvastatin, p. 180); plasma concentration of simvastatin increased by • Lomitapide—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; increased risk of myopathy when statins given with • NICOTINIC ACID (applies to lipid regulating doses of nicotinic acid)

- Antivirals (continued)
  - • INDINAVIR, • RITONAVIR or • SAQUINAVIR (avoid concomitant use); plasma concentration of pravastatin increased by • BOCEPREVIR; plasma concentration of atorvastatin increased by • DASLAMIDE; increased risk of myopathy when atorvastatin given with • DASLAMIDE, • ROSUVASTATIN; plasma concentration of atorvastatin possibly reduced by • FOSAMPRENAVIR (see under Atorvastatin, p. 179); plasma concentration of atorvastatin possibly reduced by • Efavirenz; plasma concentration of atorvastatin possibly reduced by • ETRAVIRINE; possible increased risk of myopathy when rosuvastatin given with • FOSAMPRENAVIR, • INDINAVIR, • RITONAVIR or • SAQUINAVIR—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when simvastatin given with • FOSAMPRENAVIR or • LOPINAVIR—avoid concomitant use; plasma concentration of atorvastatin, rosuvastatin and simvastatin increased by • SIMEPRENAVIR (consider reducing dose of atorvastatin, rosuvastatin and simvastatin); avoidance of atorvastatin advised by manufacturer of • TELAPREVIR; plasma concentration of simvastatin possibly increased by • TIPRANAVIR—avoid concomitant use; increased risk of myopathy when atorvastatin given with • TIPRANAVIR (see under Atorvastatin, p. 179)

- Antidepressants and Hypnotics: atorvastatin possibly increases plasma concentration of • MIDAZOLAM—Bosentan: plasma concentration of simvastatin reduced by • BOSEANTAN

- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with • AMLODIPINE or • DILTIAZEM (see under Simvastatin, p. 181); plasma concentration of atorvastatin increased by • DILTIAZEM—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with • VERAPAMIL (see under Simvastatin, p. 181); atorvastatin increases plasma concentration of • VERAPAMIL, also possible increased risk of myopathy (consider reducing dose of atorvastatin)

- Cardiac Glycosides: atorvastatin possibly increases plasma concentration of • DIGOXIN

- Cytotoxic: increased risk of myopathy when rosuvastatin or simvastatin given with • CICLOSPORIN (avoid concomitant use); increased risk of myopathy when atorvastatin given with • CICLOSPORIN (see under Atorvastatin, p. 179); increased risk of myopathy when fluvastatin or pravastatin given with • CICLOSPORIN; • COPIDOGREL: plasma concentration of rosuvastatin increased by • COPIDOGREL—adjust dose of rosuvastatin (consult product literature)

- Cobicistat: plasma concentration of atorvastatin possibly increased by • COBICISTAT—manufacturer of cobicistat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of • COBICISTAT

- Colchicine: possible increased risk of myopathy when statins given with • COLCHICINE

- Cytoxics: plasma concentration of simvastatin possibly increased by • DASLAMIDE; avoidance of simvastatin advised by manufacturer of • IDEALISIB; plasma concentration of simvastatin increased by • IMATINIB

- Etilomabopag: plasma concentration of rosuvastatin increased by • EILTROMBOPAG—adjust dose of rosuvastatin (consult product literature)

- Grapefruit Juice: plasma concentration of atorvastatin possibly increased by • GRAPEFRUIT JUICE; plasma concentration of simvastatin increased by • GRAPEFRUIT JUICE—avoid concomitant use

- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with • DANAZOL—avoid concomitant use

- Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with • BEZAFIBRATE (see under Simvastatin, p. 181); possible increased risk of myopathy
Sulfonamides (continued)
- Anticoagulants: sulfonamides enhance anticoagulant effect of
- COUMARINS; sulfonamides possibly inhibit metabolism of PHENINDIONE
- Antidiabetics: sulfonamides rarely enhance the effects of SULfonylureAS
- Antiepileptics: sulfonamides possibly increase plasma concentration of PHOSPHENYTOIN and PHENYTOIN
- Antimarials: increased antifolate effect when sulfonamides given with PYRIMETHAMINE
- Antipsychotics: avoid concomitant use of sulfonamides with
- CLOZAPINE (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with
- AZATHIOPRINE
- Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with • CICLOSPORIN; sulfadiazine possibly reduces plasma concentration of • CICLOSPORIN
- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with
- MERCAPTOPURINE or • METHOTREXATE; sulfonamides increase risk of METHOTREXATE toxicity
- Potassium Aminobenzoate: effects of sulfonamides inhibited by
POTASSIUM AMINOBENZOATE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

SulfonilureAes see Antidiabetics
Sulindac see NSAIDs
Sulpiride see Antipsychotics
Sumatriptan see 5HT1-receptor Agonists (under HT)
Sunitinib
- Antibacterials: metabolism of sunitinib accelerated by RIFAMPICIN (reduced plasma concentration)
- Antifungals: metabolism of sunitinib inhibited by KETOCONAZOLE (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with • CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of sunitinib advised by manufacturer of • BOCEPREVIR

Suxamethonium see Muscle Relaxants

Sympathomimetics
- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylenphedinit, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypertensive effect of • ADRENERGIC NEURONE BLOCKERS; dexamethasamine and lisdexametase antagonise hypertensive effect of • GUANETHIDINE; increased risk of hypertension when adrenaline (epinephrine) given with • GUANETHIDINE
- Alcohol: effects of methylphenidate possibly enhanced by ALCOHOL
- Alpha-adrenoceptor Stimulants: avoidance of sympathomimetics advised by manufacturer of APRACLONIDINE
- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with VOLAZOLINE
- Aminophylline: avoidance of ephedrine in children advised by manufacturer of AMINOPHYLLINE
- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of • ISOFLURANE (risk of ventricular arrhythmias); increased risk of arrhythmias when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with • VOLATILE LIQUID GENERAL ANAESTHETICS;
- Antacids: absorption of pseudoephedrine possibly increased by ALUMINIUM HYDROXIDE
- Antipsychotics: methylphenidate possibly enhances anticoagulant effect of • COUMARIN
- Antidepressants: risk of hypertensive crisis when adrenaline (epinephrine), dobutamine, dopamine, noradrenaline (norepinephrine) or xylometazoline given with • MAOI; risk of hypertensive crisis when dexamethasamine, ephedrine, isometheptene, lisdexametase, metaraminol,
**Sympathomimetics**
- Antidepressants (continued): methylphenidate, phenylephrine or pseudoephedrine given with MAOIs, avoid dexamfetamine, ephedrine, isometheptene, lisdamphetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when oxymetazoline given with MAOIs, some manufacturers advise avoiding oxymetazoline for at least 2 weeks when stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with moclobemide; methylphenidate possibly inhibits metabolism of SSRIs and tricyclics; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with tricyclics (but local anaesthetics with adrenaline appear to be safe); increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) or phenylephrine given with tricyclics.
- Antipsychotics: methylphenidate increases plasma concentration of osphenytoin and phenytoin; methylphenidate possibly increases plasma concentration of phenoxybarbital and primidone.
- Antipyschotics: hypertensive effect of sympathomimetics antagonised by antipsychotics; effects of lisdamphetamine possibly reduced by chlorpromazine; dexamfetamine possibly antagonises antipsychotic effects of chlorpromazine; methylphenidate possibly increases side-effects of risperidone.
- Antivirals: plasma concentration of dexamfetamine possibly increased by ritonavir.
- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective beta-blockers, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective beta-blockers; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective beta-blockers.
- Anticoagulants: possible risk of hypertension when adrenaline (epinephrine) or phenylephrine given with clonidine; serious adverse events reported with concomitant use of methylphenidate and clonidine (causality not established).
- Corticosteroids: ephedrine accelerates metabolism of dexamethasone.
- Dopaminergics: risk of toxicity when isometheptene given with bromocriptine; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by entacapone, avoid concomitant use of sympathomimetics with rasagiline; avoidance of sympathomimetics advised by manufacturer of selegiline; risk of hypertensive crisis when dopamine given with selegiline.
- Selegiline: dopamine, increased risk of hypertension when sympathomimetics given with doxapram.
- Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with ergotamine.
- Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with oxytocin (due to enhanced vasopressor effect).
- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by dopexamine; dopexamine possibly enhances effects of noradrenaline (norepinephrine).
- Theophylline: avoidance of ephedrine in children advised by manufacturer of theophylline.
- Ulcer-healing Drugs: metabolism of dobutamine possibly inhibited by cimetidine.

**Sympathomimetics, Beta₂**
- Antivirals (continued): salmeterol advised by manufacturer of telaprevir (risk of ventricular arrhythmias).
- Atomoxetine: increased risk of cardiovascular side-effects when parenteral salbutamol given with atomoxetine.
- Cardiac Glycosides: salbutamol possibly reduces plasma concentration of digoxin.
- Cocistat: avoidance of salbutamol advised by manufacturer of cocistat.
- Corticosteroids: increased risk of hypokalaemia when high doses of beta₂; sympathomimetics given with corticosteroids.
- Cytotoxics: avoidance of salbutamol advised by manufacturer of idelalisib.
- Diuretics: increased risk of hypokalaemia when high doses of beta₂; sympathomimetics given with acetazolamide, loop diuretics or thiazides and related diuretics.
- Methyldopa: acute hypotension reported when infusion of salbutamol given with methyldopa.
- Muscle Relaxants: bantemur bolus enhances effects of suxamethonium.
- Theophylline: increased risk of hypokalaemia when high doses of beta₂; sympathomimetics given with theophylline.

**Tacrolimus**
- Note: Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with topical tacrolimus on consumption of alcohol.
- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with nsaids; increased risk of nephrotoxicity when tacrolimus given with ibuprofen.
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with angiotensin-II receptor antagonists.
- Anti-arrhythmics: caution with tacrolimus advised by manufacturer of ibotenic acid.
- Antibacterials: plasma concentration of tacrolimus increased by clarithromycin and erythromycin; plasma concentration of tacrolimus possibly reduced by rifabutin; plasma concentration of tacrolimus reduced by rifampicin; increased risk of nephrotoxicity when tacrolimus given with am influences.
- Anticoagulants: tacrolimus possibly increases plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use.
- Antidepressants: plasma concentration of tacrolimus reduced by st john’s wort—avoid concomitant use.
- Antiepileptics: plasma concentration of tacrolimus reduced by fosphenytoin and phenytoin; plasma concentration of tacrolimus increased by phenobarbital and primidone.
- Antifungals: plasma concentration of tacrolimus increased by fluconazole, itraconazole, ketoconazole, posaconazole and voriconazole (consider reducing dose of tacrolimus); plasma concentration of tacrolimus possibly increased by miconazole oral gel; increased risk of nephrotoxicity when tacrolimus given with amphotericin; plasma concentration of tacrolimus reduced by caspofungin.
- Antipsychotics: avoidance of tacrolimus advised by manufacturer of droperidol (risk of ventricular arrhythmias).
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with aciclovir, ganciclovir, valaciclovir or valganciclovir; plasma concentration of tacrolimus possibly increased by telaprevir and ritonavir; plasma concentration of tacrolimus increased by boceprevir (reduce dose of tacrolimus); plasma concentration of tacrolimus possibly affected by efavirenz; plasma concentration of tacrolimus increased by fosamprenavir, plasma concentration of tacrolimus increased by saquinavir (consider reducing dose of tacrolimus); plasma...
Tacrolimus
- Antivirals (continued) concentration of both drugs increased when tacrolimus given with TELAPREVIr (reduce dose of tacrolimus)
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by FELODIPINE and VERAPAMIL; plasma concentration of tacrolimus increased by DILTAZEM, NICARDIPINE and NIFEDIPINE
- Ciclosporin: tacrolimus increases plasma concentration of CICLOSPORIN (increased risk of nephrotoxicity)—avoid concomitant use
- Colestilan: manufacturer of colestilan advises give tacrolimus at least 1 hour before or 3 hours after COLESTILAN
- Cytoxics: tacrolimus possibly increases plasma concentration of CYCLOSPORIN (increased risk of nephrotoxicity)—avoid concomitant use
- DEXRAZOXANE: increased risk of immunosuppression with tacrolimus advised by manufacturer of DEXRAZOXANE
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with POTASSIUM-SPARING DIURETICS and ALDOSTERONE ANTAGONISTS
- Grapefruit Juice: plasma concentration of tacrolimus increased by GRAPEFRUIT JUICE
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by DANOZOL
- Lipid-regulating Drugs: separating administration from tacrolimus by 12 hours advised by manufacturer of LOMITAPIDE
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of MIFAMURTIDE
- Oestradiols: plasma concentration of tacrolimus possibly increased by ETHINYLESTRADIOL
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with POTASSIUM SALTS
- Ranolazine: plasma concentration of tacrolimus increased by RANOLAZINE
- Sevelamer: plasma concentration of tacrolimus possibly reduced by SEVELAMER
- Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by OMEPRAZOLE

Tadalafil
- Alpha-blockers: enhanced hypotensive effect when tadalafil given with DOXAZOSIN—manufacturer of tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with ALPHA-BLOCKERS—when patient is stable on the alpha blocker initiate tadalafil at the lowest possible dose
- Anti-arrhythmics: avoidance of tadalafil advised by manufacturer of DISOPYRAMIDE (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of tadalafil possibly increased by CLARITHROMYCIN and ERYTHROMYCIN; plasma concentration of tadalafil reduced by RIFAMPICIN—manufacturer of tadalafil advises avoid concomitant use
- Antifungals: tadalafil concentration is increased by KETOCONAZOLE—avoid concomitant use of tadalafil for pulmonary hypertension; plasma concentration of tadalafil possibly increased by ITRACONAZOLE
- Antivirals: plasma concentration of tadalafil possibly increased by FOSAMPRENAVIR and INDAVIR; plasma concentration of tadalafil increased by RITONAVIR—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with SACHINAVIR—avoid concomitant use; avoidance of high doses of tadalafil advised by manufacturer of TELAPREVIr consult product literature
- Bosentan: plasma concentration of tadalafil reduced by BOSENTAN
- Cobastic: plasma concentration of tadalafil possibly increased by COBICASTM—manufacturer of cobastic advises reduce dose of tadalafil (consult cobastic product literature)
- Dapoxetine: avoidance of tadalafil advised by manufacturer of DAPOXETINE

Tadalafil (continued)
- Grapefruit Juice: plasma concentration of tadalafil possibly increased by GRAPEFRUIT JUICE
- Nicorandil: tadalafil significantly enhances hypotensive effect of NICORANDIL (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of NITRIC OXIDE (avoid concomitant use)
- NITRATES (avoid concomitant use)
- Riociguat: possible enhanced hypotensive effect when tadalafil given with RIOCIGUAT—avoid concomitant use

Tamoxifen
- Antibacterials: metabolism of tamoxifen accelerated by RIFAMPICIN (reduced plasma concentration)
- Antiocoagulants: tamoxifen enhances anticoagulant effect of COUMARINS
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by FLUOXETINE and PAROXETINE (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of DROPERIDOL (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by BUPROPION (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by CINACALCEt (avoid concomitant use)

Tamulosin see Alpha-blockers

Tapentadol see Opioid Analgesics

Taxanes see Cabazitaxel, Docetaxel, and Paclitaxel

Tegafur
- Antibacterials: metabolism of tegafur inhibited by METRONIDAZOLE (increased toxicity)
- Anticoagulants: tegafur enhances anticoagulant effect of COUMARINS
- Anti-epileptics: tegafur possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
- Filgrastim: neutropenia possibly exacerbated when tegafur given with FILGRASTIM
- Folates: toxicity of tegafur increased by FOLIC ACID—avoid concomitant use
- Lipogfilgrastim: neutropenia possibly exacerbated when tegafur given with LIPGfilGRASTIM
- Pegfilgrastim: neutropenia possibly exacerbated when tegafur given with PEGFILGRASTIM
- Ulcer-healing Drugs: metabolism of tegafur inhibited by CIMETIDINE (increased plasma concentration)

Teicoplanin
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Telaprevir
- Alpha-blockers: manufacturer of telaprevir advises avoid concomitant use with ALFuzosIN
- Analgesics: manufacturer of telaprevir advises caution with METHADONE (risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of telaprevir advises avoid concomitant use with AMIODARONE and DISOPYRAMIDE (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with intravenous LIDOCAINE
- Antibacterials: plasma concentration of both drugs possibly increased when telaprevir given with CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with INDAVIR; concentration of Cimetidine (increased plasma concentration)

Tezepelumab see Antibacterials

Teriflunomide see Immune Modulating Drugs

Tocilizumab see Antipsychotics, Biologic Anti-rheumatic Drugs and JAK Inhibitors

Tolfenamic Acid see Nonsteroidal Anti-inflammatory Drugs
Telaprevir (continued)

- Anti-diabetics: telaprevir increases plasma concentration of METFORMIN (consider reducing dose of metformin)
- Antiepileptics: manufacturer of telaprevir advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHYTONTOIN and SIRMIDONE
- Antifungals: plasma concentration of both drugs possibly increased when telaprevir given with KETOCONAZOLE (increased risk of ventricular arrhythmias)—reduce dose of ketcocazole; telaprevir possibly increases plasma concentration of ITRACONAZOLE; telaprevir possibly increases plasma concentration of POSACONAZOLE (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of VORICONAZOLE (possible increased risk of ventricular arrhythmias)
- Antipsychotics: telaprevir possibly increases plasma concentration of LEVOSIDONE—avoid concomitant use; manufacturer of telaprevir advises avoid concomitant use with PIMOZIDE; telaprevir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: telaprevir possibly reduced by DASLATASVIR—manufacturer of daslatasvir (see under Daslatasvir, p. 544); avoid concomitant use of telaprevir with DARUNAVIR; plasma concentration of telaprevir reduced by EFAVIRENZ—increase dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with OSAPRANAVIR and LOPINAVIR; telaprevir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by NEVIRAPINE—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by BOSENTAN, also plasma concentration of bosentan possibly increased
- Calcium-channel Blockers: telaprevir increases plasma concentration of AMLODIPINE (consider reducing dose of amlodipine); manufacturer of telaprevir advises caution with DILTIAZEM, FELODIPINE, NICARDIPINE, NIFEDIPINE and VERAPAMIL
- Cardiac Glycosides: telaprevir increases plasma concentration of DIGOXIN
- Ciclosporin: plasma concentration of both drugs increased when telaprevir given with CILOSPORIN (reduce dose of ciclosporin)
- Cislozal: telaprevir possibly increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 206)
- Colchicine: telaprevir possibly increases risk of COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: telaprevir possibly increases plasma concentration of INHALED and INTRanasal Budesonide and FLUTicasone; plasma concentration of telaprevir possibly reduced by DXEMETHASONE
- Cytotoxics: telaprevir possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with RUXOLITINIB—consult ruxolitinib product literature
- Dapemidine: possible increased risk of ventricular arrhythmias when telaprevir given with DAPERMIDINE—avoid concomitant use
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with ERGOT ALKALOIDS

Telaprevir (continued)

- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with ATORVASTATIN; manufacturers advise avoid concomitant use of telaprevir with SIMVASTATIN; avoidance of telaprevir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Nitrates: telaprevir possibly reduces plasma concentration of ETHYNLESTRADIOL—manufacturer of telaprevir advises additional contraceptive precautions
- Sildenafil: manufacturer of telaprevir advises avoid concomitant use with SILDENAFIL
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with SIROLIMUS (reduce dose of sirolimus)
- Sympathomimetics, Beta; manufacturer of telaprevir advises avoid concomitant use with SALMETEROL (risk of ventricular arrhythmias)
- Tacrolimus: plasma concentration of both drugs increased when telaprevir given with TACROLIMUS (reduce dose of tacrolimus)
- Tadalafil: manufacturer of telaprevir advises avoid concomitant use with high doses of TADALAFIL—consult product literature
- Vardenafil: manufacturer of telaprevir advises avoid concomitant use with VARDENAFIL

Telavancin

- Vaccines: antibiotics inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

Telbivudine

- Interferons: increased risk of peripheral neuropathy when telbivudine given with INTERFERON ALFA and PEGINTERFERON ALFA

Telithromycin

- Analgesics: possible increased risk of ventricular arrhythmias when telithromycin given with METADONE; telithromycin inhibits the metabolism of OXYCODONE
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when telithromycin given with AMIODARONE and DISOPRYRAMIDE; increased risk of ventricular arrhythmias when telithromycin given with DRONEDARONE—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when telithromycin given with MOXIFLOXACIN; plasma concentration of telithromycin reduced by BIMFAMIC (avoid during and for 2 weeks after rifampicin)
- Anticoagulants: avoidance of telithromycin advised by manufacturer of APIXABAN
- Antidepressants: possible increased risk of ventricular arrhythmias when telithromycin given with CITLORPAM and TRICYCLICS; plasma concentration of telithromycin reduced by ST JOHN’S WORT (avoid during and for 2 weeks after St John’s wort)
- Antiepileptics: plasma concentration of telithromycin reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENTYTOIN and PRIMIDONE (avoid during and for 2 weeks after carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone)
- Antifungals: plasma concentration of telithromycin increased by KETOCONAZOLE—avoid in severe renal and hepatic impairment
- Immunomodulators: manufacturer of fesoterodine advises dose reduction when telithromycin given with FESOTERODINE—consult fesoterodine product literature
- Antipsychotics: possible increased risk of ventricular arrhythmias when telithromycin given with CHLORPROMAZINE; telithromycin possibly increases plasma concentration of LURASIDONE—avoid concomitant use; increased risk of ventricular arrhythmias when telithromycin given with PIMOZIDE—avoid concomitant use; telithromycin possibly increases plasma concentration of QUETIAPINE
- Antivirals: manufacturer of telithromycin advises avoid concomitant use with ATAZANAVIR, POSACONAZOLE, RITONAVIR and TIPRANAVIR in severe renal and hepatic impairment; telithromycin possibly increases the plasma concentration of DACLATASVIR—reduce
Telithromycin

- Antivirals (continued)
  - dose of daclatasvir (see under Daclatasvir, p. 544); telithromycin possibly increases plasma concentration of
  - MARAVIROC (consider reducing dose of maraviroc); manufacturer of telithromycin advises avoid concomitant use with
    - SAQUINAVIR (risk of ventricular arrhythmias); telithromycin possibly increases plasma concentration of
  - SIMPEPREVIR—manufacturer of simprevir advises avoid concomitant use; plasma concentration of both drugs possibly increased when telithromycin given with
  - TELAPREVIR (increased risk of ventricular arrhythmias)
  - Anxiolytics and Hypnotics: telithromycin inhibits metabolism of
  - MIDAZOLAM (increased plasma concentration with increased sedation)
  - Aprepitant: telithromycin possibly increases plasma concentration of
  - Aprepitant
  - AVANAFIL: telithromycin possibly increases plasma concentration of
    - AVANAFIL—manufacturer of avanafil advises avoid concomitant use
  - Calcium-channel blockers: telithromycin possibly inhibits metabolism of
    - CICLOSPORIN—telithromycin possibly increases plasma concentration of
  - Colchicine: telithromycin possibly increases risk of
    - COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Cytotoxics: telithromycin possibly increases plasma concentration of
    - AXITINIB (reduce dose of axitinib—consult axitinib product literature); telithromycin possibly increases the plasma concentration of
    - BOSUTINIB and
    - CABAZITAXEL—manufacturer of bostutinib and cabazitaxel advises avoid or consider reducing dose of bostutinib and cabazitaxel; telithromycin possibly increases plasma concentration of
    - CRIZOTINIB and
    - EVEROLINUS—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of
    - LARATINIB and
    - NILOTINIB; telithromycin possibly increases plasma concentration of
    - PAZOPANIB (reduce dose of pazopanib); telithromycin possibly increases plasma concentration of
    - PONATINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 814); manufacturer of ruxolitinib advises dose reduction when telithromycin given with
    - RUXOLITINIB—consult ruxolitinib product literature; telithromycin possibly increases plasma concentration of
    - DOCETAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
  - Dapoxetine: avoidance of telithromycin advised by manufacturer of
    - DAPOXETINE (increased risk of toxicity)
  - Diuretics: telithromycin increases plasma concentration of
    - EPLERENONE—avoid concomitant use
  - Ergot alkaloids: increased risk of ergotism when telithromycin given with
    - ERGOTAMINE—avoid concomitant use
  - Fosaprepitant: telithromycin possibly increases plasma concentration of
  - IVACAFOR (see under Ivacaftor, p. 257)
  - Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with
    - ATORVASTATIN or
    - SIMVASTATIN (avoid concomitant use); possible increased risk of myopathy when telithromycin given with
    - PRAVASTATIN; avoidance of telithromycin advised by manufacturer of
    - LOMITAPIDE (plasma concentration of lomitapide possibly increased)

Telithromycin (continued)

- Pentamidine isetionate: possible increased risk of ventricular arrhythmias when telithromycin given with
  - PENTAMIDINE ISETIONATE
- Ranolazine: telithromycin possibly increases plasma concentration of
  - RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: telithromycin possibly increases plasma concentration of
  - SILDENAFIL—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension
- Sirolimus: telithromycin increases plasma concentration of
  - SIROLIMUS—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of
  - TACROLIMUS
- Ulipristal: avoidance of telithromycin advised by manufacturer of
  - ULIPRISTAL
- Vaccines: antibacterials inactivate
  - ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF
- Temsirolimus
  - NOTE
  - The main active metabolite of temsirolimus is sirolimus—see also interactions of sirolimus and consult product literature
  - Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by
    - RIFAMPICIN—avoid concomitant use
  - Antifungals: plasma concentration of active metabolite of temsirolimus increased by
    - KETOCONAZOLE—avoid concomitant use; manufacturer of temsirolimus advises avoid concomitant use with
    - ITRACONAZOLE (plasma concentration of temsirolimus possibly increased)
  - Antipsychotics: avoid concomitant use of cytotoxics with
    - CLOzapine (increased risk of agranulocytosis)

Tenafavir

- Antivirals: manufacturer of tenafavir advises avoid concomitant use with ADEOFAVIR; tenafavir reduces plasma concentration of
  - ATAZANAVIR, also plasma concentration of tenafavir possibly increased; tenafavir increases plasma concentration of
  - DIDANOxINE (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenafavir increased by
  - LOPINAVIR and TELAPREVIR
  - Orlistat: absorption of tenafavir possibly reduced by
    - ORLISTAT

Tenoxicam see NSAIDs

Terazosin see Alpha-blockers

Terbinafine

- Antibacterials: plasma concentration of terbinafine reduced by
  - RIFAMPICIN
- Antidepressants: terbinafine possibly increases plasma concentration of
  - PAROXETINE and TRICYCLICS
- Antifungals: terbinafine increases plasma concentration of
  - FLUCONAZOLE
- Ciclosporin: terbinafine possibly reduces plasma concentration of
  - CICLOSPORIN
- Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with
  - OESTROGENS (when used for contraception)
- Progestogens: occasional reports of breakthrough bleeding when terbinafine given with
  - PROGESTGENS (when used for contraception)
- Ulcer-healing Drugs: plasma concentration of terbinafine increased by
  - CIMETIDINE

Terbutaline see Sympathomimetics, Beta2
Teriflunomide
▶ Antibacterials: teriflunomide increases plasma concentration of cefaclor; plasma concentration of teriflunomide reduced by rifampicin.
▶ Antidiabetics: teriflunomide increases plasma concentration of repaglinide.
▶ Lipid-regulating Drugs: the effect of teriflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired; teriflunomide increases plasma concentration of • rosuvastatin (consider reducing dose of rosuvastatin).
▶ Oestrogens: teriflunomide increases plasma concentration of ethinylestradiol.
▶ Progestogens: teriflunomide increases plasma concentration of levonorgestrel.
▶ Vaccines: risk of generalised infections when teriflunomide given with live • vaccines—avoid concomitant use.

Testolactone
▶ Anticoagulants: testolactone enhances anticoagulant effect of • coumarins and ▶ phenindione.
▶ Antidepressants: testolactone enhances anticoagulant effect of • coumarins and ▶ phenindione.
▶ Antidiabetics: testolactone possibly enhances hypoglycaemic effect of antidiabetics.

Tetabenazine
▶ Antidepressants: risk of CNS toxicity when tetabenazine given with • MAOIs (avoid tetabenazine for 2 weeks after MAOIs).
▶ Antipsychotics: increased risk of extrapyramidal side-effects when tetabenazine given with antipsychotics.
▶ Dopaminergics: increased risk of extrapyramidal side-effects when tetabenazine given with amantadine.
▶ Metoclopramide: increased risk of extrapyramidal side-effects when tetabenazine given with metoclopramide.

Tetracosactide
▶ See Corticosteroids.

Tetracyclines
▶ ACE inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate).
▶ Adsorbents: absorption of tetracyclines possibly reduced by kaolin.
▶ Antacids: absorption of tetracyclines reduced by antacids.
▶ Antidiabetics: plasma concentration of doxycycline reduced by rifampicin—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of penicillins.
▶ Anticoagulants: tetracyclines possibly enhance anticoagulant effect of • coumarins and ▶ phenindione.
▶ Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of antidiabetics.
▶ Tetraphenylboron: absorption of tetracycline reduced by tetrphenylboron.
▶ Fosphenytoin, phenobarbital, phenytoin and primidone (reduced plasma concentration).
▶ Alovacaine: tetracycline reduces plasma concentration of atovaquone.
▶ Calcium Salts: absorption of tetracycline reduced by calcium salts.
▶ Cytotoxics: doxycycline or tetracycline increase risk of methotrexate toxicity.
▶ Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by dairy products.
▶ Diuretics: manufacturer of lymecycline advises avoid concomitant use with diuretics.
▶ Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ergotamine.
▶ Iron Salts: absorption of tetracyclines reduced by oral iron salts, also absorption of oral iron salts reduced by tetracyclines.
▶ Lipid-regulating Drugs: absorption of tetracycline possibly reduced by colestipol and colestyramine.
▶ Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with ▶ retinoids (avoid concomitant use).

Tetracyclines (continued)
▶ Strontium ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use).
▶ Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicitratabisulfate.
▶ Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF.
▶ Zinc: absorption of tetracyclines reduced by zinc, also absorption of zinc reduced by tetracyclines.

Theophylline
▶ Allopurinol: plasma concentration of theophylline possibly increased by allopurinol.
▶ Anaesthetics: general: increased risk of convulsions when theophylline given with ketamine.
▶ Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of adenosine—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by propafenone.
▶ Antibacterials: plasma concentration of theophylline possibly increased by clarithromycin and isoniazid; plasma concentration of theophylline increased by erythromycin; plasma concentration of theophylline increased by ciprofloxacin and norfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with quinolones.
▶ Antidepressants: plasma concentration of theophylline increased by fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by ST JOHN’S WORT.
▶ Antiepileptics: metabolism of theophylline accelerated by carbamazepine, phenobarbital and ▶ primidone (reduced effect); plasma concentration of both drugs reduced when theophylline given with fosphenytoin and phenytoin.
▶ Antifungals: plasma concentration of theophylline possibly increased by fluconazole and ketoconazole.
▶ Antivirals: plasma concentration of theophylline possibly increased by aciclovir and valaciclovir; metabolism of theophylline accelerated by ritonavir (reduced plasma concentration).
▶ Anti-arrhythmics and Hypnotics: theophylline possibly reduces effects of benzodiazepines.
▶ Caffeine citrate: avoidance of theophylline advised by manufacturer of caffeine citrate.
▶ Calcium-channel Blockers: plasma concentration of theophylline possibly increased by calcium-channel blockers (enhanced effect); plasma concentration of theophylline increased by diltiazem; plasma concentration of theophylline increased by verapamil (enhanced effect).
▶ Corticosteroids: increased risk of hypokalaemia when theophylline given with corticosteroids.
▶ Cytotoxics: plasma concentration of theophylline possibly increased by methotrexate.
▶ Deferasirox: plasma concentration of theophylline increased by deferasirox (consider reducing dose of theophylline).
▶ Disulfiram: metabolism of theophylline inhibited by disulfiram (increased risk of toxicity).
▶ Diuretics: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics of thiazides and related diuretics.
▶ Doxapram: increased CNS stimulation when theophylline given with doxapram.
▶ Interferons: metabolism of theophylline inhibited by interferon alfa and peginterferon alfa (consider reducing dose of theophylline).
▶ Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by zafirlukast; also plasma concentration of zafirlukast reduced.
▶ Lithium: theophylline increases excretion of lithium (reduced plasma concentration).
▶ Oestrogens: plasma concentration of theophylline increased by oestrogens (consider reducing dose of theophylline).
Appendix 1 Interactions

Thyroid Hormones

Thiabendazole: reduced absorption of levothyroxine possibly reduced by ANTACIDS and ANTICOLICICATIONS.

Cimetidine: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Colestyramine: absorption of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.

Calcium Salts: absorption of levothyroxine reduced by ANTACIDS.

Calcium Salts: increased plasma concentration of levothyroxine possibly reduced by ANTACIDS.
Tipranavir
- Analgesics: plasma concentration of tipranavir possibly reduced by BUPRENORPHINE.
- Antacids: absorption of tipranavir reduced by ANTACIDS (give at least 2 hours apart).
- Antidepressants: tipranavir increases plasma concentration of CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of RIFABUTIN (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by RIFAMPICIN—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of TELITHROMYCIN.
- Anticoagulants: avoid tipranavir advised by manufacturer of ST JOHN'S WORT—avoid concomitant use.
- Antiepileptics: plasma concentration of tipranavir possibly reduced by CARBAMAZEPINE.
- Antifungals: plasma concentration of tipranavir increased by FLUCONAZOLE.
- Antimalarials: caution with tipranavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; tipranavir possibly increases plasma concentration of QUININE (increased risk of toxicity).
- Antimucosals: avoidance of tipranavir advised by manufacturer of DARIFENACIN.
- Antipsychotics: tipranavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); tipranavir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use.
- Antiretrovirals: tipranavir reduces plasma concentration of ABACAVIR, FOSAMPRENAVIR, LOPINAVIR, SAQUINAVIR and ZIDOVUDINE; plasma concentration of tipranavir increased by ATAZANAVIR (also plasma concentration of atazanavir reduced); manufacturer of tipranavir advises avoid concomitant use with BOSONERI and TELAPREVIR; tipranavir reduces plasma concentration of DIDOSINASE—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of DOLTEGRAVIR (see under Dolutegravir, p. 75); tipranavir reduces plasma concentration of ETARVIREN, also plasma concentration of tipranavir increased (avoid concomitant use).
- Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with METOPROLOL for heart failure.
- Benzodiazepine manufacturer of tipranavir advises avoid concomitant use with BOSENAT.
- Cobicistat: plasma concentration of both drugs reduced when tipranavir given with Cobicistat (see under Atorvastatin, p. 179); tipranavir increases plasma concentration of ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); tipranavir possibly increases plasma concentration of SIMVASTATIN—avoid concomitant use; avoidance of tipranavir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased).
- Orlistat: absorption of tipranavir possibly reduced by ORLISTAT.
- Ranolazine: tipranavir possibly increases plasma concentration of RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: manufacturer of tipranavir advises avoid concomitant use of SILDENAFIL for pulmonary arterial hypertension.
- Sympathomimetics, Beta-2: manufacturer of tipranavir advises avoid concomitant use with SALMETEROL.
- Ulcer-healing Drugs: tipranavir reduces plasma concentration of ESOMEPRAZOLE and OMEPRAZOLE.
- Vardenafil: manufacturer of tipranavir advises caution with VARDENAFIL.

Tipranavir (continued)
- Vitamins: increased risk of bleeding when tipranavir given with high doses of VITAMIN E.
- Tirolanib: increased risk of bleeding when tirolanib given with EBOSPOST.
- Tizanidine: see Muscle Relaxants.
- Tobramycin: see Aminoglycosides.
- Tocilizumab: avoid anticonvulsant use of cytotoxics with CARBAMAZEPINE (increased risk of agranulocytosis).
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use.
- Tolazoline: see Alpha-blockers.
- Tolbutamide: see Antidiabetics.
- Tocapone: avoid anticonvulsant use of tolcapone with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
- Tolmentamic Acid: see NSAIDs.
- Tolterodine: see Antimuscarinics.
- Tolvaptan: avoid anticonvulsant use of tolvaptan with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
- Topiramate: avoid anticonvulsant use of topiramate with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
- Topiramate: avoid anticonvulsant use of topiramate with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.

Tipranavir: see Antipsychotics.
- Antipsychotics: avoid concomitant use of cytotoxics with CARBAMAZEPINE (increased risk of agranulocytosis).
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use.

Tipranavir (continued)
- Vitamins: increased risk of bleeding when tipranavir given with high doses of VITAMIN E.
- Tirolanib: increased risk of bleeding when tirolanib given with EBOSPOST.
- Tizanidine: see Muscle Relaxants.
- Tobramycin: see Aminoglycosides.
- Tocilizumab: avoid anticonvulsant use of cytoxics with CARBAMAZEPINE (increased risk of agranulocytosis).
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use.
- Tolazoline: see Alpha-blockers.
- Tolbutamide: see Antidiabetics.
- Tocapone: avoid anticonvulsant use of tolcapone with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
- Tolmentamic Acid: see NSAIDs.
- Tolterodine: see Antimuscarinics.
- Tolvaptan: avoid anticonvulsant use of tolvaptan with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
- Topiramate: avoid anticonvulsant use of topiramate with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
- Topiramate: avoid anticonvulsant use of topiramate with MAOIS.
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.
Interactions

Trimethoprim

- Anticoagulants: toremifene possibly increases anticoagulant effect of COUMARINS.
- Antibiotics: metabolism of toremifene possibly accelerated by CARRABAZEPINE (reduced plasma concentration); metabolism of toremifene possibly accelerated by FOSPHENYTIOIN and PHENOTYIN; metabolism of toremifene accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration).

- Cytotronics: possible increased risk of ventricular arrhythmias when trimethoprim given with VANDETANIB—avoid concomitant use.
- Diuretics: increased risk of hypercalcaemia when toremifene given with THIAZIDES AND RELATED DIURETICS.

Trabectedin

- Alcohol: manufacturer of trabectedin advises avoid concomitant use with ALCOHOL.

- Antivirals: co-trimoxazole increases plasma concentration of AZATHIOPRINE.

- Antihypertensives: co-trimoxazole increases plasma concentration of AZATHIOPRINE.

- Antidepressants: co-trimoxazole increases plasma concentration of AZATHIOPRINE.

- ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with ACE INHIBITORS.

- Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with ANGIOSTENIN-II RECEPTOR ANTAGONISTS.

- Anti-arrrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with AMIODARONE—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole.

- Anticoagulants: trimethoprim possibly enhances anticoagulant effect of COUMARINS.

- Antibacterials: trimethoprim increases plasma concentration of REPAGLINIDE (contraceptive effect of ulipristal possibly reduced).

- Analgesics: trimethoprim possibly enhances anticoagulant effect of COUMARINS.

- Sulfonylureas: trimethoprim increases plasma concentration of PHOSPHENYTIOIN and PHENOTYIN (increased antifolate effect).

- Antimalarials: increased antifolate effect when trimethoprim given with PYRIMETHamine.

- Antituberculars: trimethoprim increases plasma concentration of LAMIVUDINE—avoid concomitant use of high-dose co-trimoxazole.

- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with AZATHIOPRINE.

- Cardiac Glycosides: manufacturer of ulipristal advises avoid concomitant use with DIBUGATRAN at least 1.5 hours before or after ulipristal.

- Progestogens: ulipristal possibly reduces contraceptive effect of DIBUGATRAN.

- Ursodeoxycholic Acid: see Bilirubins.

- Antipsychotics: ulipristal possibly reduces contraceptive effect of DIBUGATRAN.

- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use.

- Anti-arrhythmics: possible increased risk of hyperkalaemia when trimethoprim given with EPLERENONE; possible increased risk of hyperkalaemia when trimethoprim given with SPIRONOLACTONE.

- Anticoagulants: toremifene possibly increased anticoagulant effect of WARFARIN.
Vaccines (continued)
  • Anakinra: risk of generalised infections when live vaccines given with • ANAKINRA—avoid concomitant use
  • Antibacterials: oral typhoid vaccine inactivated by ANTI-BACTERIALS—see under Typhoid Vaccine in BNF
  • Antivirals: influenza vaccine possibly enhances anticoagulant effect of WARFARIN
  • Antiepileptics: influenza vaccine enhances effects of FOSPHENYTOIN and PHENYTOIN
  • Antimalarials: oral typhoid vaccine inactivated by ANTIMALARIALS—see under Typhoid Vaccine in BNF
  • Corticosteroids: immune response to vaccines impaired by high doses of • CORTICOSTEROIDS—avoid concomitant use with live vaccines
  • Cytotoxics: risk of generalised infections when live vaccines given with • DOXORUBICIN, • MONOCLONAL ANTIBODIES,
    • PIAXANTRONE or • TRABECTEDIN—avoid concomitant use
  • Dexrazoxane: risk of generalised infections when live vaccines given with • DEXRAZOXANE—avoid concomitant use
  • Etanercept: risk of generalised infections when live vaccines given with • ETANERCEPT—avoid concomitant use
  • Immunoglobulins: impaired immune response to oral poliomyelitis vaccine might occur with • ANTI-D IMMUNOGLOBULINS and • NORMAL IMMUNOGLOBULIN—give oral poliomyelitis vaccine at least 5 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine might occur with • ANTI-D IMMUNOGLOBULINS—give BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins; impaired immune response to live influenza vaccine might occur with • ANTI-D IMMUNOGLOBULINS and • NORMAL IMMUNOGLOBULIN—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine might occur with • NORMAL IMMUNOGLOBULIN—give BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine at least 3 weeks before or 3 months after normal immunoglobulin
  • Interferons: avoidance of vaccines advised by manufacturer of • INTERFERON GAMMA
  • Leflunomide: risk of generalised infections when live vaccines given with • LEFLUNOMIDE—avoid concomitant use
  • Teriflunomide: risk of generalised infections when live vaccines given with • TERIFLUNOMIDE—avoid concomitant use
  • Theophylline: influenza vaccine possibly increases plasma concentration of • THEOPHYLLINE
  • Valaciclovir
Valaciclovir (continued)
  • Mycophenolate: plasma concentration of inactive metabolite of mycophenolate possibly increased
• Tacrolimus: possible increased risk of nephrotoxicity when valaciclovir given with • TACROLIMUS
Valproic Acid
  • Analgesics: effects of valproic acid enhanced by • ASPIRIN
  • Antibacterials: metabolism of valproic acid possibly inhibited by • ERYTHROMYCIN (increased plasma concentration); avoidance of valproic acid advised by manufacturer of • PIVMECILLINAM; plasma concentration of valproic acid reduced by • CARBAPENEMS—avoid concomitant use
  • Anticoagulants: valproic acid possibly enhances anticoagulant effect of • COUMARINS
  • Antidepressants: anticonvulsant effect of antiiepileptics possibly antagonised by • MAOIS and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
  • Antiepileptics: plasma concentration of valproic acid reduced by • CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; valproic acid possibly increases plasma concentration of • ETHOSUXIMIDE; valproic acid increases or possibly decreases plasma concentration of • FOSPHENYTOIN and • PHENYTOIN, also plasma concentration of valproic acid reduced; valproic acid increases plasma concentration of • LAMOTRIGINE (increased risk of toxicity—reduce lamotrigine dose); valproic acid sometimes reduces plasma concentration of an active metabolite of • OXCARBAZEPINE; valproic acid increases plasma concentration of • PHENOBARBITAL and • PRIMIDONE (also plasma concentration of valproic acid reduced); valproic acid possibly increases plasma concentration of • RUFINAMIDE (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproic acid given with • TOPIRAMATE
  • Antimalarials: anticonvulsant effect of antiiepileptics antagonised by • MEFLOQUINE
  • Antipsychotics: anticonvulsant effect of antiiepileptics antagonised by • ANTI-PsyCHOTiCS (convulsive threshold lowered); valproic acid possibly increases or decreases plasma concentration of • CLOZAPiNE; increased risk of side-effects including neutropenia when valproic acid given with • OLANZAPiNE
  • Antivirals: plasma concentration of valproic acid possibly reduced by • RITONAViR; valproic acid possibly increases plasma concentration of • ZIDOVUDiNE (increased risk of toxicity)
  • Anxiolytics and Hypnotics: plasma concentration of valproic acid possibly increased by • CLOBAZAM; increased risk of side-effects when valproic acid given with • CLONAZEPAM; valproic acid possibly increases plasma concentration of • DIAZEPAM and • LORAZEPAM
  • Bupropion: valproic acid inhibits the metabolism of • BUPROPiON
  • Cytoxics: valproic acid increases plasma concentration of • TEMOZOLOMiDE
  • Lipid-regulating Drugs: absorption of valproic acid possibly reduced by • COLESTiRAMiNE
  • Oestrogens: plasma concentration of valproic acid possibly reduced by • ETHiNYLESTRADiOL
  • Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
  • Sodium Benzoate: valproic acid possibly reduces effects of • SODiUM BENZOATE
  • Sodium Oxysolate: valproic acid increases the plasma concentration of • SODiUM oXyBATE (see under Sodium Oxysolate, p. 425)
  • Sodium Phenytoin: valproic acid possibly reduces effects of • SODiUM PHENyTOiN
  • Ultra-healing Drugs: metabolism of valproic acid inhibited by • CIEMETiDiNE (increased plasma concentration)
Valscant See Angiotensin-II Receptor Antagonists
Vancocycin
  • Anaesthetics, General: hypersensitivity-like reactions can occur when intravenous vancocycin given with • GENERAL ANAESTHETICS
Interactions

Appendix 1

Vancomycin (continued)

- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with amphotericin B, aminoglycosides, capreomycin or colistimethate sodium; increased risk of nephrotoxicity when vancomycin given with polyoxymymin.
- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with amphotericin B.
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with ciclosporin.
- Cyclosporin: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with cisplatin.
- Diuretics: increased risk of toxicity when vancomycin given with loop diuretics.
- Lipid-regulating Drugs: effects of oral vancomycin antagonised by colestyramine.
- Muscle Relaxants: vancomycin enhances effects of suxamethonium.
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with tacrolimus.
- Vaccines: antibacterials inactivate the oral typhoid vaccine—see under Typhoid Vaccine in BNF.

Vandetanib

- Analgesics: possible increased risk of ventricular arrhythmias when vandetanib given with methadone—avoid concomitant use.
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vandetanib given with amiodarone or disopyramide—avoid concomitant use.
- Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with moxifloxacin—avoid concomitant use; plasma concentration of vandetanib reduced by parenteral erythromycin—avoid concomitant use; possible increased risk of ventricular arrhythmias when vandetanib given with moxifloxacin.
- Antidepressants: manufacturer of vandetanib advises avoidance of vandetanib with st john’s wort (plasma concentration of vandetanib possibly reduced).
- Antidiabetics: vandetanib possibly increases plasma concentration of metformin (consider reducing dose of metformin).
- Antiepileptics: manufacturer of vandetanib advises avoidance of vandetanib with carbamazepine, phenobarbital and primidone (plasma concentration of vandetanib possibly reduced).
- Antihistamines: possible increased risk of ventricular arrhythmias when vandetanib given with mizolastine—avoid concomitant use.
- Antimalarials: possible increased risk of ventricular arrhythmias when vandetanib given with artemether with lumefantrine—avoid concomitant use.
- Antipsychotics: possible increased risk of ventricular arrhythmias when vandetanib given with amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use; avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Beta-blockers: possible increased risk of ventricular arrhythmias when vandetanib given with sotalol—avoid concomitant use.
- Cardiac Glycosides: vandetanib increases plasma concentration of digoxin—possible increased risk of bradycardia.
- Cytotoxics: possible increased risk of ventricular arrhythmias when vandetanib given with arsenic trioxide—avoid concomitant use.
- Hormone Antagonists: possible increased risk of ventricular arrhythmias when vandetanib given with toremifene—avoid concomitant use.
- SHT-receptor Antagonists: increased risk of ventricular arrhythmias when vandetanib given with ondansetron—avoid concomitant use.
- Pentamidine isethionate: possible increased risk of ventricular arrhythmias when vandetanib given with pentamidine isethionate—avoid concomitant use.

Vardenafil

- Alpha-blockers: enhanced hypotensive effect when vardenafil given with α-blockers—when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose—separate doses by 6 hours (except with tamsulosin).
- Anti-arrhythmics: avoidance of vardenafil advised by manufacturer of disopyramide (risk of ventricular arrhythmias).
- Antibacterials: plasma concentration of vardenafil possibly increased by clarithromycin (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil).
- Antifungals: plasma concentration of vardenafil increased by ketoconazole—avoid concomitant use; plasma concentration of vardenafil possibly increased by itraconazole.
- Antivirals: plasma concentration of vardenafil possibly increased by fosamprenavir; plasma concentration of vardenafil increased by indinavir and ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with saquinavir—avoid concomitant use; avoidance of vardenafil advised by manufacturer of telaprevir; caution with vardenafil advised by manufacturer of tipranavir.
- Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with nifedipine.
- Cocistat: plasma concentration of vardenafil possibly increased by cocistat—manufacturer of cocistat advises reduced dose of vardenafil (consult cocistat product literature).
- Dapoxetine: avoidance of vardenafil advised by manufacturer of dapoxetine.
- Grapefruit Juice: plasma concentration of vardenafil possibly increased by grapefruit juice—avoid concomitant use.
- Nitrates: possible increased hypotensive effect when vardenafil given with nitrates—avoid concomitant use.
- Riociguat: possible enhanced hypotensive effect when vardenafil given with riociguat—avoid concomitant use.

Varicella-zoster Vaccine

See Vaccines.

Vasodilator Antihypertensives

- ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE inhibitors.
- Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with adrenergic neurone blockers.
- Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alcohol.
- Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with aldesleukin.
- Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with α-blockers.
- Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with general anaesthetics.
- Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs.
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with angiotensin-II receptor antagonists.
- Antidotes: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with dialysis.
- Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with tricyclic-related antidepressants.
- Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with phenothiazines.
- Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with β-blockers.

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with β-blockers.
Vasodilator Antihypertensives (continued)

- Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with METHYLDOPA; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with LEVODOPA; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with METYLBENZDIAZEPINE; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with METYLBENZDIAZEPINE.

- Minoxidil: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with METYLBENZDIAZEPINE.

- Nitrites: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with NITROPRUSSIDE.

- Nicardipine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with NITROPRUSSIDE.

- Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given withoprostenol; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALPROSTADIL.

- Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with MINOXIDIL or OF CORTISONE.

Vemurafenib

- Anticoagulants: avoid concomitant use with anticoagulants; see Muscle Relaxants and Vancocinum for use with muscle relaxants.

Vigabatrin

- Antidepressants: possible increased serotonergic effects when venlafaxine given with ST JOHN’S WORT, DULOXETINE or METHYLDOPA; enhanced CNS effects and toxicity when venlafaxine given with MAOIS (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start MOXIBEBEME for at least 1 week.

- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER with Lumefantrine and ARTEMIMOL with PIPERINE.

- Psychotics: venlafaxine increases plasma concentration of HALOPERIDOL.

- Antidepressants: possible increased risk of convulsions when antidepressants given with ATOMOXETINE.

Venlafaxine (continued)

- Antidepressants: possible increased serotonergic effects when venlafaxine given with ST JOHN’S WORT, DULOXETINE or METHYLDOPA; enhanced CNS effects and toxicity when venlafaxine given with MAOIS (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start MOXIBEBEME for at least 1 week.

- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER with Lumefantrine and ARTEMIMOL with PIPERINE.

- Psychotics: venlafaxine increases plasma concentration of HALOPERIDOL.

- Antidepressants: possible increased risk of convulsions when antidepressants given with ATOMOXETINE.

- Dopamine: possible increased risk of serotonergic effects when venlafaxine given with DAPoxetine (manufacturer of dapsone advises venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping venlafaxine).

- Dopamine: caution with venlafaxine advised by manufacturer of ENTACAPONE; increased risk of hypertension and CNS excitation when venlafaxine given with SELEGLINE (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline).

- SH1-receptor Agonists: possible increased serotonergic effects when venlafaxine given with SH1 AGONISTS.

- Anticonvulsant: possible increased serotonergic effects when venlafaxine given with ANTICONVULSANT.

- Lithium: possible increased serotonergic effects when venlafaxine given with LITHIUM.

- Neuroleptic: increased risk of CNS toxicity when SSRI-related antidepressants given with METHYLTHIONinium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration).

Venlafaxine

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRI and TRICYCLICs (convulsive threshold lowered).

- Antiepileptics: vigabatrin reduces plasma concentration of FOSPHENTYNOIN and PHENOTYNOIN.

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MEFLOQUINE.

- Psychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered).

- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT.

Vilanterol

- See Sympathomimetics, Beta2.

Vildagliptin

- See Antidiabetics.

Vinblastine

- Aldesleukin: avoidance of vinblastine advised by manufacturer of ALDESLEUKIN.

- Antibacterials: toxicity of vinblastine increased by ERYTHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when vinblastine given with DELAMANID.

- Antifungals: possible increased risk of vinblastine toxicity when given with TRACONAZOLE; metabolism of vinblastine possibly inhibited by POSACONAZOLE (increased risk of neurotoxicity).

- Antimalarials: avoidance of vinblastine advised by manufacturer of ARTEMETHER with PIPERINE.

- Psychotics: avoid concomitant use of cytotoxic with CLOZAPINE (increased risk of agranulocytosis).

- Antivirals: plasma concentration of vinblastine possibly increased by RITONAVIR.
Vincristine
- Antibacterials: possible increased risk of ventricular arrhythmias when vincristine given with delamanid
- Antifungals: possible increased risk of vincristine toxicity when given with itraconazole; metabolism of vincristine possibly inhibited by posaconazole (increased risk of neurotoxicity)
- Antimalarials: avoidance of vincristine advised by manufacturer of artemether with piperaquine
- Antipsychotics: avoid concomitant use of cytoxotics with clocapine (increased risk of agranulocytosis)
- Calcium-channel blockers: metabolism of vincristine possibly inhibited by nefedipine
- Cardiac Glycosides: vincristine possibly reduces absorption of digoxin tablets

Vinflunine
- Antibacterials: plasma concentration of vinflunine possibly reduced by rifampicin — manufacturer of vinflunine advises avoid concomitant use; increased risk of ventricular arrhythmias when vinflunine given with delamanid
- Antidepressants: plasma concentration of vinflunine possibly reduced by st john’s wort — manufacturer of vinflunine advises avoid concomitant use
- Antifungals: plasma concentration of vinflunine increased by ketoconazole — manufacturer of vinflunine advises avoid concomitant use; possible increased risk of vinflunine toxicity when given with itraconazole
- Antimalarials: avoidance of vinflunine advised by manufacturer of artemether with piperaquine
- Antipsychotics: avoid concomitant use of cytoxotics with clocapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinflunine possibly increased by ritonavir — manufacturer of vinflunine advises avoid concomitant use
- Grapefruit juice: plasma concentration of vinflunine possibly increased by grapefruit juice — manufacturer of vinflunine advises avoid concomitant use

Vindesine
- Antibacterials: possible increased risk of ventricular arrhythmias when vindesine given with delamanid
- Antifungals: possible increased risk of vindesine toxicity when given with itraconazole
- Antipsychotics: avoid concomitant use of cytoxotics with clocapine (increased risk of agranulocytosis)

Vinorelbine
- Antibacterials: possible increased risk of neutropenia when vinorelbine given with clarithromycin; possible increased risk of ventricular arrhythmias when vinorelbine given with delamanid
- Antifungals: possible increased risk of vinorelbine toxicity when given with itraconazole
- Antimalarials: avoidance of vinorelbine advised by manufacturer of artemether with piperaquine
- Antipsychotics: avoid concomitant use of cytoxotics with clocapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinorelbine possibly increased by ritaonavir — manufacturer of vinorelbine advises avoid concomitant use
- Wasp venom extracts given with pyranavir; possible severe anaphylactoid reaction when
- Leukotriene receptor antagonists

Vismodegib
- Antibacterials: manufacturer of vismodegib advises avoid concomitant use with rifampicin (plasma concentration of vismodegib possibly reduced)
- Antidepressants: manufacturer of vismodegib advises avoid concomitant use with st john’s wort (plasma concentration of vismodegib possibly reduced)
- Antiepileptics: manufacturer of vismodegib advises avoid concomitant use with carbamazepine, fosphenytoin and phenytoin (plasma concentration of vismodegib possibly reduced)
- Antipsychotics: avoid concomitant use of cytoxotics with clocapine (increased risk of agranulocytosis)

Vitamin A see Vitamins

Vitamin D see Vitamins

Vitamin E see Vitamins

Vitamin K (Phytomenadione) see Vitamins

Vitamins (continued)
- Anticoagulants: vitamin E possibly enhances anticoagulant effect of coumarins; vitamin K antagonises anticoagulant effect of coumarins and phenindione
- Antiepileptics: alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with carbamazepine; alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with fosphenytoin; alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with phenytoin; alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with primidone
- Antifungals: plasma concentration of paricalcitol possibly increased by ketoconazole; effects of alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol and vitamin D possibly reduced by miconazole
- Antivirals: increased risk of bleeding when high doses of vitamin E given with pyranavir
- Ciclosporin: vitamin E possibly affects plasma concentration of ciclosporin
- Cytotoxics: effects of alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol and vitamin D possibly reduced by dactinomycin; avoidance of vitamin E advised by manufacturer of ibrutinib
- Diuretics: increased risk of hypercalcaemia when alfalcaldiol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D given with thiazides and related diuretics
- Dopaminergics: pyridoxine reduces effects of levodopa when given without dopa-decarboxylase inhibitor
- Lipid-regulating Drugs: absorption of calcitriol possibly reduced by colestyramine (give at least 1 hour before or 4 to 6 hours after colestyramine)
- Retinoids: risk of hypervitaminosis A when vitamin A given with retinoids — avoid concomitant use
- Selenium: ascorbic acid possibly reduces absorption of selenium (give at least 4 hours apart)
- Sevelamer: absorption of calcitriol reduced by sevelamer (give at least 1 hour before or 3 hours after sevelamer)
- Voriconazole see Antifungals, Triazole

Warfarin see Coumarins

Wasp Venom Extracts
- Given with ace inhibitors: possible severe anaphylactoid reaction when wasp venom extracts given with ace inhibitors

Xipamide see Diuretics

Xylometazoline see sympathomimetics

Yellow Fever Vaccine see Vaccines

Zafirlukast see Leukotriene Receptor Antagonists

Zaleplon see Anxiolytics and Hypnotics

Zidovudine

NOTE Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature
- Analgesics: increased risk of haematological toxicity when zidovudine given with nsaids; plasma concentration of zidovudine possibly increased by methadone
- Antibacterials: absorption of zidovudine reduced by clarithromycin tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with rifampicin
- Antiepileptics: zidovudine increases or decreases plasma concentration of fosphenytoin and phenytoin; plasma concentration of zidovudine possibly increased by sodium valproate and valproic acid (increased risk of toxicity)
- Antifungals: plasma concentration of zidovudine increased by fluconazole (increased risk of toxicity)
- Antimalarials: increased antifolate effect when zidovudine given with pyrimethamine
Zidovudine (continued)
- Antivirals: profound myelosuppression when zidovudine given with • GANCICLOVIR or • VALGANCICLOVIR (if possible avoid concomitant administration, particularly during initial ganciclovir or valganciclovir therapy); increased risk of granulocytopenia when zidovudine given with • NEVIRAPINE; increased risk of anaemia when zidovudine given with • RIBAVIRIN—avoid concomitant use; zidovudine possibly inhibits effects of • STAVUDINE (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by • TIPRANAVIR
- Atovaquone: plasma concentration of zidovudine increased by ATOVAQUONE (increased risk of toxicity)
- Orlistat: absorption of zidovudine possibly reduced by • ORLISTAT

Zinc
- Antibiotics: zinc reduces absorption of CIPROFLOXacin, LEVOFLOXacin, MOXIFLOXacin and OFLOXacin; zinc reduces absorption of NORFLOXacin (give at least 2 hours apart); zinc reduces absorption of TETRACYCLines, also absorption of zinc reduced by tetracyclines
  - Calcium Salts: absorption of zinc reduced by CALCIUM SALTS
- Eltrombopag: zinc possibly reduces absorption of ELTROMBOPAG (give at least 4 hours apart)
  - Iron Salts: absorption of zinc reduced by oral IRON SALTS, also absorption of oral iron salts reduced by zinc
- Penicillamine: absorption of zinc reduced by PEnicillAMINE, also absorption of penicillamine reduced by zinc
- Trientine: absorption of zinc reduced by TRIENTINE, also absorption of trientine reduced by zinc

Zoledronic Acid see Bisphosphonates
Zolmitriptan see 5HT1-receptor Agonists (under HT)
Zolpidem see Anxiolytics and Hypnotics
Zonisamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and • TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered);
  anticonvulsant effect of antiepileptics antagonised by • SSRIS and • TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of zonisamide reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENITOIN and PRIMIDONE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEfloQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS (convulsive threshold lowered)
- Diuretics: manufacturer of zonisamide advises avoid concomitant use with CARBONIC ANHYDRASE INHIBITORS in children
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
Zopiclone see Anxiolytics and Hypnotics
Zuclopenthixol see Antipsychotics

Phenyketonuria 1288
Tyrosinaemia 1290

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

Information

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)

All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry. Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements

For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin. The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietitian.

Nutritional values

Nutritional values of products vary with flavour and pack size—consult product literature.

Other conditions for which ACBS products can be prescribed

This is a list of clinical conditions for which the ACBS has approved toilet preparations.

Birthmarks

Dermatitis

Eczema and Pruritis

Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)

Covermark® classic foundation and finishing powder; Dermablend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

Disinfectants (antiseptics)

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for...
the treatment of patients, but not for general hygienic purposes.

**Dry mouth (xerostomia)**
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

*AS Saliva Orthana®; Biotène Oralbalance®; BioXtra®; Glandosane®; Saliveze®*

**Photodermatoses (skin protection in)**
*Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50*

**Standard ACBS Indications**
Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula.
### Table 1 Enteral feeds (non-disease specific)

**Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL**

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1–6 years

- For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

Multi-thick powder (Abbott Laboratories Ltd)
250 gram (ACBS) - NHS indicative price = £4.83

Nutilis® Clear
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.

Nutilis Clear powder (Nutricia Ltd)
175 gram (ACBS) - NHS indicative price = £8.46

Nutilis® Powder
- For thickening of foods in dysphagia. Not suitable for child under 3 years.

Nutilis powder (Nutricia Ltd)
240 gram (ACBS) - NHS indicative price = £6.40 | 300 gram (ACBS) - NHS indicative price = £4.92

Resource® ThickenUp Clear
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.

Resource ThickenUp Clear powder (Nestle Health Science)
24 x 1.2 g sachets (ACBS) - NHS indicative price = £5.28 | 125 gram (ACBS) - NHS indicative price = £8.46

Resource® Thickened Drink
- For dysphagia. Not suitable for children under 1 year.

Resource Thickened Drink custard (Nestle Health Science)
apple, orange 114 ml (ACBS) - NHS indicative price = £0.71

Resource ThickenUp powder (Nestle Health Science)
227 gram (ACBS) - NHS indicative price = £4.55 | 337.5 gram (ACBS) - NHS indicative price = £17.44

Resource® Thickened® Clear
POWDER, maltodextrin, xanthan gum, gluten- and lactose-free, sweetened with fructose. Available in 12 strengths.

Resource Thickened Drink (Ferring Pharmaceuticals Ltd)
consistency (3 consistencies available), see product literature.

Thick and Easy®
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

POWDER, modified maize starch

Thick & Easy powder (Fresenius Kabi Ltd)
225 gram (ACBS) - NHS indicative price = £5.06 | 900 gram (ACBS) - NHS indicative price = £31.00 | 4540 gram (ACBS) - NHS indicative price = £84.71

Thicken Aid powder (M & A Pharmachem Ltd)
225 gram (ACBS) - NHS indicative price = £3.71 | 900 gram (ACBS) - NHS indicative price = £22.40

Thixo-D®
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

POWDER, modified maize starch, gluten- and lactose-free.

Thixo-D (Sutherland Health Ltd)
Cal-Free powder 50 gram - NHS indicative price = £2.85 powder 375 gram (ACBS) - NHS indicative price = £7.15

Vitaquick®
- For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

POWDER, modified maize starch.

Vitaquick powder (Vitaflo International Ltd)
300 gram (ACBS) - NHS indicative price = £7.05 | 2000 gram (ACBS) - NHS indicative price = £38.92

Flavouring preparations

Flavour Mix®
POWDER

Nestle Nutrition Flavour (Nestle Health Science)
Mix banana, Mix chocolate 60 gram (ACBS) - NHS indicative price = £7.17

FlavourPac®
- For use with Vitaflor’s range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 3 years.

all purpose mix, chocolate cake mix, plain cake mix 500 gram (ACBS) - NHS indicative price = £6.97

Juvela® Mix
LOW-PROTEIN
Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

GA1 Anamix® Infant

– Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

GA Gel®

– Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years. GEL, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.

GA gel oral powder 24g sachets (Vitalfo International Ltd)
30 sachet (ACBS) - NHS indicative price = £210.12

XLYS, Low TRY, Maxamaid®

– Nutritional supplement for the dietary management of type 1 glutaric aciduria. POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (327 kcal)/100 g, with vitamins, minerals, and trace elements.

XLYS LOW TRY Maxamaid powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £96.40

XLYS, TRY Glutaridon®

– Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements. POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

XLYS TRY Glutaridon powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £182.61

Juvela low protein mix (Hero UK Ltd)
500 gram (ACBS) - NHS indicative price = £7.79

Loprofin® Flour mixes and egg substitutes

mix (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £8.27

Loprofin low protein cake (Nutricia Ltd)
mix lemon, mix chocolate 500 gram (ACBS) - NHS indicative price = £8.76

Loprofin low protein egg (Nutricia Ltd)
white replace 100 gram (ACBS) - NHS indicative price = £9.79
replacer 500 gram (ACBS) - NHS indicative price = £15.22

PK Foods® Flour mix and egg substitute

PK Foods low protein (Gluten Free Foods Ltd)
egg replace 200 gram (ACBS) - NHS indicative price = £4.08
flour mix 750 gram (ACBS) - NHS indicative price = £10.71

Pasta

Loprofin® Pasta

Loprofin low protein pasta (Nutricia Ltd)
penne, long cut spaghetti 500 gram (ACBS) - NHS indicative price = £8.66
animal shapes 500 gram (ACBS) - NHS indicative price = £8.33
tagliatelle, macaroni elbows 250 gram (ACBS) - NHS indicative price = £4.16
lasagne 250 gram (ACBS) - NHS indicative price = £4.21

Promin® Pasta

Promin Plus low protein pasta (Firstplay Dietary Foods Ltd)
macaroni, flat noodles 500 gram (ACBS) - NHS indicative price = £6.99

Promin low protein imitation rice (Firstplay Dietary Foods Ltd)
500 gram (ACBS) - NHS indicative price = £6.99

Promin low protein lasagne sheets (Firstplay Dietary Foods Ltd)
200 gram (ACBS) - NHS indicative price = £3.03

Promin low protein pasta (Firstplay Dietary Foods Ltd)
alphabets, shells, short cut spaghetti, spirals 500 gram (ACBS) - NHS indicative price = £6.99

Promin low protein tricolour pasta (Firstplay Dietary Foods Ltd)
spirals, alphabets, shells 500 gram (ACBS) - NHS indicative price = £6.99

Pizza bases

Juvela® Pizza base

Juvela low protein pizza base (Hero UK Ltd)
360 gram (ACBS) - NHS indicative price = £8.61

Savoury meals and mixes

Promin® Savoury meals and mixes

pastameal (Firstplay Dietary Foods Ltd)
500 gram (ACBS) - NHS indicative price = £6.99

elbows (Firstplay Dietary Foods Ltd)
500 gram (ACBS) - NHS indicative price = £6.99

macaroni (Firstplay Dietary Foods Ltd)
500 gram (ACBS) - NHS indicative price = £6.99

Promin Plus low protein pasta spirals (Firstplay Dietary Foods Ltd)
500 gram (ACBS) - NHS indicative price = £6.99

Promin low protein X-Pot (Firstplay Dietary Foods Ltd)
all day scramble, beef & tomato, chip shop curry, rogan style curry 240 gram (ACBS) - NHS indicative price = £20.94

Promin low protein burger mix (Firstplay Dietary Foods Ltd)
124 gram (ACBS) - NHS indicative price = £6.36
Glycogen storage disease

Corn flour and corn starch
For glycogen storage disease

Glycosad®
- A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years.
- POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 805 kJ (192 kcal)/60 g.
- Glycosade oral powder 60g sachets (Vitafo International Ltd) 50 sachet (ACBS) - NHS indicative price = £110.44

Homocystinuria or hypermethioninaemia

HCU Anamix® Infant
- Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 5 years.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
- HCU Anamix Infant powder (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £38.18

HCU Express® 15
- A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years with homocystinuria. LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 595 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements.
- HCU orange cooler 15 liquid (Vitafo International Ltd) 130 mL (ACBS) - NHS indicative price = £11.09

HCU Express® 20
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 5.8 g, fat 30 mg, energy 515 kJ (75.3 kcal)/25 mL, with vitamins, minerals, and trace elements.
- HCU express 20 oral powder 25g sachets (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £52.30

HCU gel®
- A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1-10 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.5 g, fat 20 mg, energy 539 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements.
- HCU gel oral powder 24g sachets (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £210.07

HCU Lophlex® LQ 20
- Nutritional supplement for the dietary management of homocystinuria in patients over 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.
- HCU Lophlex LQ 20 liquid (Nutricia Ltd) 125 ml (ACBS) - NHS indicative price = £15.75

HCU LV®
- Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in children over 8 years.
- POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.
- HCU-LV oral powder 27.8g sachets (Nutricia Ltd) tropical, unflavoured 30 sachet (ACBS) - NHS indicative price = £483.90

XMET Homidon®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.
- XMET Homidon powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £182.61

XMET Maxamaid®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (369 kcal)/100 g, with vitamins, minerals, and trace elements.
- Maxamaid products are generally intended for use in children 1-8 years.
- XMET Maxamaid powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £96.40

XMET Maxamum®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements.
- Maxamum products are generally intended for use in children over 8 years.
- XMET Maxamum powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £154.52

Hyperlysinaemia

HYPER LYS Anamix® Infant
- Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except lysine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre less than 500 mg, energy 1260 kJ (297 kcal)/100 g.
- HYPER LYS Anamix Infant powder (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £38.18

XLYS Maxamaid®
- Nutritional supplement for the dietary management of hyperlysinaemia.
- POWDER, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (369 kcal)/100 g, with vitamins, minerals, and trace elements.
- XLYS Maxamaid powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £96.40
**Isovaleric acidemia**

**IVA Anamix® Infant**
- Nutritional supplement for the dietary management of proven isovaleric acidemia or other proven disorders of leucine metabolism in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except leucine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**IVA Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £38.18

**XLEU Faladon®**
- Nutritional supplement for the dietary management of isovaleric acidemia.

POWDER, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**XLEU Maxamaid®**
- Nutritional supplement for the dietary management of isovaleric acidemia.

POWDER, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements.

**XLEU Maxamaid powder** (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £96.40

**Maple syrup urine disease**

**MSUD Aid III®**
- Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**MSUD Aid III powder** (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £182.61

**MSUD Anamix® Infant**
- Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**MSUD Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £38.18

**MSUD Anamix® Junior**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (115 kcal)/29 g sachet, with vitamins, minerals, and trace elements.

**MSUD Anamix Junior oral powder 29g sachets** (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £204.00

**MSUD Anamix® Junior LQ**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.

LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**MSUD Anamix Junior LQ liquid** (Nutricia Ltd)
- 125 ml (ACBS) - NHS indicative price = £8.85

**MSUD cooler® 15**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults.

LIQUID, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 395 kJ (92 kcal)/150 mL pouch, with vitamins, minerals, and trace elements.

**MSUD (Vitalfo International Ltd)**
- orange cooler 15 liquid, red cooler 15 liquid 130 ml (ACBS) - NHS indicative price = £11.09

**MSUD express® 15**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.

POWDER, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 5.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g, with vitamins, minerals, and trace elements.

**MSUD express 15 oral powder 25g sachets** (Vitalfo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £326.30

**MSUD express® 20**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/24 g, with vitamins, minerals, and trace elements.

**MSUD express 20 oral powder 34g sachets** (Vitalfo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £421.57

**MSUD Gel®**
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 539 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.

**MSUD gel 24g sachets** (Vitalfo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £212.54

**MSUD Lophelix® LQ 20**
- Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults.

LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

**MSUD Lophelix LQ 20 liquid** (Nutricia Ltd)
- 125 ml (ACBS) - NHS indicative price = £15.75

**MSUD Maxamaid®**
- Nutritional supplement for the dietary management of maple syrup urine disease.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**MSUD Maxamaid powder** (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £96.40

**MSUD Maxamum®**
- Nutritional supplement for the dietary management of maple syrup urine disease.

POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum products are generally intended for use in children over 8 years.

**MSUD Maxamum powder** (Nutricia Ltd)
- orange, unflavoured 500 gram (ACBS) - NHS indicative price = £154.52
Methylmalonic or propionic acidaemia

**MMA/PA Anamix® Infant**

- Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 15.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
- **MMA PA Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £38.18
- **XMTVI Asadon®**
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1586 kJ (32 kcal)/100 g.
- **XMTVI Asadon powder** (Nutricia Ltd) 200 gram (ACBS) - NHS indicative price = £73.04
- **XMTVI Maxamaid®**
- Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.
- **XMTVI Maxamaid powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £96.40
- **XMTVI Maxamum®**
- Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements.
- **XMTVI Maxamum powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £115.52

Other inborn errors of metabolism

**Cystine50®**

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g
- **DocOmega®**
- Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
- POWDER, protein (cows’ milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals
- **DocOmega oral powder 4g sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £38.64
- **EAA® Supplement**
- Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 5 years.
- POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.
- **EAA Supplement oral powder 12.5g sachets** (Vitafllo International Ltd) 50 sachet (ACBS) - NHS indicative price = £201.42

**Isoleucine50®**

- Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g
- **Isoleucine50 oral powder 4g sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £53.38

**KeyOmega®**

- Nutritional supplement for the dietary management of inborn errors of metabolism.
- POWDER, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g
- **KeyOmega oral powder 4g sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £59.50

**Leucine100®**

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g
- **Leucine100 oral powder sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £53.38

**Low protein drink**

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.
- POWDER, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose.
- **Milupa LP drink** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £9.06

**Phenylalanine50®**

- Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.
- POWDER, phenylalanine 50 mg, carbohydrate 5.8 g, fat nil, energy 65 kJ (15 kcal)/4 g
- **Phenylalanine50 oral powder sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £51.83

**ProZero®**

- A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.
- LIQUID, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.
- **ProZero liquid** (Vitafllo international Ltd) 250 ml (ACBS) - NHS indicative price = £1.42 | 1000 ml (ACBS) - NHS indicative price = £5.68

**Tyrosine100®**

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 65 kJ (15 kcal)/4-g sachet.
- **Tyrosine100 oral powder 4g sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £4.89

**Valine50®**

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, valine 50 mg, carbohydrate 5.8 g, fat nil, energy 65 kJ (15 kcal)/4 g
- **Valine50 oral powder 4g sachets** (Vitafllo International Ltd) 30 sachet (ACBS) - NHS indicative price = £53.38
Phenylketonuria

Add-ins®
- Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years.
  POWDER, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements.

Add Ins oral powder 18.2g sachets (Nutricia Ltd)
60 sachet (ACBS) - NHS indicative price = £368.40

Easyphen®
- Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years.
  LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easyphen liquid (Nutricia Ltd)
250 ml (ACBS) - NHS indicative price = £9.47

Lophlex®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 585 kJ (141 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.

Lophlex powder 27.8g sachets (Nutricia Ltd)
berry, orange, unflavoured 30 sachet (ACBS) - NHS indicative price = £284.40

Loprofin® PKU Drink
- Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.
  LIQUID, protein (cows’ milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL.

Loprofin PKU drink (Nutricia Ltd)
200 ml (ACBS) - NHS indicative price = £0.74

Loprofin® Sno-Pro
- Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism.
  LIQUID, protein (cows’ milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 5.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose.

Loprofin SNO-PRO drink (Nutricia Ltd)
200 ml (ACBS) - NHS indicative price = £1.25

Milupa PKU 2-prima®
- Nutritional supplement for the dietary management of phenylketonuria in children 1-8 years.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements.

Milupa PKU 2 Prima powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £153.73

Milupa PKU 2-secunda®
- Nutritional supplement for the dietary management of phenylketonuria in children 9-15 years.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements.

Milupa PKU 2 Secunda powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £179.34

Milupa PKU 3-advanta®
- Nutritional supplement for the dietary management of phenylketonuria in children over 15 years.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements.

Milupa PKU 3 Advanta powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £179.34

Phlexy-10® Exchange System
- Nutritional supplement for the dietary management of phenylketonuria.
  CAPSULES, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.

Phlexy-10 500mg capsules (Nutricia Ltd)
200 capsule (ACBS) - NHS indicative price = £42.00

Phlexy-Vits®
- For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities.
  POWDER, vitamins, minerals, and trace elements

Phlexy-Vits (Nutricia Ltd)
powder 210 gram (ACBS) - NHS indicative price = £70.20

Phlexy-Vits® (Nutricia Ltd)
tablets 180 tablet (ACBS) - NHS indicative price = £79.20

PK Aid®
- Nutritional supplement for the dietary management of phenylketonuria in children and adults.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g.

PK Aid® powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £140.37

PKU Anamix® Infant
- Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15.1 g, carbohydrate 49.5 g, fat 23.5 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

PKU Anamix Infant powder (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £34.70

PKU Anamix® Junior
- Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.
  POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements.

PKU Anamix Junior powder (Nutricia Ltd)
chocolate, neutral 870 gram (ACBS) - NHS indicative price = £125.90 | 1080 gram (ACBS) - NHS indicative price = £123.90

PKU Anamix® Junior LQ
- Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.
  LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

PKU Anamix Junior LQ liquid (Nutricia Ltd)
berry, orange 125 ml (ACBS) - NHS indicative price = £5.51
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 5 years.

**PKU cooler**
- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 5 years.
  - **PKU Lophlex**

    - Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.
    - L-tyrosine 20 g, energy 768 kJ (183 kcal) with vitamins, minerals, and trace elements.
POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

TYR Anamix Infant methionine free powder (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £38.18

TYR Anamix® Infant
> Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

TYR Anamix Infant (Nutricia Ltd) methionine free powder, powder 400 gram (ACBS) - NHS indicative price = £38.18

TYR Anamix® Junior
> Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 5.9 g, energy 475 kJ (115 kcal)/29-g sachet, with vitamins, minerals, and trace elements.

TYR Anamix Junior oral powder 29g sachets (Nutricia Ltd) 30 sachet (ACBS) - NHS Indicative Price = £202.50

TYR Anamix® Junior LQ
> Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see ), type II, and type III, in children over 1 year.

LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 510 mg, energy 500 kJ (121 kcal)/125 mL, with vitamins, minerals and trace elements.

TYR Anamix Junior LQ liquid (Nutricia Ltd) 125 ml (ACBS) - NHS Indicative price = £8.85

TYR cooler® 15
> Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults.

LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 15 g, carbohydrate 7 g, fat 500 mg, energy 395 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.

TYR orange cooler 15 liquid (Vitafluo International Ltd) 130 ml (ACBS) - NHS indicative price = £11.09

TYR red cooler (Vitafluo International Ltd) 15 liquid 130 ml (ACBS) - NHS indicative price = £11.09

TYR express®
> Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults.

POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 510 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements.

TYR express 15 oral powder 25g sachets (Vitafluo International Ltd) 30 sachet (ACBS) - NHS indicative price = £326.30

TYR express®
> Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years.

POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/54 g, with vitamins, minerals, and trace elements.

TYR express 20 oral powder 34g sachets (Vitafluo International Ltd) 30 sachet (ACBS) - NHS indicative price = £421.57

TYR Gel®
> Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.

GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.5 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.

TYR gel oral powder 24g sachets (Vitafluo International Ltd) 30 sachet (ACBS) - NHS indicative price = £210.07

TYR Lophlex® LQ 20
> Nutritional supplement for the dietary management of tyrosinaemia in children over 5 years and adults.

LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (121 kcal)/125 mL, with vitamins, minerals, and trace elements.

TYR Lophlex LQ 20 liquid (Nutricia Ltd) 125 ml (ACBS) - NHS indicative price = £15.75

XPHEN TYR Maxamaid®
> Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (361 kcal)/100 g, with vitamins, minerals, and trace elements.

XPHEN TYR Tyrosidan®
> Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XPHEN TYR Tyrosidan Free AA Mix powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £182.61

XPTM Tyrosidan®
> Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasma-methionine concentrations are normal.

POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XPTM Tyrosidan powder (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £91.31
Appendix 3

Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discoloration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. A label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if no specific order is given by the patient, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard.... days after opening' and 'Do not use after....', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Labels

1 Warning: This medicine may make you sleepy

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses. In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.
Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and deaehololised (low alcohol) drink is covered by the patient information leaflet. Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary. Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

To be used on preparations containing ciprofloxacin, norfloxacin, tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs). Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment. The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given. This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

To be used on preparations containing sulfipyrazone whose activity is reduced by aspirin. Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless

To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine

To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening

To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than... in 24 hours

To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules. It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than... in 24 hours. Also, do not take more than... in any one week

To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol

To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed...
for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night. It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

21 Take with or just after food, or a meal
   To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.
   Patients should be advised that a small amount of food is sufficient.

22 Take 30 to 60 minutes before food
   To be used on some preparations whose absorption is thereby improved.
   Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
   To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
   To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush
   To be used on preparations that are enteric-coated or designed for modified-release.
   Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
   Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue
   To be used on preparations designed for sublingual use.
   Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water
   To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that ‘a full glass’ means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
   To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
   To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis. The dose form should be specified, e.g. tablets or capsules.
   This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
   To be used on all containers of dispensed preparations containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
   To be used on containers of dispensed preparations containing aspirin when the name on the label does not include the word ‘aspirin’.

The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are: cleansing, removal of debris; granulation, vascularisation; epithelialisation. The ideal dressing for moist wound healing needs to ensure that the wound remains: moist with exudate, but not macerated; free of clinical infection and excessive slough; free of toxic chemicals, particles or fibres; at the optimum temperature for healing; undisturbed by the need for frequent changes; at the optimum pH value. As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease). Advanced wound dressings, p. 1297 are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginites, foams). Practices such as the use of irritant cleansers and deesloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water. Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris. There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers’ Guide: Advanced wound dressings (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing. Prices quoted in Appendix 4 are basic NHS net prices; for further information see Prices in the BNF. The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

Basic wound contact dressings

Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings. Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only
### Wound contact material for different types of wounds

#### Note

In each section of this table the dressings are listed in order of increasing absorbency. Some wound contact (primary) dressings require a secondary dressing.

---

Partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with ‘normal loading’ (such as Jelonet®) have been used for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

**Knitted polyester primary dressing**

**Atrauman**

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides

**Atrauman dressing** (Paul Hartmann Ltd) 10cm x 20cm = £0.63, 20cm x 30cm = £1.72, 5cm x 5cm = £0.27, 7.5cm x 10cm = £0.28

**Knitted viscose primary dressing**

**N-A Dressing**

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A dressing** (Systagenix Wound Management Ltd) 19cm x 9.5cm = £0.67, 9.5cm x 9.5cm = £0.35

**N-A Ultra**

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A Ultra dressing** (Systagenix Wound Management Ltd) 19cm x 9.5cm = £0.63, 9.5cm x 9.5cm = £0.33

**Profore**

Warp knitted fabric manufactured from a bright viscose monofilament.

**Profore** (Smith & Nephew Healthcare Ltd) wound contact layer 14cm x 20cm = £0.32

**Tricotex**

Warp knitted fabric manufactured from a bright viscose monofilament.

**Tricotex dressing** (Smith & Nephew Healthcare Ltd) 9.5cm x 9.5cm = £0.34

**Paraffin Gauze Dressing**

**Cuticell**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

**Cuticell** (BSN medical Ltd) Classic dressing 10cm x 10cm = £0.29

**Jelonet**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

**Jelonet dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm = £0.41

**Neotulle**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin

**Neotulle** (Neomedic Ltd) dressing 10cm x 10cm = £0.29
Paragauze
(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin. Paragauze (C D Medical Ltd) dressing 10cm x 10cm = £0.28
Paranet
(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin. Paranet (Synergy Health Plc) dressing 10cm x 10cm = £0.25
Absorbent dressings
Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.
Absorbent cellulose dressing
CelluDress
Absorbent Cellulose Dressing with Fluid Repellent Backing. CelluDress dressing (Medicareplus International Ltd) 10cm x 10cm = £0.19, 10cm x 15cm = £0.20, 15cm x 20cm = £0.22, 15cm x 20cm = £0.20, 20cm x 25cm = £0.40, 20cm x 30cm = £0.45
Exu-Dry
Absorbent Cellulose Dressing with Fluid Repellent Backing. Exu-Dry dressing (Smith & Nephew Healthcare Ltd) 10cm x 15cm = £1.12, 15cm x 23cm = £2.29, 23cm x 38cm = £5.32
Mesorb
Cellulose wadding pad with gauze wound contact layer and non-woven repellent backing. Mesorb dressing (Mohlyche Health Care Ltd) 10cm x 10cm = £0.62, 10cm x 15cm = £0.81, 10cm x 20cm = £1.00, 15cm x 20cm = £1.42, 20cm x 25cm = £2.24, 20cm x 30cm = £2.54
Telfa Max
Absorbent Cellulose Dressing with Fluid Repellent Backing. Zetuvit E
Absorbent Cellulose Dressing with Fluid Repellent Backing; sterile or non-sterile. Zetuvit E (Paul Hartmann Ltd) non-sterile dressing 10cm x 10cm = £0.07, 10cm x 20cm = £0.09, 20cm x 20cm = £0.14, 20cm x 40cm = £0.27, sterile dressing 10cm x 10cm = £0.21, 10cm x 20cm = £0.25, 20cm x 20cm = £0.39, 20cm x 40cm = £1.10,
Absorbent perforated dressing
Adpore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Adpore dressing (Medicareplus International Ltd) 10cm x 10cm = £0.10, 10cm x 15cm = £0.16, 10cm x 20cm = £0.30, 10cm x 25cm = £0.34, 10cm x 30cm = £0.42, 10cm x 35cm = £0.50, 7cm x 8cm = £0.08
Cosmopore E
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Cosmopore E dressing (Paul Hartmann Ltd) 10cm x 20cm = £0.45, 10cm x 25cm = £0.56, 10cm x 35cm = £0.78, 5cm x 7.2cm = £0.08, 8cm x 10cm = £0.17, 8cm x 15cm = £0.28
Cutiplast Steril
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Cutiplast Steril dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm = £0.31, 10cm x 25cm = £0.32, 10cm x 30cm = £0.42, 8cm x 10cm = £0.11, 8cm x 15cm = £0.24
Leukomed
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Leukomed dressing (B5N medical Ltd) 10cm x 20cm = £0.43, 10cm x 25cm = £0.48, 10cm x 30cm = £0.62, 10cm x 35cm = £0.72, 5cm x 7.2cm = £0.09, 8cm x 10cm = £0.18, 8cm x 15cm = £0.32
Medipore + Pad
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Medipore + Pads dressing (3M Health Care Ltd) 10cm x 10cm = £0.15, 10cm x 15cm = £0.25, 10cm x 20cm = £0.37, 10cm x 25cm = £0.46, 10cm x 35cm = £0.64, 5cm x 7.2cm = £0.07
Medisafe
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Medisafe dressing (Neomedic Ltd) 6cm x 8cm = £0.08, 8cm x 10cm = £0.13, 8cm x 12cm = £0.23, 9cm x 15cm = £0.29, 9cm x 25cm = £0.34, 9cm x 25cm = £0.36
Mepore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Mepore dressing (Paul Hartmann Ltd) 10cm x 11cm = £0.22, 11cm x 15cm = £0.36, 7cm x 8cm = £0.11, 9cm x 20cm = £0.44, 9cm x 25cm = £0.61, 9cm x 30cm = £0.70, 9cm x 35cm = £0.76
PremierPore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. PremierPore dressing (Shermond) 10cm x 10cm = £0.12, 10cm x 15cm = £0.18, 10cm x 20cm = £0.32, 10cm x 25cm = £0.36, 10cm x 30cm = £0.45, 10cm x 35cm = £0.52, 5cm x 7cm = £0.05
Primapore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Primapore dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm = £0.43, 10cm x 25cm = £0.50, 10cm x 30cm = £0.62, 10cm x 35cm = £0.76, 6cm x 8.5cm = £0.18, 8cm x 10cm = £0.19, 8cm x 15cm = £0.33
Softpore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Softpore dressing (Richardson Healthcare Ltd) 10cm x 10cm = £0.13, 10cm x 15cm = £0.20, 10cm x 20cm = £0.35, 10cm x 25cm = £0.40, 10cm x 30cm = £0.49, 10cm x 35cm = £0.58, 6cm x 7cm = £0.06
Sterifix
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Sterifix dressing (Paul Hartmann Ltd) 10cm x 14cm = £0.58, 5cm x 7cm = £0.26, 7cm x 10cm = £0.32
Telfa Island
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border. Telfa Island dressing (Aria Medical Ltd) 10cm x 12.5cm = £0.27, 10cm x 20cm = £0.35, 10cm x 25.5cm = £0.45, 10cm x 35cm = £0.62, 5cm x 10cm = £0.08
Absorbent perforated plastic film faced dressing
Absopad
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing. Absopad dressing (Medicareplus International Ltd) 10cm x 10cm = £0.13, 20cm x 10cm = £0.28
Askina Pad
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing. Askina (B.Braun Medical Ltd) Pad dressing 10cm x 10cm = £0.21
Melolin
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing. Melolin dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm = £0.27, 20cm x 10cm = £0.53, 5cm x 5cm = £0.17
Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy. Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

Hydrogel application (amorphous)

**ActiveHeal Hydrogel**

Hydrogel containing guar gum and propylene glycol

*ActiveHeal* (Advanced Medical Solutions Ltd) Hydrogel dressing = £1.41

**Aquaform**

Hydrogel containing modified starch copolymer

*Aquaform* (Aspen Medical Europe Ltd) Hydrogel dressing = £2.02

**Askina Gel**

Hydrogel containing modified starch and glycerol

*Askina* (B.Braun Medical Ltd) Gel dressing = £2.00

**Cutimed**

Hydrogel

*Cutimed* (BSN medical Ltd) Gel dressing = £2.99

**Flexigran**

Hydrogel containing modified starch and glycerol

*Flexigran* (A1 Pharmaceuticals) Gel dressing = £1.90

**GranuGel**

Hydrogel containing carboxymethylcellulose, pectin and propylene glycol

*GranuGel* (ConvaTec Ltd) Hydrocolloid Gel dressing = £2.32

**Intrasite Gel**

Hydrogel containing modified carmellose polymer and propylene glycol

*Intrasite* (Smith & Nephew Healthcare Ltd) Gel dressing = £3.57

**Nu-Gel**

Hydrogel containing alginate and propylene glycol

*Nu-Gel* (Systagenix Wound Management Ltd) dressing = £2.09

**Purilon Gel**

Hydrogel containing carboxymethylcellulose and calcium alginate

*Purilon* (Coloplast Ltd) Gel dressing = £2.26

**Hydrogel sheet dressings**

**ActiFormCool**

Hydrogel dressing

*ActiFormCool sheet* (Activa Healthcare Ltd) 10cm x 10cm square = £6.63, 10cm x 15cm rectangular = £3.79, 20cm x 20cm square = £7.93, 5cm x 6.5cm rectangular = £1.79

**Aquaflo**

Hydrogel dressing

*Aquaflo* (Covidien (UK) Commercial Ltd) sheet 7.5cm discs = £2.60

**Coolie**

Hydrogel dressing (without adhesive border)

*Coolie* (Zerderma Ltd) sheet 7cm discs = £1.96

**Gel FX**

Hydrogel dressing (without adhesive border)

*Gel FX sheet* (Synergy Health Pk) 6cm x 10cm square = £1.60, 6cm x 15cm rectangular = £3.20

**Geliperm**

Hydrogel sheets

*Geliperm* (Geistlich Sono Ltd) sheet 10cm x 10cm square = £2.53

**Hydrosorb**

Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film

*Hydrosorb sheet* (Paul Hartmann Ltd) 10cm x 10cm square = £2.24, 20cm x 20cm square = £6.71, 5cm x 7.5cm rectangular = £1.56
Wound management products and elasticated garments

**Hydrosorb Comfort**
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film (with adhesive border, waterproof).

**Hydrosorb Comfort sheet** (Paul Hartmann Ltd) 12.5cm x 12.5cm square = £3.58, 4.5cm x 6.5cm rectangular = £1.85, 7.5cm x 10cm rectangular = £2.46.

**Intrasite Conformable**
Soft non-woven dressing impregnated with Intrasite gel.

**Intrasite Conformable dressing 10cm x 10cm** (Smith & Nephew Healthcare Ltd) 10cm square = £1.80, 20cm rectangular = £2.42, 40cm rectangular = £4.33.

**Novogel**
Glycerol-based hydrogel sheets (standard or thin).

**Novogel sheet** (Ford Medical Associates Ltd) 10cm x 10cm square = £3.18, 15cm x 20cm rectangular = £6.07, 20cm x 40cm rectangular = £11.56, 30cm x 30cm (0.15cm thickness) square = £12.71, (0.30cm thickness) square = £13.47, 5cm x 7.5cm rectangular = £1.99, 7.5cm diameter circular = £2.89.

**Sanoskin NET**
Hydrogel sheet (without adhesive border).

**Sanoskin (Ideal Medical Solutions Ltd)** NET sheet 8.5cm x 12cm rectangular = £2.28.

**Vacunet**
Non-adherent, hydrogel coated polyester net dressing.

**Vacunet dressing 10cm** x 1 (Pro-Tex Capillary Dressings Ltd) 10cm square = £1.93, 5cm rectangular = £2.86.

**Sodium hyaluronate dressings**
The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound.

**Hyiodine**
Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution.

**Hyiodine (H & R Healthcare Ltd)** dressing = £35.00.

**Vapour-permeable films and membranes**
Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

**Novo Fix**
For intravenous and subcutaneous catheter sites.

**Niko** (Unomedical Ltd) Fix dressing 7cm x 8.5cm = £0.19.

**Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Askina Derm**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Askina Derm dressing** (B. Braun Medical Ltd) 10cm x 12cm = £1.08, 15cm x 20cm = £2.05, 15cm x 20cm = £2.49, 20cm x 30cm = £4.44, 6cm x 7cm = £0.37.

**Biocclusiv**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Biocclusiv dressing** (Systagenix Wound Management Ltd) dressing 10.2cm x 12.7cm = £1.54.

**C-View**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**C-View dressing** (Aspen Medical Europe Ltd) 10cm x 12cm = £1.02, 12cm x 12cm = £1.09, 15cm x 20cm = £2.36, 6cm x 7cm = £0.38.

**Dressfilm**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Dressfilm dressing** (St Georges Medical Ltd) 12cm x 12cm = £0.93, 15cm x 20cm = £1.90, 6cm x 7cm = £0.30.

**Hydrosorb Comfort**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Hydrosorb Comfort dressing** (Paul Hartmann Ltd) 10cm x 12.5cm = £0.42, 10cm x 15cm = £0.52, 10cm x 25cm = £0.61, 12cm x 25cm = £0.86, 15cm x 20cm = £0.96, 20cm x 30cm = £1.60, 6cm x 7cm = £0.22.

**Hypafix Transparent**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Hypafix Transparent dressing** (BSN medical Ltd) dressing 10cm x 2m = £8.71.

**Leukomed T**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Leukomed T dressing** (BSN medical Ltd) 10cm x 12.5cm = £1.01, 11cm x 14cm = £1.23, 15cm x 20cm = £2.35, 15cm x 25cm = £2.51, 7.2cm x 5cm = £0.37, 8cm x 10cm = £0.69.

**Mepitel Film**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Mepitel Film dressing** (Molnlycke Health Care Ltd) 10.5cm x 12cm = £1.31, 10.5cm x 25cm = £2.55, 15.5cm x 20cm = £3.24, 6.5cm x 7cm = £0.49.

**Mepore Film**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Mepore Film dressing** (Molnlycke Health Care Ltd) 10cm x 12cm = £1.23, 10cm x 25cm = £2.39, 15cm x 20cm = £3.04, 6cm x 7cm = £0.46.

**OpSite Flexifix**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**OpSite Flexifix dressing** (Smith & Nephew Healthcare Ltd) 10cm x 1m = £6.57, 5cm x 1m = £3.89.

**OpSite Flexigrid**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**OpSite Flexigrid dressing** (Smith & Nephew Healthcare Ltd) 12cm x 12cm = £1.12, 15cm x 20cm = £2.84, 6cm x 7cm = £0.40.
Polyskin II
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Kendall Film dressing (Aria Medical Ltd) 10cm x 12cm = £1.03, 10cm x 20cm = £2.04, 15cm x 20cm = £2.35, 20cm x 25cm = £4.11, 4cm x 4cm = £0.36, 6cm x 7cm = £0.40

ProtectFilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

ProtectFilm dressing (Wallace, Cameron & Company Ltd) 10cm x 12cm = £0.20, 15cm x 20cm = £0.40, 6cm x 7cm = £0.11

Suprasorb F
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Suprasorb F dressing (Johann & Rauscher (UK) Ltd) 10cm x 12cm = £0.80, 15cm x 20cm = £2.50, 5cm x 7cm = £0.33

Tegaderm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Diamond dressing (3M Health Care Ltd) 12cm x 12cm = £1.11, 15cm x 20cm = £2.41, 6cm x 7cm = £0.39

Vacuskin
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Vacuskin dressing (Pro-Tex Capillary Dressings Ltd) 10cm x 12cm = £1.06, 10cm x 25cm = £2.06, 6cm x 7cm = £0.40

Vellafilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Vellafilm dressing 1 (Advancis Medical) 2cm x 12cm = £1.10, 2cm x 35cm = £2.75, 5cm x 20cm = £2.10

Vapour-permeable Adhesive Film Dressing with absorbent pad

Adapore Ultra dressing (Medicareplus International Ltd) 10cm x 10cm = £0.14, 10cm x 15cm = £0.22, 10cm x 20cm = £0.33, 15cm x 25cm = £0.35, 10cm x 30cm = £0.52, 7cm x 8cm = £0.12

Alldress
Film dressing with absorbent pad

Alldress dressing 1 (Molynckye Health Care Ltd) 1cm x 10cm = £0.95, 5cm x 15cm = £2.07, 6cm x 20cm = £2.56

C-View Post-Op
Film dressing with absorbent pad

C-View Post-Op dressing (Aspen Medical Europe Ltd) 10cm x 12cm = £1.10, 10cm x 25cm = £1.60, 10cm x 35cm = £2.60, 6cm x 7cm = £0.40

Clearpore
Film dressing with absorbent pad

Clearpore dressing (Richardson Healthcare Ltd) 10cm x 10cm = £0.20, 10cm x 15cm = £0.24, 10cm x 20cm = £0.36, 10cm x 25cm = £0.40, 10cm x 30cm = £0.65, 6cm x 10cm = £0.15, 6cm x 7cm = £0.12

Hydrofilm Plus
Film dressing with absorbent pad

Hydrofilm Plus dressing (Paul Hartmann Ltd) 10cm x 20cm = £0.45, 10cm x 25cm = £0.60, 10cm x 30cm = £0.68, 7.2cm x 5cm = £0.18, 9cm x 10cm = £0.27, 9cm x 15cm = £0.30

Leukomed T Plus
Film dressing with absorbent pad

Leukomed T Plus dressing (BSN medical Ltd) 10cm x 20cm = £1.34, 10cm x 25cm = £1.50, 10cm x 30cm = £2.51, 10cm x 35cm = £3.04, 7.2cm x 5cm = £0.27, 8cm x 10cm = £0.53, 8cm x 15cm = £0.80

Mepore Film & Pad
Film dressing with absorbent pad

Mepore Film & Pad dressing (Molynckye Health Care Ltd) 4cm x 5cm = £0.24, 5cm x 7cm = £0.24, 6cm x 10cm = £0.62, 5cm x 15cm = £0.92, 9cm x 20cm = £1.36, 9cm x 25cm = £1.50, 9cm x 30cm = £2.00, 9cm x 35cm = £2.49

Mepore Ultra
Film dressing with absorbent pad

Mepore Ultra dressing (Molynckye Health Care Ltd) 10cm x 11cm = £0.79, 11cm x 15cm = £1.17, 7cm x 8cm = £0.40, 9cm x 20cm = £1.51, 10cm x 25cm = £1.67, 9cm x 30cm = £2.75

OpSite Plus
Film dressing with absorbent pad

OpSite Plus dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.19, 10cm x 20cm = £2.01, 10cm x 30cm = £3.33, 6.5cm x 5cm = £0.32, 8.5cm x 9.5cm = £0.88

OpSite Post-op
Film dressing with absorbent pad

OpSite Post-Op dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.17, 10cm x 20cm = £1.97, 10cm x 25cm = £2.48, 10cm x 30cm = £2.92, 10cm x 35cm = £3.27, 8.5cm x 15.5cm = £1.19, 8.5cm x 9.5cm = £0.86

Pharmapore-PU
Film dressing with absorbent pad

Pharmapore-PU dressing (Wallace, Cameron & Company Ltd) 10cm x 25cm = £0.38, 10cm x 30cm = £0.58, 8.5cm x 15.5cm = £0.20

PremierPore VP
Film dressing with absorbent pad

PremierPore VP dressing (Shermon) 10cm x 10cm = £0.16, 10cm x 15cm = £0.24, 10cm x 20cm = £0.36, 10cm x 25cm = £0.38, 10cm x 30cm = £0.57, 10cm x 35cm = £0.69, 5cm x 7cm = £0.13

Tegaderm
Film dressing with absorbent pad

Tegaderm + Pad dressing (3M Health Care Ltd) 5cm x 7cm = £0.26, 9cm x 10cm = £0.65, 9cm x 15cm = £0.95, 9cm x 20cm = £1.40, 9cm x 25cm = £1.57, 9cm x 35cm = £2.60

Tegaderm Absorbent Clear
Film dressing with clear acrylic polymer oval-shaped pad or rectangular-shaped pad

Tegaderm Absorbent Clear Acrylic dressing (3M Health Care Ltd) 11.1cm x 12.7cm oval = £4.11, 14.2cm x 15.8cm oval = £5.78, 14.9cm x 15.2cm rectangular = £8.66, 16.8cm x 19cm sacral = £10.37, 20cm x 20cm rectangular = £13.91, 7.6cm x 9.5cm oval = £3.17

Vapour-permeable transparent film dressing with adhesive foam border.

Central Gard
For intravenous and subcutaneous catheter sites

Central Gard dressing 16cm x (Union Medical Ltd) 7cm = £0.94, 8.8cm = £1.03

East-V
For intravenous and subcutaneous catheter sites

East-V (Convatec Ltd) dressing 7cm x 7.5cm = £0.38

Vapour-permeable transparent, adhesive film dressing.

Hydrofilm I.V. Control
For intravenous and subcutaneous catheter sites

Hydrofilm (Paul Hartmann Ltd) I.V. Control dressing 7cm x 9cm = £0.31

IV3000
For intravenous and subcutaneous catheter sites

IV3000 dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.39, 5cm x 6cm = £0.42, 6cm x 7cm = £0.55, 7cm x 9cm = £0.73, 9cm x 12cm = £1.44

Mepore IV
For intravenous and subcutaneous catheter sites

Mepore IV dressing (Molynckye Health Care Ltd) 10cm x 11cm = £1.06, 5cm x 5.5cm = £0.31, 8cm x 9cm = £0.40
Wound management

Pharmapure-PIV
For intravenous and subcutaneous catheter sites
Pharmapure-PIV dressing (Wallace, Cameron & Company Ltd) 6cm x 7cm = £0.08, 7cm x 8.5cm = £0.07, 7cm x 9cm = £0.17

Tegaderm IV
For intravenous and subcutaneous catheter sites
Tegaderm IV dressing with securing tapes (3M Health Care Ltd) 10cm x 15.5cm = £1.67, 7cm x 8.5cm = £0.59, 8.5cm x 10.5cm = £1.16

Soft polymer dressings
Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used. Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes. Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface. For silicone keloid dressings see p. 1309.

Cellulose dressings
Sorbion Sachet Border
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border
sorbion sachet border dressing (H & R Healthcare Ltd) 10cm x 10cm square = £2.95, 15cm x 15cm square = £4.49, 25cm x 15cm rectangular = £6.99
Sorbion Sachet EXTRA
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
sorbion sachet EXTRA dressing (H & R Healthcare Ltd) 10cm x 10cm = £2.71, 15cm x 10cm = £3.73, 20cm x 20cm = £7.00, 30cm x 20cm = £9.99, 5cm x 5cm = £1.45, 7.5cm x 7.5cm = £1.78
Sorbion Sachet Multi Star
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
sorbion sachet multi star dressing (H & R Healthcare Ltd) 14cm x 14cm = £4.89, 8cm x 8cm = £2.99
Sorbion Sachet 5 Drainage
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (‘Y’ shaped dressing)
sorbin (H & R Healthcare Ltd) sachet 5 drainage dressing 10cm x 10cm = £2.64
Suprasorb X
Biosynthetic cellulose fibre dressing
Suprasorb X dressing (Lohmann & Rauscher (UK) Ltd) 14cm x 20cm rectangular = £8.38, 20cm x 20cm rope = £6.51, 5cm x 5cm square = £2.03, 9cm x 9cm square = £4.23
With absorbent pad
Advazorb Border
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border dressing (Advancis Medical) 10cm x 10cm = £2.10, 15cm x 10cm = £2.90, 10cm x 20cm = £4.25, 12.5cm x 12.5cm = £2.58, 15cm x 15cm = £3.15, 20cm x 20cm = £5.46, 7.5cm x 7.5cm = £1.19
Advazorb Border Lite
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border Lite dressing (Advancis Medical) 10cm x 10cm = £1.89, 10cm x 20cm = £2.61, 10cm x 30cm = £3.83, 12.5cm x 12.5cm = £2.32, 15cm x 15cm = £2.84, 20cm x 20cm = £4.91, 7.5cm x 7.5cm = £1.07
Advazorb Silfix
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Silfix dressing (Advancis Medical) 10cm x 10cm = £1.85, 10cm x 20cm = £3.18, 12.5cm x 12.5cm = £2.59, 15cm x 15cm = £3.36, 20cm x 20cm = £4.98, 7.5cm x 7.5cm = £0.99
Advazorb Silfix Lite
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Silfix Lite dressing (Advancis Medical) 10cm x 10cm = £1.67, 10cm x 20cm = £2.86, 12.5cm x 12.5cm = £3.33, 15cm x 15cm = £3.02, 20cm x 20cm = £4.48, 7.5cm x 7.5cm = £0.89
Allevyn Gentle
Soft gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm = £2.49, 10cm x 20cm = £4.01, 15cm x 15cm = £4.18, 20cm x 20cm = £6.68, 5cm x 5cm = £1.26
Allevyn Gentle Border
Silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border dressing (Smith & Nephew Healthcare Ltd) Heel dressing 23cm x 23.2cm = £9.59, dressing 10cm x 10cm = £2.18, 12.5cm x 12.5cm = £2.67, 17.5cm x 17.5cm = £5.26, 7.5cm x 7.5cm = £1.48
Allevyn Gentle Border Lite
Silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border Lite dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm = £2.15, 15cm x 15cm = £3.79, 5.5cm x 12cm = £1.84, 5cm x 5cm = £0.89, 9cm x 15cm = £3.41
Allevyn Life
Soft silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border
Allevyn Life dressing (Smith & Nephew Healthcare Ltd) 10.3cm x 10.3cm = £1.68, 12.9cm x 12.9cm = £2.47, 15.4cm x 15.4cm = £3.02, 21cm x 21cm = £5.95
Cutimed Siltec
Soft silicone wound contact dressing, with polyurethane foam film backing
Cutimed Siltec (BSN medical Ltd) Heel dressing 16cm x 24cm = £7.15, Sacrum dressing 17.5cm x 17.5cm = £4.55, 23cm x 23cm = £7.29, dressing 10cm x 10cm = £2.46, 10cm x 20cm = £4.06, 15cm x 15cm = £4.59, 20cm x 20cm = £6.97, 5cm x 6cm = £3.31
Cutimed Siltec B
Soft silicone wound contact dressing, with polyurethane foam film backing, with adhesive border, for lightly to moderately exuding wounds
Cutimed Siltec B dressing (BSN medical Ltd) 12.5cm x 12.5cm = £3.24, 15cm x 15cm = £4.16, 17.5cm x 17.5cm = £5.25, 22.5cm x 22.5cm = £8.47, 7.5cm x 7.5cm = £1.53
Cutimed Siltec L
Soft silicone wound contact dressing, with polyurethane foam film backing, for lightly to moderately exuding wounds
Cutimed Siltec L dressing (BSN medical Ltd) 10cm x 10cm = £2.12, 15cm x 15cm = £3.48, 5cm x 6cm = £1.05
Eclipse Adherent
Soft silicone wound contact layer with absorbent pad and film backing
Eclipse Adherent dressing (Advancis Medical) 10cm x 10cm = £2.99, 10cm x 20cm = £3.75, 15cm x 15cm = £4.99, 20cm x 20cm = £9.99, 17cm x 19cm sacral = £3.76, 22cm x 23cm sacral = £6.23
Flivarsorb
Absorbent polymer dressing with non-adherent wound contact layer
Flivarsorb dressing (Lohmann & Rauscher (UK) Ltd) 10cm x 10cm square = £0.88, 10cm x 20cm rectangular = £1.05, 20cm x 20cm square = £1.86, 20cm x 30cm rectangular = £2.35
Flivarsorb Adhesive
Absorbent polymer dressing with non-adherent wound contact layer and adhesive border
Flivarsorb Adhesive dressing (Lohmann & Rauscher (UK) Ltd) 2cm x 12cm square = £3.32, 5cm x 15cm square = £4.54
Mepilex
Absorbent soft silicone dressing with polyurethane foam film backing
Mepilex (Molnlycke Health Care Ltd) Heel dressing 13cm x 20cm = £5.41, 15cm x 22cm = £6.22, XT dressing 10cm x 11cm = £2.66, 11cm x 20cm = £4.39, 15cm x 16cm = £4.82, 20cm x 21cm = £7.28, dressing 5cm x 5cm = £1.21.

**Mepilex Border**
Absorbt soft silicone dressing with polyurethane foam film backing and adhesive border.

**Mepilex Border** (Molnlycke Health Care Ltd) Heel dressing 18.5cm x 24cm = £5.00, Sacrum dressing 18cm x 18cm = £8.45, 23cm x 23cm = £7.91, dressing 10cm x 12.5cm = £2.72, 10cm x 20cm = £3.69, 10cm x 30cm = £5.55, 15cm x 17.5cm = £4.74, 17cm x 20cm = £5.07.

**Mepilex Border Lite**
Thin absorbent soft silicone dressing with polyurethane foam film backing and adhesive border.

**Mepilex Border dressing** (Molnlycke Health Care Ltd) 10cm x 10cm = £2.53, 15cm x 15cm = £4.13, 4cm x 5cm = £0.92, 5cm x 12.5cm = £2.51, 7.5cm x 7.5cm = £1.39.

**Mepilex Lite**
Thin absorbent soft silicone dressing with polyurethane foam film backing.

**Mepilex Lite Dressing** (Molnlycke Health Care Ltd) 10cm x 10cm = £2.17, 15cm x 15cm = £4.22, 20cm x 20cm = £26.66, 6cm x 8.5cm = £1.92.

**Mepilex Transfer**
Soft silicone exudate transfer dressing.

**Mepilex Transfer dressing** (Molnlycke Health Care Ltd) 10cm x 12cm = £3.51, 15cm x 20cm = £10.64, 20cm x 50cm = £27.20, 7.5cm x 8.5cm = £2.23.

**Sorban Sana**
Non-adherent polyethylene wound contact dressing with absorbent core.

**Sorban Sana Gentle dressing** (H & R Healthcare Ltd) 12cm x 12cm = £2.49, 12cm x 22cm = £4.49, 22cm x 22cm = £7.99, 8.5cm x 8.5cm = £1.99.

**Urgotol Duo**
Non-adherent soft polyethylene wound contact dressing with absorbent pad.

**UrgotolDuo dressing** (Urgo Ltd) 10cm x 12cm = £3.81, 15cm x 20cm = £8.85, 5cm x 10cm = £2.46.

**Without absorbent pad**

**Adaptic Touch**
Non-adherent soft silicone wound contact dressing.

**Adaptic Touch dressing** (Systagenix Wound Management Ltd) 12.7cm x 15cm = £4.65, 20cm x 32cm = £12.50, 5cm x 7.5cm = £1.13, 7.5cm x 11cm = £2.25.

**Askina SilNet**
Soft silicone-coated wound contact dressing.

**Askina SilNet dressing** (B.Braun Medical Ltd) 10cm x 18cm = £4.98, 20cm x 30cm = £12.20, 5cm x 7.5cm = £1.13, 7.5cm x 10cm = £2.28.

**Meptel**
Soft silicone, semi-transparent wound contact dressing.

**Meptel dressing** (Molnlycke Health Care Ltd) 12cm x 15cm = £6.45, 5cm x 7cm = £1.59, 8cm x 10cm = £2.19.

**Meptel One**
Soft silicone, thin, transparent wound contact dressing.

**Meptel One dressing** (Molnlycke Health Care Ltd) 13cm x 15cm = £6.45, 24cm x 27.5cm = £17.38, 6cm x 7cm = £1.59, 9cm x 10cm = £3.19.

**Physiostyle**
Non-adherent soft polyurethane wound contact dressing.

**Physiostyle dressing 1** (Coloplast Ltd) 0cm x 10cm = £2.25, 5cm x 20cm = £6.86.

**Silflex**
Soft silicone-coated polyester wound contact dressing.

**Silflex dressing** (Advancis Medical) 12cm x 15cm = £4.58, 20cm x 30cm = £12.79, 35cm x 60cm = £39.54, 5cm x 7cm = £2.11, 8cm x 10cm = £2.27.

**Silon- TSR**
Soft silicone polymer wound contact dressing.

**Silon- TSR dressing** (Bio Med Sciences) 13cm x 13cm = £3.52, 13cm x 25cm = £5.47, 28cm x 30cm = £7.37.

**Sohion Contact**
Non-adherent soft polymer wound contact dressing.

**Sohion Contact dressing** (H & R Healthcare Ltd) 10cm x 10cm = £1.99, 10cm x 20cm = £3.39, 20cm x 20cm = £5.99, 20cm x 30cm = £8.99, 7.5cm x 7.5cm = £1.49.

**Tegaderm Contact**
Non-adherent soft polyurethane wound contact dressing.

**Tegaderm Contact dressing** (3M Health Care Ltd) 20cm x 25cm = £10.86, 7.5cm x 10cm = £2.27, 7.5cm x 20cm = £4.46.

**Urgotol**
Non-adherent soft polyurethane wound contact dressing.

**Urgotol dressing** (Urgo Ltd) 10cm x 10cm = £3.06, 10cm x 40cm = £10.29, 15cm x 15cm = £5.50, 15cm x 20cm = £8.66, 20cm x 30cm = £13.92, 5cm x 5cm = £1.53.

**Hydrocolloid dressings**
Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehybridation in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation. Hydrocolloid-fibrous dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorbent and suitable for moderately to heavily exuding wounds.

**Hydrocolloid-fibrous dressings**

**Aquacel**
Soft non-woven pad containing hydrocolloid-fibres.

**Aquacel** (Convatec Ltd) Ribbon dressing 1cm x 45cm = £1.83, 2cm x 45cm = £2.44, dressing 10cm x 10cm square = £2.41, 15cm x 15cm square = £4.53, 4cm x 10cm rectangular = £1.30, 4cm x 20cm rectangular = £1.91, 4cm x 30cm rectangular = £2.88, 5cm x 5cm square = £1.01.

**Aquacel Foam**
Soft non-woven pad containing hydrocolloid-fibres with foam layer; with or without adhesive border.

**Aquacel Foam dressing** (Convatec Ltd) adhesive 10cm x 10cm = £2.34, 12.5cm x 12.5cm = £2.65, 17.5cm x 17.5cm = £5.30, 19.8cm x 14cm heel = £5.43, 20cm x 16.5cm sacral = £4.87, 21cm x 21cm = £7.76, 25cm x 30cm = £10.05, 6cm x 6cm = £1.38, non-adhesive 10cm x 10cm = £2.53, 15cm x 15cm = £4.25, 15cm x 20cm = £5.81, 20cm x 20cm = £6.94.

**UrgoClean Pad**
Pad, hydrocolloid fibres coated with soft-adherent lipo-colloidal wound contact layer.

**UrgoClean Pad dressing** (Urgo Ltd) 10cm x 10cm square = £2.11, 20cm x 15cm rectangular = £3.96, 6cm x 6cm square = £0.95.

**UrgoClean Rope**
Rope, non-woven rope containing hydrocolloid fibres.

**UrgoClean rope dressing** (Urgo Ltd) 2.5cm x 40cm = £2.37, 5cm x 40cm = £3.14.

**Versiva XC, non-adhesive**
Hydrocolloid gelling foam dressing; with or without adhesive border.

**Versiva XC dressing** (Convatec Ltd) 10cm x 10cm square = £2.50, 11cm x 11cm square = £2.44, 14cm x 14cm square = £3.13, 15cm x 15cm square = £4.50, 15cm x 19cm square = £5.37, 20cm x 20cm square = £6.73, 21cm x 25cm sacral = £6.40, 22cm x 22cm square = £6.39, 7.5cm x 7.5cm square = £1.47.

**Polyurethane matrix dressing**

**Cutinova Hydro**
Polyurethane matrix with absorbent particles and waterproof polyurethane film.

**Cutinova Hydro dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £2.53, 15cm x 20cm rectangular = £5.36, 5cm x 6cm rectangular = £1.26.
With adhesive border

**Biatain Super**
Semi-permeable hydrocolloid dressing; without adhesive border

**Biatain Super dressing (adhesive)** (Coloplast Ltd) 10cm x 10cm square = £2.16, 12.5cm x 12.5cm square = £3.57, 15cm x 15cm square = £3.93, 18cm x 18cm rectangular = £3.58, 15cm x 15cm square = £4.30, 20cm x 20cm square = £6.71

**Granuflex Border**
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

**Granuflex Border dressing (Convatec Ltd) 10cm x 10cm square = £3.32, 10cm x 18cm triangular = £3.91, 15cm x 15cm square = £6.33, 15cm x 18cm triangular = £6.10, 6cm x 6cm square = £1.75

**Hydrocoll Border**
Hydrocolloid dressing with adhesive border and absorbent wound contact pad

**Hydrocoll Border (bevelled edge) dressing** (Paul Hartmann Ltd) 10cm x 10cm square = £2.41, 12cm x 12cm square = £3.60, 15cm x 15cm square = £4.53, 5cm x 5cm square = £1.01, 7.5cm x 7.5cm square = £1.65, 8cm x 12cm concave = £2.12

**Tegaderm Hydrocolloid**
Hydrocolloid dressing with adhesive border; normal or thin

**Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing** 10cm x 12cm oval = £1.55, 13cm x 15cm oval = £2.08, dressing 10cm x 12cm oval = £2.33, 13cm x 15cm oval = £4.34, 17.1cm x 16.1cm sacral = £4.85,

**Ultec Pro**
Semi-permeable hydrocolloid dressing with adhesive border

**Ultec Pro dressing (adhesive)** (Covidien (UK) Commercial Ltd) 15cm x 18cm sacral = £3.30, 19.5cm x 23cm sacral = £4.98, 21cm x 21cm square = £4.67

Without adhesive border

**ActiveHeal Hydrocolloid**
Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, with or without polyurethane foam later

**ActiveHeal Hydrocolloid (Advanced Medical Solutions Ltd) dressing**
10cm x 10cm square = £1.58, 15cm x 15cm square = £3.43, 15cm x 18cm sacral = £3.98, 5cm x 7.5cm rectangular = £0.78, foam backed dressing 10cm x 10cm square = £1.55, 15cm x 15cm square = £2.91, 15cm x 18cm sacral = £3.36, 5cm x 7.5cm rectangular = £0.97,

**Askins Biofilm Transparent**
Semi-permeable, polyurethane film dressing with hydrocolloid adhesive

**Askins Biofilm Transparent dressing** (B.Braun Medical Ltd) 10cm x 10cm square = £1.07, 20cm x 20cm square = £1.15

**Biatain Super**
Semi-permeable, hydrocolloid film dressing without adhesive border

**Biatain Super dressing (non-adhesive)** (Coloplast Ltd) 10cm x 10cm square = £2.16, 12.5cm x 12.5cm square = £3.57, 12cm x 20cm rectangular = £3.58, 15cm x 15cm square = £4.30, 20cm x 20cm square = £6.71

**Comfeel Plus Contour**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Contour dressing** (Coloplast Ltd) 6cm x 8cm = £2.19, 9cm x 11cm = £3.81

**Comfeel Plus Pressure Relieving**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Pressure Relieving dressing** (Coloplast Ltd) 10cm diameter circular = £4.59, 15cm diameter circular = £6.91, 7cm diameter circular = £3.43

**Comfeel Plus Transparent**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Transparent dressing** (Coloplast Ltd) 10cm x 10cm square = £1.26, 15cm x 15cm square = £3.30, 15cm x 20cm rectangular = £3.35, 20cm x 20cm square = £3.37, 5cm x 15cm rectangular = £1.57, 5cm x 25cm rectangular = £2.55, 5cm x 7cm rectangular = £0.66, 9cm x 14cm rectangular = £2.41, 9cm x 25cm rectangular = £3.42

**Comfeel Plus Ulcer**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Ulcer (bevelled edge) dressing** (Coloplast Ltd) 10cm x 10cm square = £2.42, 18cm x 20cm triangular = £5.65, 20cm x 20cm square = £7.47, 4cm x 5cm rectangular = £0.95

**DuoDERM Extra Thin**
Semi-permeable hydrocolloid dressing

**DuoDERM Extra Thin dressing** (Convatec Ltd) 10cm x 10cm square = £1.31, 15cm x 15cm square = £2.84, 5cm x 10cm rectangular = £0.76, 7.5cm x 7.5cm square = £0.79, 9cm x 15cm rectangular = £1.76, 9cm x 25cm rectangular = £2.81, 9cm x 35cm rectangular = £3.93

**DuoDERM Signal**
Semi-permeable hydrocolloid dressing with "Time to change" indicator

**DuoDERM Signal dressing** (Convatec Ltd) 10cm x 10cm square = £2.12, 11cm x 10cm oval = £1.22, 14cm x 14cm square = £3.71, 18.5cm x 19.5cm heel = £5.19, 20cm x 20cm square = £7.38, 22.5cm x 20cm sacral = £6.07

**Flexigran**
Semi-permeable hydrocolloid dressing without adhesive border; normal or thin

**Flexigran (A1 Pharmaceuticals) Thin dressing** 10cm x 10cm square = £1.08, dressing 10cm x 10cm square = £2.19

**Granuflex**
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethan film

**Granuflex (modified) dressing** (Convatec Ltd) 10cm x 10cm square = £2.78, 15cm x 15cm square = £5.28, 15cm x 20cm rectangular = £5.72, 20cm x 20cm square = £7.95

**Hydrocoll Basic**
Hydrocolloid dressing with absorbent wound contact pad

**Hydrocoll (Paul Hartmann Ltd) Basic dressing** 10cm x 10cm square = £2.45

**Hydrocoll Thin Film**
Thin hydrocolloid dressing with absorbent wound contact pad

**Hydrocoll Thin Film dressing** (Paul Hartmann Ltd) 10cm x 10cm square = £1.15, 15cm x 15cm square = £2.59, 7.5cm x 7.5cm square = £0.70

**Nu-Derm**
Semi-permeable hydrocolloid dressing (normal and thin)

**Nu-Derm dressing** (Syntagenex Wound Management Ltd) 10cm x 10cm square = £1.56, 15cm x 15cm square = £3.18, 15cm x 18cm sacral = £4.45, 20cm x 20cm square = £6.36, 5cm x 5cm square = £0.85, 8cm x 12cm heel/elbow = £3.18, thin 10cm x 10cm square = £1.06

**Tegaderm Hydrocolloid**
Hydrocolloid dressing without adhesive border; normal and thin

**Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing** 10cm x 10cm square = £1.55, dressing 10cm x 10cm square = £2.37, 15cm x 15cm square = £4.59,

**Ultec Pro**
Semi-permeable hydrocolloid dressing; without adhesive border

**Ultec Pro dressing** (Covidien (UK) Commercial Ltd) 10cm x 10cm square = £2.28, 15cm x 15cm square = £4.44, 20cm x 20cm square = £6.69

**Foam dressings**
Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependent on the level of exudate.
Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound.

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing ibuprofen is available and may be useful for treating painful exuding wounds.

Cavi-Care
Soft, conforming cavity wound dressing prepared by mixing Cavi-Care exuding wounds. The handling capacity of the foam dressing may be reduced.

**Primary wound contact dressings.** If used under
others have greater fluid-handing capacity and are suitable
Foam dressings vary in their ability to absorb exudate; some

Melagisorb
Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven

Melagisorb (Molynex Health Care Ltd) Cavity dressing 2.2cm x 32cm = £3.55, dressing 10cm x 10cm = £1.88, 10cm x 20cm = £3.52, 5cm x 5cm = £0.80.

Sorbalgan
Calcium alginate dressing
Sorbalgan (Paul Hartmann Ltd) T dressing 2g = £3.47, dressing 10cm x 10cm = £1.70, 5cm x 5cm = £0.81.

Sorbsan Flat
Calcium alginate fibre, highly absorbent, flat non-woven pads

Sorbsan Flat dressing (Aspen Medical Europe Ltd) 10cm x 10cm = £1.71, 10cm x 20cm = £3.20, 5cm x 5cm = £0.81.

Sorbsan Plus
Alginate dressing bonded to a secondary absorbent viscose pad

Sorbsan Plus dressing (Aspen Medical Europe Ltd) 10cm x 10cm = £3.10, 10cm x 20cm = £3.96, 15cm x 20cm = £5.49, 7.5cm x 10cm = £1.76.

Sorbsan Ribbon
Alginate dressing bonded to a secondary absorbent viscose pad

Sorbsan (Aspen Medical Europe Ltd) Ribbon dressing 40cm = £2.04.

Sorbsan Surgical Packing
Alginate dressing bonded to a secondary absorbent viscose pad

Sorbsan (Aspen Medical Europe Ltd) Packing dressing 2g = £3.47.

Suprasorb A
Calcium alginate dressing

Suprasorb A (Lohmann & Rauscher (UK) Ltd) alginate dressing 10cm x 10cm = £1.22, 5cm x 5cm = £0.62, cavity dressing 2g = £2.26.

Tegaderm Alginate
Calcium alginate dressing

Tegaderm Alginate dressing (3M Health Care Ltd) 10cm x 10cm = £1.72, 2cm x 30.4cm = £2.87, 5cm x 5cm = £0.81.

Urgosorb
Alginate and carboxymethylcellulose dressing without adhesive border

Urgosorb (Urgo Ltd) Pad dressing 10cm x 10cm = £2.10, 10cm x 20cm = £3.85, 5cm x 5cm = £0.87. Rope dressing 30cm = £2.75.

Capillary-action dressings
Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer. The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary. Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

Advadraw
Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers

Advadraw dressing (Advancis Medical) 10cm x 10cm = £0.88, 10cm x 15cm = £1.19, 15cm x 15cm = £1.57, 5cm x 7.5cm = £0.57.

Advadraw Spiral

Advadraw (Advancis Medical) Spiral dressing 0.5cm x 40cm = £0.82.

Cerdak Aerocloth
Non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing

Cerdak Aerocloth dressing 5cm x (Apollo Medical Products Ltd) 10cm = £1.94, 5cm = £1.37.

Cerdak Aerofilin
Non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing

Cerdak Aerofilin dressing 5cm x (Apollo Medical Products Ltd) 10cm = £2.07, 5cm = £1.51.

Cerdak Basic
Non-adhesive wound contact sachet containing ceramic spheres

Cerdak Basic dressing (Apollo Medical Products Ltd) 10cm x 10cm = £1.56, 10cm x 15cm = £2.08, 5cm x 5cm = £0.70.

Sumar Lite

Sumar Lite dressing (Lantor (UK) Ltd) 10cm x 10cm = £1.59, 10cm x 15cm = £2.12, 5cm x 5cm = £0.93.

Sumar Max

Sumar Max dressing (Lantor (UK) Ltd) 10cm x 10cm = £1.61, 10cm x 15cm = £2.15, 5cm x 5cm = £0.95.

Sumar Spiral

Sumar (Lantor (UK) Ltd) Spiral dressing 0.5cm x 40cm = £1.57.

Vacutex
Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer

Vacutex dressing (Pro-Tex Capillary Dressings Ltd) 10cm x 10cm = £1.66, 10cm x 15cm = £2.23, 10cm x 20cm = £2.68, 15cm x 20cm = £3.14, 20cm x 20cm = £4.89, 5cm x 5cm = £0.94.

Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

Askina Carbosorb
Activated charcoal and non-woven viscose rayon dressing

Askina Carbosorb dressing 10cm x (B. Braun Medical Ltd) 10cm = £2.88, 20cm = £3.56.

CarboFLEX
Dressing in 5 layers: wound-facing absorber layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer

CarboFLEX dressing (Convatec Ltd) 10cm x 10cm = £3.18, 15cm x 20cm = £7.23, 8cm x 15cm oval = £3.82.

Carbopad VC
Activated charcoal non-absorbent dressing

Carbopad VC dressing 10cm x (Synergy Health Plc) 10cm = £1.62, 20cm = £2.19.

CliniSorb Odour Control Dressings
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating

CliniSorb dressing 1 (CliniMed Ltd) 5cm x 10cm = £1.88, 5cm x 20cm = £2.50, 5cm x 25cm = £4.03.

Sorbsan Plus Carbon
Alginate dressing with activated carbon

Sorbsan Plus Carbon dressing (Aspen Medical Ltd) 10cm x 15cm = £4.96, 10cm x 20cm = £5.94, 15cm x 20cm = £6.84, 7.5cm x 15cm = £2.56.

Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound
Wound management

where removal of waxes may be difficult.

Knitted viscose impregnated with medical grade manuka
Activon Tulle

10
Actilite gauze dressing
honey and manuka oil

Knitted viscose impregnated with medical grade manuka

Activon Honey

medical grade honey

Honey

Medical grade honey has antimicrobial and anti-
inflammatory properties and can be used for acute or
chronic wounds. Medical grade honey has osmotic
properties, producing an environment that promotes
autolytic debridement; it can help control wound malodour.
Honey dressings should not be used on patients with
extreme sensitivity to honey, bee stings or bee products.
Patients with diabetes should be monitored for changes in
blood-glucose concentrations during treatment with topical
honey or honey-impregnated dressings. For Activon Tulle®,
where no size is stated by the prescriber the 5 cm size is to
be supplied. Medihoney® Antimicrobial Wound Gel is not
recommended for use in deep wounds or body cavities
where removal of waxes may be difficult.

Honey-based topical application

Activon Honey

Medical grade manuka honey

L-Mesitran SOFT ointment dressing
Honey (medical grade) 40%

L-Mesitran (Aspen Medical Europe Ltd) SOFT ointment dressing = £3.59

MANUKA Honeys

Medical grade manuka honey

MANUKA Honeys (Manuka Medical Ltd) dressing = £5.90

Medihoney Antibacterial Medical Honey

Medical grade, Leptospermum sp.

Medihoney (Derma Sciences Europe, Ltd) Antibacterial Medical Honey dressing = £9.90

Medihoney Antibacterial Wound Gel

Medical grade, Leptospermum sp. 80% in natural waxes and oils

Medihoney (Derma Sciences Europe, Ltd) Antibacterial Wound Gel dressing = £4.02

MelMax Plus Honey

Medical grade; Bulgarian, mountain flower) 45% in basis

containing polyethylene glycol

Mesitran Ointment
Honey (medical grade) 47% Excipients include lanolin

Mesitran (Aspen Medical Europe Ltd) ointment dressing = £9.90

Sheet dressing

Actilite

Knitted viscose impregnated with medical grade manuka
honey and manuka oil

Actilite gauze dressing (Advancis Medical) 10 cm x 10 cm = £0.98,
10 cm x 20 cm = £1.90, 5 cm x 5 cm = £0.57

Activon Tulle

Knitted viscose impregnated with medical grade manuka
honey

Activon Tulle gauze dressing (Advancis Medical) 10 cm x 10 cm = £2.97, 5 cm x 5 cm = £1.80

Algovon
Absorbent, non-adherent calcium alginate dressing
impregnated with medical grade manuka honey

Algovon dressing (Advancis Medical) 10 cm x 10 cm = £3.40, 5 cm x 5 cm = £1.98

Algovon Plus
Reinforced calcium alginate dressing impregnated with medical grade manuka honey

Algovon Plus (Advancis Medical) Ribbon dressing 2.5 cm x 20 cm = £3.36, dressing 10 cm x 10 cm = £3.36, 5 cm x 5 cm = £1.96,

L-Mesitran Border
Hydrogel, semi-permeable dressing impregnated with medical grade honey, with adhesive border

L-Mesitran (Aspen Medical Europe Ltd) Border sheet 10 cm x 10 cm square = £2.74

L-Mesitran Hydro
Hydrogel, semi-permeable dressing impregnated with medical grade honey, without adhesive border

L-Mesitran Hydro sheet 1 (Aspen Medical Europe Ltd) 0 cm x 10 cm square = £2.63, 5 cm x 20 cm rectangular = £5.48

L-Mesitran Net
Hydrogel, non-adherent wound contact layer, without
adhesive border

L-Mesitran (Aspen Medical Europe Ltd) Net sheet 10 cm x 10 cm square = £2.53

Medihoney Antibacterial Honey Apinate
Non-adherent calcium alginate dressing, impregnated with medical grade honey

Medihoney Antibacterial Honey Apinate (Derma Sciences Europe, Ltd) dressing 10 cm x 10 cm square = £3.40, 5 cm x 5 cm square = £2.00,

Medihoney Antibacterial Honey Tulle
Woven fabric impregnated with medical grade manuka honey

Medihoney (Derma Sciences Europe, Ltd) Tulle dressing 10 cm x 10 cm = £2.98

Medihoney Gel sheet
Sodium alginate dressing impregnated with medical grade honey

Medihoney Gel Sheet dressing (Derma Sciences Europe, Ltd) 10 cm x 10 cm = £4.20, 5 cm x 5 cm = £1.75

MelMax
Acetate wound contact layer impregnated with buckwheat
honey 75% in ointment basis

MelMax dressing (CliniMed Ltd) 5 cm x 6 cm rectangular = £4.82, 8 cm x 10 cm rectangular = £9.90, 8 cm x 20 cm rectangular = £19.79

Meladerm Plus Tulle
Knitted viscose impregnated with medical grade honey

(Bulgarian, mountain flower) 45% in a basis containing
polyethylene glycol

Meladerm (SanoMed Manufacturing BV) Plus Tulle dressing 10 cm x 10 cm = £2.10

Iodine
Cadeoximer–iodine, like povidone–iodine, releases free
iodine when exposed to wound exudate. The free iodine acts
as an antisepic on the wound surface, the cadeoximer
absorbs wound exudate and encourages de-sloughing.
Two-component hydrogel dressings containing glucose
oxidase and iodide ions generate a low level of free iodine in
the presence of moisture and oxygen.

Povidone–iodine fabric dressing is a knitted viscose
dressing with povidone–iodine incorporated in a
hydrophilic polyethylene glycol basis; this facilitates
diffusion of the iodine into the wound and permits removal of
the dressing by irrigation. The iodine has a wide
spectrum of antimicrobial activity but it is rapidly
 deactivated by wound exudate. Systemic absorption of iodine may occur, particularly from
large wounds or with prolonged use.
Iodosflex® and Iodosorb® are used for the treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment. They are contra-indicated in patients receiving lithium, in thyroid disorders, in pregnancy and breast feeding, and in children; they should be used with caution in patients with severe renal impairment or history of thyroid disorder. Iodozyme® is an antimicrobial dressing used for lightly to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding. Oxyzyme® is used for non-infected, dry to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding. Povidone-iodine Fabric Dressing is used as a wound contact layer for abrasions and superficial burns. It is contra-indicated in patients with severe renal impairment and in children under 6 months.

Iodosflex Paste
Iodine 0.9% as cadexomer–iodine in a paste basis with gauze backing
Iodosorb Ointment
Iodine 0.9% as cadexomer–iodine in an ointment basis
Iodosorb (Smith & Nephew Healthcare Ltd) ointment dressing = £3.03
Iodosorb Powder
Iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet
Iodosorb (Smith & Nephew Healthcare Ltd) powder dressing sachets = £1.93
Iodozyme Hydrogel
Hydrogel (two-component dressing containing glucose oxidase and iodide ions)
Iodozyme dressing (Archimed Llp) 10 cm x 10 cm square = £12.50, 6.5 cm x 5 cm rectangular = £7.50
Oxyzyme Hydrogel
Hydrogel (two-component dressing containing glucose oxidase and iodide ions)
Oxyzyme dressing (Archimed Llp) 10 cm x 10 cm square = £10.00, 6.5 cm x 5 cm rectangular = £6.00
Povidone-iodine fabric dressing
Inadine
(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%
Inadine dressing (Systagenix Wound Management Ltd) 5 cm x 5 cm = £0.33, 9.5 cm x 9.5 cm = £0.49

Silver
Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also notes above). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing. Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see p. 1010). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).

Alginate dressings

Acticoat Absorbent
Calcium alginate dressing with a silver coated antimicrobial barrier
Acticoat Absorbent (Smith & Nephew Healthcare Ltd) cavity dressing 2 cm x 3 cm = £12.87, dressing 10 cm x 12.5 cm rectangular = £12.79, 5 cm x 5 cm square = £5.33.

Algisite Ag
Calcium alginate dressing, with silver
Algisite Ag dressing (Smith & Nephew Healthcare Ltd) 10 cm x 10 cm = £4.12, 10 cm x 20 cm = £7.57, 2 g = £5.69, 5 cm x 5 cm = £1.65

Askina Calgitrol Ag
Calcium alginate and silver alginate dressing with polysurethane foam backing
Askina Calgitrol Ag dressing (B.Braun Medical Ltd) 10 cm x 10 cm square = £3.21, 15 cm x 15 cm square = £6.21, 20 cm x 20 cm square = £14.48

Askina Calgitrol Thin
Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings
Askina Calgitrol Thin dressing (B.Braun Medical Ltd) 10 cm x 10 cm square = £4.06, 15 cm x 15 cm square = £9.12, 20 cm x 20 cm square = £16.11, 5 cm x 5 cm square = £1.96

Melgisorb Ag
Alginate and carboxymethylcellulose dressing, with ionic silver
Melgisorb Ag (Molyncke Health Care Ltd) Cavity dressing 3 cm x 4 cm = £4.47, dressing 10 cm x 10 cm = £3.59, 15 cm x 15 cm = £7.60, 5 cm x 5 cm = £1.79.

Silvercel
Alginate and carboxymethylcellulose dressing impregnated with silver
Silvercel dressing (Systagenix Wound Management Ltd) 10 cm x 20 cm rectangular = £7.68, 11 cm x 11 cm square = £4.14, 2.5 cm x 30.5 cm rectangular = £4.45, 5 cm x 5 cm square = £1.68

Silvercel Non-adherent
Alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver
Silvercel Non-Adherent (Systagenix Wound Management Ltd) cavity dressing 2.5 cm x 30.5 cm = £3.94, dressing 10 cm x 20 cm rectangular = £7.25, 11 cm x 11 cm square = £3.89, 5 cm x 5 cm square = £1.62.

Sorbax Silver Flat
Calcium alginate fibre, highly absorbent, flat non-woven pads, with silver
Sorbax Silver Flat dressing (Aspen Medical Europe Ltd) 10 cm x 10 cm = £3.97, 10 cm x 20 cm = £7.26, 5 cm x 5 cm = £1.57

Sorbax Silver Plus
Calcium alginate dressing with absorbent backing, with silver
Sorbax Silver Plus dressing (Aspen Medical Europe Ltd) 10 cm x 15 cm = £5.56, 10 cm x 20 cm = £6.77, 15 cm x 20 cm = £9.08, 7.5 cm x 10 cm = £3.35

Sorbax Silver Plus SA
Calcium alginate dressing with absorbent backing and adhesive border, with silver
Sorbax (Aspen Medical Europe Ltd) Silver Plus SA dressing 11.5 cm x 14 cm = £5.44

Sorbax Silver Ribbon
With silver
Sorbax (Aspen Medical Europe Ltd) Silver Ribbon dressing 1 g = £4.15

Sorbax Silver Surgical Packaging
With silver
Sorbax (Aspen Medical Europe Ltd) Silver Packaging dressing 7 cm x 5 cm = £5.76

Suprasorb A + Ag
Calcium alginate dressing, with silver
Suprasorb A + Ag (Lohmann & Rauscher (UK) Ltd) dressing 10cm x 10cm = £4.07, 10cm x 20cm = £7.52, 5cm x 5cm = £1.62, rose dressing 2g = £6.02.

Tegaderm Alginat Ag
Calcium alginate and carboxymethylcellulose dressing, with silver

Tegaderm Alginat Ag dressing (3M Health Care Ltd) 10cm x 10cm = £3.24, 3cm x 30cm = £3.70, 5cm x 5cm = £1.39

Urgosor Silver
Alginat and carboxymethylcellulose dressing, impregnated with silver
Urgosor Silver ( Urgo Ltd) Rope dressing 2.5cm x 30cm = £3.65, dressing 10cm x 10cm = £3.63, 10cm x 20cm = £6.85, 5cm x 5cm = £1.52

Foam dressings

Acticoat Moisture Control
Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer
Acticoat Moisture Control dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £16.70, 10cm x 20cm rectangular = £22.55, 5cm x 5cm square = £7.14

Allevyn
Silver sulfadiazine impregnated polyurethane foam film dressing with or without adhesive border
Allevyn (Smith & Nephew Healthcare Ltd) Adhesive dressing 10cm x 10cm square = £5.45, 12.5cm x 12.5cm square = £7.16, 17.5cm x 17.5cm square = £13.77, 17cm x 17cm square = £10.75, 22cm x 22cm sacral = £14.40, 7.5cm x 7.5cm square = £3.46, Heel Non-Adhesive dressing 10.5cm x 13.5cm = £10.66, Non-Adhesive dressing 10cm x 10cm square = £6.08, 15cm x 15cm square = £11.55, 20cm x 20cm square = £16.68, 5cm x 5cm square = £3.23

Blatain Ag
Silver impregnated polyurethane foam film dressing, with or without adhesive border
Blatain Ag (Coloplast Ltd) cavity dressing 5cm x 8cm = £4.01, dressing 10cm x 10cm square = £8.04, 10cm x 20cm rectangular = £14.78, 12.5cm x 12.5cm square = £9.20, 15cm x 15cm square = £16.14, 18cm x 18cm square = £18.45, 19cm x 20cm heel = £18.20, 20cm x 20cm square = £22.76, 22cm x 22cm sacral = £19.34, 5cm x 7cm rectangular = £3.30

PolyMem Silver
Silver impregnated polyurethane foam film dressing, with or without adhesive border
PolyMem Silver (Aspen Medical Europe Ltd) WIC dressing 8cm x 8cm = £7.05, dressing 10.8cm x 10.8cm square = £8.56, 12.7cm x 12.7cm oval = £5.60, 17cm x 17cm rectangular = £17.76, 5cm x 7cm oval = £2.27

UrgoCell Silver
Non-adherent, polyurethane foam film dressing with silver in wound contact layer
UrgoCell Silver dressing (Urgo Ltd) 10cm x 10cm = £5.86, 15cm x 20cm = £10.74, 6cm x 6cm = £4.26

Hydrocolloid dressings

Aquacel Ag
Soft non-woven pad containing hydrocolloid fibres, (silver impregnated),
Aquacel Ag (Convatec Ltd) Ribbon dressing 1cm x 45cm = £3.08, 2cm x 45cm = £4.71, dressing 10cm x 10cm square = £6.69, 15cm x 15cm square = £8.82, 20cm x 20cm rectangular = £21.89, 4cm x 10cm rectangular = £2.85, 4cm x 20cm rectangular = £3.72, 4cm x 30cm rectangular = £5.57

Physiostulle Ag
Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine
Physiostulle (Coloplast Ltd) dressing 10cm x 10cm = £2.25

Low adherence dressing

Acticoat
Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)
Acticoat dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £8.52, 10cm x 20cm rectangular = £13.33, 20cm x 20cm rectangular = £45.60, 5cm x 5cm square = £3.49

Acticoat 7
Five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)
Acticoat 7 dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £18.07, 15cm x 15cm square = £32.48, 5cm x 5cm square = £6.07

Acticoat Flex 3
Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)
Acticoat Flex 3 dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £8.56, 10cm x 20cm rectangular = £13.37, 20cm x 40cm rectangular = £45.77, 5cm x 5cm square = £3.50

Acticoat Flex 7
Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)
Acticoat Flex 7 dressing (Smith & Nephew Healthcare Ltd) 10cm x 12.5cm rectangular = £18.14, 15cm x 15cm square = £32.61, 5cm x 5cm square = £6.09

Atrauman Ag
Non-adherent polyamide fabric impregnated with silver and neutral triglycerides
Atrauman Ag dressing (Paul Hartmann Ltd) 10cm x 10cm = £1.25, 10cm x 20cm = £2.45, 5cm x 5cm = £0.51

Soft polymer dressings

Allevyn Ag Gentle
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with or without adhesive border
Allevyn Ag Gentle (Smith & Nephew Healthcare Ltd) Border dressing 10cm x 10cm = £6.33, 12.5cm x 12.5cm = £8.14, 17.5cm x 17.5cm = £15.51, 7.5cm x 7.5cm = £4.21, dressing 10cm x 10cm = £6.15, 20cm x 20cm = £10.16, 15cm x 15cm = £11.44, 20cm x 20cm = £16.94, 5cm x 5cm = £3.39

Mepilex Ag
Soft silicone wound contact dressing with polyurethane foam film backing, with silver, with or without adhesive border
Mepilex (Mohrlycke Health Care Ltd) Ag dressing 10cm x 10cm = £6.12, 10cm x 20cm = £10.09, 15cm x 15cm = £11.36, 20cm x 20cm = £16.84, 20cm x 50cm = £63.20, Border Ag dressing 10cm x 12.5cm = £5.16, 10cm x 20cm = £8.97, 10cm x 30cm = £13.46, 15cm x 17.5cm = £11.31, 17cm x 20cm = £14.66, 7cm x 7.5cm = £3.41, Border Sacrum Ag dressing 18cm x 18cm = £11.83, 20cm x 20cm = £14.38, 23cm x 23cm = £18.89, Heel Ag dressing 13cm x 20cm = £12.78, 15cm x 22cm = £14.32

Urgotol 550
Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine
Urgotol Silver
Non-adherent soft polymer wound contact dressing, with silver
Urgotol Silver dressing 1 (Urgo Ltd) 5cm x 12cm = £3.53, 5cm x 20cm = £9.61

With charcoal

Actisorb Silver 220
Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve
Actisorb Silver 220 dressing (Systagenix Wound Management Ltd) 10.5cm x 10.5cm = £2.58, 10.5cm x 19cm = £4.70, 6.5cm x 9.5cm = £1.64

Other antimicrobials

Cutimed Siltec Sorbact
Polyurethane foam dressing with acetate fabric coated with diallylcarbamoyl chloride, with adhesive border
Cutimed Siltec Sorbact dressing (BSN medical Ltd) 12.5cm x 12.5cm = £6.38, 15cm x 15cm = £7.91, 17.5cm x 17.5cm = £11.06, 22.5cm x 22.5cm = £16.83, 7.5cm x 7.5cm = £2.49, 17.5cm x 17.5cm sacral = £8.00, 23cm x 23cm sacral = £12.02.

**Cutimed Sorbact**

Low adherence acetate tissue impregnated with dialky carbamoyl chloride; dressign pad, swabs, round swabs or ribbon gauze, cotton

**Cutimed Sorbact** (BSN medical Ltd) Ribbon dressing 2cm x 50cm = £4.00, 5cm x 200cm = £7.87, Round swab 3cm = £3.27, dressing pad 10cm x 10cm = £5.45, 10cm x 20cm = £8.49, 7cm x 9cm = £3.49, swab 4cm x 6cm = £1.63, 7cm x 9cm = £2.72,

**Cutimed Sorbact Gel**

Hydrogel dressing impregnated with dialky carbamoyl chloride

**Cutimed Sorbact Gel dressing** 7.5cm x (BSN medical Ltd) 15cm rectangular = £4.43, 7.5cm square = £2.63

**Cutimed Sorbact Hydroactive**

Non-adhesive gel dressing with hydropolymer matrix and acetate fabric coated with dialky carbamoyl chloride

**Cutimed Sorbact Hydroactive dressing** (BSN medical Ltd) 14cm x 14cm = £5.31, 14cm x 24cm = £8.52, 19cm x 19cm = £10.01, 24cm x 24cm = £15.17, 7cm x 8.5cm = £3.64

**Cutimed Sorbact Hydroactive B**

Gel dressing with hydropolymer matrix and acetate fabric coated with dialky carbamoyl chloride, with adhesive border

**Cutimed Sorbact Hydroactive B dressing** (BSN medical Ltd) 10cm x 10cm = £7.02, 10cm x 20cm = £11.24, 15cm x 15cm = £13.21, 20cm x 20cm = £20.02, 5cm x 6.5cm = £3.94

**Flaminal Forte gel**

Alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds

**Flaminal Hydro gel**

Alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds

**Kendall AMD**

Foam dressing with polyhexanide, without adhesive border

**Kendall AMD Antimicrobial foam dressing** (Aria Medical Ltd) 10cm x 10cm square = £4.71, 10cm x 20cm rectangular = £8.92, 15cm x 15cm square = £8.92, 20cm x 20cm square = £13.07, 5cm x 5cm square = £2.56, 8.8cm x 7.5cm rectangular (fenestrated) = £4.43

**Kendall AMD Plus**

Foam dressing with polyhexanide, without adhesive border

**Kendall AMD Antimicrobial Plus foam dressing** (Aria Medical Ltd) 10cm x 10cm square = £4.94, 8.8cm x 7.5cm rectangular (fenestrated) = £4.43

**Octenilin Wound gel**

Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride

**Prontosan Wound Gel**

Hydrogel containing betaine surfactant and polyhexanide

**Suprasorb X + PHMB**

Biosynthetic cellulose fibre dressing with polyhexanide

**Suprasorb X + PHMB dressing** (Lohmann & Rauscher (UK) Ltd) 14cm x 20cm rectangular = £11.53, 2cm x 21cm rope = £7.18, 5cm x 5cm square = £2.59, 8cm x 9cm square = £2.07

**Telfa AMD**

Low adherence absorbent perforated plastic film faced dressing with polyhexanide

**Telfa AMD dressing** (Aria Medical Ltd) 10cm x 7.5cm = £0.18, 20cm x 7.5cm = £0.28

**Telfa AMD Island**

Low adherence dressing with adhesive border and absorbent pad, with polyhexanide

**Telfa AMD Island dressing** 10cm x (Aria Medical Ltd) 12.5cm = £0.59, 20cm = £0.86, 25.5cm = £0.98, 35cm = £1.22

**Chlorhexidine gauze dressing**

**Bactigras**

Fabric of linen weave, wet and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate

**Bactigras gauze dressing** (Smith & Nephew Healthcare Ltd) 5cm x 5cm = 28p, 10cm x 10cm = 59p

**Irrigation fluids**

**Octenilin Wound irrigation solution**

Aqueous solution containing glycerol, ethylhexylglycerin and octenidine hydrochloride

**Prontosan Wound Irrigation Solution**

Aqueous solution containing betaine surfactant and polyhexanide

**Prontosan irrigation solution** (B.Braun Medical Ltd) 350ml bottles = £4.75, 40ml unit dose = £14.12

**Specialised dressings**

**Protease-modulating matrix dressings**

**Cadesorb Ointment**

Cadesorb (Smith & Nephew Healthcare Ltd) ointment = £9.18

**Catrix**

Catrix dressing (Cranage Healthcare Ltd) sachets = £3.80

**Promogran**

Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing

**Promogran dressing** (Systagenix Wound Management Ltd) 123 square cm = £15.62, 28 square cm = £5.19

**Promogran Prisma Matrix**

Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing

**Promogran Prisma dressing** (Systagenix Wound Management Ltd) 123 square cm = £17.98, 28 square cm = £6.31

**Tegaderm Matrix**

Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis

**Tegaderm Matrix dressing** (3M Health Care Ltd) 5cm x 5cm = £4.98, 8cm x 10cm = £10.23

**UroStart**

Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing

**UroStart dressing** (Urgo Ltd) 10cm x 10cm = £6.07, 15cm x 20cm = £10.92, 6cm x 6cm = £4.39, 12cm x 19cm heel = £8.36

**UroStart Contact**

Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF)

**UroStart (Urgo Ltd) Contact dressing** 5cm x 7cm = £2.96

**Silicone keloid dressings**

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

**Silicone gel**

**Bapscarcare**

Silicone gel

**Bapscarcare (BAP Medical UK Ltd) gel** = £17.00

**Cilitech**

Silicone gel

**Cilitech (Su-Med International (UK) Ltd) gel** = £50.00

**Dermatix**

Silicone gel

**Dermatix gel** (Meda Pharmaceuticals Ltd) = £60.53

**Kelo-cote UV**

Silicone gel with SPF 30 UV protection

**Kelo-cote** (Sinclair IS Pharma Plc) UV gel = £17.88

**Kelo-cote gel**

Silicone gel
Wound management

NewGel E
Silicone gel with vitamin E
NewGel E (AdvanTec Surgical Ltd) gel = £17.70

Scarsil
Silicone gel
Scarsil (Jobskin Ltd) gel = £15.19

Silgel
Silicone gel
Silgel (Nagor Ltd) STC-SE gel = £19.00

Silicone sheets
Advasil Conform
Self-adhesive silicone gel sheet with polyurethane film backing
Advasil Conform sheet I (AdvanTec Medical) 10cm x 10cm square = £5.20, 5cm x 10cm rectangular = £9.17

Bapsccare T
Self-adhesive silicone gel sheet
Bapsccare T sheet (BAP Medical UK Ltd) 10cm x 15cm rectangular = £9.00, 5cm x 30cm rectangular = £9.00, 5cm x 7cm rectangular = £3.15

Cica-Care
Soft, self-adhesive, semi-occlusive silicone gel sheet with backing
Cica-Care sheet (Smith & Nephew Healthcare Ltd) 15cm x 12cm rectangular = £28.40, 6cm x 12cm rectangular = £14.57

Ciltech
Silicone gel sheet
Ciltech sheet 1 (Su-Med International (UK) Ltd) 10cm x 10cm square = £7.50, 0cm x 20cm rectangular = £12.50, 5cm x 15cm square = £14.00

Dermafix
Self-adhesive silicone gel sheet (clear- or fabric-backed)
Dermafix (Meda Pharmaceuticals Ltd) Clear sheet 13cm x 13cm square = £15.79, 13cm x 25cm rectangular = £28.53, 20cm x 30cm rectangular = £51.97, 4cm x 13cm rectangular = £6.88. Fabric sheet 13cm x 13cm square = £15.79, 13cm x 25cm rectangular = £28.53, 20cm x 30cm rectangular = £51.97, 4cm x 13cm rectangular = £6.88

Mepiform
Self-adhesive silicone gel sheet with polyurethane film backing
Mepiform sheet (Molnlycke Health Care Ltd) 4cm x 31cm rectangular = £16.80, 5cm x 7cm rectangular = £3.42, 9cm x 18cm rectangular = £13.37

Scar FX
Self-adhesive, transparent, silicone gel sheet
Scar FX sheet (Jobskin Ltd) 10cm x 20cm rectangular = £16.00, 22.5cm x 14.5cm shaped = £12.00, 25.5cm x 30.5cm rectangular = £50.00, 3.75cm x 2.25cm rectangular = £12.00, 7.5cm diameter shaped = £8.50

Silgel
Silicone gel sheet
Silgel sheet (Nagor Ltd) 10cm x 10cm square = £13.50, 10cm x 30cm rectangular = £31.50, 10cm x 5cm rectangular = £7.50, 15cm x 10cm rectangular = £19.50, 20cm x 20cm square = £40.00, 25cm x 15cm shaped = £21.12, 30cm x 5cm rectangular = £19.50, 40cm x 40cm square = £144.00, 46cm x 8.5cm shaped = £39.46, 5.5cm diameter shaped = £4.00

Adjunct dressings and appliances

Surgical absorbents
Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate (‘strike through’) with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings, p. 1305). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous p. 1301, foam p. 1302, or alginate p. 1304) layered into the cavity is often more suitable.

Cotton

Absorbent Cotton, BP
Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls

Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Absorbent Cotton, Hospital Quality
As for absorbent cotton but lower quality materials, shorter staple length etc.

Absorbent (Robert Bailey & Son Plc) cotton hospital quality

Gauze and cotton tissue

Gamgee Tissue (blue)
Consists of absorbent cotton enclosed in absorbent cotton gauze type 2 or absorbent cotton and viscose gauze type 2

Gamgee (Robinson Healthcare) tissue blue label

Gamgee Tissue (pink)
Consists of absorbent cotton enclosed in absorbent cotton gauze type 2 or absorbent cotton and viscose gauze type 2

Gamgee (Robinson Healthcare) tissue pink label DF

Gauze and tissue

Absorbent Cotton Gauze, BP 1988
Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile

Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Alvita (Alliance Healthcare (Distribution) Ltd) absorbent cotton BP 1988

Clini (Clinisupplies Ltd) absorbent cotton BP 1988

Vermaid (Synergy Health Plc) absorbent cotton BP 1988

Absorbent Cotton and Viscose Ribbon Gauze, BP 1988
Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile

Vermaid Fast Edge ribbon gauze sterile (Synergy Health Plc) 1.25cm, 2.5cm

Lint

Absorbent Lint, BPC
Cotton cloth of plain weave with nap raised on one side from warp yarns

Absorbent (Robinson Healthcare) lint

Alvita (Alliance Healthcare (Distribution) Ltd) absorbent lint BPC

Clini (Clinisupplies Ltd) absorbent lint BPC

Pads

Drisorb
Absorbent Dressing Pads, Sterile
Drisorb (Synergy Health Plc) dressing pad 10cm x 20cm = £0.17

PremierPad
Absorbent Dressing Pads, Sterile
PremierPad dressing pad (Shermond) 10cm x 20cm = £0.18, 20cm x 20cm = £0.25

Xupad
Absorbent Dressing Pads, Sterile
Xupad dressing pad (Richardson Healthcare Ltd) 10cm x 20cm = £0.17, 20cm x 20cm = £0.28, 20cm x 40cm = £0.40

Wound drainage pouches
Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

Biotrol Draina S
Wound drainage pouch

Biotrol Draina S wound drainage bag (B.Braun Medical Ltd) large (Transparent) = £94.55, medium (Transparent) = £76.88, mini (Transparent) = £77.11
Biotrol Draina S Vision
Wound drainage pouch
Draina S Vision (B. Braun Medical Ltd) 100 wound drainage bag = £123.38, 50 wound drainage bag = £100.66, 75 wound drainage bag = £106.34

Eakin Access window
For use with Eakin pouches
Eakin (Pelican Healthcare Ltd) access window = £37.39

Eakin Wound pouch, bung closure
Wound pouch, bung closure
Eakin wound drainage bag with bung closure (Pelican Healthcare Ltd) £101.48, medium = £74.78, small = £53.41, and access window for horizontal wounds, extra large = £101.48, for horizontal wounds, extra large = £90.80; for vertical incision wounds, extra large = £90.80, wounds, extra large = £90.80,

Eakin Wound pouch, fold and tuck closure
Wound pouch, fold and tuck closure
Eakin wound drainage bag with fold and tuck closure, (Pelican Healthcare Ltd) £90.80, medium = £69.94, small = £48.07, extra large = £80.12,

Option Wound Manager
Wound drainage bag
Option wound manager bag (Oxamed Ltd) £158.71, medium = £133.16, small = £130.26, square = £138.95, extra small = £117.12.

Option Wound Manager with access port
Wound drainage bag, with access port
Option wound manager bag with access port, (Oxamed Ltd) large = £169.65, medium = £138.95, small = £136.05, square = £144.74, extra small = £128.06.

Option Wound Manager, cut to fit
Wound drainage bag, cut to fit
Option wound manager bag (Oxamed Ltd) large = £83.44, medium = £79.66, small = £71.91

Welland Fistula bag
Wound drainage bag, cut-to-fit
Welland (Welland Medical Ltd) Fistula wound drainage bag = £81.29

Physical debridement pads
Debrisoft® is a pad that is used for the debridement of superficial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. Debrisoft® must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

Debrisoft Pad
Polyester fibres with bound edges and knitted outer surface coated with polyacrylate
Debrisoft (Activa Healthcare Ltd) pad 10cm x 10cm = £6.39

Complex adjunct therapies
Topical negative pressure therapy
Accessories
Renasys
Soft port and connector
Renasys (Smith & Nephew Healthcare Ltd) Soft Port = £11.11, connector for use with soft port = £3.24

V.A.C.
Drape, gel for canister, Sensa T.R.A.C. Pad
SensaT.R.A.C. (KCI Medical Ltd) pad = £10.95
T.R.A.C. (KCI Medical Ltd) connector = £3.13
V.A.C. (KCI Medical Ltd) drape = £9.39, gel strips = £3.76
Venturi
Gel patches, adhesive, and connector
Venturi (Talley Group Ltd) adhesive gel patch = £15.00, connector = £15.00

WoundASSIST gel strip
WoundASSIST (Huntleigh Healthcare Ltd) TNP gel strip = £3.37

Vacuum assisted closure products
Exsu-Fast kit 1
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 1 = £28.04
Exsu-Fast kit 2
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 2 = £35.83
Exsu-Fast kit 3
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 3 = £35.83
Exsu-Fast kit 4
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 4 = £28.04

V.A.C. GranaFoam
Polypolyurethane foam dressing (with adhesive drapes and pad connector); with or without silver
V.A.C. GranaFoam (KCI Medical Ltd) Bridge dressing kit = £32.04, Silver with SensaT.R.A.C dressing kit medium = £38.04, small = £32.78, dressing kit large = £31.70, medium = £27.32, small = £22.95,

V.A.C. Simplace
Spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector)
V.A.C. Simplace EX dressing kit (KCI Medical Ltd) medium = £30.58, small = £26.60

V.A.C. WhiteFoam
Polyvinyl alcohol foam dressing or dressing kit
V.A.C. WhiteFoam dressing (KCI Medical Ltd) large = £17.04, small = £10.64, kit large = £33.54, small = £25.91,
Venturi
Wound sealing kit, flat drain; with or without channel drain
Venturi wound sealer with steel (Talley Group Ltd) channel drain = £15.00, flat drain, large = £17.50, standard = £15.00,

WoundASSIST
Wound pack and channel drain
WoundASSIST TNP dressing pack (Huntleigh Healthcare Ltd) medium/large = £23.85, small/medium = £20.81, channel drain medium/large = £23.85, small/medium = £20.81, extra large = £34.05,

Wound drainage collection devices
ActiV.A.C.
Canister with gel
ActiV.A.C (KCI Medical Ltd) canister with gel = £28.42

S-Canister
Canister kit
S-Canister (Smith & Nephew Healthcare Ltd) kit = £19.00

V.A.C. Freedom
Canister with gel
V.A.C. (KCI Medical Ltd) Freedom Canister with gel = £28.85
Venturi
Canister kit with solidifier
Venturi (Talley Group Ltd) Compact canister kit = £12.50, canister kit = £12.50

WoundASSIST wound pack
Canister
WoundASSIST (Huntleigh Healthcare Ltd) TNP canister = £20.30

Wound care accessories
Dressing packs
The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

Multiple Pack Dressing No. 1
Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded)

Vernaid (Synergy Health Plc) multiple pack dressing
Non-drug tariff specification sterile dressing packs

Dressit
Vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field
Dressit sterile dressing pack with (Richardson Healthcare Ltd) medium/large gloves = £0.60, small/medium gloves = £0.60

Nurse It
Contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-sterile swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape

Nurse It sterile dressing pack with (Medicaplus International Ltd) medium/large gloves = £0.54, small/medium gloves = £0.54

Polyfield Nitrile Patient Pack
Contains powder-free nitrile gloves, laminate sheet, non-sterile or non-sterile 4 ply absorbent paper towel, water repellent inner wrapper

Polyfield Nitrile Patient Pack with (Shermond) large gloves = £0.52, medium gloves = £0.52, small gloves = £0.52

Sovereign medium gloves = £0

Softswab non-sterile fabric swab 4ply (Richardson Healthcare Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Softswab non-sterile fabric swab 4ply (Synergy Health Plc) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Topper 8 non-sterile fabric swabs 4ply (Syntagenix Wound Management Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

Filamated gauze swabs

Cotfil
As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile
Cotfil (Synergy Health Plc) filamated gauze swab 8ply non-sterile 10cm x 10cm

Filamated non-woven Fabric Swab

Regal
(Drug Tariff specification 29). Film of viscose fibres enclosed within non-sterile viscose fabric folded 8-ply, non-sterile
Regal (Syntagenix Wound Management Ltd) filamated swab 8ply 10cm x 10cm

Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment. Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Occlusive adhesive tapes

Blender
(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with a polymeric adhesive mass
Blender tape (3M Health Care Ltd) 2.5cm = £1.77, 5cm = £3.37

Sleek
(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with an adhesive mass
Leukoplast Sleek tape (BSN medical Ltd) 2.5cm, 5cm, 7.5cm

Permeable adhesive tapes

3m Kid Removal Silicone Tape
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
3m Kid removal tape (3M Health Care Ltd) 2.5cm = £3.58, 5cm = £6.48

Chemifix
(Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988). Non-sterile fabric with a polyacrylate adhesive
Chemifix tape (Medicareplus International Ltd) 10cm = £2.10, 2.5cm = £0.90, 5cm = £1.40

Chemipore
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-sterile textile material spread with a polymeric adhesive mass
Chemipore tape (Medicareplus International Ltd) 1.25cm = £0.27, 2.5cm = £0.70, 5cm = £0.95

Clinipore
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-sterile textile material spread with a polymeric adhesive mass
Clinipore tape (CliniSupplies Ltd) 1.25cm = £0.35, 2.5cm = £0.73, 5cm = £0.99

Elastoplast
(Elastic Adhesive Tape, BP 1988). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide
Tensoplast (BSN medical Ltd) elastic adhesive tape 2.5cm

Hypafix tape (BSN medical Ltd) 10cm = £4.63, 15cm = £6.86, 2.5cm = £1.67, 5cm = £9.10, 10cm = £13.15, 5cm = £2.65

Insil (Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape.

Insil tape (Insight Medical Products Ltd) 2cm = £5.77, 4cm = £5.77

Leukofix (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass.

Leukofix tape (BSN medical Ltd) 1.25cm = £0.55, 2.5cm = £0.89, 5cm = £1.55

Leukopor (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass.

Leukopor tape (Robert Bailey & Son Plc) 1.25cm = £0.49, 2.5cm = £0.76, 5cm = £1.34

Mediplast (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass.

Mediplast tape (Neomedic Ltd) 1.25cm = £0.30, 2.5cm = £0.50

Mediplast (Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide.

Mediplast Zinc Oxide plaster (Neomedic Ltd) 1.25cm = £0.82, 2.5cm = £1.19, 5cm = £1.99, 7.5cm = £2.99

Mefix tape (Molnlycke Health Care Ltd) 10cm = £2.89, 15cm = £3.94, 2.5cm = £1.02, 20cm = £5.04, 30cm = £7.24, 5cm = £1.81

Mepitac (Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape.

Mepitac tape (Molnlycke Health Care Ltd) 2cm = £0.93, 4cm = £0.93

Micropore (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass.

Micropore tape (3M Health Care Ltd) 1.25cm = £0.62, 2.5cm = £0.92, 5cm = £1.62

Omnifix tape (Paul Hartmann Ltd) 10cm = £4.04, 15cm = £5.97, 5cm = £2.40

OpSite Flexifix Gentle (Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape.

OpSite Flexifix Gentle tape (Smith & Nephew Healthcare Ltd) 2.5cm = £10.20, 5cm = £19.13

Primaflex tape (Smith & Nephew Healthcare Ltd) 10cm = £2.32, 15cm = £3.43, 20cm = £4.22, 5cm = £1.58

Scanpor (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass.

Scanpor tape (Bio-Diagnostics Ltd) 1.25cm = £0.55, 2.5cm = £0.92, 5cm = £1.75, 7.5cm = £2.56

Siltape (Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape.

Siltape (Advancis Medical) 2cm = £5.60, 4cm = £5.60

Strappal (Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide.

Strappal adhesive tape (BSN medical Ltd) 2.5cm = £1.37, 5cm = £2.32, 7.5cm = £3.49

Transpore (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass.

Transpore tape (3M Health Care Ltd) 1.25cm = £0.52, 2.5cm = £0.84, 5cm = £1.48

Zinc Oxide Adhesive Tape, BP 1988 (Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide.

Fast Aid zinc oxide adhesive tape (Robinson Healthcare) 1.25cm, 2.5cm, 5cm, 7.5cm

Skin closure dressings
Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

Skin closure strips, sterile

Leukostrip (Drug Tariff specifies that these are specifically for personal administration by the prescriber.

Leukostrip (Smith & Nephew Healthcare Ltd) skin closure strips 6.4mm x 76mm = £6.28

Omnistrip (Drug Tariff specifies that these are specifically for personal administration by the prescriber.

Omnistrip (Paul Hartmann Ltd) skin closure strips sterile 6mm x 76mm = £24.11

Steri-strip (Drug Tariff specifies that these are specifically for personal administration by the prescriber.

Steri-strip (3M Health Care Ltd) skin closure strips 6mm x 75mm = £8.77

Bandages
Non-extendable bandages
Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

Open-wound Bandage, Type 1 BP 1988
Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length.

Clini open wave bandage Type 1 BP 1988 (CliniSupplies Ltd) 10cm x 5m, 2.5cm x 5m, 5cm x 5m, 7.5cm x 5m.

Vernaoid white open wave bandage (Synergy Health Plc) 10cm x 5m, 2.5cm x 5m, 5cm x 5m, 7.5cm x 5m.

White open wave bandage (Robert Bailey & Son Plc) 10cm x 5m, 2.5cm x 5m, 5cm x 5m, 7.5cm x 5m.

Triangular Calico Bandage, BP 1980
Unbleached calico right-angled triangle.

Clini (CliniSupplies Ltd) triangular calico bandage BP 1980 90cm x 127cm.

Triangular (BSN medical Ltd) calico bandage 90cm x 127cm.

Light-weight conforming bandages
Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contour bandages) is greater than that of cotton conforming bandages.
Wound management
Appendix 4

Acti-Wrap
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Acti-Wrap (cohesive/latex free) bandage (Activa Healthcare Ltd) 10cm x 4m = £0.80, 6cm x 4m = £0.65, 8cm x 4m = £0.68

Cotton Conforming Bandage, BP 1988
Cotton fabric, plain weave, treated to impart some elasticity to warp and weft

Easifix
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Easifix (BN medical Ltd) 10cm x 4m = £0.50, 15cm x 4m = £0.85, 5cm x 4m = £0.35, 7.5cm x 4m = £0.42

Easifix K
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched

Easifik bandage (BSN medical Ltd) 10cm x 4m = £0.18, 15cm x 4m = £0.32, 2.5cm x 4m = £0.10, 5cm x 4m = £0.11, 7.5cm x 4m = £0.16

Hospiform
Fabric, plain weave, warp of polyamide, weft of viscose

Hospiform bandage (Paul Hartmann Ltd) 10cm x 4m = £0.19, 12cm x 4m = £0.23, 6cm x 4m = £0.13, 8cm x 4m = £0.17

K-Band
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched

K-Band bandage (Urgo Ltd) 10cm x 4m = £0.28, 15cm x 4m = £0.49, 5cm x 4m = £0.20, 7cm x 4m = £0.26

Knit Fix
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched

Knit Fix bandage (Robert Bailey & Son Plc) 10cm x 4m = £0.17, 15cm x 4m = £0.33, 5cm x 4m = £0.12, 7cm x 4m = £0.17

Knit-Band
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched

Knit-Band bandage (CliniSupplies Ltd) 10cm x 4m = £0.17, 15cm x 4m = £0.30, 5cm x 4m = £0.10, 7cm x 4m = £0.15

Kontour
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Kontour bandage (EasiGrip Ltd) 10cm x 4m = £0.40, 15cm x 4m = £0.66, 5cm x 4m = £0.28, 7.5cm x 4m = £0.35

Mollelast
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Mollelast (Lohmann & Rauscher (UK) Ltd) bandage 4cm x 4m = £0.30

Peha-haft
Polyamide and Cellulose Contour Bandage, cohesive, latex-free

Peha-haft bandage (Paul Hartmann Ltd) 10cm x 4m = £0.76, 12cm x 4m = £0.90, 2.5cm x 4m = £0.73, 4cm x 4m = £0.47, 6cm x 4m = £0.56, 8cm x 4m = £0.66

PremierBand
Polyamide and Cellulose Contour Bandage

PremierBand bandage (Shermond) 10cm x 4m = £0.17, 15cm x 4m = £0.25, 5cm x 4m = £0.12, 7.5cm x 4m = £0.14

Slinky
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Slinky bandage (Molnycke Health Care Ltd) 10cm x 4m = £0.71, 15cm x 4m = £1.02, 7.5cm x 4m = £0.59

Stayform
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Stayform bandage (Robinson Healthcare) 10cm x 4m = £0.40, 15cm x 4m = £0.68, 5cm x 4m = £0.29, 7.5cm x 4m = £0.36

Tubular bandages and garments
Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

Compression hosiery reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

Silk clothing is available as an alternative to elasticated viscose stockinet garments, for use in the management of severe eczema and allergic skin conditions.

Elasticated Surgical Tubular Stockinette, Foam padded is used for relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface.

For Elasticated Tubular Bandage, BP 1993, where no size stated by the prescriber, the 30 cm length should be supplied and width endorsed. Non-elasticated Cotton Stockinette, Bleached, BP 1988 1m lengths is used as basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage.

For Non-elasticated Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988, the Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage. It is used as protective dressings with tar-based and other steroid ointments.

Elasticated

Acti-Fast
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage

Acti-Fast 2-way stretch stockinette (Activa Healthcare Ltd) 10.75cm = £6.04, 17.5cm = £1.83, 20cm = £3.20, 3.5cm = £0.56, 5cm = £0.58, 7.5cm = £0.77

Clinifast
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Clinifast stockinette (CliniSupplies Ltd) 10.75cm = £5.04, 17.5cm = £1.83, 3.5cm = £0.56, 5cm = £0.58, 7.5cm = £0.77

Comfifast
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Comfifast stockinette (Synergy Health Plc) 10.75cm = £6.04, 17.5cm = £1.83, 3.5cm = £0.56, 5cm = £0.58, 7.5cm = £0.77

Comfifast Easywrap
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes
Comfifast Multistretch Tubular Bandage with polyurethane foam lining.

Coverflex Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Coverflex stockinette (Paul Hartmann Ltd) 10.75cm = £0.81, 17.5cm = £0.89, 25.5cm = £0.95

Coverflex stockinette (Easyrip Ltd) 10.75cm = £0.90, 17.5cm = £0.91, 25.5cm = £0.96

Elasticated Surgical Tubular Stockinette, Foam padded or Topipad

DreamSkin Knitted silk fabric, hypoallergenic, sericin-free

DreamSkin (DreamSkin Health Ltd) baby leggins with foldaway feet 0–3 months = £24.95, 3–6 months = £27.81, 6–9 months = £28.32, 9–12 months = £28.77, 12–18 months = £29.87, 18–24 months = £32.43, 24–30 months = £34.49, 30–36 months = £36.63, 36–42 months = £38.87, 42–48 months = £41.21, 48–54 months = £43.65, 54–60 months = £46.19, 60–66 months = £48.83, 66–72 months = £51.64, 72–78 months = £54.62, 78–84 months = £57.77, 84–90 months = £60.95, 90–96 months = £64.21, 96–108 months = £67.62, 108–120 months = £71.15, 120–144 months = £74.81, 144–168 months = £78.64, 168–192 months = £82.60, 192–216 months = £86.66, 216–240 months = £90.83, 240–270 months = £95.10, 270–300 months = £99.48

Elasticated Tubular Bandage, BP 1993

Easystrip Cotton stockinette bleached heavyweight (E Salis Ltd) 10cm, 2.5cm, 5cm

Wound management products and elasticated garments
Support bandages

Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see p. 1317.

CliniLite

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

CliniLite bandage (Clinisupplies Ltd) 10cm x 4.5m = £0.80, 15cm x 4.5m = £1.16, 5cm x 4.5m = £0.44, 7.5cm x 4.5m = £0.61

CliniPlus

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

CliniPlus (Clinisupplies Ltd) bandage 10cm x 8.7m = £1.80

Cotton Crepe Bandage

Light support bandage, 4.5 m stretched (all)

Hospirecpe 2 (Paul Hartmann Ltd) 29 bandage 10cm x 4.5m = £0.81, 15cm x 4.5m = £1.18, 15cm x 5m = £0.65, 7.5cm x 4.5m = £0.62, 39 bandage 10cm x 4.5m = £0.80, 15cm x 4.5m = £1.17, 5cm x 4.5m = £0.44, 7.5cm x 4.5m = £0.62,

Cotton Crepe Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (both)

Elastocrepe bandage (BSN medical Ltd) 10cm x 4.5m, 7.5cm x 4.5m

Flexocrepe bandage (Robinson Healthcare) 10cm x 4.5m, 7.5cm x 4.5m

Sterocrepe bandage (Steroplast Healthcare Ltd) 10cm x 4.5m, 7.5cm x 4.5m

Cotton Suspensory Bandage

(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all)

Crepe Bandage, BP 1988

Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage; 4.5 m stretched

Alvita crepe bandage (Alliance Healthcare (Distribution) Ltd) 10cm x 4.5m, 15cm x 4.5m, 5cm x 4.5m, 7.5cm x 4.5m

Clinicrepe bandage (Clinisupplies Ltd) 10cm x 4.5m, 15cm x 4.5m, 5cm x 4.5m, 7.5cm x 4.5m

Crepe bandage (Robert Bailey & Son Plc) 10cm x 4.5m, 15cm x 4.5m, 5cm x 4.5m, 7.5cm x 4.5m

Propax crepe bandage (BSN medical Ltd) 10cm x 4.5m, 15cm x 4.5m, 5cm x 4.5m, 7.5cm x 4.5m

Vernade crepe bandage (Synergy Health Plc) 10cm x 4.5m, 15cm x 4.5m, 5cm x 4.5m, 7.5cm x 4.5m

Elset

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

Elset (Molnlycke Health Care Ltd) bandage 15cm x 12m = £5.52, bandage 10cm x 6m = £2.57, 10cm x 8m = £3.29, 15cm x 6m = £2.76.

Hospicrepe 233

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)

Hosprise 233 bandage (Paul Hartmann Ltd) 10cm x 4.5m = £0.96, 15cm x 4.5m = £1.36, 5cm x 4.5m = £0.52, 7.5cm x 4.5m = £0.72

Hosplite

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Hosplite bandage (Paul Hartmann Ltd) 10cm x 4.5m = £0.61, 15cm x 4.5m = £0.90, 5cm x 4.5m = £0.36, 7.5cm x 4.5m = £0.50

K-Lite

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

K-Lite (Urto Ltd) Long bandage 10cm x 5.25m = £1.14, bandage 10cm x 4.5m = £0.99, 15cm x 4.5m = £1.44, 5cm x 4.5m = £0.55, 7cm x 4.5m = £0.76

K-Plus

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

K-Plus (Urto Ltd) Long bandage 10cm x 10.25m = £2.61, bandage 10cm x 8.7m = £2.26

Knit-Firm

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

Knit-Firm bandage (Millsedge Healthcare) 10cm x 4.5m = £0.66, 15cm x 4.5m = £0.96, 5cm x 4.5m = £0.36, 7cm x 4.5m = £0.51

L3

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

L3 (Smith & Nephew Healthcare Ltd) bandage 10cm x 8.6m = £2.19

Neosport

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Neosport bandage (Euromed Ltd) 10cm x 4.5m = £0.91, 15cm x 4.5m = £1.12, 5cm x 4.5m = £0.54, 7.5cm x 4.5m = £0.73

PremierBand

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)

PremierBand bandage (Sherwood) 10cm x 4.5m = £0.79, 15cm x 4.5m = £1.18, 15cm x 4.5m = £0.65, 7.5cm x 4.5m = £0.63

Profore #2

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Profore #2 (Smith & Nephew Healthcare Ltd) bandage 10cm x 4.5m = £1.34, latex free bandage 10cm x 4.5m = £1.42

Profore #3

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

Profore #3 (Smith & Nephew Healthcare Ltd) bandage 10cm x 8.7m = £3.90, latex free bandage 10cm x 8.7m = £4.24

Setocrepe

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Setocrepe (Molnlycke Health Care Ltd) bandage 10cm x 4.5m = £1.18

Selfcrepe
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Selfcrepe bandage (BSN medical Ltd) 10cm x 4.5m = £1.23, 15cm x 4.5m = £1.79, 5cm x 4.5m = £0.69, 7.5cm x 4.5m = £0.97

Adhesive bandages
Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

Elastic Adhesive Bandage, BP 1993
Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched
Tensoplast bandage (BSN medical Ltd) 10cm x 4.5m, 5cm x 4.5m, 7.5cm x 4.5m

Cohesive bandages
Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

Cohesive extensible bandages
Coban Bandage
Coban (3M Health Care Ltd) self-adherent bandage 10cm x 6m = £2.93
K Press Bandage
K Press bandage (Urgo Ltd) 10cm x 6.5m = £2.89, 10cm x 7.5m = £3.37, 12cm x 7.5m = £4.25, 8cm x 7.5m = £3.18
Profore #4 Bandage
Profore #4 (Smith & Nephew Healthcare Ltd) bandage 10cm x 2.5m = £3.23, latex free bandage 10cm x 2.5m = £3.51
Ultra Fast Bandage
Ultra (Robinson Healthcare) Fast cohesive bandage 10cm x 6.3m = £2.39

Compression bandages
High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline, p. 207 can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

High compression bandages
High Compression Bandage
Cotton, viscose, nylon, and Lycra extensible bandage, 3 m (unstretched)
K-Three (Urgo Ltd) bandage 10cm x 3m = £2.81
SurePress (ConvaTec Ltd) bandage 10cm x 3m = £3.61
PEC High Compression Bandages
Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched
Setopress (Molnlycke Health Care Ltd) bandage 10cm x 3.5m = £3.50
VEC High Compression Bandages
Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both)
Tensoplast bandage (BSN medical Ltd) 10cm x 3m = £3.43, 7.5cm x 3m = £2.67
Short stretch compression bandages
Actico Bandage
Actico bandage (Activa Healthcare Ltd) 10cm x 6m = £3.33, 12cm x 6m = £4.24, 4cm x 6m = £2.38, 6cm x 6m = £2.79, 8cm x 6m = £3.21
Comprian Bandage
Comprian bandage (BSN medical Ltd) 10cm x 5m = £3.36, 12cm x 5m = £4.09, 6cm x 5m = £2.66, 8cm x 5m = £3.12
Residal K Bandage
Residal K bandage (Lohmann & Rauscher (UK) Ltd) 10cm x 10m = £5.97, 10cm x 5m = £3.43, 12cm x 5m = £4.16, 6cm x 5m = £2.63, 8cm x 5m = £3.14
Sub-compression wadding bandage
Cellona Undercast Padding
Padding
Cellona Undercast padding bandage (Lohmann & Rauscher (UK) Ltd) 10cm x 2.75m = £0.47, 15cm x 2.75m = £0.60, 5cm x 2.75m = £0.31, 7.5cm x 2.75m = £0.38
Flexi-Ban Padding
Flexi-Ban (Activa Healthcare Ltd) bandage 10cm x 3.5m = £0.50
K Tech Reduced Padding
K Tech Reduced bandage 10cm x (Urgo Ltd) 6m = £4.68, 7.3m = £5.11
K-Soft Padding
K-Soft (Urgo Ltd) Long bandage 10cm x 4.5m = £0.56, bandage 10cm x 3.5m = £0.45
K-Tech (K Tech in DMD) Padding
K Tech (Urgo Ltd) Reduced bandage 10cm x 7.3m = £5.11, bandage 10cm x 5m = £3.90, 10cm x 6m = £4.68, 12cm x 6m = £5.91, 12cm x 7.3m = £6.45, 8cm x 6m = £4.42, 8cm x 7.3m = £4.82,
Ortho-Band Plus Padding
Ortho-Band (Millpledge Healthcare) Plus bandage 10cm x 3.5m = £0.37
Profore #1 Padding
Profore #1 (Smith & Nephew Healthcare Ltd) bandage 10cm x 3.5m = £0.70, latex free bandage 10cm x 3.5m = £0.76
Softexe Padding
Softexe (Molnlycke Health Care Ltd) bandage 10cm x 3.5m = £0.62
SurePres Padding
SurePres (ConvaTec Ltd) bandage 10cm x 3m = £3.61
Ultra Soft Padding
Ultra (Robinson Healthcare) Soft wadding bandage 10cm x 3.5m = £0.39
Wound management

**Multi-layer compression bandaging**

Multi-layer compression bandaging systems are an alternative to High Compression Bandages for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

**Four layer systems**

**K-Four**

Padding

**K-Four (Urgo Ltd)** Reduced Compression multi-layer compression bandage kit 18cm+ ankle circumference = £6.89, 25cm-32cm ankle circumference = £8.80, multi-layer compression bandage kit 18cm-25cm ankle circumference = £4.92, 25cm-30cm ankle circumference = £6.80, greater than 30cm ankle circumference = £3.96, less than 18cm ankle circumference = £7.11.

**Profore**

Wound contact layer

**Profore (Smith & Nephew Healthcare Ltd)** Lite latex free multi-layer compression bandage kit = £5.91, multi-layer compression bandage kit 18cm-25cm ankle circumference = £10.07, multi-layer compression bandage kit 18cm-25cm ankle circumference = £9.42, 25cm-30cm ankle circumference = £7.82, above 30cm ankle circumference = £11.71, up to 18cm ankle circumference = £10.11.

**Ultra Four**

Wound contact layer

**Ultra Four (Robinson Healthcare)** Reduced Compression multi-layer compression bandage kit = £6.44, latex free multi-layer compression bandage kit 18cm-25cm ankle circumference = £5.67, up to 18cm ankle circumference = £6.41.

**Zizoc**

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%

**Zizoc (Smith & Nephew Healthcare Ltd)** stockings = £31.26

**Compression hosiery and garments**

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging. Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

Graduated Compression hosiery, Class 1 Light Support is used for superficial or early varices, varicosis during pregnancy.

Graduated Compression hosiery, Class 2 Medium Support is used for varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy.

Graduated Compression hosiery, Class 3 Strong Support is used for gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis.

Compression values for hosiery and lymphoedema garments

**Class 1: Compression hosiery (British standard)**

14–17 mmHg, lymphoedema garments (European classification) 18–21 mmHg; Class 2 Compression hosiery (British standard) 18–24 mmHg, lymphoedema garments (European classification) 23–32 mmHg; Class 3 Compression hosiery (British standard) 25–35 mmHg, lymphoedema garments (European classification) 34–46 mmHg; Class 4 Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 49–70 mmHg; Class 4 super Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 60–90 mmHg.
Graduated compression hosiery

**Class 1 Light Support**
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Class 2 Light Support**
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Accessories**
- **Suspender**
  - Suspender, for thigh stockings

**Anklets**

**Class 2 Medium Support**
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure),

**Class 3 Strong Support**
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure),

**Knee caps**

**Class 2 Medium Support**
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Lymphoedema garments**

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) armsleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details. Note There are different compression values for lymphoedema garments and graduated compression hosiery, see above.
Dental Practitioners’ Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales). Licensed sugar-free versions, where available, are preferred. Licensed alcohol-free mouthwashes, where available, are preferred.

Azithromycin Tablets, Aciclovir Tablets, BP, Benzydamine Mouthwash, BP
Azithromycin Capsules, Aspirin Tablets, Dispersible, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF

Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):

BioXtra® Gel Mouthwash
BioXtra® Moisturising Gel
Glandosane® Saliveze®

Artificial Saliva Substitute Spray, DPF
Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/ metered inhalation, CFC-free, as:

Clen Modulite®

Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Oral Solution, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, Gastro-resistant, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, DPF
Loratadine Syrup, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxycycline Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxymethylpenicillin Oral Solution, BP
Phenoxymethylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations. For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF publications.

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF. Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder
amoxicillin (as trihydrate) 3 g sachet

Additional information on the use of these preparations is available in the BNF publications.
Artificial Saliva Gel
(proprietary product: Biotene Oralbalance), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

Artificial Saliva Oral Spray
(proprietary product: Xerotin) consists of water, sorbitol, carmelllose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Artificial Saliva Pastilles
(proprietary product: Salivix), consists of acacia, malic acid, and other ingredients

Artificial Saliva Protective Spray
(proprietary product: Aquoral) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame

Artificial Saliva Substitute Spray
(proprietary product: AS Saliva Orthana Spray) consists of mucin, methylparaben, benzalkonium chloride, EDTA, xylitol, peppermint oil, spearmint oil, mineral salts

Azithromycin Capsules
azithromycin 250 mg

Azithromycin Oral Suspension
200 mg/5 mL.
azithromycin 200 mg/5 mL when reconstituted with water

Azithromycin Tablets
azithromycin 250 mg and 500 mg

Betamethasone Soluble Tablets
500 micrograms
betamethasone (as sodium phosphate) 500 micrograms

Chlorhexidine Oral Spray
(proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension
125 mg/5 mL.
clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension
250 mg/5 mL.
clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets
20 mg
(proprietary product: Periostat), doxycycline (as hyclate) 20 mg

Fluconazole Capsules
50 mg
fluconazole 50 mg

Fluconazole Oral Suspension
50 mg/5 mL.
(proprietary product: Diflucan), fluconazole 50 mg/5 mL when reconstituted with water

Lidocaine Spray
10%
(proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Syrup
5 mg/5 mL.
loratadine 5 mg/5 mL

Saliva Stimulating Tablets
(proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste
0.619%
(proprietary product: Duraphat '2800 ppm' Toothpaste), sodium fluoride 0.619%

Sodium Fluoride Toothpaste
1.1%
(proprietary product: Duraphat '5000 ppm' Toothpaste), sodium fluoride 1.1%
Nurse Prescribers’ Formulary

Nurse Prescribers’ Formulary for Community Practitioners

Nurse Prescribers’ Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 1323.

- Almond Oil Ear Drops, BP
- Arachis Oil Enema, NPF
- Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets)
- Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
- Bisacodyl Tablets, BP
- Catheter Maintenance Solution, Sodium Chloride, NPF
- Catheter Maintenance Solution, Solution C’, NPF
- Catheter Maintenance Solution, ‘Solution R’, NPF
- Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
- Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
- Choline Salicylate Dental Gel, BP
- Clotrimazole Cream 1%, BP
- Co-danthramer Capsules, NPF
- Co-danthramer Capsules, Strong, NPF
- Co-danthramer Oral Suspension, NPF
- Co-danthramer Oral Suspension, Strong, NPF
- Co-danthrusate Capsules, BP
- Co-danthrusate Oral Suspension, NPF
- Crotamiton Cream, BP
- Crotamiton Lotion, BP
- Diclofenac barrier creams containing at least 20%
- Diclofenac Lotion, BP
- Diclofenac Tablets, BP
- Diltiazem Tablets, BP
- Dimeticone Lotion, NPF
- Dimeticone barrier creams containing at least 0.5%
- Dimeticone barrier creams containing at least 1%
- Dimeticone Lotion, NPF
- Docosate Capsules, BP
- Docosate Enema, NPF
- Docosate Oral Solution, BP
- Docosate Oral Solution, Paediatric, BP
- Econazole Cream 1%, BP
- Emollients as listed below:
  - Aquadrate® 10% w/w Cream
  - Arachis Oil, BP
  - Balneum® Plus Cream
  - Cetraben® Emollient Cream
  - Dermamist
  - Diprobalse® Cream
  - Diprobalse® Ointment
  - Doublebase®
  - Doublebase® Dayleve Gel
  - E45® Cream
  - E45® Itch Relief Cream
  - Emulsifying Ointment, BP
  - Eucerin® Intensive 10% w/w Urea Treatment Cream
  - Eucerin® Intensive 10% w/w Urea Treatment Lotion
- Hydromol® Cream
- Hydromol® Intensive
- Hydrous Ointment, BP
- Lipobase®
- Liquid and White Soft Paraffin Ointment, NPF
- Neutrogena® Norwegian Formula Dermatological Cream
- Nutraplus® Cream
- Oilatum® Cream
- Oilatum® Junior Cream
- Paraffin, White Soft, BP
- Paraffin, Yellow Soft, BP
- Ultrabase®
- Ungsentum M®
- Emollient Bath and Shower Preparations as listed below:
  - Aqueous Cream, BP
  - Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
  - Balneum® Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
  - Cetraben® Emollient Bath Additive
  - Dermalo® Bath Emollient
  - Doublebase® Emollient Bath Additive
  - Doublebase® Emollient Shower Gel
  - Doublebase® Emollient Wash Gel
  - Hydromol® Bath and Shower Emollient
  - Oilatum® Emollient
  - Oilatum® Gel
  - Ointate® Emollient
  - Zerolatum® Emollient Medicinal Bath Oil
- Folic Acid Tablets 400 micrograms, BP
- Glycerol Suppositories, BP
- Ibuprofen Oral Suspension, BP (except for indications and doses that are PoM)
- Ibuprofen Tablets, BP (except for indications and doses that are PoM)
- Ispaghula Husk Granules, BP
- Ispaghula Husk Granules, Effervescent, BP
- Ispaghula Husk Oral Powder, BP
- Lactulose Solution, BP
- Lidocaine Ointment, BP
- Lidocaine and Chlorhexidine Gel, BP
- Macroglol Oral Liquid, Compound, NPF
- Macroglol Oral Powder, Compound, NPF
- Macrogol Oral Powder, Compound, Half-strength, NPF
- Magnesium Hydroxide Mixture, BP
- Magnesium Sulfate Pante, BP
- Malathion aqueous lotions containing at least 0.5%
- Mecobalamin Oral Suspension, NPF
- Mecobalamin Tablets, NPF
- Methylcellulose Tablets, BP
- Miconazole Cream 2%, BP
- Miconazole Oromucosal Gel, BP
- Mouthwash Solution-tablets, NPF
- Nicotine Inhalation Cartridge for Oromucosal Use, NPF
- Nicotine Lozenge, NPF
- Nicotine Medicated Chewing Gum, NPF
- Nicotine Nasal Spray, NPF
- Nicotine Oral Spray, NPF
- Nicotine Sublingual Tablets, NPF
- Nicotine Transdermal Patches, NPF
- Nystatin Oral Suspension, BP
- Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets); (max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone-Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulphate Elixir, NPF
Spermicidal contraceptives as listed below:

Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)
Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

Appliances (including Contraceptive Devices)—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic) as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff).

Incontinence Appliances as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).
Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

Chemical Reagents as listed in Part IX of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhispsni.gov.uk/pas-tariff
Scottish Drug Tariff: www.isdscotland.org/HealthTopics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Details of NPF preparations
Preparations on the Nurse Prescribers' Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers' Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema
arachis oil 100%

Catheter Maintenance Solution, Sodium Chloride (proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride; Uriflex-S), sodium chloride 0.9%

Catheter Maintenance Solution, 'Solution G' (proprietary products: OptiFlo G; Uro-Tainer Saby G; Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, 'Solution R' (proprietary products: OptiFlo R; Uro-Tainer Solution R; Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions (proprietary product: Unisept chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules P (paracetamol 150 mg, co-danthramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg)
Co-danthramer Capsules, Strong P (paracetamol 150 mg, co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg)
Co-danthramer Oral Suspension P (paracetamol product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL)
Co-danthramer Oral Suspension, Strong P (paracetamol product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL)
Co-danthrusate Oral Suspension P (paracetamol product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams (proprietary products: Conotran Cream, dimeticone '350' 22%, Sispel Barrier Cream, dimeticone '1000' 10%, dimeticone 10–22%)

Dimeticone Lotion (proprietary product: Hedrin), dimeticone 4%

Docusate Enema (proprietary product: Norgalax Micro-enema) docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound (proprietary product: Movicol Liquid), macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound (proprietary product: Laxido Orange, Molaxole, Movicol) macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet

Note: Amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre

Macrogol Oral Powder, Compound, Half-strength (proprietary product: Movicol-Half), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet
Malathion aqueous lotions
(proprietary products: Derbac-M Liquid), malathion 0.5% in
an aqueous basis

Mebendazole Oral Suspension (PrM)
(proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets (PrM)
(can be sold to the public if supplied for oral use in the
treatment of enterobiasis in adults and children over 2 years
provided its container or package is labelled to show a max.
single dose of 100 mg and it is supplied in a container or
package containing not more than 800 mg (proprietary
products: Oves, Vermox), mebendazole 100 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial,
colouring and flavouring agents in a suitable soluble
effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use
(for use with inhalation mouthpiece; to be prescribed as
either a starter pack (6 cartridges with inhalator device and
holder) or refill pack (42 cartridges with inhalator device))
(proprietary products: NicAssist Inhalator, Nicorette
Inhalator), nicotine 10 mg or 15 mg

Nicotine Lozenge
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product:
Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine
(as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product:
NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

Nicotine Medicated Chewing Gum
(proprietary products: NicAssist Gum, Nicorette Gum,
Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicotine Nasal Spray
(proprietary product: NicAssist Nasal Spray, Nicorette Nasal
Spray), nicotine 500 micrograms/metered spray

Nicotine Oral Spray
(proprietary product: Nicorette Quickmist), nicotine
1 mg/metered spray

Nicotine Sublingual Tablets
(to be prescribed as either a starter pack (2 × 15-tablet
discs with dispenser) or refill pack (7 × 15-tablet discs))
(proprietary product: NicAssist Microtab, Nicorette Microtab),
nicotine (as a cyclodextrin complex) 2 mg

Nicotine Transdermal Patches
(prescriber should specify the brand to be dispensed)
releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or
15 mg (proprietary products: Boots NicAssist Patch, Nicorette
Patch) or releasing in each 16 hours approx. 10 mg, 15 mg,
or 25 mg (proprietary products: NicAssist Transparent Patch,
Nicorette Invisi Patch), or releasing in each 24 hours nicotine
approx. 7 mg, 14 mg, or 21 mg (proprietary products:
Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear)

Permethrin Cream
(proprietary product: Lyclear Dermal Cream), permethrin 5%

Senna Oral Solution
(proprietary product: Senokot Syrup), sennosides
7.5 mg/5 mL

Senna and Ispaghula Granules
(proprietary product: Manevac Granules), senna fruit 12.4%,
ispaghula 54.2%

Sodium Citrate Compound Enema
(proprietary products: Micolette Micro-enema; Micralax
Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg
with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules
(proprietary products: Dulcolax Perles), sodium picosulfate
2.5 mg

Sodium Picosulfate Elixir
(proprietary products: Dulcolax Liquid), sodium picosulfate
5 mg/5 mL

Sterculia Granules
(proprietary product: Normacol Granules), sterculia 62%
Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

**Nurses**

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers’ Formulary p. 1322 for Community Practitioners provides information on prescribing.

**Pharmacists**

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

**Optometrists**

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration.

Optometrist Independent Prescribers must work within their own level of professional competence and expertise.
Index of proprietary manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see 'Special-order manufacturers'.

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdskhe.

Licensed hospital manufacturing units also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNF or www.mhra.gov.uk/yellowcard for guidance. Do not be put off reporting because some details are not known.

**PATIENT DETAILS**

Patient Initials: ___________  Sex: M / F  Is the patient pregnant? Y / N  Ethnicity: ___________
Age (at time of reaction): ___________  Weight (kg): ___________  Identification number (e.g. Practice or Hospital Ref): ___________

**SUSPECTED DRUG(S)/VACCINE(S)**

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>

</tbody>
</table>

**SUSPECTED REACTION(S)** Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):

Date reaction(s) started: ___________  Date reaction(s) stopped: ___________

Do you consider the reactions to be serious?  Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- Patient died due to reaction
- Life threatening
- Congenital abnormality
- Involved or prolonged inpatient hospitalisation
- Involved persistent or significant disability or incapacity
- Medically significant; please give details: ___________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- Mild
- Unpleasant, but did not affect everyday activities
- Bad enough to affect everyday activities
It’s easy to report online: www.mhra.gov.uk/yellowcard

**OTHER DRUG(S) (including self-medication and complementary remedies)**

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No

If yes, please give the following information if known:

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>

Adult Advanced Life Support Algorithm

Unresponsive?
Not breathing or only occasional gasps

Call Resuscitation Team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable
(VF/pulseless VT)

Non-shockable
(PEA/Asystole)

Return of spontaneous circulation

1 Shock
Immediately resume CPR for 2 mins
Minimise interruptions

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Controlled oxygenation and ventilation
- 12-lead ECG
- Treat precipitating cause
- Temperature control / therapeutic hypothermia

During CPR
- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Consider advance airway and capnography
- Continuous chest compressions when advanced airway in place
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Correct reversible causes

Reversible causes
- Hypoxia
- Hypovolaemia
- Hypo- / hyperkalaemia / metabolic
- Hypothermia
- Thrombosis – coronary or pulmonary
- Tamponade – cardiac
- Toxins
- Tension pneumothorax

Adapted with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, October 2010
Medical emergencies in the community

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown, advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Acute coronary syndromes

- ANGINA: UNSTABLE
  - ASPIRIN dispersible tablets p. 104 (75 mg, 300 mg)
    - BY MOUTH (DISPERSED IN WATER OR CHEWED)
      - Adult: 300 mg
  - PLUS
    - EITHER Glyceryl trinitrate aerosol spray p. 190 (400 micrograms/metered dose)
      - SUBLINGUALLY
        - Adult: 1–2 sprays, repeated as required
    - OR Glyceryl trinitrate tablets p. 190 (300 micrograms, 500 micrograms, 600 micrograms)
      - SUBLINGUALLY
        - Adult: 0.3–1 mg, repeated as required

- MYOCARDIAL INFARCTION: NON-ST-SEGMENT ELEVATION
  Treat as for Angina: unstable

- MYOCARDIAL INFARCTION: ST-SEGMENT ELEVATION
  - ASPIRIN dispersible tablets p. 104 (75 mg, 300 mg)
    - BY MOUTH (DISPERSED IN WATER OR CHEWED)
      - Adult: 300 mg
  - Glyceryl trinitrate aerosol spray p. 190 (400 micrograms/metered dose)
    - SUBLINGUALLY
      - Adult: 1–2 sprays, repeated as required
  - OR Glyceryl trinitrate tablets p. 190 (300 micrograms, 500 micrograms, 600 micrograms)
    - SUBLINGUALLY
      - Adult: 0.3–1 mg, repeated as required
  - Metoclopramide hydrochloride injection p. 347 (5 mg/mL)
    - BY INTRAVENOUS INJECTION
      - Adult (under 60 kg) 18-19 years: 5 mg
      - Adult over 60 kg 18-19 years: 10 mg
      - Adult over 19 years: 10 mg
  - Diamorphine hydrochloride injection p. 361 (5 mg powder for reconstitution)
    - BY SLOW INTRAVENOUS INJECTION (1-2 mg/minute)
      - Adult: 5 mg followed by a further 2.5–5 mg if necessary
        - Elderly or frail patients: reduce dose by half
    - OR Morphine sulphate injection p. 367 (10 mg/mL)
      - BY SLOW INTRAVENOUS INJECTION (1-2 mg/minute)
        - Adult: 5–10 mg followed by a further 5–10 mg if necessary
        - Elderly or frail patients: reduce dose by half
  - Oxygen, if appropriate

Airways disease, obstructive

- ASTHMA: ACUTE
  Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital

- EITHER Salbutamol aerosol inhaler p. 222
  (100 micrograms/metered inhalation)
    - BY AEROSOL INHALATION VIA LARGE-VOLUME SPACER (AND A CLOSE-FITTING FACE MASK IF CHILD UNDER 3 YEARS)
      - Adult and child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary
  - OR Salbutamol nebuliser solution p. 222 (1 mg/mL, 2 mg/mL)
    - BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
      - Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
      - Child 5-11 years: 2.5–5 mg every 20–30 minutes or as necessary
      - Child 12-17 years: 5 mg every 20–30 minutes or as necessary
      - Adult: 5 mg every 20–30 minutes or as necessary
  - OR Terbutaline sulfate nebuliser solution p. 225 (2.5 mg/mL)
    - BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
      - Child 4 years and below: 5 mg every 20–30 minutes or as necessary
      - Child 5-11 years: 5–10 mg every 20–30 minutes or as necessary
      - Child 12-17 years: 10 mg every 20–30 minutes or as necessary
      - Adult: 10 mg every 20–30 minutes or as necessary
  - PLUS (in all cases)
    - EITHER Prednisolone tablets p. 585 (or prednisolone soluble tablets) (5 mg)
      - BY MOUTH
        - Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
        - Child 12-17 years: 40–50 mg once daily for at least 5 days
        - Adult: 40–50 mg once daily for at least 5 days
    - OR Hydrocortisone (preferably as sodium succinate) p. 583
      - BY INTRAVENOUS INJECTION
        - Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:
          - Child 1 year and below: 25 mg
          - Child 2-4 years: 50 mg
          - Child 5-17 years: 100 mg
          - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible
      - High-flow oxygen should be given if available (via face mask in children)
      - Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat nebulised beta, agonist (as above) and give with
        - Ipratropium bromide nebuliser solution p. 217
          (250 micrograms/mL)
          - BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
            - Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
            - Child 12-17 years: 500 micrograms every 4–6 hours as necessary
            - Adult: 500 micrograms every 4–6 hours as necessary
Anaphylaxis

**ANAPHYLAXIS**

**Adrenaline/epinephrine injection p. 196 (1 mg/mL (1 in 1000))**

- **Child 5 years and below:** 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
- **Child 6-11 years:** 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
- **Child 12-17 years:** 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
- **Adult:** 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow oxygen and intravenous fluids should be given as soon as available.

**Chlorphenamine maleate injection p. 245**

- **BY INTRAMUSCULAR OR INTRAVENOUS INJECTION** may help counter histamine-mediated vasodilation and bronchoconstriction.

**Hydrocortisone (preferably as sodium succinate) p. 583**

BY INTRAVENOUS INJECTION has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial infection

**MENINGOCOCCAL DISEASE**

**Benzy1penicillin sodium injection p. 480 (600 mg, 1.2 g)**

- **Neonate:** 300 mg
- **Child 1 month-11 months:** 300 mg
- **Child 1-9 years:** 600 mg
- **Child 10-17 years:** 1.2 g
- **Adult:** 1.2 g

*Note* A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

**OR** if history of allergy to penicillin

**Cefotaxime injection p. 457 (1 g)**

- **Neonate:** 50 mg/kg
- **Child 1 month-11 years:** 50 mg/kg (max. 1 g)
- **Child 12-17 years:** 1 g
- **Adult:** 1 g

*Note* A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

**OR** if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

**Chloramphenicol injection p. 452 (1 g)**

- **Neonate:** 50 mg/kg
- **Child 1 month-11 years:** 50 mg/kg
- **Child 12-17 years:** 1 g
- **Adult:** 1.2 g

*Note* A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

Seizures

**CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES**

**OR** Diazepam rectal solution p. 267 (2 mg/mL, 4 mg/mL)

- **EITHER** by rectum
  - **Neonate:** 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
  - **Child 1 month-11 years:** 5 mg, repeated once after 10–15 minutes if necessary
  - **Child 12-17 years:** 10–20 mg, repeated once after 10–15 minutes if necessary
  - **Adult:** 10–20 mg, repeated once after 10–15 minutes if necessary
  - **Elderly 65 years and over:** 10 mg, repeated once after 10–15 minutes if necessary

**OR** Midazolam oromucosal solution p. 414

- **BY BUCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY**
  - **Neonate:** 300 micrograms/kg [unlicensed]
  - **Child 1-2 months:** 300 micrograms/kg (max. 2.5 mg) [unlicensed]
  - **Child 3 months-11 months:** 2.5 mg
  - **Child 1-4 years:** 5 mg
  - **Child 5-9 years:** 7.5 mg
  - **Child 10-17 years:** 10 mg
  - **Adult:** 10 mg [unlicensed]

Recommended wording of cautionary and advisory labels

For details please see p. 1291

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow.
   Store the tablets in this bottle with the cap tightly closed.
   Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
20. Take with or just after food, or a meal
21. Take 30 to 60 minutes before food
22. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
23. Suck or chew this medicine
24. Swallow this medicine whole. Do not chew or crush
25. Dissolve this medicine under your tongue
26. Take with a full glass of water
27. Spread thinly on the affected skin only
28. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
29. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
30. Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)

b. d. = bis die (twice daily)

o. d. = omni die (every day)

o. m. = omni mane (every morning)

o. n. = omni nocte (every night)

p. c. = post cibum (after food)

p. r. n. = pro re nata (when required)

q. d. s. = quater die sumendum (to be taken four times daily)

q. q. h. = quarta quaque hora (every four hours)

stat = immediately

t. d. s. = ter die sumendum (to be taken three times daily)

t. i. d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

| E102  | Tartrazine                     |
| E211  | Sodium Benzoate               |
| E104  | Quinoline Yellow              |
| E223  | Sodium Metabisulphite         |
| E110  | Sunset Yellow FCF             |
| E320  | Butylated Hydroxyanisole      |
| E123  | Amaranth                      |
| E321  | Butylated Hydroxytoluene      |
| E124  | Ponceau 4R                    |
| E322  | Lecithins                     |
| E127  | Erythrosine BS                |
| E420  | Sorbitol                      |
| E132  | Indigo Carmine                |
| E421  | Mannitol                      |
| E142  | Green S                       |
| E422  | Glycerol                      |
| E171  | Titanium Dioxide              |
| E901  | Beeswax (white and yellow)    |
| E172  | Iron oxides, iron hydroxides  |
| E1520 | Propylene Glycol              |
| E200  | Sorbic Acid                   |
